oasis-cefact-xhe-1.0-UnqualifiedDataTypes

## Abstract:

This specification defines a business-oriented artefact either referencing (as a header) or containing (as an envelope) a payload of one or more business documents or other artefacts with supplemental semantic information about the collection of payloads as a whole. This is distinct from any transport-layer infrastructure header or envelope that may be required to propagate documents from one system to another. An exchange header envelope describes contextual information important to the sender and receiver about the payloads, without having to modify the payloads in any fashion.

## Status:

This document has been prepared and submitted both to the OASIS Business Document Exchange (BDXR) TC and to the UN/CEFACT Methodology and Technology PDA. It is the intent of both groups to share any further proposed changes to both panels and to approve identical final versions. Final approval by one or both organizations may also require their mutual commitment to approve and maintain one and the same final specification.

This document was last approved by the OASIS Business Document Exchange (BDXR) TC on the above date. The level of approval is also listed above. Check the "Latest version" location noted above for possible later revisions of this document. Any other numbered Versions and other technical work produced by the Technical Committee (TC) are listed at [https://www.oasis-open.org/committees/tc\\_home.php?wg\\_abbrev=bdxx#technical](https://www.oasis-open.org/committees/tc_home.php?wg_abbrev=bdxx#technical).

TC members should send comments on this specification to the TC's email list. Others should send comments to the TC's public comment list, after subscribing to it by following the instructions at the "[Send A Comment](#)" button on the TC's web page at <https://www.oasis-open.org/committees/bdxx/>.

[This specification is being developed under the Non-Assertion Mode of the OASIS IPR Policy, the mode chosen when the Technical Committee was established. All members of the TC should be familiar with this document, which may create obligations regarding the disclosure and availability of a member's patent, copyright, trademark and license rights that read on an approved OASIS](#)

specification. For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the ~~Technical Committee~~ TC's web page at (<https://www.oasis-open.org/committees/bdxx/ipr.php>).

Note that any machine-readable content (Computer Language Definitions) declared Normative for this Work Product is provided in separate plain text files. In the event of a discrepancy between any such plain text file and display content in the Work Product's prose narrative document(s), the content in the separate plain text file prevails.

# 1 Introduction

## 1.1 Conveying information about payloads **(Informative)**

### 1.1.1 Overview

File or document headers have long been used to describe the information about a set of payloads in an entity that is kept separate and arm's-length from the payloads themselves.

The metaphor of a paper envelope in which one places business documents for transport or management is apt to describe the role of an exchange header envelope in a container relationship to its payloads. Concepts of routing, authentication, non-repudiation and concealment all apply in both the metaphor and the electronic equivalent.

### 1.1.2 What is an Exchange Header Envelope?

The Exchange Header Envelope (XHE) specifies an XML vocabulary ~~[XML]~~**[XML]** expressing in machine-processable syntax the semantics of describing either a header to or an envelope of a set of payloads of content with information about that content. This vocabulary is modeled using the UN/CEFACT Core Component Technical Specification Version 2.01 ~~[CCTS 2.01]~~**[CCTS 2.01]**.

XHE, a specification developed jointly by UN/CEFACT and OASIS, is the successor to the UN/CEFACT Standard Business Document Header (SBDH) version 1.3 ~~[SBDH]~~**[SBDH]** and the OASIS Business Document Envelope (BDE) version 1.1 ~~[BDE]~~**[BDE]**.

## Note regarding publications

The UN/CEFACT Exchange Header Envelope and the OASIS Exchange Header Envelope are the same specification developed in collaboration and published as standards by the two organizations following the practices of each.

This specification enumerates the information components of a payload header envelope and formally describes the semantics of each component.

~~This specification mandates a suite of XML schemas [XSD1][XSD2] and additional limitations describing the document constraints against which a conforming instance SHALL validate without error.~~

## Normative markings

All clauses not marked as “informative” and also not a subclause of a clause marked as “informative” are to be considered normative. All notes and examples are informative.

The XHE is designed to be either a header as an integral part of a business document (e.g. either XML instance document or EDI interchange), an object associated with the business document itself, or as an envelope functioning as wrapper that contains one or more business documents.

This specification mandates a suite of XML schemas [XMLSCHEMA-1][XMLSCHEMA-2] and additional limitations describing the document constraints against which a conforming instance SHALL validate without error.

### 1.1.3 How is it used in EDI and XML environments?

There exist several business document exchange architectures and approaches, some using EDI formats and approaches, some using XML document types, and yet others use different document formats or non-standardized approaches. The XHE is designed to work with any document format and business process, whether standardized or not, and as such supports both the EDI, the XML and any other e-business community. Including a XHE in each instance of the business document reduces the effort needed to route and process documents and permits trading partner organizations to use different implementation approaches.

When implementing EDI, the provision of an additional business document header may not always be necessary, since EDI interchanges already contain functionality for some of the information in the XHE. An example is the EDIFACT UNB interchange header, the UNH message header, and the ‘function’ part of the BGM. The XHE specification allows for this existing approach and provides an option to express additional functionality, such as service and correlation information.

### 1.1.4 The Scope of the Exchange Header Envelope

Many users, implementers and supporting industry standard bodies are in agreement on the need for an Exchange Header Envelope. In their business-to-business activities, the XHE facilitates several different business needs:

- The routing of business documents from one point to another. This refers not only to the transfer of information from an external originator to receiver, but also from one intermediate application to another. Information in the XHE can help ensure that a document gets to the correct recipient.
- Ensuring integrity and confidentiality of business documents when routed over multiple hops, intermediaries, routers or access points, such as in 4-corner networks and architectures.
- Simplifying the bundling of several business documents or support documents into one package for simplified exchange.
- Facilitating the exchange of location pointers and access credentials to externally located business documents, not suitable for sending through an e-business network. This is necessary when the sending party needs to keep the business document confidential until a specified date (such as in tendering processes), and when sending very large files.

- The simplified processing of documents. Processing refers to taking action on data, for example transforming it from one format into another. Information in the XHE can reduce the effort required to determine the correct processing actions.
- Associating a data message with its originator is important from a business and legal perspective. It is especially important when using intermediaries for data transfer, as information from the transport protocol, may be lost after the initial transmission. Because information in the XHE is retained, it can help ensure that a document's originator is correctly identified.

In addition to header functions provided by the XHE for routing and/or processing of business documents, there is the need for a completely separate technical communications transport layer. This deals with communications protocols and physical addresses which are outside the scope of this technical specification. Transport specifications including EDIINT-AS2 and ebXML Message Service (ebMS) are among a number of possible transport options that address technical communications needs by defining a separate technical header. The transport layer is completely outside the scope as it is a different layer of the stack.

### 1.1.5 Dual Semantic Identifiers

This specification accommodates both CEFACT and OASIS naming conventions of all semantic identifiers by documenting the two values for every business information entity. In each table row in [Section 2, "Header and envelope information"](#) the semantic identifiers are provided in two sub-rows, the upper one carrying the ~~OASIS~~~~CEFACT~~ semantic identifier and the lower one carrying the ~~CEFACT~~~~OASIS~~ semantic identifier.

### 1.1.6 Stakeholders and Audience

All organizations that manage infrastructure operations and business processes for various functional areas (e.g. ordering, invoicing, planning, or financial), all service provider organizations and associations, as well as e-business networks and infrastructures, which create, route and process business documents can benefit from the use of the Exchange Header Envelope.

### 1.1.7 Schema validation artefact expression

The entities defined by this specification are realized as schema validation artefacts using the conventions specified by the OASIS Business Document Naming and Design Rules [BD-NDR] and the OASIS semantic identifiers.

## 1.2 Terminology

### 1.2.1 Key words

The key words MUST, MUST NOT, REQUIRED, SHALL, SHALL NOT, OPTIONAL and SHOULD in this document are to be interpreted as described in ~~[RFC 2119]~~~~[RFC2119]~~.

### ~~1.2.2 Terms and Definitions~~

~~schema, noun~~

~~An expression of constraints placed on XML content.~~

~~value constraints, noun~~

~~An expression of constraints placed on the values of attributes and textual content.~~

### 1.2.3 Symbols and Abbreviations

**ABIE, noun**

Aggregate Business Information Entity

**BBIE, noun**

Basic Business Information Entity

**ASBIE, noun**

Association Business Information Entity

**RFC, noun**

Request for comment

**XSD, noun**

XML Schema Definition

**XSLT, noun**

Extensible Stylesheet Language Transformations

### **1.2.3 Terms and Definitions**

**schema, noun**

An expression of constraints placed on XML content.

**value constraints, noun**

An expression of constraints placed on the values of attributes and textual content.

### **1.2.4 Key concepts**

**validation, ~~verb~~ noun**

The act of testing an XML document against a set of structural constraints (as expressed in a schema) or value constraints (as expressed in an arbitrary XML processing language, for example, XSLT).

## 1.5 IPR Policy

This specification is being developed under the Non-Assertion Mode of the OASIS IPR Policy, the mode chosen when the Technical Committee was established. All members of the TC should be familiar with this document, which may create obligations regarding the disclosure and availability of a member's patent, copyright, trademark and license rights that read on an approved OASIS specification. For information on

whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the TC's web page (<https://www.oasis-open.org/committees/bdxr/ipr.php>).

## 2 Header and envelope information

### 2.1 XHE ~~class diagram~~entity diagrams

The information derived for XHE has been distilled into a suite of CCTS Aggregate Business Information Entities (ABIEs), each comprised of a set of Basic Business Information Entities (BBIEs) and/or Association Business Information Entities (ASBIEs).

Each entity is listed with its two semantic identifiers, one specified by CEFACT members of the development team, and one specified by OASIS members of the development team. See Section 1.1.5, "Dual Semantic Identifiers" for more information.

The relationships between these business information entities are depicted in this class diagram using the CEFACT names:

*Figure 1. Exchange Header Envelope entity diagram - CEFACT names*

The relationships between these business information entities are depicted in this class diagram using the OASIS names:

Figure 2. Exchange Header Envelope entity diagram - OASIS names

## 2.2 Header envelope information

Metadata information about the header envelope itself, independent of the information it contains, includes the following:

Semantic identifier	Card.	Definition
XHE_Envelope.Details	N/A	The Exchange Header Envelope
XHE_Envelope.Details		
XHE_Envelope.XHEVersionIdentifier	1	The version of the specific envelope model in use.
XHE_Envelope.XHEVersionIdentifier		
XHE_Envelope.CustomizationIdentifier	0..1	The identification of a customization or use of the envelope model.
XHE_Envelope.CustomizationIdentifier		
XHE_Envelope.ProfileIdentifier	0..1	The identification of a specific profile found within the customization.
XHE_Envelope.ProfileIdentifier		
XHE_Envelope.ProfileExecutionIdentifier	0..1	The identification of a particular instance of using the given profile.
XHE_Envelope.ProfileExecutionIdentifier		
XHE_Envelope.Metadata.XHEDocumentHeader	1	Information relevant to the handling of the envelope.

Semantic identifier	Card.	Definition
<del>XHE_Header</del> <del>XHE_Envelope_Metadata</del> <del>XHE_Document</del>		
<del>XHE_Envelope_Included</del> <del>XHE_Payload</del> <del>XHE_Payloads</del>	0..1	The set of payloads
<del>XHE_Payloads</del> <del>XHE_Envelope_Included</del> <del>XHE_Payload</del>		

## Note

The set of payloads can be omitted to allow the XHE either to be embedded in a document that contains the actual payloads (as in the Standard Business Document) or in a standalone document entirely separate from the payloads (as in the standalone Standard Business Document Header). When present, the set of payloads is wrapped by the XHE document itself (as in the Business Document Envelope).

The information for a header envelope begins with an additional optional extensions item that is neither a BBIE nor an ASBIE and so is not modeled using CCTS. Rather, this extensions item is a schema artefact. This extensions item has the cardinality 0..1. See [Section 5.6.2, "Extension content"](#) for more information.

The information for a header envelope ends with an additional optional and repeatable number of digital signatures that are neither a BBIE nor an ASBIE and so are not modeled using CCTS. Rather, these signatures are a schema artefact published by the W3C. See [Section 3.1, "Signing the exchange header envelope"](#) for more information.

## 2.3 Header information

Metadata information about the header envelope itself, independent of the information it contains or references, includes the following:

Semantic identifier	Card.	Definition
<del>XHE_Document_</del> <del>Identification</del> <del>Header_Identifier</del>	1	Unique ID of the envelope for tracking purposes.
<del>Header</del> <del>XHE_Document_</del> <del>Identification</del> <del>Identifier</del>		
<del>XHE_Document_Header_</del> <del>UUID_Identifier</del>	0..1	An additional identifier of the envelope.
<del>Header</del> <del>XHE_Document_</del> <del>UUID_Identifier</del>		
<del>XHE_Document_Header_</del> <del>Creation_Date_Time</del> <del>Date Time</del>	1	Date and time when the envelope was created.
<del>Header</del> <del>XHE_Document_</del> <del>Creation</del> <del>Date Time</del> <del>Date Time</del>		
<del>XHE_Document_Header_</del> <del>Business_Scope</del> <del>XHE_Context</del>	0..1	Documentation of the scope of business or other contextual details useful to understand the purpose of the envelope and its contents. For examples: Europe vs Asia, Direct-to-Consumer vs Replenishment, or Prepaid vs Credit.
<del>Header</del> <del>Business</del> <del>XHE_</del> <del>Document</del> <del>Scope</del> <del>XHE_</del> <del>Context</del>		
<del>XHE_Document_Sender</del> <del>XHEHeader</del> <del>From_Party</del> <del>Party</del>	0..1	Information about the party that originated the envelope.

Semantic identifier	Card.	Definition
<del>Header. From. XHE_ Document. Sender. XHE_ Party. Party</del>		
<del>XHE_ Document. Recipient. XHE_ Header. To_ Party. Party</del> <del>Header. To. XHE_ Document. Recipient. XHE_ Party. Party</del>	1..n	Information about the parties to receive the envelope.

## 2.4 Party information

The information about a party includes the following:

Semantic identifier	Card.	Definition
<del>XHE_ Party. Party Identification</del> <del>Specified. XHE_ Identity</del>	1..n	Unambiguous identifications of a party.
<del>XHE_ Party. Specified. XHE_ Identity</del> <del>Party Identification</del>		

## 2.5 Party identification information

The information about a party's identification includes the following:

Semantic identifier	Card.	Definition
<del>XHE_ Party Identification. Identifier</del> <del>Specified. XHE_ Identity</del>	1	An unambiguous identification of a party.
<del>XHE_ Party. Specified. XHE_ Identity</del> <del>Identification. Identifier</del>		

## 2.6 Business scope information

Documentation of the scope of business or other contextual details useful to understand the purpose of the envelope and its contents includes the following:

Semantic identifier	Card.	Definition
<del>XHE_ Context. Specified. XHE_ Parameter</del> <del>Business Scope. Business Scope Criterion</del>	0..n	Internal specification of the scope and/or context of business.
<del>Business Scope. Business Scope Criterion</del> <del>XHE_ Context. Specified. XHE_ Parameter</del>		
<del>XHE_ Context. Business Scope. External</del> <del>XHE_ Reference</del>	0..n	External documentation of the scope and/or context of business.
<del>Business</del> <del>XHE_ Context. Scope. XHE_ External</del> <del>Reference</del>		

## 2.7 Business scope criterion information

Documentation of one criterion of the scope of business or other contextual detail useful to understand the purpose of the envelope and its contents includes the following:

Semantic identifier	Card.	Definition
<del>XHE_ Parameter. Business Scope Criterion. Business Scope Criterion Type. Code</del>	1	Identifies the property of the scope by a code.
<del>Business Scope Criterion. Business Scope Criterion</del> <del>XHE_ Parameter. Type. Code</del>		

Semantic identifier	Card.	Definition
<del>XHE_Parameter_Business Scope Criterion_Business Scope Criterion</del> Value. Text	1	Specifies the value of the given property.
<del>Business Scope Criterion_Business Scope Criterion_XHE_Parameter</del> Value. Text		

## 2.8 External reference information

A reference to a business case, document or other issues which are relevant to the handling of the envelope includes the following:

Semantic identifier	Card.	Definition
<del>External_XHE_ Reference. Identification_Identifier</del>	1	Identifies the referenced object by some identifier or URI.
<del>XHE_External Reference. Identification_Identifier</del>		
<del>External_XHE_ Reference. Start_Availability_Start Date Time_ Date Time</del>	0..1	The start date and time when the information is available
<del>XHE_External Reference. Start_Availability_ Start Date Time_ Date Time</del>		
<del>External_XHE_ Reference. End_Availability_End Date Time_ Date Time</del>	0..1	The end date and time when the information is available
<del>XHE_External Reference. End_Availability_ End Date Time_ Date Time</del>		
<del>External_XHE_ Reference. Login_ Text</del>	0..1	Text describing any login details to access the information.
<del>XHE_External Reference. Login_ Text</del>		
<del>External_XHE_ Reference. Password_ Text</del>	0..1	A password needed to access the information.
<del>XHE_External Reference. Password_ Text</del>		

## 2.9 Payload information

### 2.9.1 Payload set information

Information about the complete set of payloads includes the following:

Semantic identifier	Card.	Definition
<del>Payloads_XHE_ Payload_ Included_ XHE_ Payload Instance</del>	1..n	The actual payload instance, such as a single invoice, conveyed within the envelope.
<del>XHE_Payloads_ Payload_ Included_ XHE_ Payload Instance</del>		

### 2.9.2 Payload item information

Information about an individual payload within the set of payloads includes the following:

Semantic identifier	Card.	Definition
<del>XHE_ Payload_ Instance_ Identification_ Identifier</del>	0..1	A unique identification of this payload instance contained within the envelope.
<del>XHE_ Payload_ Instance_ Identification_ Identifier</del>		
<del>XHE_ Payload_ Instance_ Description_ Text</del>	0..n	Text description of the payload instance.

Semantic identifier	Card.	Definition
<del>XHE_Payload_Instance</del> . Description. Text		
<del>XHE_Payload_Instance</del> . Document_Type_Code	0..1	Identifies the abstract archetype of the payload instance.
<del>XHE_Payload_Instance</del> . Document_Type_Code		
<del>XHE_Payload_Instance</del> . Content_Type_Code	0..1	Identifies the file format or octet representation of the payload instance.
<del>XHE_Payload_Instance</del> . Content_Type_Code		
<del>XHE_Payload_Instance</del> . Customization_Identifier	0..1	Identifies the customization that applies to the payload instance.
<del>XHE_Payload_Instance</del> . Customization_Identifier		
<del>XHE_Payload_Instance</del> . Profile_Identifier	0..1	Identifies the profile that the payload instance is part of.
<del>XHE_Payload_Instance</del> . Profile_Identifier		
<del>XHE_Payload_Instance</del> . Profile_Execution_Identifier	0..1	Identifies the particular instance of an executing profile that the payload instance is part of.
<del>XHE_Payload_Instance</del> . Profile_Execution_Identifier		
<del>XHE_Payload_Instance</del> . Handling_Service_Identifier	0..1	Identifies the service that should process the payload instance.
<del>XHE_Payload_Instance</del> . Handling_Service_Identifier		
<del>XHE_Payload_Instance</del> . Validation_Type_Code	0..1	The validation type of the payload, used for the task of verifying that the grammar of a payload is valid.
<del>XHE_Payload_Instance</del> . Validation_Type_Code		
<del>XHE_Payload_Instance</del> . Validation_Version_Identifier	0..1	Descriptor containing version information of the validation type.
<del>XHE_Payload_Instance</del> . Validation_Version_Identifier		
<del>XHE_Payload_Instance</del> . Encryption_Indicator	1	Indicator to state whether the payload instance is encrypted or not.
<del>XHE_Payload_Instance</del> . Encryption_Indicator		
<del>XHE_Payload_Instance</del> . Encryption_Method_Text	0..1	Method used to encrypt the payload instance.
<del>XHE_Payload_Instance</del> . Encryption_Method_Text		
<del>XHE_Payload_Instance</del> . Encryption_Hash_Value_Text	0..1	SHA-256 hash total of the unencrypted payload instance.
<del>XHE_Payload_Instance</del> . Encryption_Hash_Value_Text		
<del>XHE_Payload_Instance</del> . Decryption_Information_External_Reference_External_XHE_Reference	0..1	Decryption information that is available external to the envelope.
<del>XHE_Payload_Instance</del> . Decryption_Information_External_Reference_External_XHE_Reference		
<del>XHE_Payload_Instance</del> . Decryption_Key_External_Reference_External_XHE_Reference	0..1	Decryption key data that is available external to the envelope.
<del>XHE_Payload_Instance</del> . Decryption_Key_External_Reference_External_XHE_Reference		

Semantic identifier	Card.	Definition
<del>XHE_Payload_Instance. Relevant_External_XHE_Reference.External Reference</del>	0..n	A reference to a business case, document or other issues which are relevant to the handling of the payload.
<del>XHE_Payload_Instance. Relevant_XHE_External Reference.External Reference</del>		
<del>XHE_Payload_Instance. Payload_External_XHE_Reference.External Reference</del>	0..1	The reference to the payload when it is not included within the envelope.
<del>XHE_Payload_Instance. Payload_XHE_External Reference.External Reference</del>		

The information for an individual payload ends with an additional optional payload content item that is neither a BBIE nor an ASBIE and so is not modeled using CCTS. Rather, this content item is a schema artefact. This content item has the cardinality 0..1. This content item can have as its child either text only (no elements) or a single element, but not a combination of both nor more than one element. See [Section 5.6.3, "Payload content"](#) for more information.

## 2.10 Extension information

Through the use of extension metadata and content, additional user-defined information that is not modelled by the CCTS classes can be added to the envelope instance.

The extension point is an optional construct as the initial child of the document element. The extension point, when it exists, SHALL contain one or more user-defined extensions,. Each extension contains optional extension metadata identifying properties of the extension as well as the extension content.

Name (Unqualified Data Type)	Description	Crd	Rationale
XHEExtensions	A container for all extensions present in the document.	0..1	This is the single point of access to all extensions as the first child of the main document.
XHEExtension	A single extension for private use.	1..n	There may be many extensions added to a single document.
ExtensionID (Identifier)	An identifier for the Extension assigned by the creator of the extension.	0..1	This identifies the extension amongst other extensions within the document.
ExtensionName (Name)	A name for the Extension assigned by the creator of the extension.	0..1	This identifies the extension in natural language within the document.
ExtensionAgencyID (Identifier)	An agency that maintains one or more Extensions.	0..1	This identifies who created the extension.
ExtensionAgencyName (Name)	The name of the agency that maintains the Extension.	0..1	This identifies who created the extension.
ExtensionAgencyURI (Identifier)	A URI for the Agency that maintains the Extension.	0..1	This identifies who created the extension.
ExtensionVersionID	The version of the Extension.	0..1	This distinguishes one version of the extension from another.

(Identifier)			
ExtensionURI (Identifier)	A URI for the Extension.	0..1	This identifies the extension amongst other extensions outside of any document.
ExtensionReasonCode (Code)	A code for the reason the Extension is being included.	0..1	This gives the author the opportunity to give rationale by way of a code.
ExtensionReason (Text)	A description of the reason for the Extension.	0..1	This gives the author the opportunity to give rationale by way of a text description.
ExtensionContent	The definition of the extension content.	1	This is the parent element of the extension content.

There are no restrictions on the extension content. See [Section 5.6.2, “Extension content”](#) for more information.

## 3 XHE digital signatures

### 3.1 Signing the exchange header envelope

Using the IETF/W3C XML Digital Signature specification [\[xmldsig\]XMLEDSIG-CORE1](#) one can add multiple “non-final” signatures or a single “final” signature to the exchange header envelope as the last children of the document element, that is, after the last BIE of the document element. A non-final signature digitally signs all content other than any of the other sibling signature elements that may exist in the document. A final signature digitally signs all content including the other sibling signature elements that may exist in the document.

The schema fragment for [Section 5.6.2, “Extension content”](#) included in this distribution provides for using digital signature extensions supporting XML Advanced Electronic Signatures [\[XAdES\]](#) (ETSI TS 101 903), when the electronic signing of an exchange header envelope is necessary to satisfy legal and technical requirements. The schema fragment can be modified to accommodate such future extension requirements without impacting on the conformance clauses of this specification.

## 4 Conformance

An Exchange Header Envelope instance exhibits conformance when complying with all of the following semantic criteria:

1. All semantic components defined by this specification, that is all information that is not found inside payload content or extension content, SHALL NOT have no value (that is, it SHALL NOT be empty).
2. The XHE Payload. Included. XHE Payload Instance / Payloads. Payload information item SHALL have one or the other of payload content or the XHE Payload Instance. Payload. XHE Reference / Payload. Payload External Reference. External Reference item child (that is, it SHALL NOT have both and SHALL NOT have neither).

An Exchange Header Envelope instance exhibits conformance when complying with all of the following syntactic criteria:

1. The instance SHALL NOT violate any document constraints expressed by the schema in Section 5.4, “The header envelope schema”

2. The `<{aggregate_prefix}:PayloadContent>` element SHALL NOT have a combination of text and an element (that is, it SHALL either be a non-empty string of text or be a single XML element).

## 5 XML syntax expression

### 5.1 Schema expression

## 4 Document model expression

The document model is expressed in four ways, found in four files of the model subdirectory:

## ~~5 XML syntax expression~~

### ~~5.1 Schema expression~~

The structural document constraints of the header envelope are expressed normatively as a set of W3C XSD XML Schemas [~~XSD1~~][~~XSD2~~].~~[XMLSCHEMA-1]~~[~~XMLSCHEMA-2~~].

### 5.2 XML namespaces

The following XML namespace URI strings are specified in the XSD schemas to be used in the XML syntax expressions:

oasis-cefact-xhe-1.0-ExchangeHeaderEnvelope  
oasis-cefact-xhe-1.0-AggregateComponents  
oasis-cefact-xhe-1.0-BasicComponents  
oasis-cefact-xhe-1.0-ExtensionComponents  
oasis-cefact-xhe-1.0-QualifiedDataTypes  
oasis-cefact-xhe-1.0-UnqualifiedDataTypes

### 5.3 The schema subdirectories

The schemas are delivered in two subdirectories:

- xsd
  - CCTS documentation is included as XSD annotations

- [xsdrt](#)
  - runtime version such that CCTS documentation is not included as XSD annotations
  - without the annotations a W3C schema processor has less work to prepare for validating documents

In both subdirectories there is a single subdirectory of ~~common files~~ [imported and included schema fragments](#):

• ~~common~~

- [fragments](#)
  - [imported and](#) included schema fragments by ~~any document fragment~~ [all other fragments](#)

## 5.4 The header envelope schema

The following is the only Document ABIE schema:

- [xsd/XHE-1.0.xsd](#)
  - the base header envelope schema fragment that incorporates other schema fragments

The following is the runtime version of the schema that has documentary annotations removed:

- [xsdrt/XHE-1.0.xsd](#)
  - the base header envelope schema fragment that incorporates other schema fragments

## 5.5 Non-content data type ~~common schemas~~ [schema fragments](#)

The following are read-only schema fragments in the ~~common~~ [fragments/](#) subdirectory:

• ~~XHE-CommonAggregateComponents-1.0.xsd~~

- [XHE-AggregateComponents-1.0.xsd](#)
  - the Library ABIE element declarations

• ~~XHE-CommonBasicComponents-1.0.xsd~~

- [XHE-BasicComponents-1.0.xsd](#)
  - the Library BBIE element declarations

• ~~XHE-CommonExtensionComponents-1.0.xsd~~

- [XHE-ExtensionComponents-1.0.xsd](#)
  - the Document ABIE extension metadata declarations
- ~~XHE-QualifiedDataTypes-1.0.xsd~~ [XHE-QualifiedDataTypes-1.0.xsd](#)
  - the qualified data types (empty; none are defined)
- ~~XHE-UnqualifiedDataTypes-1.0.xsd~~ [XHE-UnqualifiedDataTypes-1.0.xsd](#)
  - the unqualified data types based on the core component types
  - see [Section 5.7, "Unqualified data type attributes"](#) for more details
- ~~XHE-xmldsig1-schema-1.0.xsd~~ [XHE-xmldsig1-schema-1.0.xsd](#)
  - the XML Digital Signature schema driver fragment copyrighted by W3C
- ~~XHE-xmldsig11-schema-1.0.xsd~~ [XHE-xmldsig11-schema-1.0.xsd](#)
  - the XML Digital Signature schema fragment copyrighted by W3C

- ~~XHE-xmlsig-core-schema-1.0.xsd~~XHE-xmlsig-core-schema-1.0.xsd
  - the XML Digital Signature Core schema fragment copyrighted by W3C
- ~~CCTS CCT SchemaModule-1.0.xsd~~CCTS CCT SchemaModule-1.0.xsd
  - the Core Component Types schema fragment copyrighted by UN/CEFACT

## 5.6 Content data type ~~common schemas~~schema fragments

### 5.6.1 Modifiable schema fragments

There are two content data type schema fragments in the ~~common~~fragments/ subdirectory, one for each of the extension content and the payload content. These are the only schemas intended to be edited by users should they wish to validate the content of their extensions or payloads. No changes are necessary to the schemas if it is not important to validate these portions of the document.

Should users wish to impose constraints on the extension or the payload contents, the only edits necessary of the content schema are for the importation of the schemas to be engaged for validation purposes. No edits are necessary for the content element, though one may wish to do so to exclude content other than that for which schemas are provided.

### 5.6.2 Extension content

The extension content schema fragment describes constraints on content placed in extensions.

- ~~XHE-ExtensionContentDataType-1.0.xsd~~XHE-ExtensionContentDataType-1.0.xsd

The extension content element's name is `<{extensions prefix}:ExtensionContent>`, for example, `<ext:ExtensionContent>`. It is the last child element of `<{extensions prefix}:XHEExtension>`.

Any given extension content may have zero or one apex (or top-most) element in the XML element tree. The absence of content is provided for situations where a processing application chooses to remove foreign unrecognized-namespace elements from the XML element tree.

The distributed version of this file imports the version of XAdES schemas that are current at the time of publication. XAdES constructs are used within W3C XML Digital Signatures. These import directives can be replaced with the importation of future versions of XAdES schemas as needed.

- ~~XHE-XAdES01903v132-201601-1.0.xsd~~XHE-XAdES01903v132-201601-1.0.xsd
  - the v1.3.2 XAdES schema fragment from the etsi.org web site
- ~~XHE-XAdES01903v141-201601-1.0.xsd~~XHE-XAdES01903v141-201601-1.0.xsd
  - the v1.4.1 XAdES schema fragment from the etsi.org web site

### 5.6.3 Payload content

The payload content schema fragment describes constraints on content placed in payloads.

- ~~XHE-PayloadContentDataType-1.0.xsd~~XHE-PayloadContentDataType-1.0.xsd

The payload content element's name is <{aggregate prefix}:PayloadContent>, for example, <eac:PayloadContent>. It is the last child element of <{aggregate prefix}:Payload>.

Any given payload content element may have as its child exactly one apex (or top-most) element in the XML element tree, or it may consist solely of text that would typically represent encrypted content or non-XML content. Special care needs to be taken that all non-XML payload content is encoded according to XML text encoding rules, such as the escaping of special markup characters, so as to permit an XML processing application to correctly interpret the non-XML content.

The schema declarations are unable to trigger a constraint error in the situation where the payload content has a combination of both text and a single element. Detecting such a condition is the responsibility of the processing agent.

The schema declarations are unable to trigger a constraint error in the situation where the payload content is empty. Detecting such a condition is the responsibility of the processing agent.

## 5.7 Unqualified data type attributes

In the Exchange Header Envelope model each BBIE is indicated to have a particular component name (specifying the element name) and to be of a particular unqualified data type (specifying the base type value constraints and the attributes). Writers of extensions using CCTS and their own BBIEs need to know the available unqualified data types for their extended business objects.

Based on the 10 approved core component types described in section 8.1 of [CCTS 2.01](#), [CCTS 2.01](#), there are 20 available unqualified data types for BBIE values. Each data type has a constraint on its content (the component) and a possibly-empty selection of available possibly-mandatory attributes (the supplementary components).

### Note

Not all of the unqualified data types listed in this table are used in the standardized components of the header envelope. All defined types are enumerated here for completeness in the event that a CCTS-based extension is created by a community of users that relies on one of the unqualified data types not used by the standardized components of the header envelope.

Data Type	Base type (XSD)	Supplementary component (attribute)	Cardinality	Type (XSD)	Definition
Amount	xsd:decimal	A number of monetary units specified using a given unit of currency.			
		currencyID	required	xsd:normalizedString	The currency of the amount.
		currencyCodeListVersionID	optional	xsd:normalizedString	The VersionID of the UN/ECE Rec9 code list.
Binary Object Graphic Picture Sound Video	xsd:base64Binary	A set of finite-length sequences of binary octets.			
		mimeCode	required	xsd:normalizedString	The mime type of the binary object.
		characterSetCode	optional	xsd:normalizedString	The character set of the binary object if the mime type is text.
		encodingCode	optional	xsd:normalizedString	Specifies the decoding

					algorithm of the binary object.	
		filename	optional	xsd:string	The filename of the binary object.	
		format	optional	xsd:string	The format of the binary content.	
		uri	optional	xsd:anyURI	The Uniform Resource Identifier that identifies where the binary object is located.	
Code	xsd:normalizedString	A character string (letters, figures, or symbols) that for brevity and/or language independence may be used to represent or replace a definitive value or text of an attribute, together with relevant supplementary information.				
		languageID	optional	xsd:language	The identifier of the language used in the code name.	
		listAgencyID	optional	xsd:normalizedString	An agency that maintains one or more lists of codes.	
		listAgencyName	optional	xsd:string	The name of the agency that maintains the list of codes.	
		listID	optional	xsd:normalizedString	The identification of a list of codes.	
		listName	optional	xsd:string	The name of a list of codes.	
		listSchemeURI	optional	xsd:anyURI	The Uniform Resource Identifier that identifies where the code list scheme is located.	
		listURI	optional	xsd:anyURI	The Uniform Resource Identifier that identifies where the code list is located.	
		listVersionID	optional	xsd:normalizedString	The version of the list of codes.	
		name	optional	xsd:string	The textual equivalent of the code content component.	

DateTime	xsd:dateTime	An instance of time according the Gregorian calendar.			
Date	xsd:date	One calendar day according the Gregorian calendar.			
Time	xsd:time	An instance of time that occurs every day.			
Identifier	xsd:normalizedString	A character string to identify and uniquely distinguish one instance of an object in an identification scheme from all other objects in the same scheme, together with relevant supplementary information.			
		schemeAgencyID	optional	xsd:normalizedString	The identification of the agency that maintains the identification scheme.
		schemeAgencyName	optional	xsd:string	The name of the agency that maintains the identification scheme.
		schemeDataURI	optional	xsd:anyURI	The Uniform Resource Identifier that identifies where the identification scheme data is located.
		schemeID	optional	xsd:normalizedString	The identification of the identification scheme.
		schemeName	optional	xsd:string	The name of the identification scheme.
		schemeURI	optional	xsd:anyURI	The Uniform Resource Identifier that identifies where the identification scheme is located.
		schemeVersionID	optional	xsd:normalizedString	The version of the identification scheme.
Indicator	xsd:boolean	A list of two mutually exclusive Boolean values that express the only possible states of a property.			
Measure	xsd:decimal	A numeric value determined by measuring an object using a specified unit of measure.			
		<b>unitCode</b>	required	xsd:normalizedString	The type of unit of measure.
		unitCodeListVersionID	optional	xsd:normalizedString	The version of the measure unit code list.
Numeric Value	xsd:decimal	Numeric information that is assigned or is determined by calculation, counting, or sequencing. It does not require a unit of quantity or unit of measure.			
		format	optional	xsd:string	Whether the number is an integer,

Percent Rate					decimal, real number or percentage.
Quantity	xsd:decimal	A counted number of non-monetary units, possibly including a fractional part.			
		unitCode	optional	xsd:normalizedString	The unit of the quantity
		unitCodeListAgencyID	optional	xsd:normalizedString	The identification of the agency that maintains the quantity unit code list
		unitCodeListAgencyName	optional	xsd:string	The name of the agency which maintains the quantity unit code list.
		unitCodeListID	optional	xsd:normalizedString	The quantity unit code list.
Text Name	xsd:string	A character string (i.e. a finite set of characters), generally in the form of words of a language.			
		languageID	optional	xsd:language	The identifier of the language used in the content component.
		languageLocaleID	optional	xsd:normalizedString	The identification of the locale of the language.

## 6 Conformance

A Exchange Header Envelope instance exhibits conformance when complying with all of the following criteria:

- ~~1. The instance SHALL NOT violate any document constraints expressed by the schema in Section 5.4, "The header envelope schema"~~
- ~~1. Any XML element that is not extension content SHALL NOT be empty.~~
- ~~2. The <{aggregate prefix}:Payload> element SHALL have one or the other of the <{aggregate prefix}:PayloadContent> element child or the <{aggregate prefix}:PayloadExternalReference> element child (that is, it SHALL NOT have both).~~
- ~~3. The <{aggregate prefix}:PayloadContent> element SHALL NOT have a combination of text and an element (that is, it SHALL either be a non-empty string of text or be a single element).~~

## Appendix A Package structure (Non-Normative Informative)

This Committee Specification ~~Public Review Draft-01~~ is published as a zip archive in the <http://docs.oasis-open.org/bdxx/xhe/v1.0/csprd01/> <https://docs.oasis-open.org/bdxx/xhe/v1.0/cs01/> directory. Unzipping this archive creates a directory tree containing a number of files and subdirectories. Note that while the two XML files comprise the revisable version of this specification, this revisable XML may not be directly viewable in all currently available web browsers.

The base directory has the following files:

• ~~xhe-v1.0-csprd01.xml~~

- xhe-v1.0-cs01.xml
  - The revisable form of the document.

• ~~xhe-v1.0-csprd01.html~~

- xhe-v1.0-cs01-oasis.html
  - An HTML rendering of the document.

• ~~xhe-v1.0-csprd01.pdf~~

- xhe-v1.0-cs01-oasis.pdf
  - A PDF rendering of the document.

The document model is expressed in four ways, found in four files of the model subdirectory:

- mod
  - XHE-Model-1.0.ods
    - model information expressed in an Open Office spreadsheet
  - XHE-Model-1.0.xls
    - model information expressed in an Excel spreadsheet
  - XHE-Model-1.0.gc
    - model information expressed in a genericcode [genericcode] file
  - XHE-Model-1.0.html
    - model information expressed in hyperlinked human-readable tables as HTML

These are the informative subdirectories in the package:

• ~~art~~

- art
  - Diagrams and illustrations used in this specification.

• ~~db~~

- db
  - DocBook stylesheets for viewing in HTML the XML of this work product.
- valval
  - Demonstrative validation of the example instances with the header envelope schemas.

See Appendix C, Demonstration XML environment (Non-Normative) for details.

See Appendix E, Demonstration XML environment (Informative) for details.

The normative subdirectories in the package are listed in normative clauses.

## Appendix B Revision History (~~Non-Normative~~Informative)

### B.1 Major version XHE 1.0

XHE version 1.0 Committee Specification 01 establishes the initial suite of semantic components as a basis for all subsequent minor revisions of the Exchange Header Envelope.

This also establishes the namespaces to be used for all subsequent minor revisions of the Exchange Header Envelope.

## Appendix C ~~Demonstration XML environment (Non-Normative~~Acknowledgements (Informative)

The following individuals have participated in the creation of this specification and are gratefully acknowledged:

Kenneth Bengtsson (co-chair)

Michel Bormans

Gait Boxman

Anders Grangard (co-chair)

G. Ken Holman (editor)

## Appendix D Encrypting payloads to multiple recipients (Informative)

The XHE supports sending business documents to multiple recipients using a single envelope, which is obtained by adding multiple instances of the ToParty element to the XHE envelope.

When encrypting payloads of envelopes with multiple recipients, users SHOULD make use of encryption technologies that support multiple recipients so that an encrypted payload to multiple recipients can be contained in a single instance of an XHE envelope's PayloadContent. Examples of encryption technologies supporting multiple recipients are [RFC5652], [RFC4880] and [XMLENC-CORE1].

The workings of individual encryption technologies and methodologies are beyond the scope of this specification.

## Appendix E Demonstration XML environment (Informative)

A working example of using the schemas with an XML instance is demonstrated in the `val/` directory.

The following support files are in this directory:

- [test.bat](#)
  - Windows invocation of the testing of the sample files
- [test.sh](#)
  - shell invocation of the testing of the sample files
- [validate.bat](#)
  - Windows invocation of the two-pass validation of a single file
- [validate.sh](#)
  - shell invocation of the two-pass validation of a single file

- [w3cschema.bat](#)
  - Windows invocation of the schema validation of a single file
- [w3cschema.sh](#)
  - shell invocation of the schema validation of a single file
- [xslt.bat](#)
  - Windows invocation of XSLT transformation on a single file
- [xslt.sh](#)
  - shell invocation of XSLT transformation on a single file

This directory has a number of simple test files:

- [simpleExample.xml](#)
  - a simple envelope with three payload instances, the second of which is simple text (note the escaped special characters) and the other two of which are XML

```

• <?xml version="1.0" encoding="UTF-8"?>
• <XHE xmlns="oasis-cefact-xhe-1.0-ExchangeHeaderEnvelope"
•   xmlns:xhb="oasis-cefact-xhe-1.0-BasicComponents"
•   xmlns:xha="oasis-cefact-xhe-1.0-AggregateComponents"
•   xmlns:ext="oasis-cefact-xhe-1.0-ExtensionComponents">
•   <xhb:XHEVersionID>1.0</xhb:XHEVersionID>
•   <xha:Header>
•     <xhb:ID>123</xhb:ID>
•     <xhb:CreationDateTime>2015-02-08T20:34:00-
04:00</xhb:CreationDateTime>

•
  <xha:PayloadContent>
•
  Non-XML payload here, with sensitive characters
•
  escaped such as &amp;, &lt; and ]]&gt;.
•
•
  Any text, provided it has been escaped, can be included in a payload.
•
  </xha:PayloadContent>
•
</xha:Payload>
•
<xha:Payload>
•
•
<xhb:InstanceEncryptionIndicator>>false</xhb:InstanceEncryptionIndicator>
•
  <xha:PayloadContent>
•
    <myOtherDocumentHere>
•
      <myOtherElement>My Content</myOtherElement>
•
      <myOtherElement>My Content</myOtherElement>
•
      <myOtherElement>My Content</myOtherElement>
•
    </myOtherDocumentHere>
•
  </xha:PayloadContent>
•
</xha:Payload>
•
</xha:Payloads>
•
</XHE>

```

- [simpleExampleFailSyntax.xml](#)
  - an envelope document with an XML well-formedness error (the end tag for the creation date and time is missing the closing right-angle bracket)
- [simpleExampleFailModel.xml](#)
  - an envelope document with an XML validity error (a misspelled element for the creation date and time)
- [simpleExampleExtension.xml](#)
  - a simple envelope with a user-defined extension adding information to the envelope
- [simpleExampleTyped.xml](#)
  - a simple envelope with a user-defined extension adding information to the envelope

To invoke the schemas with the demonstration instances, navigate to the directory and invoke the test script:

- in Windows:

## test.bat

- in shell:

## sh test.sh

The result on the screen should appear as follows:

```
val $ sh test.sh

val $

```

The test script invokes the validation script using the following::

- in Windows:

```
validate.bat schema-file instance-file
```

- in shell:

```
sh validate.sh schema-file instance-file
```

The validation script invokes the schema script using the following:

- in Windows:

```
w3cschema.bat schema-file instance-file
```

- in shell:

```
sh w3cschema.sh schema-file instance-file
```

The validation script invokes the XSLT script using the following:

- in Windows:

```
xslt.bat instance-file stylesheet-file output-file
```

- in shell:

```
sh xslt.sh instance-file stylesheet-file output-file
```

The empty stylesheet [XHE-DefaultDTQ-1.0.xsl](#) is a placebo that would be replaced with an XSLT stylesheet imposing value validation constraint checking on a given instance of an exchange header envelope. An example of such data type qualification checking would be for code list enumerations.

Components of two freely available software distributions were used to create the tools in the `val` directory. Sources are given below so that these components can be updated as later releases become available.

- [xjparse.jar](#) (renamed from `xjparse-2.0.1.jar`) and the files in the “`val/lib`” directory are from the Xjparse 2.0.1 distribution at

<http://xjparse.org>

- [saxon.jar](#) is from the Saxon 6.5.5 distribution at

<http://prdownloads.sourceforge.net/saxon/saxon6-5-5.zip>
