Technical Committee:

OASIS Biometrics TC

Chair:

Kevin Mangold (kevin.mangold@nist.gov), NIST

Editors:

Kevin Mangold (kevin.mangold@nist.gov), NIST
Ross J. Micheals (ross.micheals@nist.gov), NIST

Additional artifacts:

This prose specification is one component of a Work Product that also includes:

- XML schemas: <http://docs.oasis-open.org/biometrics/WS-BD/v1.0/csprd02/schemas/>

Related work:

This specification replaces or supersedes:

- *Specification for WS-Biometric Devices (WS-BD) Version 1.*
<http://www.nist.gov/itl/iad/ig/upload/NIST-SP-500-288-v1.pdf>

Declared XML namespaces:

- <http://docs.oasis-open.org/biometrics/ns/ws-bd-1.0>

Abstract:

WS-Biometric Devices is a protocol for the command and control of biometric sensors using the same protocols that underlie the Web.

Status:

This document was last revised or approved by the OASIS Biometrics TC on the above date. The level of approval is also listed above. Check the “Latest version” location noted above for possible later revisions of this document. Any other numbered Versions and other technical work produced

by the Technical Committee (TC) are listed at https://www.oasis-open.org/committees/tc_home.php?wg_abbrev=biometrics#technical.

TC members should send comments on this specification to the TC's email list. Others should send comments to the TC's public comment list, after subscribing to it by following the instructions at the "Send A Comment" button on the TC's web page at <https://www.oasis-open.org/committees/biometrics/>.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (<https://www.oasis-open.org/committees/biometrics/ipr.php>).

All capitalized terms in the following text have the meanings assigned to them in the OASIS Intellectual Property Rights Policy (the "OASIS IPR Policy"). The full [Policy](#) may be found at the OASIS website.

This document and translations of it may be copied and furnished to others, and derivative works that comment on or otherwise explain it or assist in its implementation may be prepared, copied, published, and distributed, in whole or in part, without restriction of any kind, provided that the above copyright notice and this section are included on all such copies and derivative works. However, this document itself may not be modified in any way, including by removing the copyright notice or references to OASIS, except as needed for the purpose of developing any document or deliverable produced by an OASIS Technical Committee (in which case the rules applicable to copyrights, as set forth in the OASIS IPR Policy, must be followed) or as required to translate it into languages other than English.

The limited permissions granted above are perpetual and will not be revoked by OASIS or its successors or assigns.

This document and the information contained herein is provided on an "AS IS" basis and OASIS DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY OWNERSHIP RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

OASIS requests that any OASIS Party or any other party that believes it has patent claims that would necessarily be infringed by implementations of this OASIS Committee Specification or OASIS Standard, to notify OASIS TC Administrator and provide an indication of its willingness to grant patent licenses to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification.

OASIS invites any party to contact the OASIS TC Administrator if it is aware of a claim of ownership of any patent claims that would necessarily be infringed by implementations of this specification by a patent holder that is not willing to provide a license to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification. OASIS may include such claims on its website, but disclaims any obligation to do so.

OASIS takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on OASIS' procedures with respect to rights in any document or deliverable produced by an OASIS Technical Committee can be found on the OASIS website. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this OASIS Committee Specification or OASIS Standard, can be obtained from the OASIS TC Administrator. OASIS makes no representation that any information or list of intellectual property rights will at any time be complete, or that any claims in such list are, in fact, Essential Claims.

The name "OASIS" is a trademark of [OASIS](#), the owner and developer of this specification, and should be used only to refer to the organization and its official outputs. OASIS welcomes reference to, and implementation and use of, specifications, while reserving the right to enforce its marks against misleading uses. Please see <https://www.oasis-open.org/policies-guidelines/trademark> for above guidance.

-------------	--------------------------------------	-----

1 Introduction

1.1 Motivation

The web services framework, has, in essence, begun to create a standard software “communications bus” in support of service-oriented architecture. Applications and services can “plug in” to the bus and begin communicating using standards tools. The emergence of this “bus” has profound implications for identity exchange.

Jamie Lewis, Burton Group, February 2005
Forward to *Digital Identity* by Phillip J. Windley

As noted by Jamie Lewis, the emergence of web services as a common communications bus has “profound implications.” The next generation of biometric devices will not only need to be intelligent, secure, tamper-proof, and spoof resistant, but first, they will need to be *interoperable*.

These envisioned devices will require a communications protocol that is secure, globally connected, and free from requirements on operating systems, device drivers, form factors, and low-level communications protocols. WS-Biometric Devices is a protocol designed in the interest of furthering this goal, with a specific focus on the single process shared by all biometric systems—*acquisition*.

1.2 Terminology

This section contains terms and definitions used throughout this document. First time readers may desire to skip this section and revisit it as needed.

biometric capture device

a system component capable of capturing biometric data in digital form

client

a logical endpoint that originates operation requests

HTTP

Hypertext Transfer Protocol. Unless specified, the term HTTP refers to either HTTP as defined in [RFC-HTTP] or HTTPS as defined in [RFC2660].

ISO

International Organization for Standardization

modality

a distinct biometric category or type of biometric—typically a short, high-level description of a human feature or behavioral characteristic (e.g., “fingerprint,” “iris,” “face,” or “gait”)

payload

the content of an HTTP request or response. An **input payload** refers to the XML content of an HTTP *request*. An **output payload** refers to the XML content of an HTTP *response*.

payload parameter

an operation parameter that is passed to a service within an input payload

profile

37 a list of assertions that a service must support

38 **REST**

39 Representational State Transfer

40 **RESTful**

41 a web service which employs REST techniques

42 **sensor** or **biometric sensor**

43 a single biometric capture device or a logical collection of biometric capture devices

44 **sensor service**

45 a “middleware” software component that exposes a biometric sensor to a client through web

46 services

47 **submodality**

48 a distinct category or subtype within a biometric modality

49 **target sensor** or **target biometric sensor**

50 the biometric sensor made available by a particular service

51 **URL parameter**

52 a parameter passed to a web service by embedding it in the URL

53 **Web service** or **service** or **WS**

54 a software system designed to support interoperable machine-to-machine interaction over a

55 network [WSGloss]

56 **XML**

57 Extensible Markup Language [XML]

58 1.3 Documentation Conventions

59 1.3.1 About

60 This section (§1.3) describes the style and usage conventions used throughout this document.

61 1.3.2 Key Words

62 The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD

63 NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described

64 in [RFC2119].

65 1.3.3 Quotations

66 If the inclusion of a period within a quotation might lead to ambiguity as to whether or not the period

67 *should* be included in the quoted material, the period will be placed outside the trailing quotation mark.

68 For example, a sentence that ends in a quotation would have the trailing period “inside the quotation, like

69 this quotation punctuated like this.” However, a sentence that ends in a URL would have the trailing

70 period outside the quotation mark, such as “http://example.com”.

1.3.4 Machine-Readable Code

With the exception of some reference URLs, machine-readable information will typically be depicted with a mono-spaced font, such as this.

1.3.5 Sequence Diagrams

Throughout this document, sequence diagrams are used to help explain various scenarios. These diagrams are informative simplifications and are intended to help explain core specification concepts. Operations are depicted in a functional, remote procedure call style.

Figure 1 is an annotated sequence diagram that shows how an example sequence of HTTP request-responses is typically illustrated. The level of abstraction presented in the diagrams, and the details that are shown (or not shown) will vary according to the particular information being illustrated. First time readers may wish to skip this section and return to it as needed.

Figure 1. Example of a sequence diagram used in this document.

1. Each actor in the sequence diagram (i.e., a client or a server) has a “swimlane” that chronicles their interactions over time. Communication among the actors is depicted with arrows. In this diagram, there are three actors: “Client A,” a WS-BD “Service,” and “Client B.”
2. State information notable to the example is depicted in an elongated diamond shape within the swimlane of the relevant actor. In this example, it is significant that the initial “lock owner” for the “Service” actor is “(none)” and that the “lock owner” changes to “{A1234567...}” after a communication from Client A.
3. Unless otherwise noted, a solid arrow represents the request (initiation) of an HTTP request; the *opening* of an HTTP socket connection and the transfer of information from a source to its destination. The arrow begins on the swimlane of the originator and ends on the swimlane of the destination. The order of the request and the operation name (§6.4 through §6.17) are shown above the arrow. URL and/or payload parameters significant to the example are shown below the arrow. In this example, the first communication occurs when Client A opens a connection to the Service, initiating a “lock” request, where the “sessionId” parameter is “{A1234567...}.”
4. Unless otherwise noted, a dotted arrow represents the response (completion) of a particular HTTP request; the *closing* of an HTTP socket connection and the transfer of information back from the destination to the source. The arrow starts on the originating request’s *destination* and ends on the swimlane of actor that *originated* the request. The order of the request, and the name of the operation that being replied to is shown above the arrow. Significant data “returned” to the

source is shown below the arrow (§3.14.2). Notice that the source, destination, and operation name provide the means to match the response corresponds to a particular request—there is no other visual indicator. In this example, the second communication is the response to the “lock” request, where the service returns a “status” of “success.”

In general, “{A1234567...}” and “{B890B123...}” are used to represent session ids (§2.5.4, §3.14.4, §6.4); “{C1D10123...}” and “{D2E21234...}” represent capture ids (§3.14.4, §6.13).

2 Design Concepts and Architecture

2.1 About

This section describes the major design concepts and overall architecture of WS-BD. The main purpose of a WS-BD service is to expose a target biometric sensor to clients via web services.

This specification provides a framework for deploying and invoking core synchronous operations via lightweight web service protocols for the command and control of biometric sensors. The design of this specification is influenced heavily by the REST architecture; deviations and tradeoffs were made to accommodate the inherent mismatches between the REST design goals and the limitations of devices that are (typically) oriented for a single-user.

2.2 Interoperability

ISO/IEC 2382-1 (1993) defines *interoperability* as “the capability to communicate, execute programs, or transfer data among various functional units in a manner that requires the user to have little to no knowledge of the unique characteristics of those units.”

Conformance to a standard does not necessarily guarantee interoperability. An example is conformance to an HTML specification. A HTML page may be fully conformant to the HTML 4.0 specification, but it is not interoperable between web browsers. Each browser has its own interpretation of how the content *should* be displayed. To overcome this, web developers add a note suggesting which web browsers are compatible for viewing. Interoperable web pages need to have the same visual outcome independent of which browser is used.

A major design goal of WS-BD is to *maximize* interoperability, by *minimizing* the required “knowledge of the unique characteristics” of a component that supports WS-BD. The technical committee recognizes that conformance to this specification alone cannot guarantee interoperability; although a minimum degree of functionality is implied. Sensor *profiles* and accompanying conformance tests will need to be developed to provide better guarantees of interoperability, and will be released in the future.

2.3 Architectural Components

2.3.1 Overview

Before discussing the envisioned use of WS-BD, it is useful to distinguish between the various components that comprise a WS-BD implementation. These are *logical* components that may or may not correspond to particular *physical* boundaries. This distinction becomes vital in understanding WS-BD's operational models.

2.3.2 Client

A *client* is any software component that originates WS-BD operation requests. A client can be one of many hosted in a parent (logical or physical) component, and that a client can send requests to a variety of destinations.

This icon is used to depict an arbitrary WS-BD client. A personal digital assistant (PDA) is used to serve as a reminder that a client might be hosted on a non-traditional computer.

2.3.3 Sensor

A biometric *sensor* is any component that is capable of acquiring a digital biometric sample. Most sensor components are hosted within a dedicated hardware component, but this is not necessarily globally true. For example, a keyboard is a general input device, but can also be used for a keystroke dynamics biometric.

This icon is used to depict a biometric sensor. The icon has a vague similarity to a fingerprint scanner, but *should* be thought of as an arbitrary biometric sensor.

The term “sensor” is used in this document in a singular sense, but may in fact be referring to multiple biometric capture devices. Because the term “sensor” may have different interpretations, practitioners are encouraged to detail the physical and logical boundaries that define a “sensor” for their given context.

2.3.4 Sensor Service

The *sensor service* is the “middleware” software component that exposes a biometric sensor to a client through web services. The sensor service adapts HTTP request-response operations to biometric sensor command & control.

This icon is used to depict a sensor service. The icon is abstract and has no meaningful form, just as a sensor service is a piece of software that has no physical form.

2.4 Intended Use

Each implementation of WS-BD will be realized via a mapping of logical to physical components. A distinguishing characteristic of an implementation will be the physical location of the sensor service component. WS-BD is designed to support two scenarios:

1. **Physically separated.** The sensor service and biometric sensor are hosted by different physical components. A *physically separated service* is one where there is both a physical and logical separation between the biometric sensor and the service that provides access to it.
2. **Physically integrated.** The sensor service and biometric sensor are hosted within the same physical component. A *physically integrated service* is one where the biometric sensor and the service that provides access to it reside within the same physical component.

Figure 2 depicts a physically separated service. In this scenario, a biometric sensor is tethered to a personal computer, workstation, or server. The web service, hosted on the computer, listens for communication requests from clients. An example of such an implementation would be a USB fingerprint scanner attached to a personal computer. A lightweight web service, running on that computer could listen to requests from local (or remote) clients—translating WS-BD requests to and from biometric sensor commands.

Figure 2. A physically separated WS-Biometric Devices (WS-BD) implementation.

Figure 3 depicts a physically integrated service. In this scenario, a single hardware device has an embedded biometric sensor, as well as a web service. Analogous (but not identical) functionality is seen in many network printers; it is possible to point a web browser to a local network address, and obtain a web page that displays information about the state of the printer, such as toner and paper levels (WS-BD enabled devices do not provide web pages to a browser). Clients make requests directly to the integrated device; and a web service running within an embedded system translates the WS-BD requests to and from biometric sensor commands.

Figure 3. A physically integrated WS-Biometric Devices (WS-BD) implementation.

The “separated” versus “integrated” distinction is a simplification with a potential for ambiguity. For example, one can imagine putting a hardware shell around a USB fingerprint sensor connected to a small form-factor computer. Inside the shell, the sensor service and sensor are on different physical components. Outside the shell, the sensor service and sensor appear integrated. Logical encapsulations, i.e., layers of abstraction, can facilitate analogous “hiding”. The definition of what constitutes the “same” physical component depends on the particular implementation and the intended level of abstraction. Regardless, it is a useful distinction in that it illustrates the flexibility afforded by leveraging highly interoperable communications protocols. As suggested in §2.3.3 practitioners *may* need to clearly define appropriate logical and physical boundaries for their own context of use.

2.5 General Service Behavior

2.5.1 About

This section (§2.5) describes the general behavior of WS-BD clients and services.

2.5.2 Security Model

In this version of the specification, it is assumed that if a client is able to establish a connection with the sensor service, then the client is fully authorized to use the service. This implies that all successfully connected clients have equivalent access to the same service. Clients might be required to connect through various HTTP protocols, such as HTTPS with client-side certificates, or a more sophisticated protocol such as Open Id (<http://openid.net/>) and/or OAuth.

Specific security measures are out of scope of this specification, but *should* be carefully considered when implementing a WS-BD service. Some recommended solutions to general scenarios are outlined Appendix D.

2.5.3 HTTP Request-Response Usage

Most biometrics devices are inherently *single user*—i.e., they are designed to sample the biometrics from a single user at a given time. Web services, on the other hand, are intended for *stateless* and *multiuser* use. A biometric device exposed via web services *must* therefore provide a mechanism to reconcile these competing viewpoints.

Notwithstanding the native limits of the underlying web server, WS-BD services *must* be capable of handling multiple, concurrent requests. Services *must* respond to requests for operations that do not

require exclusive control of the biometric sensor and *must* do so without waiting until the biometric sensor is in a particular state.

Because there is no well-accepted mechanism for providing asynchronous notification via REST, each individual operation *must* block until completion. That is, the web server does not reply to an individual HTTP request until the operation that is triggered by that request is finished.

Individual clients are not expected to poll—rather they make a single HTTP request and block for the corresponding result. Because of this, it is expected that a client would perform WS-BD operations on an independent thread, so not to interfere with the general responsiveness of the client application. WS-BD clients therefore *must* be configured in such a manner such that individual HTTP operations have timeouts that are compatible with a particular implementation.

WS-BD operations may be longer than typical REST services. Consequently, there is a clear need to differentiate between service level errors and HTTP communication errors. WS-BD services *must* pass-through the status codes underlying a particular request. In other words, services *must not* use (or otherwise ‘piggyback’) HTTP status codes to indicate failures that occur within the service. If a service successfully receives a well-formed request, then the service *must* return the HTTP status code 200–299 indicating such. Failures are described within the contents of the XML data returned to the client for any given operation. The exception to this is when the service receives a poorly-formed request (i.e., the XML payload is not valid), then the service *may* return the HTTP status code 400, indicating a bad request.

This is deliberately different from REST services that override HTTP status codes to provide service-specific error messages. Avoiding the overloading of status codes is a pattern that facilitates the debugging and troubleshooting of communication versus client & service failures.

DESIGN NOTE 1 (Informative): Overriding HTTP status codes is just one example of the rich set of features afforded by HTTP; content negotiation, entity tags (e-tags), and preconditions are other features that could be leveraged instead of “recreated” (to some degree) within this specification. However, the technical committee avoided the use of these advanced HTTP features in this version of the specification for several reasons:

- To reduce the overall complexity required for implementation.
- To ease the requirements on clients and servers (particularly since the HTTP capabilities on embedded systems may be limited).
- To avoid dependencies on any HTTP feature that is not required (such as entity tags).

In summary, the goal for this initial version of the specification is to provide common functionality across the broadest set of platforms. As this standard evolves, the technical committee will continue to evaluate the integration of more advanced HTTP features, as well as welcome feedback on their use from users and/or implementers of the specification.

2.5.4 Client Identity

Before discussing how WS-BD balances single-user vs. multi-user needs, it is necessary to understand the WS-BD model for how an individual client can easily and consistently identify itself to a service.

HTTP is, by design, a *stateless* protocol. Therefore, any persistence about the originator of a sequence of requests must be built in (somewhat) artificially to the layer of abstraction above HTTP itself. This is accomplished in WS-BD via a *session*—a collection of operations that originate from the same logical endpoint. To initiate a session, a client performs a *registration* operation and obtains a *session identifier* (or “session id”). During subsequent operations, a client uses this identifier as a parameter to uniquely identify itself to a server. When the client is finished, it is expected to close a session with an *unregistration* operation. To conserve resources, services *may* automatically unregister clients that do not explicitly unregister after a period of inactivity (see §6.5.3.2).

This use of a session id directly implies that the particular sequences that constitute a session are entirely the responsibility of the *client*. A client *may* opt to create a single session for its entire lifetime, or, *may* open (and close) a session for a limited sequence of operations. WS-BD supports both scenarios.

It is possible, but discouraged, to implement a client with multiple sessions with the same service simultaneously. For simplicity, and unless otherwise stated, this specification is written in a manner that assumes that a single client maintains a single session id. (This can be assumed without loss of generality, since a client with multiple sessions to a service could be decomposed into “sub-clients”—one sub-client per session id.)

Just as a client *may* maintain multiple session ids, a single session id *may* be shared among a collection of clients. By sharing the session id, a biometric sensor may then be put in a particular state by one client, and then handed-off to another client. This specification does not provide guidance on how to perform multi-client collaboration. However, session id sharing is certainly permitted, and a deliberate artifact of the convention of using of the session id as the client identifier. Likewise, many-to-many relationships (i.e., multiple session ids being shared among multiple clients) are also possible, but *should* be avoided.

2.5.5 Sensor Identity

A WS-BD service *must* be exposed to potential clients by a unique URI that serves as entry point for that service.

Implementers *should* map each target biometric sensor to a single service; that is, independent sensors *should* be exposed via different URIs. However, just as it is possible for a client to communicate with multiple services, a host can be responsible for controlling multiple target biometric sensors.

EXAMPLE 1: Figure 4 shows a physically separate implementation where a single host machine controls two biometric sensors—one fingerprint scanner and one digital camera. The devices act independently and are therefore exposed via two different services—one at the URL *http://wsbd/fingerprint* and one at *http://wsbd/camera*.

Figure 4. Independent sensors controlled by separate services.

A service that controls multiple biometric devices simultaneously (e.g., an array of cameras with synchronized capture) *should* be exposed via the same endpoint; this **SHOULD NOT** be the preferred architecture if the sensors would need to be addressed or controlled separately.

Figure 5. A sensor array controlled by a single service.

EXAMPLE 2: Figure 5 shows a physically separate implementation where a single host machine controls a pair of cameras used for stereo vision. The cameras act together as a single logical sensor and are both exposed via the same service, `http://wsbd/camera_array`. The left and right camera are not individually addressable because the service is exposing both by a single endpoint. If the left and right camera needed to be separately addressable, then the host should expose two services—one for each camera—`http://wsbd/left_camera` and `http://wsbd/right_camera`.

A biometric sensor *should not* be exposed by more than one service at a time as it can *significantly* increase the complexity of implementation.

2.5.6 Locking

2.5.6.1 Overview and General Behavior

WS-BD uses a *lock* to satisfy two complementary requirements:

1. A service *must* have exclusive, sovereign control over biometric sensor hardware to perform a particular *sensor operation* such as initialization, configuration, or capture.
2. A client needs to perform an sequence of sensor operations and not be interrupted by another client

Each WS-BD service exposes a *single* lock (one per service) that controls access to the sensor. Clients obtain the lock in order to perform a sequence of operations that *should not* be interrupted. Obtaining the lock is an indication to the server (and indirectly to peer clients) that (1) a series of sensor operations is about to be initiated and (2) that server *may* assume sovereign control of the biometric sensor. There *must* only be a single lock per service—regardless of the number of underlying biometric sensors under the service’s control. (This is one of the reasons why implementers *should* map each target biometric sensor to a single endpoint.)

A client releases the lock upon completion of its desired sequence of tasks. This indicates to the server (and indirectly to peer clients) that the uninterruptable sequence of operations is finished. A client *may* obtain and release the lock many times within the same session or a client *may* open and close a session for each pair of lock/unlock operations. This decision is entirely dependent on a particular client.

The statement that a client *may* “own” or “hold” a lock is a convenient simplification that makes it easier to understand the client-server interaction. In reality, each sensor service maintains a unique global variable that contains a session id. The originator of that session id can be thought of as the client that “holds” the lock to the service. Clients are expected to release the lock after completing their required sensor operations, but there is lock *stealing*—a mechanism for forcefully releasing locks. This feature is necessary to ensure that one client cannot hold a lock indefinitely, denying its peers access to the biometric sensor.

As stated previously (see §2.5.4), it is implied that all successfully connected clients enjoy the same access privileges. Each client is treated the same and are expected to work cooperatively with each other. This is critically important, because it is this implied equivalence of “trust” that affords a lock *stealing* operation.

DESIGN NOTE 2 (Informative): In the early development states of this specification, the specification designers considered having a single, atomic sensor operation that performed initialization, configuration *and* capture. This would avoid the need for locks entirely, since a client could then be ensured (if successful), the desired operation completed as requested. However, given the high degree of variability of sensor operations across different sensors and modalities, the explicit locking was selected so that clients could have a higher degree of control over a service and a more reliable way to predict timing. Regardless of the enforcement mechanism, it is undesirable if once a “well-behaved” client started an operation and a “rogue” client changed the internal state of the sensor midstream.

WS-BD only offers the core *locking*, *unlocking*, and *lock stealing* operations. Any other lock coordination is outside of scope of this specification and is the clients’ responsibility.

2.5.6.2 Pending Operations

Changing the state of the lock *must* have no effect on pending (i.e., currently running) sensor operations. That is, a service *must not* interrupt ongoing sensor operations even if a client unlocks, steals, or re-obtains a service lock. In this case, overlapping sensor operations are prevented by sensor operations returning *sensorBusy*.

2.5.7 Operations Summary

All WS-BD operations fall into one of eight categories:

1. Registration
2. Locking
3. Information
4. Initialization
5. Configuration
6. Capture
7. Download
8. Cancellation

Of these, the initialization, configuration, capture, and cancellation operations are all sensor operations (i.e., they require exclusive sensor control) and require locking. Registration, locking, and download are all non-sensor operations. They do not require locking and (as stated earlier) *must* be available to clients regardless of the status of the biometric sensor.

Download is not a sensor operation as this allows for a collection of clients to dynamically share acquired biometric data. One client could perform the capture and hand off the download responsibility to a peer.

The following is a brief summary of each type of operation:

- *Registration* operations open and close (unregister) a session.
- *Locking* operations are used by a client to obtain the lock, release the lock, and *steal* the lock.
- *Information* operations query the service for information about the service itself, such as the supported biometric modalities, and service configuration parameters.
- The *initialization* operation prepares the biometric sensor for operation.
- *Configuration* operations get or set sensor parameters.
- The *capture* operation signals to the sensor to acquire a biometric.
- *Download* operations transfer the captured biometric data from the service to the client.
- Sensor operations can be stopped by the *cancellation* operation.

2.5.8 Idempotency

The W3C Web Services glossary [WSGloss] defines idempotency as:

[the] property of an interaction whose results and side-effects are the same whether it is done one or multiple times.

When regarding an operation's idempotence, it *should* be assumed no *other* operations occur in between successive operations, and that each operation is successful. Notice that idempotent operations may have side-effects—but the final state of the service *must* be the same over multiple (uninterrupted) invocations.

The following example illustrates idempotency using an imaginary web service.

EXAMPLE 3: A REST-based web service allows clients to create, read, update, and delete customer records from a database. A client executes an operation to update a customer's address from "123 Main St" to "100 Broad Way."

Suppose the operation is idempotent. Before the operation, the address is "123 Main St". After one execution of the update, the server returns "success", and the address is "100 Broad Way". If the operation is executed a second time, the server again returns "success," and the address remains "100 Broad Way".

Now suppose that when the operation is executed a second time, instead of returning "success", the server returns "no update made", since the address was already "100 Broad Way." Such an operation is *not* idempotent, because executing the operation a second time yielded a different result than the first execution.

The following is an example in the context of WS-BD.

EXAMPLE 4: A service has an available lock. A client invokes the lock operation and obtains a "success" result. A subsequent invocation of the operation also returns a "success" result. The operation being idempotent means that the results ("success") and side-effects (a locked service) of the two sequential operations are identical.

To best support robust communications, WS-BD is designed to offer idempotent services whenever possible.

2.5.9 Service Lifecycle Behavior

The lifecycle of a service (i.e., when the service starts responding to requests, stops, or is otherwise unavailable) *must* be modeled after an integrated implementation. This is because it is significantly easier for a physically separated implementation to emulate the behavior of a fully integrated implementation than it is the other way around. This requirement has a direct effect on the expected behavior of how a physically separated service would handle a change in the target biometric sensor.

Consequently, this specification does NOT make any specific recommendations on how a WS-BD service should be started, stopped, or reset. This (a) reflects the connectionless nature of HTTP but also (b) allows the host environment maximum flexibility on how to implement service availability. For example, a manufacturer of an embedded device might elect to have the device run a service as long as the device is powered on.

Specifically, on a desktop computer, hot-swapping the target biometric sensor is possible through an operating system's plug-and-play architecture. By design, this specification does not assume that it is possible to replace a biometric sensor within an integrated device. Therefore, having a physically separated implementation emulate an integrated implementation provides a simple means of providing a common level of functionality.

By virtue of the stateless nature of the HTTP protocol, a client has no simple means of detecting if a web service has been restarted. For most web communications, a client *should not* require this—it is a core

429 capability that constitutes the robustness of the web. Between successive web requests, a web server
430 might be restarted on its host any number of times. In the case of WS-BD, replacing an integrated device
431 with another (configured to respond on the same endpoint) is an *effective* restart of the service.
432 Therefore, by the emulation requirement, replacing the device within a physically separated
433 implementation *must* behave similarly.

434 If the service is written in a robust manner, then a client SHOULD NOT be directly affected by a service
435 restart. For example, upon detecting a new target biometric sensor, a robust server could *quiesce* (refuse
436 all new requests until pending requests are completed) and automatically restart.

437 Upon restarting, services *should* return to a fully reset state—i.e., all sessions *should* be dropped, and
438 the lock *should not* have an owner. However, a high-availability service *may* have a mechanism to
439 preserve state across restarts, but is significantly more complex to implement (particularly when using
440 integrated implementations!). A client that communicated with a service that was restarted would lose
441 both its session and the service lock (if held). With the exception of the get service info operation,
442 through various fault statuses a client would receive indirect notification of a service restart. If needed, a
443 client could use the service's common info timestamp (§A.2.1) to detect potential changes in the get
444 service info operation.

3 Data Dictionary

3.1 About

This section contains descriptions of the data elements that are contained within the WS-BD data model. Each data type is described via an accompanying XML Schema type definition [XMSCHEMA-1, XMSCHEMA-2].

Refer to Appendix A for a complete XML schema containing all types defined in this specification.

IMPORTANT: XML Schema (and fragments) are used throughout this section and this document for the convenience of the reader so that the document may be self-contained. However, in the event that there is a discrepancy between this document and the electronic version of the schema that accompanies this specification, the electronic version *shall* be the authoritative source.

3.2 Namespaces

Table 1 lists the namespaces and corresponding namespace prefixes are used throughout this document.

Table 1. Namespaces

Prefix	Namespace	Remarks
xs	http://www.w3.org/2001/XMLSchema	The xs namespace refers to the XML Schema specification. Definitions for the xs data types (i.e., those not explicitly defined here) can be found in [XMSCHEMA-2].
xsi	http://www.w3.org/2001/XMLSchema-instance	The xsi namespace allows the schema to refer to other XML schemas in a qualified way.
wsbd	http://docs.oasis-open.org/biometrics/ns/ws-bd-1.0	The wsbd namespace is a uniform resource name [RFC1737, RFC2141] consisting of an object identifier [RFC3061] reserved for this specification's schema. This namespace can be written in ASN.1 notation as {joint-iso-ccitt(2) country(16) us(840) organization(1) gov(101) csor(3) biometrics(9) wsbd(3) version1(1)}.

All of the datatypes defined in this section (§3) belong to the wsbd namespace defined in the above table. If a datatype is described in the document without a namespace prefix, the wsbd prefix is assumed.

3.3 UUID

A UUID is a unique identifier as defined in [RFC4122]. A service *must* use UUIDs that conform to the following XML Schema type definition.

```
<xs:simpleType name="UUID">
  <xs:restriction base="xs:string">
    <xs:pattern value="[\da-fA-F]{8}-[\da-fA-F]{4}-[\da-fA-F]{4}-[\da-fA-F]{4}-[\da-fA-F]{12}"/>
  </xs:restriction>
</xs:simpleType>
```

EXAMPLE 5: Each of the following is a well-formed UUID.

```
E47991C3-CA4F-406A-8167-53121C0237BA
10fa0553-9b59-4D9e-bbcd-8D209e8d6818
161FdBf5-047F-456a-8373-D5A410aE4595
```

3.4 Dictionary

A Dictionary is a generic container used to hold an arbitrary collection of name-value pairs.

```
<xs:complexType name="Dictionary">
  <xs:sequence>
    <xs:element name="item" minOccurs="0" maxOccurs="unbounded">
      <xs:complexType>
        <xs:sequence>
          <xs:element name="key" type="xs:string" nillable="true"/>
          <xs:element name="value" type="xs:anyType" nillable="true"/>
        </xs:sequence>
      </xs:complexType>
    </xs:element>
  </xs:sequence>
</xs:complexType>
```

EXAMPLE 6: A query to get the metadata of a capture returns a dictionary of supported settings and the values at the time of capture. Enclosing tags (which may vary) are omitted.

```
<item>
  <key>imageWidth</key>
  <value>640</value>
</item>
<item>
  <key>imageHeight</key>
  <value>640</value>
</item>
<item>
  <key>captureDate</key>
  <value>2011-01-01T01:23:45Z</value>
</item>
```

Dictionary instances are nestable—i.e., the value element of one Dictionary can contain another Dictionary. The use of `xs:anyType` allows for an XML element of any structure or definition to be used. Using types not defined in this document or types defined in W3's XML Schema recommendations [XMSCHEMA-1, XMSCHEMA-2] might require a client to have unique knowledge about the service. Because the requirement of unique knowledge negatively impacts interoperability, using such elements is discouraged.

3.5 Parameter

3.5.1 Overview

A Parameter is a container used to describe the parameters or settings of a service or sensor.

```
<xs:complexType name="Parameter">
  <xs:sequence>
    <xs:element name="name" type="xs:string" nillable="true"/>
    <xs:element name="type" type="xs:QName" nillable="true"/>
    <xs:element name="readOnly" type="xs:boolean" minOccurs="0"/>
    <xs:element name="supportsMultiple" type="xs:boolean" minOccurs="0"/>
    <xs:element name="defaultValue" type="xs:anyType" nillable="true"/>
    <xs:element name="allowedValues" nillable="true" minOccurs="0">
```

```

522     <xs:complexType>
523       <xs:sequence>
524         <xs:element name="allowedValue" type="xs:anyType" nillable="true"
525 minOccurs="0" maxOccurs="unbounded"/>
526       </xs:sequence>
527     </xs:complexType>
528   </xs:element>
529 </xs:sequence>
530 </xs:complexType>

```

See §4 for more information on metadata and the use of Parameter.

3.5.2 Element Summary

Table 2 contains a description of each Parameter element.

Table 2. Parameter—element summary

Element	Description
name	The name of the parameter.
type	The fully qualified type of the parameter.
readOnly	Whether or not this parameter is read-only.
supportsMultiple	Whether or not this parameter can support multiple values for this parameter (§3.5.2.1).
defaultValue	The default value of this parameter.
allowedValues	A list of allowed values for this parameter (§3.5.2.2).

3.5.2.1 “Supports Multiple” Element

In some cases, a parameter **MAY** require multiple values. This flag specifies whether the parameter is capable of multiple values.

When **supportsMultiple** is true, communicating values **must** be done through a defined array type. If a type-specialized array is defined in this specification, such as a **StringArray** (§3.8) for **xs:string**, such type **should** be used. The generic **Array** (§3.7) type **must** be used in all other cases.

The parameter’s type element **must** be the qualified name of a single value. For example, if the parameter expects multiple strings during configuration, then the type **must** be **xs:string** and not **StringArray**.

EXAMPLE 7: An iris scanner might have the ability to capture a left iris, right iris, and/or frontal face image simultaneously. This example configures the scanner to capture left and right iris images together.

The first code block is what the service exposes to the clients:

```

548   <name>submodality</name>
549   <type>xs:string</type>
550   <readOnly>false</readOnly>
551   <supportsMultiple>true</supportsMultiple>
552   <defaultValue xsi:type="wsbd:StringArray">
553     <element>leftIris</element>
554     <element>rightIris</element>
555   </defaultValue>
556   <allowedValues>
557     <allowedValue>leftIris</allowedValue>
558     <allowedValue>rightIris</allowedValue>
559     <allowedValue>frontalFace</allowedValue>
560   </allowedValues>

```

The second code block is how a client would configure this parameter for simultaneous left and right iris capture.

```
<item>
  <key>submodality</key>
  <value xsi:type="wsbd:StringArray">
    <element>leftIris</element>
    <element>rightIris</element>
  </value>
</item>
```

The client configures the submodality by supplying a `StringArray` with two elements: left and right—this tells the service to capture both the left and right iris.

The resulting captured data must specify the respective submodality for each captured item in its metadata.

In both code blocks, enclosing tags (which may vary) are omitted.

3.5.2.2 Allowed Values

For parameters that are not read-only and have restrictions on what values it may have, this allows the service to dynamically expose it to its clients.

EXAMPLE 8: The following code block demonstrates a parameter, “CameraFlash”, with only three valid values. Enclosing tags (which may vary) are omitted.

```
<name>cameraFlash</name>
<type>xs:string</type>
<readOnly>false</readOnly>
<supportsMultiple>false</supportsMultiple>
<defaultValue>auto</defaultValue>
<allowedValues>
  <allowedValue xsi:type="xs:string">on</allowedValue>
  <allowedValue xsi:type="xs:string">off</allowedValue>
  <allowedValue xsi:type="xs:string">auto</allowedValue>
</allowedValues>
```

Parameters requiring a range of values *should* be described by using `Range` (§3.6). Because the allowed type is not the same as its parameter type, a service *must* have logic to check for a `Range` and any appropriate validation.

EXAMPLE 9: The following code block demonstrates a parameter, “CameraZoom”, where the allowed value is of type `Range` and consists of integers. Enclosing tags (which may vary) are omitted.

```
<name>cameraZoom</name>
<type>xs:integer</type>
<readOnly>false</readOnly>
<supportsMultiple>false</supportsMultiple>
<defaultValue>0</defaultValue>
<allowedValues>
  <allowedValue xsi:type="wsbd:Range">
    <minimum>0</minimum>
    <maximum>100</maximum>
  </allowedValue>
</allowedValues>
```

If a configurable parameter has no restrictions on its value then the parameter *must not* include the `allowedValues` element.

3.6 Range

A Range is a container used to describe a range of data, and whether the upper and lower bounds are exclusive. The upper and lower bounds *must* be inclusive by default.

```
<xs:complexType name="Range">
  <xs:sequence>
    <xs:element name="minimum" type="xs:anyType" nillable="true"
minOccurs="0"/>
    <xs:element name="maximum" type="xs:anyType" nillable="true"
minOccurs="0"/>
    <xs:element name="minimumIsExclusive" type="xs:boolean" nillable="true"
minOccurs="0"/>
    <xs:element name="maximumIsExclusive" type="xs:boolean" nillable="true"
minOccurs="0"/>
  </xs:sequence>
</xs:complexType>
```

EXAMPLE 10: An example range of numbers from 0 to 100. The minimum is exclusive while the maximum is inclusive. Enclosing tags (which may vary) are omitted.

```
<minimum>0</minimum>
<maximum>100</maximum>
<minimumIsExclusive>true</minimumIsExclusive>
<maximumIsExclusive>false</maximumIsExclusive>
```

Table 3 provides a description of each Range element.

Table 3. Range—element summary

Element	Description
<code>minimum</code>	The lower bound of the range.
<code>maximum</code>	The upper bound of the range.
<code>minimumIsExclusive</code>	Boolean indicating whether the lower bound is exclusive or not. This is true by default.
<code>maximumIsExclusive</code>	Boolean indicating whether the upper bound is exclusive or not. This is true by default.

3.7 Array

An Array is a generic container used to hold a collection of elements.

```
<xs:complexType name="Array">
  <xs:sequence>
    <xs:element name="element" type="xs:anyType" nillable="true" minOccurs="0"
maxOccurs="unbounded"/>
  </xs:sequence>
</xs:complexType>
```

EXAMPLE 11: In the following fragment the values “flatLeftThumb” and “flatRightThumb” are of type `xs:anyType`, and are likely to be deserialized as a generic “object.”

```
<element>flatLeftThumb</element><element>flatRightThumb</element>
```

EXAMPLE 12: In the following fragment, the two values are of *different* types.

```
651 <element xsi:type="xs:boolean">false</element>
652 <element xsi:type="xs:int">1024</element>
```

653 **EXAMPLE 13:** In the following fragment, the array contains a single element.

```
654 <element xsi:type="xs:decimal">2.0</element>
```

656 3.8 StringArray

657 A StringArray is a generic container used to hold a collection of strings.

```
658 <xs:complexType name="StringArray">
659   <xs:sequence>
660     <xs:element name="element" type="xs:string" nillable="true" minOccurs="0"
661     maxOccurs="unbounded"/>
662   </xs:sequence>
663 </xs:complexType>
```

664 **EXAMPLE 14:** Each line below is an example of a valid StringArray. Enclosing tags (which may vary) are omitted.

```
667 <element>flatLeftThumb</element><element>flatRightThumb</element>
668 <element>value1</element><element>value2</element>
669 <element>sessionId</element>
```

671 3.9 UuidArray

672 A UuidArray is a generic container used to hold a collection of UUIDs.

```
673 <xs:complexType name="UuidArray">
674   <xs:sequence>
675     <xs:element name="element" type="wsbd:UUID" nillable="true" minOccurs="0"
676     maxOccurs="unbounded"/>
677   </xs:sequence>
678 </xs:complexType>
```

679 **EXAMPLE 15:** The following code fragment is an example of a *single* UuidArray with three elements.
680 Enclosing tags (which may vary) are omitted.

```
682 <element>E47991C3-CA4F-406A-8167-53121C0237BA</element>
683 <element>10fa0553-9b59-4D9e-bbcd-8D209e8d6818</element>
684 <element>161FdBF5-047F-456a-8373-D5A410aE4595</element>
```

686 3.10 ResourceArray

687 A ResourceArray is a generic container used to hold a collection of Resources (§3.11).

```
688 <xs:complexType name="ResourceArray">
689   <xs:sequence>
690     <xs:element name="element" type="wsbd:Resource" nillable="true"
691     minOccurs="0" maxOccurs="unbounded"/>
692   </xs:sequence>
693 </xs:complexType>
```

EXAMPLE 16: The following code fragment is an example of a *single* ResourceArray with two elements. Enclosing tags (which may vary) are omitted.

```
<element><uri>file:///tmp/test.png<uri><contentType>image/png</contentType></element>
<element><uri>http://192.168.1.1/robots.txt<uri><contentType>text/plain</contentType></element>
```

3.11 Resource

Resource is a container to describe a resource at a specified URI.

```
<xs:complexType name="Resource">
  <xs:sequence>
    <xs:element name="uri" type="xs:anyURI"/>
    <xs:element name="contentType" type="xs:string" nillable="true" minOccurs="0"/>
    <xs:element name="relationship" type="xs:string" nillable="true" minOccurs="0"/>
  </xs:sequence>
</xs:complexType>
```

3.12 Resolution

Resolution is a generic container to describe values for a width and height and optionally a description of the unit.

```
<xs:complexType name="Resolution">
  <xs:sequence>
    <xs:element name="width" type="xs:decimal"/>
    <xs:element name="height" type="xs:decimal"/>
    <xs:element name="unit" type="xs:string" nillable="true" minOccurs="0"/>
  </xs:sequence>
</xs:complexType>
```

Table 4 provides a description of each Size element.

Table 4. Resolution—element summary

Element	Description
width	The decimal value of the width
height	The decimal value of the height
unit	A string describing the units of the width and height values

3.13 Status

The Status represents a common enumeration for communicating state information about a service.

```
<xs:simpleType name="Status">
  <xs:restriction base="xs:string">
    <xs:enumeration value="success"/>
    <xs:enumeration value="failure"/>
    <xs:enumeration value="invalidId"/>
    <xs:enumeration value="canceled"/>
    <xs:enumeration value="canceledWithSensorFailure"/>
    <xs:enumeration value="sensorFailure"/>
    <xs:enumeration value="lockNotHeld"/>
    <xs:enumeration value="lockHeldByAnother"/>
    <xs:enumeration value="initializationNeeded"/>
    <xs:enumeration value="configurationNeeded"/>
    <xs:enumeration value="sensorBusy"/>
    <xs:enumeration value="sensorTimeout"/>
  </xs:restriction>
</xs:simpleType>
```

```

738 <xs:enumeration value="unsupported"/>
739 <xs:enumeration value="badValue"/>
740 <xs:enumeration value="noSuchParamter"/>
741 <xs:enumeration value="preparingDownload"/>
742 </xs:restriction>
743 </xs:simpleType>

```

744 Table 5 defines all of the potential values for the Status enumeration.

745 *Table 5. Potential values for the Status enumeration.*

Value	Description
<i>success</i>	The operation completed successfully.
<i>failure</i>	The operation failed. The failure was due to a web service (as opposed to a sensor error).
<i>invalidId</i>	The provided id is not valid. This can occur if the client provides a (session or capture) id that is either: unknown to the server (i.e., does not correspond to a known registration or capture result), or the session has been closed by the service (§6.5.3.2) (See §6.2.3 for information on parameter failures.)
<i>canceled</i>	The operation was canceled. A sensor service <i>may</i> cancel its own operation, for example, if an operation is taking too long. This can happen if a service maintains its own internal timeout that is shorter than a sensor timeout.
<i>canceledWithSensorFailure</i>	The operation was canceled, but during (and perhaps because of) cancellation, a sensor failure occurred. This particular status accommodates for hardware that may not natively support cancellation.
<i>sensorFailure</i>	The operation could not be performed because of a biometric sensor (as opposed to web service) failure. NOTE: Clients that receive a status of sensorFailure should assume that the sensor will need to be reinitialized in order to restore normal operation.
<i>lockNotHeld</i>	The operation could not be performed because the client does not hold the lock. This status implies that at the time the lock was queried, no other client currently held the lock. However, this is not a guarantee that any subsequent attempts to obtain the lock will succeed.
<i>lockHeldByAnother</i>	The operation could not be performed because another client currently holds the lock.
<i>initializationNeeded</i>	The operation could not be performed because the sensor requires initialization.
<i>configurationNeeded</i>	The operation could not be performed because the sensor requires configuration.
<i>sensorBusy</i>	The operation could not be performed because the sensor is currently

	<p>performing another task that prohibits the request.</p> <p>Services <i>may</i> self-initiate an activity that triggers a <code>sensorBusy</code> result. That is, it may not be possible for a client to trace back a <code>sensorBusy</code> status to any particular operation. An automated self-check, heartbeat, or other activity such as a data transfer may place the target biometric sensor into a “busy” mode. (See §6.14.3.3 for information about post-acquisition processing.)</p>
<i>sensorTimeout</i>	<p>The operation was not performed because the biometric sensor experienced a timeout.</p> <p>The most common cause of a sensor timeout would be a lack of interaction with a sensor within an expected timeframe.</p>
<i>unsupported</i>	The service does not support the requested operation. (See §6.2.3 for information on parameter failures.)
<i>badValue</i>	The operation could not be performed because a value provided for a particular parameter was either (a) an incompatible type or (b) outside of an acceptable range. (See §6.2.3 for information on parameter failures.)
<i>noSuchParameter</i>	The operation could not be performed because the service did not recognize the name of a provided parameter. (See §6.2.3 for information on parameter failures.)
<i>preparingDownload</i>	The operation could not be performed because the service is currently preparing captured data for download. (See §6.14.3.3)

Many of the permitted status values have been designed specifically to support physically separate implementations—a scenario where it is easier to distinguish between failures in the web service and failures in the biometric sensor. This is not to say that within an integrated implementation such a distinction is not possible, only that some of the status values are more relevant for physically separate versions.

For example, a robust service would allow all sensor operations to be canceled with no threat of a failure. Unfortunately, not all commercial, off-the-shelf (COTS) sensors natively support cancellation. Therefore, the *canceledWithSensorFailure* status is offered to accommodate this. Implementers can still offer cancellation, but have a mechanism to communicate back to the client that sensor initialization may be required.

3.14 Result

3.14.1 Overview

Unless a service returns with an HTTP error, all WS-BD operations *must* reply with an HTTP message that contains an element of a Result type that conforms to the following XML Schema snippet.

```
<xs:element name="result" type="wsbd:Result" nillable="true"/>
<xs:complexType name="Result">
  <xs:sequence>
    <xs:element name="status" type="wsbd:Status"/>
    <xs:element name="badFields" type="wsbd:StringArray" nillable="true"
minOccurs="0"/>
    <xs:element name="captureIds" type="wsbd:UuidArray" nillable="true"
minOccurs="0"/>
    <xs:element name="metadata" type="wsbd:Dictionary" nillable="true"
minOccurs="0"/>
```

```

771     <xs:element name="message" type="xs:string" nillable="true"
772 minOccurs="0"/>
773     <xs:element name="sensorData" type="xs:base64Binary" nillable="true"
774 minOccurs="0"/>
775     <xs:element name="sessionId" type="wsbd:UUID" nillable="true"
776 minOccurs="0"/>
777   </xs:sequence>
778 </xs:complexType>

```

3.14.2 Terminology Shorthand

Since a Result is the intended outcome of all requests, this document may state that an operation “returns” a particular status value. This is shorthand for a Result output payload with a `status` element containing that value.

EXAMPLE 17: The following result payload “returns success”. A result might contain other child elements depending on the specific operation and result status—see §5 for operations and their respective details.

```

786 <result xmlns="http://docs.oasis-open.org/biometrics/ns/ws-bd-1.0"
787       xmlns:xs="http://www.w3.org/2001/XMLSchema"
788       xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
789   <status>success</status>
790 </result>

```

Likewise, the same shorthand is implied by a client “receiving” a status, or an operation “yielding” a status.

3.14.3 Required Elements

Notice that from a XML Schema validation perspective [XMSCHEMA-1], a schema-valid Result *must* contain a `status` element, and *may* contain any of the remaining elements.

The specific permitted elements of a Result are determined via a combination of (a) the operation, and (b) the result’s status. That is, different operations will have different requirements on which elements are permitted or forbidden, depending on that operation’s status.

EXAMPLE 18: As will be detailed later (§6.4.5.2 and §6.6.5.2), a *register* operation returning a status of success *must* also populate the `sessionId` element. However, a *try lock* operation that returns a status of success cannot populate any element other than `status`.

DESIGN NOTE 3 (Informative): An XML inheritance hierarchy could have been used to help enforce which elements are permitted under which circumstances. However, a de-normalized representation (in which all of the possible elements are valid with respect to a *schema*) was used to simplify client and server implementation. Further, this reduces the burden of managing an object hierarchy for the sake of enforcing simple constraints.

3.14.4 Element Summary

Table 6 provides a brief description of each element of a Result.

Table 6. Result — element summary

Element	Description
status	The disposition of the operation. All Result elements <i>must</i> contain a status element. (Used

	in all operations.)
badFields	The list of fields that contain invalid or ill-formed values. (Used in almost all operations.)
captureIds	Identifiers that <i>may</i> be used to obtain data acquired from a capture operation (§6.13, §6.14).
metadata	This field <i>may</i> hold <ul style="list-style-type: none"> a) metadata for the service (§6.9), or b) a service and sensor's configuration (§6.11, §6.12), or c) metadata relating to a particular capture (§6.14, §6.15, §6.16) (See §4 for more information regarding metadata)
message	A string providing <i>informative</i> detail regarding the output of an operation. (Used in almost all operations.)
sensorData	The biometric data corresponding to a particular capture identifier (§6.14, §6.16).
sessionId	A unique session identifier (§6.4).

3.15 Validation

The provided XML schemas may be used for initial XML validation. It should be noted that these are not strict schema definitions and were designed for easy consumption of web service/code generation tools. Additional logic *should* be used to evaluate the contents and validity of the data where the schema falls short. For example, additional logic will be necessary to verify the contents of a `Result` are accurate as there is not a different schema definition for every combination of optional and mandatory fields.

A service *must* have separate logic validating parameters and their values during configuration. For example, if the type of the parameter is an integer and an allowed value is a `Range`, the service *must* handle this within the service as it cannot be appropriately validated using XML schema.

4 Metadata

4.1 About

Metadata can be broken down into three smaller categories: service information, sensor information or configuration, and capture information. Metadata can be returned in two forms: as a key/value pair within a Dictionary or a Dictionary of Parameter types.

4.2 Service Information

Service information includes read-only parameters unrelated to the sensor as well as parameters that can be set. Updating the values of a parameter *should* be done in the set configuration operation.

Service information *must* include the required parameters listed in Appendix A; including the optional parameters is highly recommended. Each parameter *must* be exposed as a Parameter (§3.5).

Parameters listed in §A.2, §A.3, and §A.4 *must* be exposed as read-only parameters.

Read-only parameters *must* specify its current value by populating the default value field with the value. Additionally, read-only parameters *must not* provide any allowed values. Allowed values are reserved to specify acceptable information which *may* be passed *to* the service for configuration.

EXAMPLE 19: An example snippet from a *get service info* call demonstrating a read-only parameter. Enclosing tags (which may vary) are omitted.

```
<name>inactivityTimeout</name>
<type>xs:nonNegativeInteger</type>
<readOnly>true</readOnly>
<supportsMultiple>false</supportsMultiple>
<defaultValue>600</defaultValue>
```

Configurable parameters, or those which are not read only, *must* provide information for the default value as well as allowed values. To specify that an allowed value is within range of numbers, refer to Range (§3.6).

EXAMPLE 20: An example snippet from a *get service info* call. The target service supports a configurable parameter called “ImageWidth”. Enclosing tags (which may vary) are omitted.

```
<name>imageWidth</name>
<type>xs:positiveInteger</type>
<readOnly>false</readOnly>
<supportsMultiple>false</supportsMultiple>
<defaultValue>800</defaultValue>
<allowedValues>
  <allowedValue>640</allowedValue>
  <allowedValue>800</allowedValue>
  <allowedValue>1024</allowedValue>
</allowedValues>
```

In many cases, an exposed parameter will support multiple values (see §3.5.2.1). When a parameter allows this capability, it *must* use a type-specific array, if defined in this specification, or the generic Array (§3.7) type. The type element within a parameter *must* be the qualified name of a single value’s type (see §3.5.2.1 for an example).

4.3 Configuration

A configuration consists of parameters specific to the sensor or post-processing related to the final capture result. This **must** only consist of key/value pairs. It **must not** include other information about the parameters, such as allowed values or read-only status.

Restrictions for each configuration parameter can be discovered through the *get service info* operation.

EXAMPLE 21: The following is an example payload to *set configuration* consisting of three parameters.

```
<configuration xmlns="http://docs.oasis-open.org/biometrics/ns/ws-bd-1.0"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <item>
    <key>imageHeight</key>
    <value xsi:type="xs:int">480</value>
  </item>
  <item>
    <key>imageWidth</key>
    <value xsi:type="xs:int">640</value>
  </item>
  <item>
    <key>frameRate</key>
    <value xsi:type="xs:int">20</value>
  </item>
</configuration>
```

4.4 Captured Data

4.4.1 Overview

Metadata related to a particular capture operation **must** include the configuration of the sensor at the time of capture. Static parameters related to the service **should not** be included in the metadata for a capture result.

A service **may** perform post-processing steps on any captured information. This information **should** be added to the particular capture result's metadata.

EXAMPLE 22: Example metadata for a particular capture. Note that this includes parameters related to the sensor. Enclosing tags (which may vary) are omitted.

```
<item>
  <key>serialNumber</key>

4.4.2 Minimal Metadata

4.4.2.1 General

At a minimum, a sensor or service *must* maintain the following (§4.4.2.2–§4.4.2.5) metadata fields for each captured result.

4.4.2.2 Capture Date

Formal Name	captureDate
-------------	-------------

Data Type	xs:dateTime [XMSCHEMA-2]
------------------	--------------------------

969 This value represents the date and time at which the capture occurred.

970 **4.4.2.3 Modality**

Formal Name	modality
Data Type	xs:string [XMSCHEMA-2]

971 The value of this field *must* be present in the list of available modalities exposed by the *get service info*
 972 operation (§6.9) as defined in §A.5.1. This value represents the modality of the captured result.

973 **4.4.2.4 Submodality**

Formal Name	submodality
Data Type	xs:anyType [XMSCHEMA-2]

974 The value of this field *must* be present in the list of available submodalities exposed by the *get service*
 975 *info* operation (§6.9) as defined in §A.5.2. This value represents the submodality of the captured result. If
 976 this parameter supports multiple, then the data type *must* be a StringArray (§3.8) of values. If
 977 submodality does not support multiple, the data type *must* be xs:string [XMSCHEMA-2].

978 **4.4.2.5 Content Type**

Formal Name	contentType [RFC2045, RFC2046]
Data Type	xs:string

979 The value of this field represents the content type of the captured data. See Appendix B for which content
 980 types are supported.

5 Live Preview

5.1 About

If a service implements live preview, then the service MUST implement it as described in this section (§5). Live preview is be used to provide feedback to the client to, when applicable, signal capture and/or what is occurring during a capture.

5.2 Endpoints

Exposing endpoint information to a client is done through the service information. If live preview is implemented, the service information MUST contain key/value where the key is “livePreview” and the value is of type Parameter (§3.5). This *must* be a read-only parameter. The default value MUST be of type ResourceArray (§3.10). An implementation may expose one or more Resources (§3.11) in the ResourceArray. For the stream parameter, each instance of a Resource MUST contain the uri, contentType, and the relationship elements.

The content type of the stream and the value of each Resource’s contentType element should be listed as it appears in Appendix B.

The value of the relationship field *must* begin with “livePreview” and there *must* be at least one entry where the element’s value consists of only “livePreview”. An implementer *may* provide additional endpoints with a modified relationship. This *may* be done by appending a forward slash immediately after “livePreview” and before any additional content; any additional content *must not* occur before the forward slash. The relationship field *must* only contain base-64 characters.

EXAMPLE 24: The follow snippet is a skeleton service information entry for a stream parameter. Enclosing tags have been omitted.

```
<item>
  <key>livePreview</key>
  <value xsi:type="Parameter">
    <name>livePreview </name>
    <type>Resource</type>
    <readOnly>true</readOnly>
    <defaultValue xsi:type="ResourceArray">
      ...
    </defaultValue>
  </value>
</item>
```

EXAMPLE 25: The following snippet is an example service information entry that exposes a Parameter (§3.5) for live preview resources. This example exposes two different endpoints, each offering a live preview with different content types. Enclosing tags (which may vary) are omitted.

```
<item>
  <key>livePreview</key>
  <value xsi:type="Parameter">
    <name>livePreview</name>
    <type>Resource</type>
    <readOnly>true</readOnly>

    <defaultValue xsi:type="ResourceArray">
      <element>
        <uri>http://192.168.1.1/stream</uri>
        <contentType>video/h264</contentType>
        <relationship>livePreview</relationship>
```

```

1030     </element>
1031     <element>
1032         <uri>http://192.168.1.1:81/stream</uri>
1033         <contentType>video/mpeg</contentType>
1034         <relationship>livePreview</relationship>
1035     </element>
1036 </defaultValue>
1037 </value>
1038 </item>

```

EXAMPLE 26: The following snippet is an example service information entry that exposes a Parameter (§3.5) for live preview resources. This example exposes two different endpoints, one with a modified relationship value. For example, the second entry *may* be describing an endpoint that has live preview of a face at 30 frames per second. Enclosing tags (which may vary) are omitted.

```

1043 <item>
1044     <key>livePreview</key>
1045     <value xsi:type="Parameter">
1046         <name>livePreview</name>
1047         <type>Resource</type>
1048         <readOnly>true</readOnly>
1049
1050         <defaultValue xsi:type="ResourceArray">
1051             <element>
1052                 <uri>http://192.168.1.1/stream</uri>
1053                 <contentType>video/h264</contentType>
1054                 <relationship>livePreview</relationship>
1055             </element>
1056             <element>
1057                 <uri>http://192.168.1.1:81/stream</uri>
1058                 <contentType>video/mpeg</contentType>
1059                 <relationship>livePreview/face+fps=30</relationship>
1060             </element>
1061         </defaultValue>
1062     </value>
1063 </item>

```

To begin receiving live preview data, the client SHALL establish a connection to the desired live preview endpoint/URI. Closing the connection to an endpoint/URI SHALL terminate the transmission of all live preview data to establishing client. A client SHALL signal a capture using the capture operation (§6.13).

5.3 Heartbeat

In many cases, live preview may not be ready to provide actual images until a certain point in a session or the lifetime of a service (e.g., after initialization). The service has two options on how to proceed when streaming is called before it is ready.

1. Immediately close the live preview connection. This is only recommended if live preview is not available for the service. It MUST NOT be expected that a client will make additional calls to the live preview endpoint after a closed connection.
2. Send a heartbeat to the client upon a live preview request. The heartbeat MUST consist of minimal null information and MUST be sent to all clients on a fixed time interval.

EXAMPLE 27: The following is an example heartbeat frame sent over a multipart/x-mixed-replace stream. For this example, the boundary indicator is `boundaryString`. A service may send this null frame as a heartbeat to all connected clients every, for example, 10 seconds to alert the client that live preview data is available, but not at the current state of the service, sensor, or session.

```

1082 --boundaryString
1083 Content-Type: multipart/x-heartbeat
1084

```

1085	0
1086	

6 Operations

6.1 About

This section, §6, provides detailed information regarding each WS-BD operation.

6.2 General Usage

6.2.1 Overview

The following usage requirements apply to all operations, unless the detailed documentation for a particular operation conflicts with these general requirements, in which case the detailed documentation takes precedence.

1. **Failure messages are informative.** If an operation fails, then the message element *may* contain an informative message regarding the nature of that failure. The message is for informational purposes only—the functionality of a client *must not* depend on the contents of the message.
2. **Results *must only* contain required and optional elements.** Services *must* only return elements that are either required or optional. All other elements *must not* be contained in the result, even if they are empty elements. Likewise, to maintain robustness in the face of a non-conformant service, clients *should* ignore any element that is not in the list of permitted Result elements for a particular operation call.
3. **Sensor operations *must not* occur within a non-sensor operation.** Services *should only* perform any sensor control within the operations:
 - a. *initialize*,
 - b. *get configuration*,
 - c. *set configuration*,
 - d. *capture*, and
 - e. *cancel*.
4. **Sensor operations *must* require locking.** Even if a service implements a sensor operation without controlling the target biometric sensor, the service *must* require that a locked service for the operation to be performed.
5. **Content Type.** Clients *must* make HTTP requests using a content type of `application/xml` [RFC-HTTP].
6. **Namespace.** A data type without an explicit namespace or namespace prefix implies it is a member of the `wsbd` namespace as defined in §3.2.

6.2.2 Precedence of Status Enumerations

To maximize the amount of information given to a client when an error is obtained, and to prevent different implementations from exhibiting different behaviors, all WS-BD services *must* return status values according to a fixed priority. In other words, when multiple status messages might apply, a higher-priority status *must* always be returned in favor of a lower-priority status.

The status priority, listed from highest priority (“invalidId”) to lowest priority (“success”) is as follows:

1. `invalidId`
2. `noSuchParameter`
3. `badValue`
4. `unsupported`
5. `canceledWithSensorFailure`
6. `canceled`

- 1129 7. lockHeldByAnother
- 1130 8. lockNotHeld
- 1131 9. sensorBusy
- 1132 10. sensorFailure
- 1133 11. sensorTimeout
- 1134 12. initializationNeeded
- 1135 13. configurationNeeded
- 1136 14. preparingDownload
- 1137 15. failure
- 1138 16. success
- 1139

1140 Notice that success is the *lowest* priority—an operation *must* only be deemed successful if no *other* kinds

1141 of (non-successful) statuses apply.

1142 The following example illustrates how this ordering affects the status returned in a situation in which

1143 multiple clients are performing operations.

1144

1145 **EXAMPLE 28:** Figure 6 illustrates that client cannot receive a “sensorBusy” status if it does not hold the

1146 lock, even if a sensor operation is in progress (recall from §2.5.6 that sensor operations require holding

1147 the lock). Suppose there are two clients; Client A and Client B. Client A holds the lock and starts

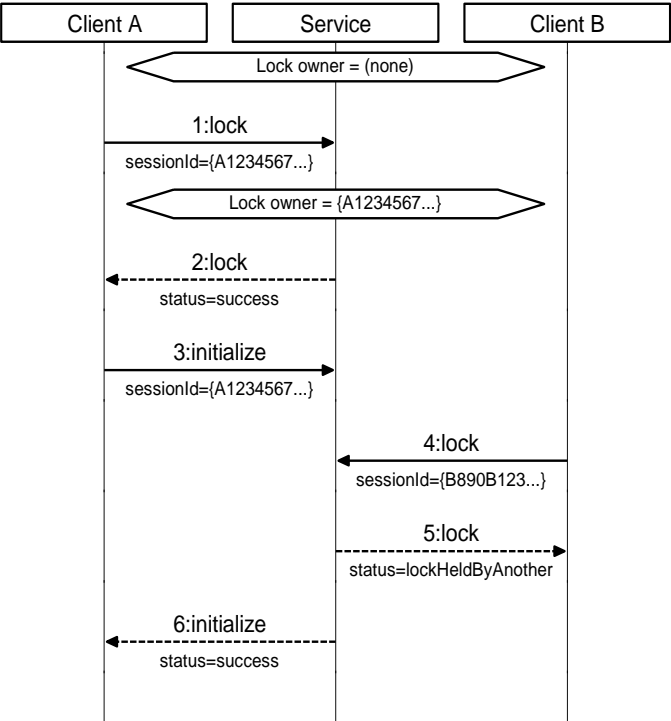

1148 initialization on (Step 1–3). Immediately after Client A initiates capture, Client B (Step 4) tries to obtain the

1149 lock while Client A is still capturing. In this situation, the valid statuses that could be returned to Client B

1150 are “sensorBusy” (since the sensor is busy performing a capture and can only perform one capture at

1151 time) and “lockHeldByAnother” (since Client A holds the lock). In this case, the service returns

1152 “lockHeldByAnother” (Step 5) since “lockHeldByAnother” is higher priority than “sensorBusy.”

1153

1154 **Figure 6.** Example illustrating why a client cannot receive a "sensorBusy" status

1155 if it does not hold the lock.

1156

6.2.3 Parameter Failures

Services *must* distinguish among *badValue*, *invalidId*, *noSuchParameter*, and *unsupported* according to the following rules. These rules are presented here in the order of precedence that matches the previous subsection.

1. **Is a recognizable UUID provided?** If the operation requires a UUID as an input URL parameter, and provided value is not an UUID (i.e., the UUID is *not* parseable), then the service *must* return *badValue*. Additionally, the Result's *badFields* list *must* contain the name of the offending parameter (*sessionId* or *captureId*).
...otherwise...
2. **Is the UUID understood?** If an operation requires an UUID as an input URL parameter, and the provided value *is* a UUID, but service cannot accept the provided value, then the service *must* return *invalidId*. Additionally, the Result's *badFields* list *must* contain the name of the offending parameter (*sessionId* or *captureId*).
...otherwise...
3. **Are the parameter names understood?** If an operation does not recognize a provided input parameter *name*, then the service *must* return *noSuchParameter*. This behavior *may* differ from service to service, as different services *may* recognize (or not recognize) different parameters. The unrecognized parameter(s) *must* be listed in the Result's *badFields* list.
...otherwise...
4. **Are the parameter values acceptable?** If an operation recognizes all of the provided parameter names, but cannot accept a provided *value* because it is (a) and inappropriate type, or (b) outside the range advertised by the service (§4.2), the then service *must* return *badValue*. The parameter names associated with the unacceptable values *must* be listed in the Result's *badFields* list. Clients are expected to recover the bad values themselves by reconciling the Result corresponding to the offending request.
...otherwise...
5. **Is the request supported?** If an operation accepts the parameter names and values, but the particular request is not supported by the service or the target biometric sensor, then the service *must* return *unsupported*. The parameter names that triggered this determination *must* be listed in the Result's *badFields* list. By returning multiple fields, a service is able to imply that a particular *combination* of provided values is unsupported.

NOTE: It may be helpful to think of *invalidId* as a special case of *badValue* reserved for URL parameters of type UUID.

6.2.4 Visual Summaries (Informative)

6.2.4.1 Overview

The two tables in this subsection provide *informative* visual summaries of WS-BD operations. These visual summaries are an overview; they are not authoritative. (§6.4–6.17 are authoritative.)

6.2.4.2 Input & Output (Informative)

Table 7 represents a visual summary of the inputs and outputs corresponding to each operation.

Operation *inputs* are indicated in the “URL Fragment” and “Input Payload” columns. Operation inputs take the form of either (a) a URL parameter, with the parameter name shown in “curly brackets” (“{” and “}”) within the URL fragment (first column), and/or, (b) a input payload (defined in §1.2).

Operation *outputs* are provided via Result, which is contained in the body of an operation’s HTTP response.

Table 7. Summary of Operations Input/Output (informative)

Operation	URL Fragment (Includes inputs)	Method	Input payload	Idempotent	Sensor Operation	Permitted Result Elements (within output payload)						Detailed Documentation §
						status	badFields	sessionId	metadata	captureIds	sensorData	
register	/register	POST	none			●		●				6.4
unregister	/register/{sessionId}	DELETE	none	◆		●	●					6.5
try lock	/lock/{sessionId}	POST	none	◆		●	●					6.6
steal lock		PUT	none	◆		●	●					6.7
unlock		DELETE	none	◆		●	●					6.8
get service info	/info	GET	none	◆		●			●			6.9
initialize	/initialize/{sessionId}	POST	none	◆	■	●	●					6.10
get configuration	/configure/{sessionId}	GET	none	◆	■	●	●		●			6.11
set configuration		POST	config	◆	■	●	●					6.12
capture	/capture/{sessionId}	POST	none		■	●	●			●		6.13
download	/download/{captureid}	GET	none	◆		●	●		●		●	6.14
get download info	/download/{captureid}/info	GET	none	◆					●			6.15
thrifty download	/download/{captureid}/{maxSize}	GET	none	◆		●	●		●		●	6.16
cancel operation	/cancel/{sessionId}	POST	none	◆	■	●	●					6.17

Presence of a symbol in a table cell indicates that operation is idempotent (◆), a sensor operation (■), and which elements may be present in the operation’s Result (●). Likewise, the lack of a symbol in a table cell indicates the operation is not idempotent, not a sensor operation, and which elements of the operation’s Result are forbidden.

EXAMPLE 29: The *capture* operation (fifth row from the bottom) is not idempotent, but is a sensor operation. The output *may* contain the elements *status*, *badFields*, and/or *captureIds* in its Result. The detailed information regarding the Result for *capture*, (i.e., which elements are specifically permitted under what circumstances) is found in §6.13.

The *message* element is not shown in this table for two reasons. First, when it appears, it is always *optional*. Second, to emphasize that the *message* content *must* only be used for informative purposes; it *must not* be used as a vehicle for providing unique information that would inhibit a service’s interoperability.

6.2.4.3 Permitted Status Values (Informative)

Table 8 provides a visual summary of the status values permitted.

Table 8. Possible Status Values Per Operation (informative)

Operation Description \ Status Values	success	failure	invalidId	canceled	canceledWithSensorFailure	sensorFailure	lockNotHeld	lockHeldByAnother	initializationNeeded	configurationNeeded	sensorBusy	sensorTimeout	unsupported	badValue	noSuchParameter	preparingDownload
register	•	•														
unregister	•	•	•								•			•		
try lock	•	•	•					•						•		
steal lock	•	•	•											•		
unlock	•	•	•					•						•		
get service info	•	•														
initialize	•	•	•	•	•	•	•	•			•	•		•		
get configuration	•	•	•	•	•	•	•	•	•	•	•	•		•		
set configuration	•	•	•	•	•	•	•	•	•		•	•	•	•	•	
capture	•	•	•	•	•	•	•	•	•	•	•	•		•		
download	•	•	•											•		•
get download info	•	•	•											•		•
thrifty download	•	•	•										•	•		•
cancel	•	•	•				•	•						•		

The presence (absence) of a symbol in a cell indicates that the respective status may (may not) be returned by the corresponding operation.

EXAMPLE 30: The *register* operation may only return a Result with a Status that contains either success or failure. The *unregister* operation may only return success, failure, invalidId, sensorBusy, or badValue.

The visual summary does not imply that services may return these values arbitrarily—the services *must* adhere to the behaviors as specified in their respective sections.

6.3 Documentation Conventions

6.3.1 About

Each WS-BD operation is documented according to the conventions described in this subsection (§6.3).

6.3.2 General Information

Each operation begins with the following tabular summary:

Description	A short description of the operation
URL Template	<p>The suffix used to access the operation. These take the form</p> <pre>/resourceName</pre> <p>or</p> <pre>/resourceName/{URL_parameter_1}/.../{URL_parameter_N}</pre> <p>Each parameter, {URL_parameter...} must be replaced, in-line with that parameter's value.</p> <p>Parameters have no explicit names, other than defined by this document or reported back to the client within the contents of a <code>badFields</code> element.</p> <p>It is assumed that consumers of the service will prepend the URL to the service endpoint as appropriate.</p> <hr/> <p>EXAMPLE 31: The resource <code>resourceName</code> hosted at the endpoint</p> <pre>http://example.com/Service</pre> <p>would be accessible via</p> <pre>http://example.com/Service/resourceName</pre> <hr/>
HTTP Method	The HTTP method that triggers the operation, i.e., GET, POST, PUT, OR DELETE
URL Parameters	<p>A description of the URL-embedded operation parameters. For each parameter the following details are provided:</p> <ul style="list-style-type: none"> the name of the parameter the expected data type (§3) a description of the parameter
Input Payload	A description of the content, if any, to be posted to the service as input to an operation.
Idempotent	<p>Yes—the operation is idempotent (§2.5.8).</p> <p>No—the operation is not idempotent.</p>
Sensor Operation (Lock Required)	<p>Yes—the service may require exclusive control over the target biometric sensor.</p> <p>No—this operation does not require a lock.</p> <p>Given the concurrency model (§2.5.6) this value doubles as documentation as to whether or not a lock is required.</p>

6.3.3 Result Summary

This subsection summarizes the various forms of a Result that `may` be returned by the operation. Each row represents a distinct combination of permitted values & elements associated with a particular status.

An operation that returns `success` `may` also provide additional information other than `status`.

success	<code>status="success"</code>
failure	<code>status="failure"</code> <code>message*=informative message describing failure</code>

[status value]	status=status literal
	[required element name]=description of permitted contents of the element
	[optional element name]*=description of permitted contents of the element
:	:

For each row, the left column contains a permitted status value, and the right column contains a summary of the constraints on the Result when the `status` element takes that specific value. The vertical ellipses at the bottom of the table signify that the summary table may have additional rows that summarize other permitted status values.

Data types without an explicit namespace or namespace prefix are members of the `wsbd` namespace as defined in §3.2.

Element names suffixed with a '*' indicate that the element is `optional`.

6.3.4 Usage

Each of the parts in this subsection describe the behaviors & requirements that are specific to its respective operation.

6.3.5 Unique Knowledge

For each operation, there is a brief description of whether or not the operation affords an opportunity for the server or client to exchange information unique to a particular implementation. The term “unique knowledge” is used to reflect the definition of interoperability referenced in §2.2.

6.3.6 Return Values Detail

This subsection details the various return values that the operation `may` return. For each permitted status value, the following table details the Result requirements:

Status Value	The particular status value
Condition	The service accepts the registration request
Required Elements	<p>A list of the <code>required</code> elements. For each required element, the element name, its expected contents, and expected data type is listed. If no namespace prefix is specified, then the <code>wsbd</code> namespace (§3.2) is inferred.</p> <p>For example,</p> <pre>badFields = { "sessionId" } (StringArray, §3.8)</pre> <p>Indicates that <code>badFields</code> is a required element, and that the contents of the element must be a <code>wsbd:StringArray</code> containing the single literal <code>"sessionId"</code>.</p>
Optional Elements	A list of the required elements. Listed for each optional element are the element names and its expected contents.

Constraints and information unique to the particular operation/status combination may follow the table, but some status values have no trailing explanatory text.

A data type without an explicit namespace or namespace prefix implies it is a member of the `wsbd` namespace as defined in §3.2.

6.4 Register

6.4.1 Overview

Description	Open a new client-server session
URL Template	/register
HTTP Method	POST
URL Parameters	None
Input Payload	None
Idempotent	No
Sensor Operation	No

6.4.2 Result Summary

success	status = "success" sessionId = session id (UUID, §3.3)
failure	status = "failure" message* = informative message describing failure

6.4.3 Usage

Register provides a unique identifier that can be used to associate a particular client with a server.

In a sequence of operations with a service, a *register* operation is likely one of the first operations performed by a client (*get service info* being the other). It is expected (but not required) that a client would perform a single registration during that client's lifetime.

DESIGN NOTE 4 (Informative): By using an UUID, as opposed to the source IP address, a server can distinguish among clients sharing the same originating IP address (i.e., multiple clients on a single machine, or multiple machines behind a firewall). Additionally, a UUID allows a client (or collection of clients) to determine client identity rather than enforcing a particular model (§2.5.4).

6.4.4 Unique Knowledge

As specified, the *register* operation cannot be used to provide or obtain knowledge about unique characteristics of a client or service.

6.4.5 Return Values Detail

6.4.5.1 Overview

The *register* operation **must** return a **Result** according to the constraints described in this subsection (§6.4.5).

6.4.5.2 Success

Status Value	success
Condition	The service accepts the registration request

Required Elements	status (Status, §3.13) the literal "success" sessionId (UUID, §3.3) an identifier that can be used to identify a session
Optional Elements	None

1289 The “register” operation `must not` provide a `sessionId` of 00000000-0000-0000-0000-000000000000.

1290

6.4.5.3 Failure

Status Value	failure
Condition	The service cannot accept the registration request
Required Elements	status (Status, §3.13) the literal "failure"
Optional Elements	message (xs:string, [XMSCHEMA-2]) an informative description of the nature of the failure

1291 Registration might fail if there are too many sessions already registered with a service. The `message`
 1292 element `must` only be used for informational purposes. Clients `must not` depend on particular contents
 1293 of the `message` element to control client behavior.

1294 See §4 and §A.2 for how a client can use sensor metadata to determine the maximum number of current
 1295 sessions a service can support.

1296

1297

6.5 Unregister

1298

6.5.1 Overview

Description	Close a client-server session
URL Template	/register/{sessionId}
HTTP Method	DELETE
URL Parameters	{sessionId} (UUID, §3.3) Identity of the session to remove
Input Payload	None
Idempotent	Yes
Sensor Operation	No

1299

6.5.2 Result Summary

success	status = "success"
failure	status = "failure" message* = informative message describing failure
sensorBusy	status = "sensorBusy"
badValue	status = "badValue" badFields = { "sessionId" } (StringArray, §3.8)

1300

6.5.3 Usage

1301

6.5.3.1 General

1302 *Unregister* closes a client-server session. Although not strictly necessary, clients *should* unregister from
1303 a service when it is no longer needed. Given the lightweight nature of sessions, services *should* support
1304 (on the order of) thousands of concurrent sessions, but this cannot be guaranteed, particularly if the
1305 service is running within limited computational resources. Conversely, clients *should* assume that the
1306 number of concurrent sessions that a service can support is limited. (See §A.2 for details on connection
1307 metadata.)

1308

6.5.3.2 Inactivity

1309 A service *may* automatically unregister a client after a period of inactivity, or if demand on the service
1310 requires that least-recently used sessions be dropped. This is manifested by a client receiving a status of
1311 *invalidId* without a corresponding unregistration. Services *should* set the inactivity timeout to a value
1312 specified in minutes. (See §A.2 for details on connection metadata.)

1313

6.5.3.3 Sharing Session Ids

1314 A session id is not a secret, but clients that share session ids run the risk of having their session
1315 prematurely terminated by a rogue peer client. This behavior is permitted, but discouraged. See §2.5 for
1316 more information about client identity and the assumed security models.

6.5.3.4 Locks & Pending Sensor Operations

If a client that holds the service lock unregisters, then a service *must* also release the service lock, with one exception. If the unregistering client both holds the lock and is responsible for a pending sensor operation, the service *must* return `sensorBusy` (See §6.5.5.4).

6.5.4 Unique Knowledge

As specified, the *unregister* operation cannot be used to provide or obtain knowledge about unique characteristics of a client or service.

6.5.5 Return Values Detail

6.5.5.1 Overview

The *unregister* operation *must* return a Result according to the constraints described in this subsection (§6.5.5).

6.5.5.2 Success

Status Value	<code>success</code>
Condition	The service accepted the unregistration request
Required Elements	<code>status</code> (Status, §3.13) the literal "success"
Optional Elements	None

If the unregistering client currently holds the service lock, and the requesting client is not responsible for any pending sensor operation, then successful unregistration *must* also release the service lock.

As a consequence of idempotency, a session id does not need to ever have been registered successfully in order to *unregister* successfully. Consequently, the *unregister* operation cannot return a status of `invalidId`.

6.5.5.3 Failure

Status Value	<code>failure</code>
Condition	The service could not unregister the session.
Required Elements	<code>status</code> (Status, §3.13) the literal "failure"
Optional Elements	<code>message</code> (<code>xs:string</code> , [XMSHEMA-2]) an informative description of the nature of the failure

In practice, failure to unregister is expected to be a rare occurrence. Failure to unregister might occur if the service experiences a fault with an external system (such as a centralized database used to track session registration and unregistration)

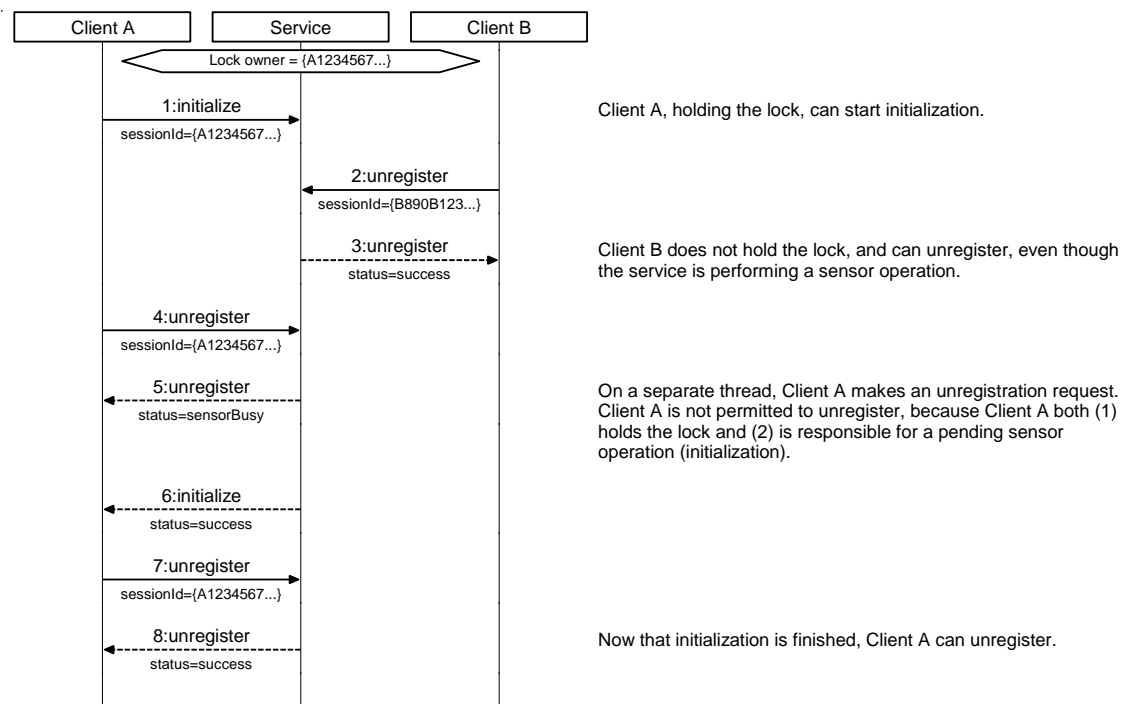

6.5.5.4 Sensor Busy

Status Value	<code>sensorBusy</code>
Condition	The service could not unregister the session because the biometric sensor is

	currently performing a sensor operation within the session being unregistered.
Required Elements	status (Status, §3.13) the literal "sensorBusy"
Optional Elements	None

1339 This status *must* only be returned if (a) the sensor is busy and (b) the client making the request holds the
1340 lock (i.e., the session id provided matches that associated with the current service lock). Any client that
1341 does not hold the session lock *must not* result in a sensorBusy status.

1342 **EXAMPLE 32:** The following sequence diagram illustrates a client that cannot unregister (Client A) and a
1343 client that can unregister (Client B). After the initialize operation completes (Step 6), Client A can
1344 unregister (Steps 7-8).
1345

1346
1347 **Figure 7.** Example of how an *unregister* operation can result in sensorBusy.

1348

1349 **6.5.5.5 Bad Value**

Status Value	badValue
Condition	The provided session id is not a well-formed UUID.
Required Elements	status (Status, §3.13) the literal "badValue" badFields (StringArray, §3.8) an array that contains the single field name, "sessionId"
Optional Elements	None

1350 See §6.2.3 for general information on how services *must* handle parameter failures.

6.6 Try Lock

6.6.1 Overview

Description	Try to obtain the service lock
URL Template	/lock/{sessionId}
HTTP Method	POST
URL Parameters	{sessionId} (UUID, §3.3) Identity of the session requesting the service lock
Input Payload	None
Idempotent	Yes
Sensor Operation	No

6.6.2 Result Summary

success	status = "success"
failure	status = "failure" message* = informative message describing failure
invalidId	status = "invalidId" badFields = { "sessionId" } (StringArray, §3.8)
lockHeldByAnother	status = "lockHeldByAnother"
badValue	status = "badValue" badFields = { "sessionId" } (StringArray, §3.8)

6.6.3 Usage

The *try lock* operation attempts to obtain the service lock. The word “try” is used to indicate that the call always returns immediately; it does not block until the lock is obtained. See §2.5.6 for detailed information about the WS-BD concurrency and locking model.

6.6.4 Unique Knowledge

As specified, the *try lock* cannot be used to provide or obtain knowledge about unique characteristics of a client or service.

6.6.5 Return Values Detail

6.6.5.1 Overview

The *try lock* operation *must* return a Result according to the constraints described in this subsection (§6.6.5)

6.6.5.2 Success

Status Value	success
---------------------	---------

Condition	The service was successfully locked to the provided session id.
Required Elements	status (Status, §3.13) the literal "success"
Optional Elements	None

1367 Clients that hold the service lock are permitted to perform sensor operations (§2.5.6). By idempotency
1368 (§2.5.8), if a client already holds the lock, subsequent try lock operations MUST also return success.

1369 6.6.5.3 Failure

Status Value	failure
Condition	The service could not be locked to the provided session id.
Required Elements	status (Status, §3.13) the literal "failure"
Optional Elements	message (xs:string, [XMSCHEMA-2]) an informative description of the nature of the failure

1370 Services *must* reserve a failure status to report system or internal failures and prevent the acquisition
1371 of the lock. Most try lock operations that do not succeed will not produce a failure status, but more likely
1372 a lockHeldByAnother status (See §6.6.5.5 for an example).

1373 6.6.5.4 Invalid Id

Status Value	invalidId
Condition	The provided session id is not registered with the service.
Required Elements	status (Status, §3.13) the literal "invalidId" badFields (StringArray, §3.8) an array that contains the single field name, "sessionId"
Optional Elements	None

1374 A session id is invalid if it does not correspond to an active registration. A session id may become
1375 unregistered from a service through explicit unregistration or triggered automatically by the service due to
1376 inactivity (§6.5.5.2).

1377 See §6.2.3 for general information on how services *must* handle parameter failures.

1378 6.6.5.5 Lock Held by Another

Status Value	lockHeldByAnother
Condition	The service could not be locked to the provided session id because the lock is held by another client.
Required Elements	status (Status, §3.13) the literal "lockHeldByAnother"
Optional Elements	None

EXAMPLE 33: The following sequence diagram illustrates a client that cannot obtain the lock (Client B) because it is held by another client (Client A).

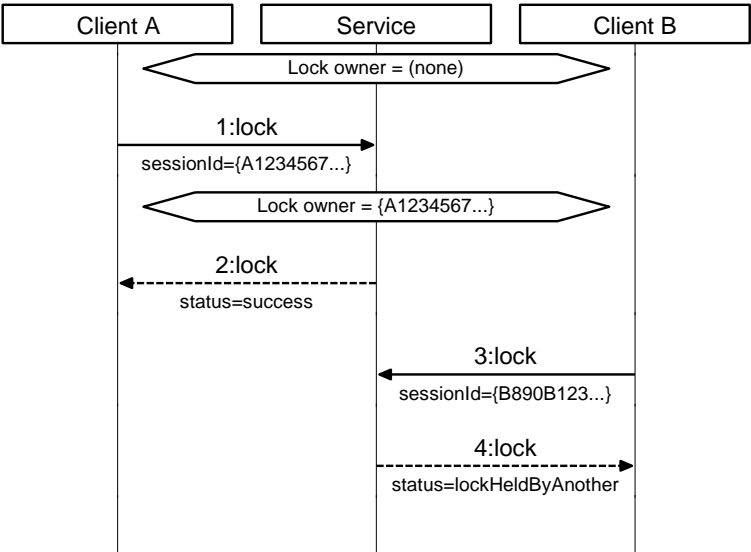

Figure 8. Example of a scenario yielding a `lockHeldByAnother` result.

6.6.5.6 Bad Value

Status Value	<code>badValue</code>
Condition	The provided session id is not a well-formed UUID.
Required Elements	<code>status</code> (Status, §3.13) the literal <code>"badValue"</code> <code>badFields</code> (StringArray, §3.8) an array that contains the single field name, <code>"sessionId"</code>
Optional Elements	None

See §6.2.3 for general information on how services `must` handle parameter failures.

6.7 Steal Lock

6.7.1 Overview

Description	Forcibly obtain the lock away from a peer client
URL Template	/lock/{sessionId}
HTTP Method	PUT
URL Parameters	{sessionId} (UUID, §3.3) Identity of the session requesting the service lock
Input Payload	None
Idempotent	Yes
Sensor Operation	No

6.7.2 Result Summary

success	status = "success"
failure	status = "failure" message* = informative message describing failure
invalidId	status = "invalidId" badFields = { "sessionId" } (StringArray, §3.8)
badValue	status = "badValue" badFields = { "sessionId" } (StringArray, §3.8)

6.7.3 Usage

6.7.3.1 General

The *steal lock* operation allows a client to forcibly obtain the lock away from another client that already holds the lock. The purpose of this operation is to prevent a client that experiences a fatal error from forever preventing another client access to the service, and therefore, the biometric sensor.

6.7.3.2 Avoid Lock Stealing

Developers and integrators *should* endeavor to reserve lock stealing for exceptional circumstances—such as when a fatal error prevents a client from releasing a lock. Lock stealing *should not be* used as the primary mechanism in which peer clients coordinate biometric sensor use.

6.7.3.3 Lock Stealing Prevention Period (LSPP)

To assist in coordinating access among clients and to prevent excessive lock stealing, a service *may* trigger a time period that forbids lock stealing for each sensor operation. For convenience, this period of time will be referred to as the *lock stealing prevention period (LSPP)*.

During the LSPP, all attempts to steal the service lock will fail. Consequently, if a client experiences a fatal failure during a sensor operation, then all peer clients need to wait until the service re-enables lock stealing.

All services *should* implement a non-zero LSPP. The recommended time for the LSPP is on the order of 100 seconds. Services that enforce an LSPP *must* start the LSPP immediately before sovereign sensor control is *required*. Conversely, services *should not* enforce an LSPP unless absolutely necessary.

If a request provides an invalid `sessionId`, then the operation *should* return an `invalidId` status instead of a `failure`—this *must* be true regardless of the LSPP threshold and whether or not it has expired. A `failure` signifies that the state of the service is still within the LSPP threshold and the provided `sessionId` is valid.

A service *may* reinitiate a LSPP when an operation yields an undesirable result, such as `failure`. This would allow a client to attempt to resubmit the request or recover without worrying about whether or not the lock is still owned by the client's session.

An LSPP ends after a fixed amount of time has elapsed, unless another sensor operation restarts the LSPP. Services *should* keep the length of the LSPP fixed throughout the service's lifecycle. It is recognized, however, that there *may* be use cases in which a variable LSPP timespan is desirable or *required*. Regardless, when determining the appropriate timespan, implementers *should* carefully consider the tradeoffs between preventing excessive lock stealing, versus forcing all clients to wait until a service re-enables lock stealing.

6.7.3.4 Cancellation & (Lack of) Client Notification

Lock stealing *must not* affect any currently running sensor operations. That is, it *must* be possible that a client initiates a sensor operation, has its lock stolen away, and have the operation completes successfully anyway. *Subsequent* sensor operations would yield a `lockNotHeld` status, which a client could use to indicate that their lock was stolen away from them.

Services *should* be implemented such that the LSPP is longer than any sensor operation.

6.7.4 Unique Knowledge

As specified, the *steal lock* operation cannot be used to provide or obtain knowledge about unique characteristics of a client or service.

6.7.5 Return Values Detail

6.7.5.1 Overview

The *steal lock* operation *must* return a Result according to the constraints described in this subsection (§6.7.5).

6.7.5.2 Success

Status Value	Success
Condition	The service was successfully locked to the provided session id.
Required Elements	<code>status</code> (Status, §3.13) the literal "success"
Optional Elements	None

See §2.5.6 for detailed information about the WS-BD concurrency and locking model. Cancellation *must* have no effect on pending sensor operations (§6.7.3.4).

6.7.5.3 Failure

Status Value	failure
---------------------	---------

Condition	The service could not be locked to the provided session id.
Required Elements	status (Status, §3.13) the literal "failure"
Optional Elements	message (xs:string, [XMSCHEMA-2]) an informative description of the nature of the failure

1440 Most steal/lock operations that yield a failure status will do so because the service receives a lock
1441 stealing request during a lock stealing prevention period (§6.7.3.3). Services *must* also reserve a failure
1442 status for other non-LSPP failures that prevent the acquisition of the lock.

1443 Implementers *may* choose to use the optional message field to provide more information to an end-user as
1444 to the specific reasons for the failure. However (as with all other failure status results), clients *must*
1445 *not* depend on any particular content to make this distinction.

1446 **6.7.5.4 Invalid Id**

Status Value	invalidId
Condition	The provided session id is not registered with the service.
Required Elements	status (Status, §3.13) the literal "invalidId" badFields (StringArray, §3.8) an array that contains the single field name, "sessionId"
Optional Elements	None

1447 A session id is invalid if it does not correspond to an active registration. A session id *may* become
1448 unregistered from a service through explicit unregistration or triggered automatically by the service due to
1449 inactivity (§6.5.5.2).

1450 See §6.2.3 for general information on how services *must* handle parameter failures.

1451 **6.7.5.5 Bad Value**

Status Value	badValue
Condition	The provided session id is not a well-formed UUID.
Required Elements	status (Status, §3.13) the literal "badValue" badFields (StringArray, §3.8) an array that contains the single field name, "sessionId"
Optional Elements	None

1452 See §6.2.3 for general information on how services *must* handle parameter failures.

1453

6.8 Unlock

6.8.1 Overview

Description	Release the service lock
URL Template	/lock/{sessionId}
HTTP Method	DELETE
URL Parameters	{sessionId} (UUID, §3.3) Identity of the session releasing the service lock
Input Payload	None
Idempotent	Yes
Sensor Operation	No

6.8.2 Result Summary

success	status = "success"
failure	status = "failure" message* = informative message describing failure
invalidId	status = "invalidId" badFields = { "sessionId" } (StringArray, §3.8)
badValue	status = "badValue" badFields = { "sessionId" } (StringArray, §3.8)

6.8.3 Usage

The unlock operation releases a service lock, making locking available to other clients.
See §2.5.6 for detailed information about the WS-BD concurrency and locking model.

6.8.4 Unique Knowledge

As specified, the unlock operation cannot be used to provide or obtain knowledge about unique characteristics of a client or service.

6.8.5 Return Values Detail

6.8.5.1 Overview

The steal lock operation must return a Result according to the constraints described in this subsection (§6.8.5).

6.8.5.2 Success

Status Value	success
Condition	The service returned to an unlocked state.
Required Elements	status (Status, §3.13)

	the literal "success"
Optional Elements	None

1468 Upon releasing the lock, a client is no longer permitted to perform any sensor operations (§2.5.6). By
1469 idempotency (§2.5.8), if a client already has released the lock, subsequent unlock operations should
1470 also return success.

1471 **6.8.5.3 Failure**

Status Value	failure
Condition	The service could not be transitioned into an unlocked state.
Required Elements	status (Status, §3.13) the literal "failure"
Optional Elements	message (xs:string, [XMSCHEMA-2]) an informative description of the nature of the failure

1472 Services must reserve a failure status to report system or internal failures and prevent the release of
1473 the service lock. The occurrence of unlock operations that fail is expected to be rare.

1474 **6.8.5.4 Invalid Id**

Status Value	invalidId
Condition	The provided session id is not registered with the service.
Required Elements	status (Status, §3.13) the literal "invalidId" badFields (StringArray, §3.8) an array that contains the single field name, "sessionId"
Optional Elements	None

1475 A session id is invalid if it does not correspond to an active registration. A session id may become
1476 unregistered from a service through explicit unregistration or triggered automatically by the service due to
1477 inactivity (§6.5.5.2).

1478 See §6.2.3 for general information on how services must handle parameter failures.

1479 **6.8.5.5 Bad Value**

Status Value	badValue
Condition	The provided session id is not a well-formed UUID.
Required Elements	status (Status, §3.13) the literal "badValue" badFields (StringArray, §3.8) an array that contains the single field name, "sessionId"
Optional Elements	None

1480 See §6.2.3 for general information on how services must handle parameter failures.

6.9 Get Service Info

6.9.1 Overview

Description	Retrieve metadata about the service that does not depend on session-specific information, or sovereign control of the target biometric sensor
URL Template	/info
HTTP Method	GET
URL Parameters	None
Input Payload	None
Idempotent	Yes
Sensor Operation	No

6.9.2 Result Summary

success	status = "success" metadata = dictionary containing service metadata (Dictionary, §3.4)
failure	status = "failure" message* = informative message describing failure

6.9.3 Usage

The *get service info* operation provides information about the service and target biometric sensor. This operation *must* return information that is both (a) independent of session, and (b) does not require sovereign biometric sensor control. In other words, services *must not* control the target biometric sensor during a *get service info* operation itself. Implementations *may* (and are encouraged to) use service startup time to query the biometric sensor directly to create a cache of information and capabilities for *get service info* operations. The service *should* keep a cache of sensor and service metadata to reduce the amount of operations that query the sensor as this can be a lengthy operation.

The *get service info* operation does *not* require that a client be registered with the service. Unlike other operations, it does *not* take a session id as a URL parameter.

See §4.2 for information about the metadata returned from this operation.

EXAMPLE 34: The following represents a ‘raw’ request to get the service’s metadata.

```
GET http://10.0.0.8:8000/Service/info HTTP/1.1
Content-Type: application/xml
Host: 10.0.0.8:8000
```

EXAMPLE 35: The following is the ‘raw’ response from the above request. The metadata element of the result contains a Dictionary (§3.4) of parameter names and parameter information represented as a Parameter (§3.5).

```
HTTP/1.1 200 OK
Content-Length: 4244
Content-Type: application/xml; charset=utf-8
Server: Microsoft-HTTPAPI/2.0
Date: Tue, 03 Jan 2012 14:54:51 GMT
```

```

6.9.4 Unique Knowledge

As specified, the *get service info* can be used to obtain knowledge about unique characteristics of a service. Through *get service info*, a service may expose implementation and/or service-specific configuration parameter names and values that are not defined in this specification (see Appendix A for further information on parameters).

6.9.5 Return Values Detail

6.9.5.1 Overview

The *get service info* operation must return a Result according to constraints described in this subsection (§6.9.5).

6.9.5.2 Success

Status Value	success
Condition	The service provides service metadata
Required Elements	status (Status, §3.13) the literal "success" metadata (Dictionary, §3.4) information about the service metadata
Optional Elements	None

6.9.5.3 Failure

Status Value	failure
Condition	The service cannot provide service metadata
Required Elements	status (Status, §3.13) the literal "failure"
Optional Elements	message (xs:string, [XMSCHEMA-2]) an informative description of the nature of the failure

6.10 Initialize

6.10.1 Overview

Description	Initialize the target biometric sensor
URL Template	/initialize/{sessionId}
HTTP Method	POST
URL Parameters	{sessionId} (UUID, §3.3) Identity of the session requesting initialization
Input Payload	None
Idempotent	Yes
Sensor Operation	Yes

6.10.2 Result Summary

success	status = "success"
failure	status = "failure" message* = informative message describing failure
invalidId	status = "invalidId" badFields = { "sessionId" } (StringArray, §3.8)
canceled	status = "canceled"
canceledWithSensorFailure	status = "canceledWithSensorFailure"
sensorFailure	status = "sensorFailure"
lockNotHeld	status = "lockNotHeld"
lockHeldByAnother	status = "lockHeldByAnother"
sensorBusy	status = "sensorBusy"
sensorTimeout	status = "sensorTimeout"
badValue	status = "badValue" badFields = { "sessionId" } (StringArray, §3.8)

6.10.3 Usage

The *initialize* operation prepares the target biometric sensor for (other) sensor operations.

Some biometric sensors have no requirement for explicit initialization. In that case, the service *should* immediately return a success result.

Although not strictly necessary, services *should* directly map this operation to the initialization of the target biometric sensor, unless the service can reliably determine that the target biometric sensor is in a fully operational state. In other words, a service *may* decide to immediately return success if there is a reliable way to detect if the target biometric sensor is currently in an initialized state. This style of “short circuit” evaluation could reduce initialization times. However, a service that always initializes the target biometric sensor would enable the ability of a client to attempt a manual reset of a sensor that has entered a faulty state. This is particularly useful in physically separated service implementations where

1618 the connection between the target biometric sensor and the web service host may be less reliable than an
1619 integrated implementation.

1620 **6.10.4 Unique Knowledge**

1621 As specified, the *initialize* operation cannot be used to provide or obtain knowledge about unique
1622 characteristics of a client or service.

1623 **6.10.5 Return Values Detail**

1624 **6.10.5.1 Overview**

1625 The *initialize* operation *must* return a *Result* according to constraints described in this subsection
1626 (§6.10.5).

1627 **6.10.5.2 Success**

Status Value	success
Condition	The service successfully initialized the target biometric sensor
Required Elements	status must be populated with the Status literal "success"
Optional Elements	None

1628 **6.10.5.3 Failure**

Status Value	failure
Condition	The service experienced a fault that prevented successful initialization.
Required Elements	status (Status, §3.13) the literal "failure"
Optional Elements	message (xs:string, [XMSCHEMA-2]) an informative description of the nature of the failure

1629 A failure status *must* only be used to report failures that occurred within the web service, not within the
1630 target biometric sensor (§6.10.5.6, §6.10.5.7)

1631 **6.10.5.4 Invalid Id**

Status Value	invalidId
Condition	The provided session id is not registered with the service.
Required Elements	status (Status, §3.13) the literal "invalidId" badFields (StringArray, §3.8) an array that contains the single field name, "sessionId"
Optional Elements	None

1632 A session id is invalid if it does not correspond to an active registration. A session id *may* become
1633 unregistered from a service through explicit unregistration or triggered automatically by the service due to
1634 inactivity (§6.5.5.2).

1635 See §6.2.3 for general information on how services `must` handle parameter failures.

1636 **6.10.5.5 Canceled**

Status Value	<code>canceled</code>
Condition	The initialization operation was interrupted by a cancellation request.
Required Elements	<code>status</code> (Status, §3.13) the literal <code>"canceled"</code>
Optional Elements	None

1637 See §6.17.3.3 for information about what `may` trigger a cancellation.

1638 **6.10.5.6 Canceled with Sensor Failure**

Status Value	<code>canceledWithSensorFailure</code>
Condition	The initialization operation was interrupted by a cancellation request and the target biometric sensor experienced a failure
Required Elements	<code>status</code> (Status, §3.13) the literal <code>"canceledWithSensorFailure"</code>
Optional Elements	<code>message</code> (<code>xs:string</code> , [XMSCHEMA-2]) an informative description of the nature of the failure

1639 Services `must` return a `canceledWithSensorFailure` result if a cancellation request caused a failure within
1640 the target biometric sensor. Clients receiving this result `may` need to reattempt the initialization request to
1641 restore full functionality. See §6.17.3.3 for information about what `may` trigger a cancellation.

1642 **6.10.5.7 Sensor Failure**

Status Value	<code>sensorFailure</code>
Condition	The initialization failed due to a failure within the target biometric sensor
Required Elements	<code>status</code> (Status, §3.13) the literal <code>"sensorFailure"</code>
Optional Elements	<code>message</code> (<code>xs:string</code> , [XMSCHEMA-2]) an informative description of the nature of the failure

1643 A `sensorFailure` status `must` only be used to report failures that occurred within the target biometric
1644 sensor, not a failure within the web service (§6.10.5.3).

1645 **6.10.5.8 Lock Not Held**

Status Value	<code>lockNotHeld</code>
Condition	Initialization could not be performed because the requesting client does not hold the lock
Required Elements	<code>status</code> (Status, §3.13) the literal <code>"lockNotHeld"</code>
Optional Elements	None

1646 Sensor operations *require* that the requesting client holds the service lock.

1647 **6.10.5.9 Lock Held by Another**

Status Value	lockHeldByAnother
Condition	Initialization could not be performed because the lock is held by another client.
Required Elements	status (Status, §3.13) the literal "lockHeldByAnother"
Optional Elements	None

1648 **6.10.5.10 Sensor Busy**

Status Value	sensorBusy
Condition	If the initialization could not be performed because the service is already performing a sensor operation.
Required Elements	status (Status, §3.13) the literal "sensorBusy"
Optional Elements	None

1649 **6.10.5.11 Sensor Timeout**

Status Value	sensorTimeout
Condition	Initialization could not be performed because the target biometric sensor took too long to complete the initialization request.
Required Elements	status (Status, §3.13) the literal "sensorTimeout"
Optional Elements	None

1650 A service did not receive a timely response from the target biometric sensor. This condition is distinct from
1651 the client's originating HTTP request, which *may* have its own, independent timeout. (See A.3 for
1652 information on how a client might determine timeouts.)

1653 **6.10.5.12 Bad Value**

Status Value	badValue
Condition	The provided session id is not a well-formed UUID.
Required Elements	status (Status, §3.13) the literal "badValue" badFields (StringArray, §3.8) an array that contains the single field name, "sessionId"
Optional Elements	None

1654 See §6.2.3 for general information on how services *must* handle parameter failures.

6.11 Get Configuration

6.11.1 Overview

Description	Retrieve metadata about the target biometric sensor's current configuration
URL Template	/configure/{sessionId}
HTTP Method	GET
URL Parameters	{sessionId} (UUID, §3.3) Identity of the session requesting the configuration
Input Payload	None
Idempotent	Yes
Sensor Operation	Yes

6.11.2 Result Summary

success	status = "success" metadata = current configuration of the sensor (Dictionary, §3.4)
failure	status = "failure" message* = informative message describing failure
invalidId	status = "invalidId" badFields = { "sessionId" } (StringArray, §3.8)
canceled	status = "canceled"
canceledWithSensorFailure	status = "canceledWithSensorFailure"
sensorFailure	status = "sensorFailure"
lockNotHeld	status = "lockNotHeld"
lockHeldByAnother	status = "lockHeldByAnother"
initializationNeeded	status = "initializationNeeded"
configurationNeeded	status = "configurationNeeded"
sensorBusy	status = "sensorBusy"
sensorTimeout	status = "sensorTimeout"
badValue	status = "badValue" badFields = { "sessionId" } (StringArray, §3.8)

6.11.3 Usage

The *get configuration* operation retrieves the service's current configuration.

EXAMPLE 36: The following represents a 'raw' request to retrieve the current configuration information of the service.

```
GET http://10.0.0.8:8000/Service/configure/d745cd19-facd-4f91-8774-aac5ca9766a2 HTTP/1.1
Content-Type: application/xml
Host: 10.0.0.8:8000
```

EXAMPLE 37: The following is the ‘raw’ response from the previous request. The metadata element in the result contains a Dictionary (§3.4) of parameter names and their respective values.

```
HTTP/1.1 200 OK
Content-Length: 554
Content-Type: application/xml; charset=utf-8
Server: Microsoft-HTTPAPI/2.0
Date: Tue, 03 Jan 2012 14:57:29 GMT

<result xmlns="http://docs.oasis-open.org/biometrics/ns/ws-bd-1.0"
  xmlns:i="http://www.w3.org/2001/XMLSchema-instance">
  <status>success</status>
  <metadata>
    <item>
      <key>width</key>
      <value i:type="a:int" xmlns:a="http://www.w3.org/2001/XMLSchema">800</value>
    </item>
    <item>
      <key>height</key>
      <value i:type="a:int" xmlns:a="http://www.w3.org/2001/XMLSchema">600</value>
    </item>
    <item>
      <key>frameRate</key>
      <value i:type="a:int" xmlns:a="http://www.w3.org/2001/XMLSchema">15</value>
    </item>
  </metadata>
</result>
```

6.11.4 Unique Knowledge

As specified, the *get configuration* can be used to obtain knowledge about unique characteristics of a service. Through *get configuration*, a service may expose implementation and/or service-specific configuration parameter names and values that are not explicitly described in this document.

6.11.5 Return Values Detail

6.11.5.1 Overview

The *get configuration* operation must return a Result according to the constraints described in this subsection (§6.11.5).

6.11.5.2 Success

Status Value	success
Condition	The service provides the current configuration
Required Elements	status (Status, §3.13) the literal "success" metadata (Dictionary, §3.4) the target biometric sensor's current configuration
Optional Elements	None

See §4.3 for information regarding configurations.

1704 **6.11.5.3 Failure**

Status Value	failure
Condition	The service cannot provide the current configuration due to service (not target biometric sensor) error.
Required Elements	status (Status, §3.13) the literal "failure"
Optional Elements	message (xs:string, [XMSHEMA-2]) an informative description of the nature of the failure

1705 Services *must* only use this status to report failures that occur within the web service, not the target
1706 biometric sensor (see §6.11.5.6, §6.11.5.7).

1707 **6.11.5.4 Invalid Id**

Status Value	invalidId
Condition	The provided session id is not registered with the service.
Required Elements	status (Status, §3.13) the literal "invalidId" badFields (StringArray, §3.8) an array that contains the single field name, "sessionId"
Optional Elements	None

1708 A session id is invalid if it does not correspond to an active registration. A session id *may* become
1709 unregistered from a service through explicit unregistration or triggered automatically by the service due to
1710 inactivity (§6.5.5.2).

1711 See §6.2.3 for general information on how services *must* handle parameter failures.

1712 **6.11.5.5 Canceled**

Status Value	canceled
Condition	The <i>get configuration</i> operation was interrupted by a cancellation request.
Required Elements	status (Status, §3.13) the literal "canceled"
Optional Elements	None

1713 See §6.17.3.3 for information about what *may* trigger a cancellation.

1714 **6.11.5.6 Canceled with Sensor Failure**

Status Value	canceledWithSensorFailure
Condition	The <i>get configuration</i> operation was interrupted by a cancellation request during which the target biometric sensor experienced a failure
Required Elements	status (Status, §3.13) the literal "canceledWithSensorFailure"

Optional Elements	message (xs:string, [XMSHEMA-2]) an informative description of the nature of the failure
--------------------------	---

Services **must** return a canceledWithSensorFailure result if a cancellation request caused a failure within the target biometric sensor. Clients receiving this result may need to perform initialization to restore full functionality. See §6.17.3.3 for information about what may trigger a cancellation.

6.11.5.7 Sensor Failure

Status Value	sensorFailure
Condition	The configuration could not be queried due to a failure within the target biometric sensor.
Required Elements	status (Status, §3.13) the literal "sensorFailure"
Optional Elements	message (xs:string, [XMSHEMA-2]) an informative description of the nature of the failure

A sensorFailure status **must** only be used to report failures that occurred within the target biometric sensor, not a failure within the web service (§6.10.5.3).

6.11.5.8 Lock Not Held

Status Value	lockNotHeld
Condition	The configuration could not be queried because the requesting client does not hold the lock.
Required Elements	status (Status, §3.13) the literal "lockNotHeld"
Optional Elements	None

Sensor operations **require** that the requesting client holds the service lock.

6.11.5.9 Lock Held by Another

Status Value	lockHeldByAnother
Condition	The configuration could not be queried because the lock is held by another client.
Required Elements	status (Status, §3.13) the literal "lockHeldByAnother"
Optional Elements	None

6.11.5.10 Initialization Needed

Status Value	initializationNeeded
Condition	The configuration could not be queried because the target biometric sensor has not been initialized.
Required Elements	status (Status, §3.13)

	the literal "initializationNeeded"
Optional Elements	None

1725 Services *should* be able to provide the sensors configuration without initialization; however, this is not
1726 strictly necessary. Regardless, robust clients *should* assume that configuration will require initialization.

1727 6.11.5.11 Configuration Needed

Status Value	configurationNeeded
Condition	The configuration could not be queried because the target biometric sensor has not been initialized.
Required Elements	status (Status, §3.13) the literal "configurationNeeded"
Optional Elements	None

1728 Services *may* require configuration to be set before a configuration can be retrieved if a service does not
1729 provide a valid default configuration.

1730 6.11.5.12 Sensor Busy

Status Value	sensorBusy
Condition	If the configuration could not be queried because the service is already performing a sensor operation.
Required Elements	status (Status, §3.13) the literal "sensorBusy"
Optional Elements	None

1731 6.11.5.13 Sensor Timeout

Status Value	sensorTimeout
Condition	The configuration could not be queried because the target biometric sensor took too long to complete the request.
Required Elements	status (Status, §3.13) the literal "sensorTimeout"
Optional Elements	None

1732 A sensorTimeout result indicates that the service did not receive a timely response from the target
1733 biometric sensor. This condition is distinct from the client's originating HTTP request, which *may* have its
1734 own, independent timeout. (See A.3 for information on how a client might determine timeouts.)

1735 6.11.5.14 Bad Value

Status Value	badValue
Condition	The provided session id is not a well-formed UUID.
Required Elements	status (Status, §3.13) the literal "badValue"

badFields (StringArray, §3.8) an array that contains the single field name, "sessionId"	
Optional Elements	None

1736 See §6.2.3 for general information on how services *must* handle parameter failures.

1737

1738

6.12 Set Configuration

1739

6.12.1 Overview

Description	Set the target biometric sensor's configuration
URL Template	/configure/{sessionId}
HTTP Method	POST
URL Parameters	{sessionId} (UUID, §3.3) Identity of the session setting the configuration
Input Payload	Desired sensor configuration (Dictionary, §3.4)
Idempotent	Yes
Sensor Operation	Yes

1740

6.12.2 Result Summary

success	status = "success"
failure	status = "failure" message* = informative message describing failure
invalidId	status = "invalidId" badFields = { "sessionId" } (StringArray, §3.8)
canceled	status = "canceled"
canceledWithSensorFailure	status = "canceledWithSensorFailure"
sensorFailure	status = "sensorFailure"
lockNotHeld	status = "lockNotHeld"
lockHeldByAnother	status = "lockHeldByAnother"
initializationNeeded	status = "initializationNeeded"
sensorBusy	status = "sensorBusy"
sensorTimeout	status = "sensorTimeout"
unsupported	status = "unsupported" badFields = { <i>field names</i> } (StringArray, §3.8)
badValue	status = "badValue" badFields = {"sessionId"} (StringArray, §3.8) (or) status = "badValue" badFields = { <i>field names</i> } (StringArray, §3.8)
noSuchParameter	status = "unsupported" badFields = { <i>field names</i> } (StringArray, §3.8)

6.12.3 Usage

The *set configuration* operation sets the configuration of a service's target biometric sensor.

The *set configuration* operation is the only operation that takes input within the body of the HTTP request. The desired configuration *must* be sent as a single Dictionary (§3.4) element named *configuration*. See §4.3 for information regarding configurations. See Appendix A for a complete XML Schema for this specification. The root element of the configuration data *must* conform to the following XML definition:

```
<xs:element name="configuration" type="wsbd:Dictionary" nillable="true"/>
```

EXAMPLE 38: The following represents a 'raw' request to configure a service at `http://10.0.0.8:8000/Sensor` such that `width=800`, `height=600`, and `frameRate=15`. (In this example, each value element contains fully qualified namespace information, although this is not necessary.)

```
POST http://10.0.0.8:8000/Service/configure/d745cd19-facd-4f91-8774-aac5ca9766a2 HTTP/1.1
Content-Type: application/xml
Host: 10.0.0.8:8000
Content-Length: 459
Expect: 100-continue

<configuration xmlns:i="http://www.w3.org/2001/XMLSchema-instance" xmlns="http://docs.oasis-open.org/biometrics/ns/ws-bd-1.0">
  <item>
    <key>width</key>
    <value xmlns:d3p1="http://www.w3.org/2001/XMLSchema" i:type="d3p1:int">800</value>
  </item>
  <item>
    <key>height</key>
    <value xmlns:d3p1="http://www.w3.org/2001/XMLSchema" i:type="d3p1:int">600</value>
  </item>
  <item>
    <key>frameRate</key>
    <value xmlns:d3p1="http://www.w3.org/2001/XMLSchema" i:type="d3p1:int">15</value>
  </item>
</configuration>
```

More information regarding the use of the `xmlns` attribute can be found in [XML-NAMES].

6.12.4 Unique Knowledge

The *set configuration* can be used to provide knowledge about unique characteristics to a service. Through *set configuration*, a client *may* provide implementation and/or service-specific parameter names and values that are not defined in this specification (see Appendix A for further information on parameters).

6.12.5 Return Values Detail

6.12.5.1 Overview

The *set configuration* operation *must* return a *Result* according to the constraints described in this subsection (§6.12.5).

6.12.5.2 Success

Status Value	success
--------------	---------

Condition	The service was able to successfully set the full configuration
Required Elements	status (Status, §3.13) the literal "success"
Optional Elements	None

1785 6.12.5.3 Failure

Status Value	failure
Condition	The service cannot set the desired configuration due to service (not target biometric sensor) error.
Required Elements	status (Status, §3.13) the literal "failure"
Optional Elements	message (xs:string, [XMSHEMA-2]) an informative description of the nature of the failure

1786 Services *must* only use this status to report failures that occur within the web service, not the target
1787 biometric sensor (see §6.12.5.6, §6.12.5.7).

1788 6.12.5.4 Invalid Id

Status Value	invalidId
Condition	The provided session id is not registered with the service.
Required Elements	status (Status, §3.13) the literal "invalidId" badFields (StringArray, §3.8) an array that contains the single field name, "sessionId"
Optional Elements	None

1789 A session id is invalid if it does not correspond to an active registration. A session id *may* become
1790 unregistered from a service through explicit unregistration or triggered automatically by the service due to
1791 inactivity (§6.5.5.2).

1792 6.12.5.5 Canceled

Status Value	canceled
Condition	The <i>set configuration</i> operation was interrupted by a cancellation request.
Required Elements	status (Status, §3.13) the literal "canceled"
Optional Elements	None

1793 See §6.17.3.3 for information about what *may* trigger a cancellation.

1794 6.12.5.6 Canceled with Sensor Failure

Status Value	canceledWithSensorFailure
---------------------	---------------------------

Condition	The <i>set configuration</i> operation was interrupted by a cancellation request during which the target biometric sensor experienced a failure
Required Elements	status (Status, §3.13) the literal "canceledWithSensorFailure"
Optional Elements	message (xs:string, [XMSCHEMA-2]) an informative description of the nature of the failure

1795 Services *must* return a canceledWithSensorFailure result if a cancellation request caused a failure within
 1796 the target biometric sensor. Clients receiving this result *may* need to perform initialization to restore full
 1797 functionality. See §6.17.3.3 for information about what *may* trigger a cancellation.

1798 6.12.5.7 Sensor Failure

Status Value	sensorFailure
Condition	The configuration could not be set due to a failure within the target biometric sensor.
Required Elements	status (Status, §3.13) the literal "sensorFailure"
Optional Elements	message (xs:string, [XMSCHEMA-2]) an informative description of the nature of the failure

1799 A sensorFailure status *must* only be used to report failures that occurred within the target biometric
 1800 sensor, not a failure within the web service (§6.12.5.3). Errors with the configuration itself *should* be
 1801 reported via an unsupported (§6.12.5.13), badValue (§6.12.5.14), or badValue status (§6.12.5.15).

1802 6.12.5.8 Lock Not Held

Status Value	lockNotHeld
Condition	The configuration could not be queried because the requesting client does not hold the lock.
Required Elements	status (Status, §3.13) the literal "lockNotHeld"
Optional Elements	None

1803 Sensor operations *require* that the requesting client holds the service lock.

1804 6.12.5.9 Lock Held by Another

Status Value	lockHeldByAnother
Condition	The configuration could not be set because the lock is held by another client.
Required Elements	status (Status, §3.13) the literal "lockHeldByAnother"
Optional Elements	None

1805 **6.12.5.10 Initialization Needed**

Status Value	initializationNeeded
Condition	The configuration could not be set because the target biometric sensor has not been initialized.
Required Elements	status (Status, §3.13) the literal "initializationNeeded"
Optional Elements	None

1806 Services *should* be able to set the configuration without initialization; however, this is not strictly
1807 necessary. Similarly, clients *should* assume that setting configuration will require initialization.

1808 **6.12.5.11 Sensor Busy**

Status Value	sensorBusy
Condition	If the configuration could not be performed because the service is already performing a sensor operation.
Required Elements	status (Status, §3.13) the literal "sensorBusy"
Optional Elements	None

1809 **6.12.5.12 Sensor Timeout**

Status Value	sensorTimeout
Condition	The configuration could not be set because the target biometric sensor took too long to complete the request.
Required Elements	status (Status, §3.13) the literal "sensorTimeout"
Optional Elements	None

1810 A sensorTimeout result indicates that the service did not receive a timely response from the target
1811 biometric sensor. Note that this condition is distinct from the client's originating HTTP request, which *may*
1812 have its own, independent timeout. (See A.3 for information on how a client might determine timeouts.)

1813 **6.12.5.13 Unsupported**

Status Value	unsupported
Condition	The requested configuration contains one or more values that are syntactically and semantically valid, but not supported by the service.
Required Elements	status (Status, §3.13) the literal "unsupported" badFields (StringArray, §3.8) an array that contains the field name(s) that corresponding to the unsupported value(s)
Optional Elements	None

1814 Returning *multiple* fields allows a service to indicate that a particular *combination* of parameters is not
1815 supported by a service (i.e., there is no direct mechanism for encoding co-occurrence constraints). See
1816 §6.2.3 for additional information on how services must handle parameter failures.

1817
1818 **EXAMPLE 39:** A WS-BD service uses a very basic off-the-shelf web camera with limited capabilities. This
1819 camera has three parameters that are all dependent on each other: ImageHeight, ImageWidth, and
1820 FrameRate. The respective allowed values for each parameter might look like: {240, 480, 600, 768},
1821 {320, 640, 800, 1024}, and {5, 10, 15, 20, 30}. Configuring the sensor will return unsupported when
1822 the client tries to set ImageHeight=768, ImageWidth=1024, and FrameRate=30; this camera might not support
1823 capturing images of a higher resolution at a fast frame rate. Another example is configuring the sensor to
1824 use ImageHeight=240 and ImageWidth=1024; as this is a very basic web camera, it might not support
1825 capturing images at this resolution. In both cases, the values provided for each parameter are individually
1826 valid but the overall validity is dependent on the combination of parameters

1828 **6.12.5.14 Bad Value**

Status Value	badValue
Condition	Either: <ul style="list-style-type: none">(a) The provided session id is not a well-formed UUID, or,(b) The requested configuration contains a parameter value that is either syntactically (e.g., an inappropriate data type) or semantically (e.g., a value outside of an acceptable range) invalid.
Required Elements	status (Status, §3.13) the literal "badValue" badFields (StringArray, §3.8) an array that contains either <ul style="list-style-type: none">(a) the single field name, "sessionId", or(b) the field name(s) that contain invalid value(s)
Optional Elements	None

1829 Notice that for the set configuration operation, an invalid URL parameter *or* one or more invalid input
1830 payload parameters can trigger a badValue status.

1831 See §6.2.3 for general information on how services *must* handle parameter failures.

1832 **6.12.5.15 No Such Parameter**

Status Value	noSuchParameter
Condition	The requested configuration contains a parameter name that is not recognized by the service.
Required Elements	status (Status, §3.13) the literal "noSuchParameter" badFields (StringArray, §3.8) an array that contains the field name(s) that are not recognized by the service
Optional Elements	None

1833 See §6.2.3 for general information on how services `must` handle parameter failures.

1834

6.13 Capture

6.13.1 Overview

Description	Capture biometric data
URL Template	/capture/{sessionId}
HTTP Method	POST
URL Parameters	{sessionId} (UUID, §3.3) Identity of the session requesting the capture
Input Payload	None
Idempotent	No
Sensor Operation	Yes

6.13.2 Result Summary

success	status = "success" captureIds = { identifiers of captured data } (UuidArray, §3.9)
failure	status = "failure" message* = informative message describing failure
invalidId	status = "invalidId" badFields = { "sessionId" } (StringArray, §3.8)
canceled	status = "canceled"
canceledWithSensorFailure	status = "canceledWithSensorFailure"
sensorFailure	status = "sensorFailure"
lockNotHeld	status = "lockNotHeld"
lockHeldByAnother	status = "lockHeldByAnother"
initializationNeeded	status = "initializationNeeded"
configurationNeeded	status = "configurationNeeded"
sensorBusy	status = "sensorBusy"
sensorTimeout	status = "sensorTimeout"
badValue	status = "badValue" badFields = { "sessionId" } (StringArray, §3.8)

6.13.3 Usage

6.13.3.1 General

The *capture* operation triggers biometric acquisition. On success, the operation returns one or more identifiers, or *capture ids*. Naturally, the *capture* operation is *not* idempotent. Each *capture* operation returns unique identifiers—each execution returning references that are particular to that capture. Clients

1843 then can retrieve the captured data itself by passing a *capture id* as a URL parameter to the *download*
1844 operation.

1845 Multiple *capture ids* are supported to accommodate sensors that return collections of biometric data. For
1846 example, a multi-sensor array might save an image per sensor. A mixed-modality sensor might assign a
1847 different capture id for each modality.

1848 **IMPORTANT:** The *capture* operation *may* include some post-acquisition processing. Although post-
1849 acquisition processing is directly tied to the *capture* operation, its effects are primarily on data transfer,
1850 and is therefore discussed in detail within the *download* operation documentation (§6.14.3.3)

1851 **6.13.3.2 Providing Timing Information**

1852 Depending on the sensor, a *capture* operation may take anywhere from milliseconds to tens of seconds
1853 to execute. (It is possible to have even longer running capture operations than this, but special
1854 accommodations *may* need to be made on the server and client side to compensate for typical HTTP
1855 timeouts.) By design, there is no explicit mechanism for a client to determine how long a capture
1856 operation will take. However, services can provide “hints” through capture timeout information (A.3.5),
1857 and clients can automatically adjust their own timeouts and behavior accordingly.

1858 **6.13.4 Unique Knowledge**

1859 As specified, the *capture* operation cannot be used to provide or obtain knowledge about unique
1860 characteristics of a client or service.

1861 **6.13.5 Return Values Detail**

1862 **6.13.5.1 Overview**

1863 The *capture* operation *must* return a Result according to the constraints described in this subsection
1864 (§6.13.5).

1865 **6.13.5.2 Success**

Status Value	success
Condition	The service successfully performed a biometric acquisition
Required Elements	status (Status, §3.13) the literal "success" captureIds (UuidArray, §3.9) one more UUIDs that uniquely identify the data acquired by the operation
Optional Elements	None

1866 See the usage requirements for *capture* (§6.13.3) and *download* (§6.14.3) for full detail.

1867 **6.13.5.3 Failure**

Status Value	failure
Condition	The service cannot perform the capture due to a service (not target biometric sensor) error.
Required Elements	status (Status, §3.13)

	the literal "failure"
Optional Elements	message (xs:string, [XMSCHEMA-2]) an informative description of the nature of the failure

1868 Services *must* only use this status to report failures that occur within the web service, not the target
1869 biometric sensor (see §6.13.5.6, §6.13.5.7). A service *may* fail at capture if there is not enough internal
1870 storage available to accommodate the captured data (§A.4).

1871 6.13.5.4 Invalid Id

Status Value	invalidId
Condition	The provided session id is not registered with the service.
Required Elements	status (Status, §3.13) the literal "invalidId" badFields (StringArray, §3.8) an array that contains the single field name, "sessionId"
Optional Elements	None

1872 A session id is invalid if it does not correspond to an active registration. A session id *may* become
1873 unregistered from a service through explicit unregistration or triggered automatically by the service due to
1874 inactivity (§6.5.5.2).

1875 See §6.2.3 for general information on how services *must* handle parameter failures.

1876 6.13.5.5 Canceled

Status Value	canceled
Condition	The <i>capture</i> operation was interrupted by a cancellation request.
Required Elements	status (Status, §3.13) the literal "canceled"
Optional Elements	None

1877 See §6.17.3.3 for information about what *may* trigger a cancellation.

1878 6.13.5.6 Canceled with Sensor Failure

Status Value	canceledWithSensorFailure
Condition	The <i>capture</i> operation was interrupted by a cancellation request during which the target biometric sensor experienced a failure
Required Elements	status (Status, §3.13) the literal "canceledWithSensorFailure"
Optional Elements	message (xs:string, [XMSCHEMA-2]) an informative description of the nature of the failure

1879 Services **must** return a canceledWithSensorFailure result if a cancellation request caused a failure within
1880 the target biometric sensor. Clients receiving this result **may** need to perform initialization to restore full
1881 functionality. See §6.17.3.3 for information about what **may** trigger a cancellation.

1882 **6.13.5.7 Sensor Failure**

Status Value	sensorFailure
Condition	The service could perform the capture due to a failure within the target biometric sensor.
Required Elements	status (Status, §3.13) the literal "sensorFailure"
Optional Elements	message (xs:string, [XMSHEMA-2]) an informative description of the nature of the failure

1883 A sensorFailure status **must** only be used to report failures that occurred within the target biometric
1884 sensor, not a failure within the web service (§6.13.5.3).

1885 **6.13.5.8 Lock Not Held**

Status Value	lockNotHeld
Condition	The service could not perform a capture because the requesting client does not hold the lock.
Required Elements	status (Status, §3.13) the literal "lockNotHeld"
Optional Elements	None

1886 Sensor operations **require** that the requesting client holds the service lock.

1887 **6.13.5.9 Lock Held by Another**

Status Value	lockHeldByAnother
Condition	The service could not perform a capture because the lock is held by another client.
Required Elements	status (Status, §3.13) the literal "lockHeldByAnother"
Optional Elements	None

1888 **6.13.5.10 Initialization Needed**

Status Value	initializationNeeded
Condition	The service could not perform a capture because the target biometric sensor has not been initialized.
Required Elements	status (Status, §3.13) the literal "initializationNeeded"
Optional Elements	None

1889 Services *should* be able perform capture without explicit initialization. However, the specification
1890 recognizes that this is not always possible, particularly for physically separated implementations.
1891 Regardless, for robustness, clients *should* assume that setting configuration will require initialization.

1892 **6.13.5.11 Configuration Needed**

Status Value	configurationNeeded
Condition	The capture could not be set because the target biometric sensor has not been configured.
Required Elements	status (Status, §3.13) the literal "configurationNeeded"
Optional Elements	None

1893 A service *should* offer a default configuration to allow capture to be performed without an explicit
1894 configuration. Regardless, for robustness, clients *should* assume that capture requires configuration.

1895 **6.13.5.12 Sensor Busy**

Status Value	sensorBusy
Condition	If the capture could not be performed because the service is already performing a sensor operation.
Required Elements	status (Status, §3.13) the literal "sensorBusy"
Optional Elements	None

1896 **6.13.5.13 Sensor Timeout**

Status Value	sensorTimeout
Condition	The service could not perform a capture because the target biometric sensor took too long to complete the request.
Required Elements	status (Status, §3.13) the literal "sensorTimeout"
Optional Elements	None

1897 A sensorTimeout result indicates that the service did not receive a timely response from the target
1898 biometric sensor. Note that this condition is distinct from the client's originating HTTP request, which *may*
1899 have its own, independent timeout. (See §A.3 for information on how a client might determine timeouts.)

1900 **6.13.5.14 Bad Value**

Status Value	badValue
Condition	The provided session id is not a well-formed UUID.
Required Elements	status (Status, §3.13) the literal "badValue" badFields (StringArray, §3.8) an array that contains the single field name, "sessionId"

Optional Elements None

1901 See §6.2.3 for general information on how services *must* handle parameter failures.

1902

1903

6.14 Download

1904

6.14.1 Overview

Description	Download the captured biometric data
URL Template	/download/{captureId}
HTTP Method	GET
URL Parameters	{captureId} (UUID, §3.3) Identity of the captured data to download
Input Payload	None
Idempotent	Yes
Sensor Operation	No

1905

6.14.2 Result Summary

success	status = "success" metadata = sensor configuration at the time of capture (Dictionary, §3.4) sensorData = biometric data (xs:base64Binary)
failure	status = "failure" message* = informative message describing failure
invalidId	status = "invalidId" badFields = { "captureId" } (StringArray, §3.8)
badValue	status = "badValue" badFields = { "captureId" } (StringArray, §3.8)
preparingDownload	status = "preparingDownload"

1906

6.14.3 Usage

1907

6.14.3.1 General

1908 The *download* operation allows a client to retrieve biometric data acquired during a particular capture.

1909

6.14.3.2 Capture and Download as Separate Operations

1910 WS-BD decouples the acquisition operation (*capture*) from the data transfer (*download*) operation. This
1911 has two key benefits. First, it is a better fit for services that have post-acquisition processes. Second, it
1912 allows multiple clients to download the captured biometric data by exploiting the concurrent nature of
1913 HTTP. By making *download* a simple data transfer operation, service can handle multiple, concurrent
1914 downloads without requiring locking.

1915

6.14.3.3 Services with Post-Acquisition Processing

1916 A service does *not* need to make the captured data available immediately after capture; a service *may*
1917 have distinct acquisition and post-acquisition processes. The following are two examples of such
1918 services:

EXAMPLE 40: A service exposing a fingerprint scanner also performs post processing on a fingerprint image—segmentation, quality assessment, and templatzation.

EXAMPLE 41: A service exposes a digital camera in which the captured image is not immediately available after a photo is taken; the image may need to be downloaded from to the camera’s internal storage or from the camera to the host computer (in a physically separated implementation). If the digital camera was unavailable for an operation due to a data transfer, a client requesting a sensor operation would receive a `sensorBusy` status.

The first method is to perform the post-processing within the `capture` operation itself. I.e., `capture` not only blocks for the acquisition to be performed, but also blocks for the post-processing—returning when the post-processing is complete. This type of capture is the easier of the two to both (a) implement on the client, and (b) use by a client.

EXAMPLE 42: Figure 9 illustrates an example of a `capture` operation that includes post-processing. Once the post-processing is complete, capture ids are returned to the client.

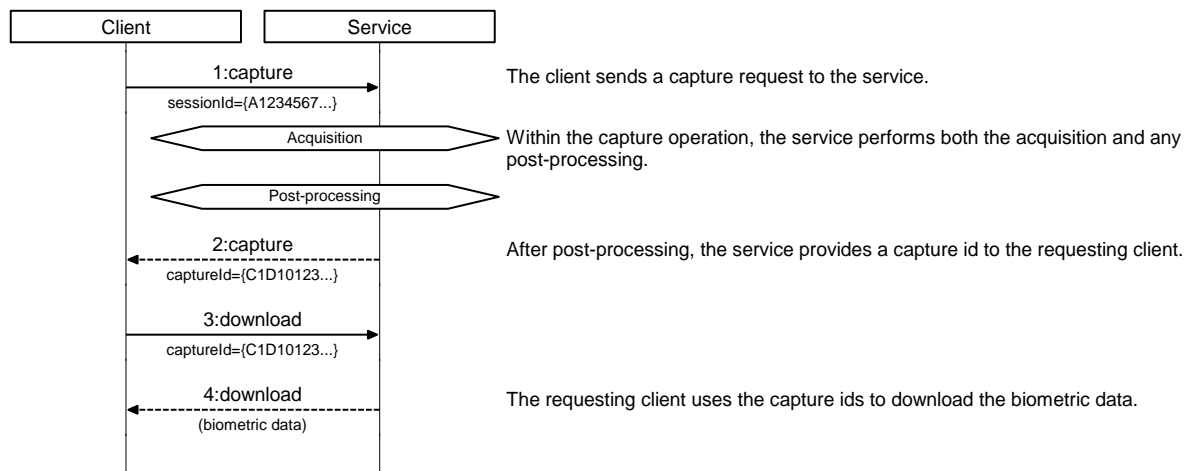

Figure 9. Including post-processing in the capture operation means downloads are immediately available when capture completes. Unless specified, the status of all returned operations is success.

In the second method, post-processing may be performed by the web service after the capture operation returns. Capture ids are still returned to the client, but are in an intermediate state. This exposes a window of time in which the capture is complete, but the biometric data is not yet ready for retrieval or download. Data-related operations (`download`, `get download info`, and `thrifty download`) performed within this window return a `preparingDownload` status to clients to indicate that the captured data is currently in an intermediate state—captured, but not yet ready for retrieval.

EXAMPLE 43: Figure 10 illustrates an example of a `capture` operation with separate post-processing. Returning to the example of the fingerprint scanner that transforms a raw biometric sample into a template after acquisition, assume that the service performs templatzation after capture returns. During post-processing, requests for the captured data return `preparingDownload`, but the sensor itself is available for another capture operation.

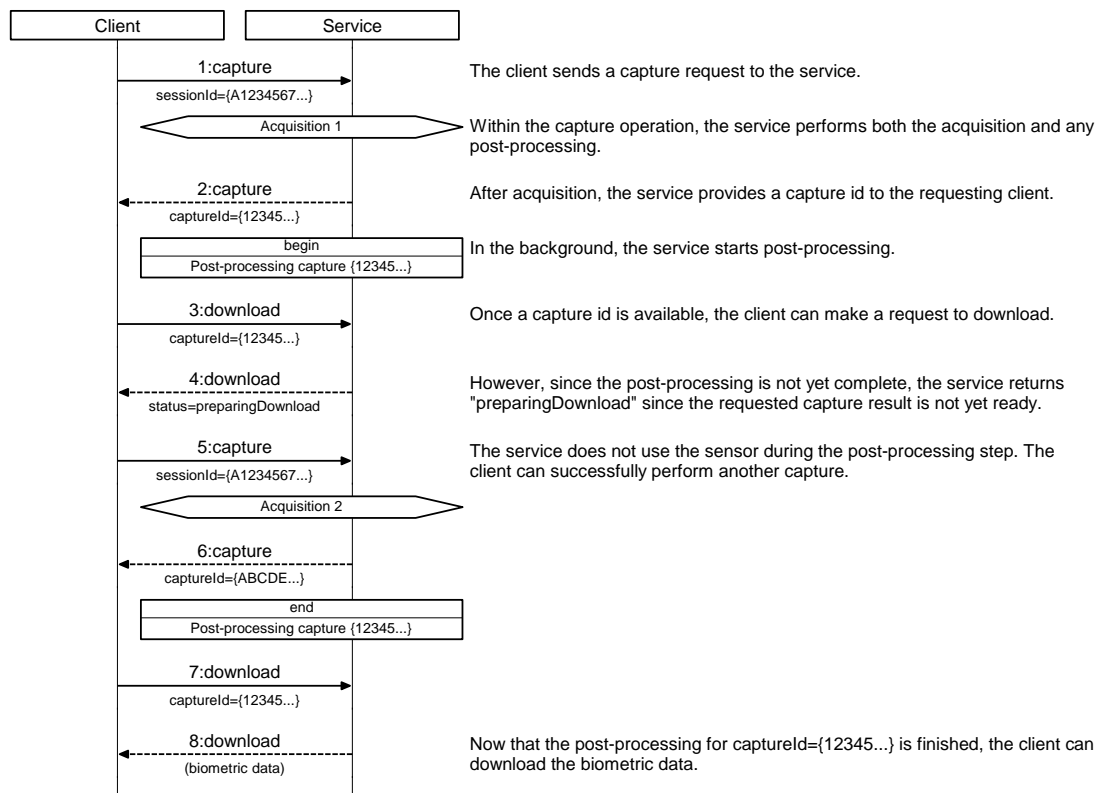

Figure 10. Example of capture with separate post-acquisition processing that involves the target biometric sensor. Because the post-acquisition processing does not involve the target biometric sensor, it is available for sensor operations. Unless specified, the status of all returned operations is `success`.

Services with an independent post-processing step *should* perform the post-processing on an independent unit of execution (e.g., a separate thread, or process). However, post-processing *may* include a sensor operation, which would interfere with incoming sensor requests.

EXAMPLE 44: Figure 11 illustrates another variation on a *capture* operation with separate post-processing. Return to the digital camera example, but assume that it is a physically separate implementation and capture operation returns immediately after acquisition. The service also has a post-acquisition process that downloads the image data from the camera to a computer. Like the previous example, during post-processing, requests for the captured data return `preparingDownload`. However, the sensor is *not* available for additional operations because the post-processing step requires complete control over the camera to transfer the images to the host machine: preparing them for download.

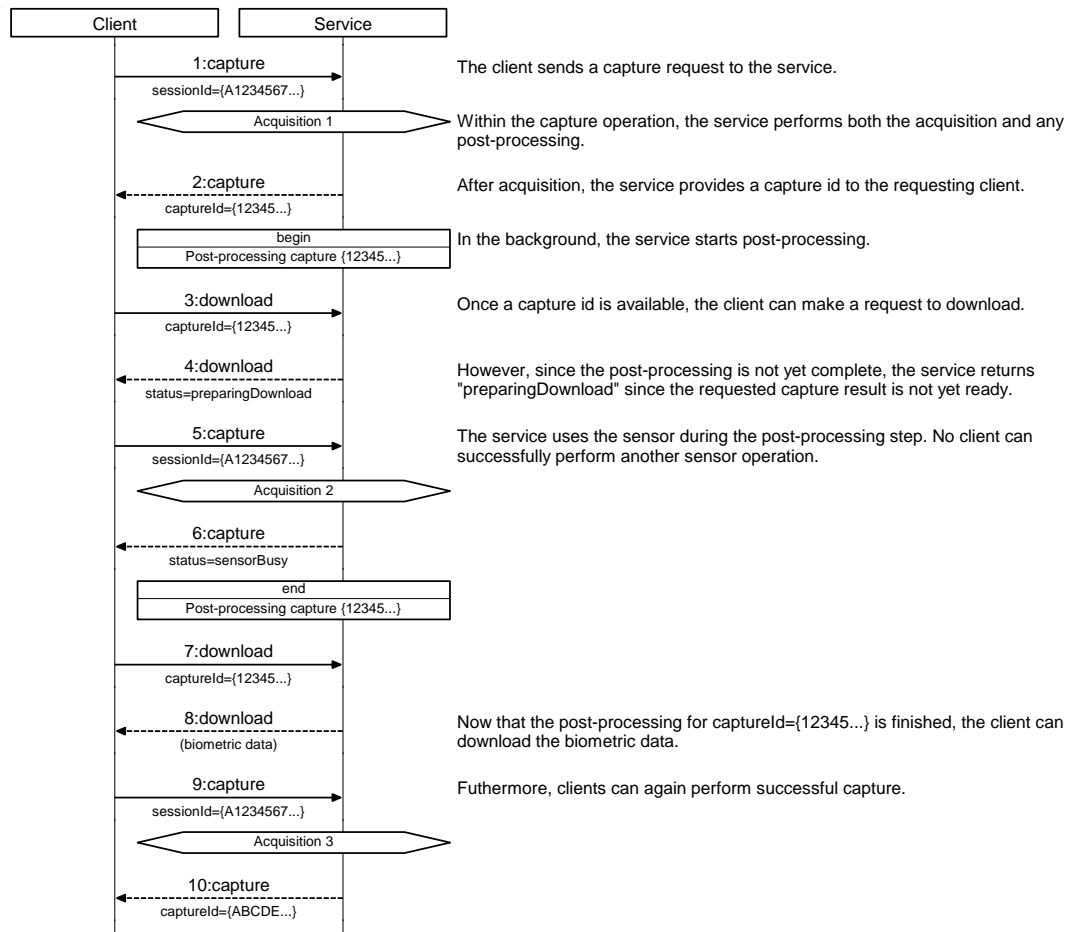

Figure 11. Because the post-acquisition processing does not involve the target biometric sensor, it is available for sensor operations. Unless specified, the status of all returned operations is success.

Unless there is an advantage to doing so, when post-acquisition processing includes a sensor operation, implementers *should* avoid having a capture operation that returns directly after acquisition. In this case, even when the capture operation finishes, clients cannot perform a sensor operation until the post-acquisition processing is complete.

In general, implementers *should* try to combine both the acquisition and post-acquisition processing into one capture operation—particularly if the delay due to post-acquisition processing is either operationally acceptable or a relatively insignificant contributor to the combined time.

A *download* operation *must* return failure if the post-acquisition processing cannot be completed successfully. Such failures cannot be reflected in the originating *capture* operation—that operation has already returned successfully with capture ids. Services *must* eventually resolve all preparingDownload statuses to success or failure. Through *get service info*, a service can provide information to a client on how long to wait after capture until a preparingDownload is fully resolved.

6.14.3.4 Client Notification

A client that receives a preparingDownload *must* poll the service until the requested data becomes available. However, through *get service info*, a service can provide “hints” to a client on how long to wait after capture until data can be downloaded (§A.3.6)

6.14.4 Unique Knowledge

The download operation can be used to provide metadata, which may be unique to the service, through the metadata element. See §4 for information regarding metadata.

6.14.5 Return Values Detail

6.14.5.1 Overview

The download operation must return a Result according to the constraints described in this section (§6.14.5).

6.14.5.2 Success

Status Value	success
Condition	The service can provide the requested data
Required Elements	status (Status, §3.13) the literal "success" metadata (Dictionary, §3.4) sensor metadata as it was at the time of capture sensorData (xs:base64Binary, [XMSCHEMA-2]) the biometric data corresponding to the requested capture id, base-64 encoded
Optional Elements	None

A successful download must populate the Result with all of the following information:

1. The status element must be populated with the Status literal "success".
2. The metadata element must be populated with metadata of the biometric data and the configuration held by the target biometric sensor at the time of capture.
3. The sensorData element must contain the biometric data, base-64 encoded (xs:base64Binary), corresponding to the requested capture id.

See the usage requirements for both capture (§6.13.3) and download (§6.14.3) for more detail regarding the conditions under which a service is permitted to accept or deny download requests.

6.14.5.3 Failure

Status Value	failure
Condition	The service cannot provide the requested data.
Required Elements	status (Status, §3.13) the literal "failure"
Optional Elements	message (xs:string, [XMSCHEMA-2]) an informative description of the nature of the failure

A service might not be able to provide the requested data due to failure in post-acquisition processing, a corrupted data store or other service or storage related failure.

2010 6.14.5.4 Invalid Id

Status Value	invalidId
Condition	The provided capture id is not recognized by the service.
Required Elements	status (Status, §3.13) the literal "invalidId" badFields (StringArray, §3.8) an array that contains the single field name, "captureId"
Optional Elements	None

2011 A capture id is invalid if it was not returned by a capture operation. A capture id *may* become
 2012 unrecognized by the service automatically if the service automatically clears storage space to
 2013 accommodate new captures (§A.4).

2014 See §6.2.3 for general information on how services *must* handle parameter failures.

2015 6.14.5.5 Bad Value

Status Value	badValue
Condition	The provided capture id is not a well-formed UUID.
Required Elements	status (Status, §3.13) the literal "badValue" badFields (StringArray, §3.8) an array that contains the single field name, "captureId"
Optional Elements	None

2016 See §6.2.3 for general information on how services *must* handle parameter failures.

2017 6.14.5.6 Preparing Download

Status Value	preparingDownload
Condition	The requested data cannot be provided because the service is currently performing a post-acquisition process—i.e., preparing it for download
Required Elements	status (Status, §3.13) the literal "preparingDownload"
Optional Elements	None

2018 See the Us for both capture (§6.13.3) and download (§6.14.3) for full detail.

2019

2020

6.15 Get Download Info

6.15.1 Overview

Description	Get only the metadata associated with a particular capture
URL Template	/download/{captureId}/info
HTTP Method	GET
URL Parameters	{captureId} (UUID, §3.3) Identity of the captured data to query
Input Payload	Not applicable
Idempotent	Yes
Sensor Operation	No

6.15.2 Result Summary

success	status = "success" metadata = sensor configuration at the time of capture
failure	status = "failure" message* = informative message describing failure
invalidId	status = "invalidId" badFields = { "captureId" } (StringArray, §3.8)
badValue	status = "badValue" badFields = { "captureId" } (StringArray, §3.8)
preparingDownload	status = "preparingDownload"

6.15.3 Usage

Given the potential large size of some biometric data the *get download info* operation provides clients with a way to get information about the biometric data without needing to transfer the biometric data itself. It is logically equivalent to the *download* operation, but without any sensor data. Therefore, unless detailed otherwise, the usage requirements for *download* (§6.15.3) also apply to *get download info*.

6.15.4 Unique Knowledge

The *get download info* operation can be used to provide metadata, which may be unique to the service, through the metadata element. See §4 for information regarding metadata.

6.15.5 Return Values Detail

6.15.5.1 Overview

The *get download info* operation must return a Result according to the constraints described in this subsection (§6.15.5).

2036 **6.15.5.2 Success**

Status Value	success
Condition	The service can provide the requested data
Required Elements	status (Status, §3.13) the literal "success" metadata (Dictionary, §3.4) the sensor's configuration as it was set at the time of capture
Optional Elements	None

2037 A successful *get download info* operation returns all of the same information as a successful *download*
2038 operation (§6.14.5.2), but without the sensor data.

2039 **6.15.5.3 Failure**

Status Value	failure
Condition	The service cannot provide the requested data.
Required Elements	status (Status, §3.13) the literal "failure"
Optional Elements	message (xs:string, [XMSHEMA-2]) an informative description of the nature of the failure

2040 A service might not be able to provide the requested data due to failure in post-acquisition processing, a
2041 corrupted data store or other service or storage related failure.

2042 **6.15.5.4 Invalid Id**

Status Value	invalidId
Condition	The provided capture id is not recognized by the service.
Required Elements	status (Status, §3.13) the literal "invalidId" badFields (StringArray, §3.8) an array that contains the single field name, "captureId"
Optional Elements	None

2043 A capture id is invalid if it was not returned by a *capture* operation. A capture id *may* become
2044 unrecognized by the service automatically if the service automatically clears storage space to
2045 accommodate new captures (§A.4).

2046 See §6.2.3 for general information on how services *must* handle parameter failures.

2047 **6.15.5.5 Bad Value**

Status Value	badValue
Condition	The provided capture id is not a well-formed UUID.
Required Elements	status (Status, §3.13)

	the literal "badValue" badFields (StringArray, §3.8) an array that contains the single field name, "captureId"
Optional Elements	None

2048 See §6.2.3 for general information on how services `must` handle parameter failures.

2049 **6.15.5.6 Preparing Download**

Status Value	preparingDownload
Condition	The requested data cannot be provided because the service is currently performing a post-acquisition process—i.e., preparing it for download
Required Elements	status (Status, §3.13) the literal "preparingDownload"
Optional Elements	None

2050 See the usage requirements for both capture (§6.13.3) and download (§6.14.3) for full detail.

2051

6.16 Thrifty Download

6.16.1 Overview

Description	Download a compact representation of the captured biometric data suitable for preview
URL Template	/download/{captureId}/{maxSize}
HTTP Method	GET
URL Parameters	{captureId} (UUID, §3.3) Identity of the captured data to download {maxSize} (xs:string, [XMSHEMA-2]) Content-type dependent indicator of maximum permitted download size
Input Payload	None
Idempotent	Yes
Sensor Operation	No

6.16.2 Result Summary

success	status = "success" metadata = minimal metadata describing the captured data (Dictionary, §3.4, §4.4.2) sensorData = biometric data (xs:base64Binary)
failure	status = "failure" message* = informative message describing failure
invalidId	status = "invalidId" badFields = {"captureId"} (StringArray, §3.8)
badValue	status = "badValue" badFields = either "captureId", "maxSize", or both (StringArray, §3.8)
unsupported	status = "unsupported"
preparingDownload	status = "preparingDownload"

6.16.3 Usage

The *thrifty download* operation allows a client to retrieve a compact representation of the biometric data acquired during a particular capture. It is logically equivalent to the *download* operation, but provides a compact version of the sensor data. Therefore, unless detailed otherwise, the usage requirements for *download* (§6.15.3) also apply to *get download info*.

The suitability of the *thrifty download* data as a biometric is implementation-dependent. For some applications, the compact representation may be suitable for use within a biometric algorithm; for others, it may only serve the purpose of preview.

For images, the *maxSize* parameter describes the maximum image width or height (in pixels) that the service may return; neither dimension SHALL exceed *maxSize*. It is expected that servers will dynamically

2065 scale the captured data to fulfill a client request. This is not strictly necessary, however, as long as the
2066 maximum size requirements are met.
2067 For non-images, the default behavior is to return unsupported. It is *possible* to use URL parameter
2068 maxSize as general purpose parameter with implementation-dependent semantics. (See the next section
2069 for details.)

2070 **6.16.4 Unique Knowledge**

2071 The *thrifty download* operation can be used to provide knowledge about unique characteristics to a
2072 service. Through *thrifty download*, a service *may* (a) redefine the semantics of maxSize or (b) provide a
2073 data in a format that does not conform to the explicit types defined in this specification (see Appendix B
2074 for content types).

2075 **6.16.5 Return Values Detail**

2076 **6.16.5.1 Overview**

2077 The *thrifty download* operation *must* return a Result according to the constraints described in this
2078 subsection (§6.16.5).

2079 **6.16.5.2 Success**

Status Value	success
Condition	The service can provide the requested data
Required Elements	status (Status, §3.13) the literal "success" metadata (Dictionary, §3.4) minimal representation of sensor metadata as it was at the time of capture. See §4.4.2 for information regarding minimal metadata. sensorData (xs:base64Binary, [XMSCHEMA-2]) the biometric data corresponding to the requested capture id, base-64 encoded, scaled appropriately to the maxSize parameter.
Optional Elements	None

2080 For increased efficiency, a successful *thrifty download* operation only returns the sensor data, and a
2081 subset of associated metadata. The metadata returned *should* be information that is absolutely essential
2082 to open or decode the returned sensor data.

2083 **6.16.5.3 Failure**

Status Value	failure
Condition	The service cannot provide the requested data.
Required Elements	status (Status, §3.13) the literal "failure"
Optional Elements	message (xs:string, [XMSCHEMA-2]) an informative description of the nature of the failure

2084 A service might not be able to provide the requested data due to a corrupted data store or other service
2085 or storage related failure.

2086 **6.16.5.4 Invalid Id**

Status Value	invalidId
Condition	The provided capture id is not recognized by the service.
Required Elements	status (Status, §3.13) the literal "invalidId" badFields (StringArray, §3.8) an array that contains the single field name, "captureId"
Optional Elements	None

2087 A capture id is invalid if it does not correspond to a capture operation. A capture id *may* become
2088 unrecognized by the service automatically if the service automatically clears storage space to
2089 accommodate new captures (§A.4).

2090 See §6.2.3 for general information on how services *must* handle parameter failures.

2091 **6.16.5.5 Bad Value**

Status Value	badValue
Condition	The provided capture id is not a well-formed UUID.
Required Elements	status (Status, §3.13) the literal "badValue" badFields (StringArray, §3.8) an array that contains one or both of the following fields: <ul style="list-style-type: none">- "captureId" if the provided session id is not well-formed- "maxSize" if the provided maxSize parameter is not well-formed
Optional Elements	None

2092 See §6.2.3 for general information on how services *must* handle parameter failures.

2093 **6.16.5.6 Unsupported**

Status Value	unsupported
Condition	The service does not support thrifty download
Required Elements	status (Status, §3.13) the literal "unsupported"
Optional Elements	None

2094 Services that capture biometrics that are not image-based *should* return unsupported.

2095 **6.16.5.7 Preparing Download**

Status Value	preparingDownload
Condition	The requested data cannot be provided because the service is currently performing a post-acquisition process—i.e., preparing it for download
Required Elements	status (Status, §3.13) the literal "preparingDownload"

Optional Elements None

2096 Like download, the availability of thrifty download data may also be affected by the sequencing of post-
2097 acquisition processing. See §6.14.3.3 for detail.

2098

2099

6.17 Cancel

2100

6.17.1 Overview

Description	Cancel the current sensor operation
URL Template	/cancel/{sessionId}
HTTP Method	POST
URL Parameters	{sessionId} (UUID, §3.3) Identity of the session requesting cancellation
Input Payload	None
Idempotent	Yes
Sensor Operation	Yes

2101

6.17.2 Result Summary

success	status = "success"
failure	status = "failure" message* = informative message describing failure
invalidId	status = "invalidId"
lockNotHeld	status = "lockNotHeld"
lockHeldByAnother	status = "lockHeldByAnother"
badValue	status = "badValue" badFields = {"sessionId"}

2102

6.17.3 Usage

2103

6.17.3.1 General

2104 The cancel operation stops any currently running sensor operation; it has no effect on non-sensor
2105 operations. If cancellation of an active sensor operation is successful, cancel operation receives a
2106 success result, while the canceled operation receives a canceled (or canceledWithSensorFailure) result.
2107 As long as the operation is canceled, the cancel operation itself receives a success result, regardless if
2108 cancellation caused a sensor failure. In other words, if cancellation caused a fault within the target
2109 biometric sensor, as long as the sensor operation has stopped running, the cancel operation is
2110 considered to be successful.

2111 All services *must* provide cancellation for all sensor operations.

2112

2113 **EXAMPLE 45:** Figure 12 illustrates a client that cancels a capture request.

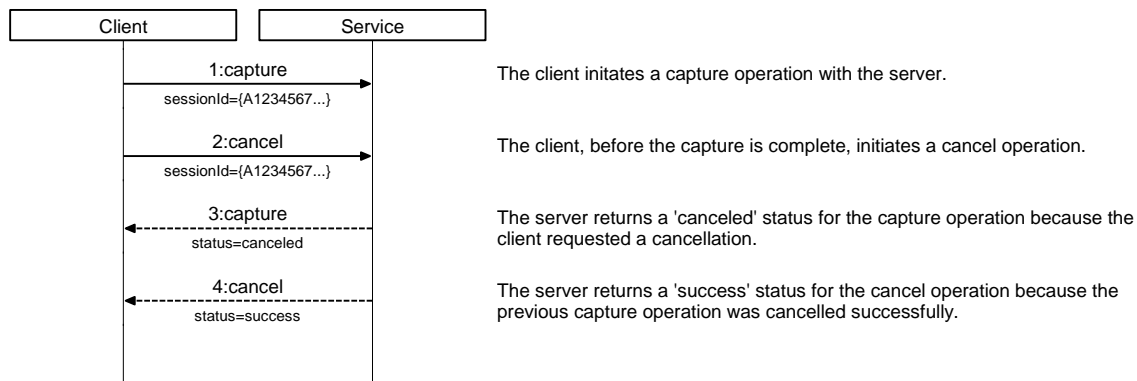

Figure 12. Example sequence of events for a client initially requesting a capture followed by a cancellation request.

6.17.3.2 Canceling Non-Sensor Operations

Clients are responsible for canceling all non-sensor operations via client-side mechanisms only. Cancellation of sensor operations requires a separate service operation, since a service *may* need to “manually” interrupt a busy sensor. A service that had its client terminate a non-sensor operation would have no way to easily determine that a cancellation was requested.

EXAMPLE 46: Figure 12 illustrates a client that cancels download request (a non-sensor operation).

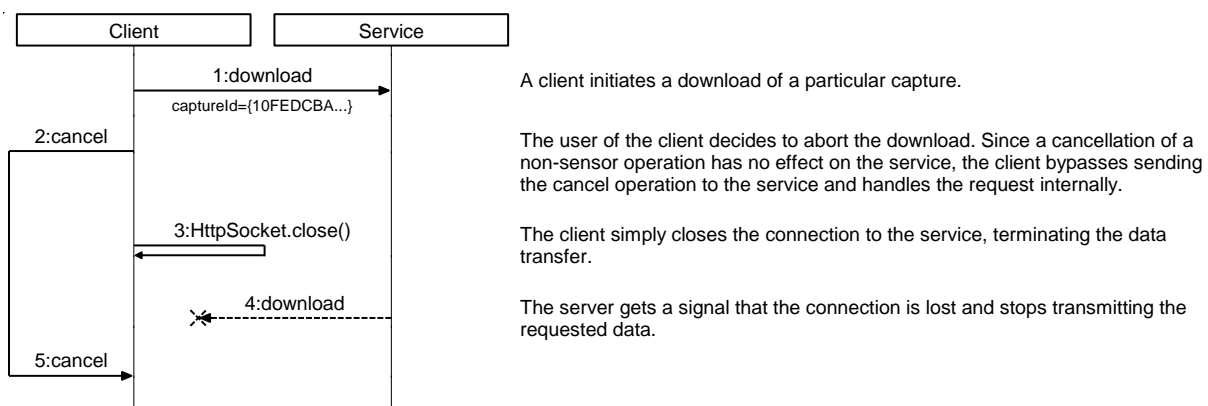

Figure 13. Cancellations of non-sensor operations do not require a cancel operation to be requested to the service. An example of this is where a client initiates then cancels a download operation.

6.17.3.3 Cancellation Triggers

Typically, the client that originates the sensor operation to be cancelled also initiates the cancellation request. Because WSBD operations are performed synchronously, cancellations are typically initiated on a separate unit of execution such as an independent thread or process.

Notice that the only requirement to perform cancellation is that the *requesting* client holds the service lock. It is *not* a requirement that the client that originates the sensor operation to be canceled also initiates the cancellation request. Therefore, it is *possible* that a client *may* cancel the sensor operation initiated by another client. This occurs if a peer client (a) manages to steal the service lock before the sensor operation is completed, or (b) is provided with the originating client's session id.

2139 A service *may* also *self-initiate* cancellation. In normal operation, a service that does not receive a timely
2140 response from a target biometric sensor would return `sensorTimeout`. However, if the service's internal
2141 timeout mechanism fails, a service *may* initiate a cancel operation itself. Implementers *should* use this
2142 as a "last resort" compensating action.

2143 In summary, clients *should* be designed to not expect to be able to match a cancelation notification to
2144 any specific request or operation.

2145 **6.17.4 Unique Knowledge**

2146 As specified, the *cancel* operation cannot be used to provide or obtain knowledge about unique
2147 characteristics of a client or service.

2148 **6.17.5 Return Values Detail**

2149 **6.17.5.1 Overview**

2150 The *cancel* operation *must* return a `Result` according to the constraints described in this subsection
2151 (§6.17.5).

2152 **6.17.5.2 Success**

Status Value	<code>success</code>
Condition	The service successfully canceled the sensor operation
Required Elements	<code>status</code> (Status, §3.13) the literal "success"
Optional Elements	None

2153 See the Usage sections for *capture* (§6.13.3) and *download* (§6.14.3) for full detail.

2154 **6.17.5.3 Failure**

Status Value	<code>failure</code>
Condition	The service could not cancel the sensor operation
Required Elements	<code>status</code> (Status, §3.13) the literal "failure"
Optional Elements	<code>message</code> (xs:string, [XMSHEMA-2]) an informative description of the nature of the failure

2155 Services *should* try to return `failure` in a timely fashion—there is little advantage to a client if it receives
2156 the cancellation failure *after* the sensor operation to be canceled completes.

2157 **6.17.5.4 Invalid Id**

Status Value	<code>invalidId</code>
Condition	The provided session id is not recognized by the service.
Required Elements	<code>status</code> (Status, §3.13) the literal "invalidId" <code>badFields</code> (StringArray, §3.8)

	an array that contains the single field name, "sessionId"
Optional Elements	None

2158 A session id is invalid if it does not correspond to an active registration. A session id *may* become
2159 unregistered from a service through explicit unregistration or triggered automatically by the service due to
2160 inactivity (§6.5.5.2).

2161 See §6.2.3 for general information on how services *must* handle parameter failures.

2162 **6.17.5.5 Lock Not Held**

Status Value	lockNotHeld
Condition	The service could cancel the operation because the requesting client does not hold the lock.
Required Elements	status (Status, §3.13) the literal "lockNotHeld"
Optional Elements	None

2163 Sensor operations require that the requesting client holds the service lock.

2164 **6.17.5.6 Lock Held by Another**

Status Value	lockHeldByAnother
Condition	The service could not cancel the operation because the lock is held by another client.
Required Elements	status (Status, §3.13) the literal "lockHeldByAnother"
Optional Elements	None

2165

2166 **6.17.5.7 Bad Value**

Status Value	badValue
Condition	The provided session id is not a well-formed UUID.
Required Elements	status (Status, §3.13) the literal "badValue" badFields (StringArray, §3.8) an array that contains the single field name, "sessionId"
Optional Elements	None

2167 See §6.2.3 for general information on how services *must* handle parameter failures.

7 Conformance Profiles

7.1 About

This section of the specification describes the requirements regarding the conformance of a service to the WS-Biometric Devices specification.

7.2 Conformance Requirements

Conformance to WS-Biometric Devices applies to WS-Biometric Devices *servers*. This version of the specification does not address *client* conformance.

In order to conform to this specification, a service *must*

- fully implement §2, Design Concepts and Architecture
- fully implement §3, Data Dictionary,
- fully implement §4, Metadata,
- *optionally* implement §5, Live Preview
- implement §6, Operations, according to §7.5 below
- fully implement Appendix A, Parameter Details (Normative)
- use applicable data format and content-type strings in Appendix B, Content Type Data (Normative)
- use XML that strictly validates according to the XML Schema located at <http://docs.oasis-open.org/biometrics/ns/ws-bd-1.0>

where the key words *must*, *must not*, *required*, *shall*, *shall not*, *should not*, *recommended*, *may* and *optional* are to be interpreted as described §1.3.2.

7.3 Claims of Conformance

Implementations claiming conformance to this specification, **MUST** make such a claim according to all three of the following factors.

1. If the implementation is *general* or *modality specific*
2. The operations that are implemented (§7.5)
3. If the implementation includes live preview (§5)

An implementation that is *modality specific* must implement the service information and configuration metadata according to their respective subsection. For example, a “fingerprint” conformant service must implement the service and configuration information according to §7.6. It is possible to implement a fingerprint-based WS-Biometric Devices service without adhering to §7.6, however, such an implementation cannot claim *modality specific* conformance.

7.4 Language

Conformance claims must take the form

“WS-Biometric Devices [*modality*] Conformance Level *n* [L]”

where

- [*modality*] is an *optional* phrase that indicates if the implementation is modality specific
- *L* * is an indicator if the implementation supports live preview.
- Square brackets, [], are indicator to the reader of this specification that the phrase is optional; they are not to be included in the claim itself

For example, the phrase “WS-Biometric Devices Conformance Level 3” indicates that the implementation is (a) not modality specific (b) implements the operations *get service information*, *initialize*, *get configuration*, *capture*, *download*, and *get download information* and (c) does NOT support live preview. Likewise, the phrase “WS-Biometric Devices Fingerprint Conformance Level 1L” indicates that the implementation (a) implements the service information and configuration parameters as specified by §7.6, (b) implements all operations and (c) supports live-preview.

For implementations that support multiple modalities, then there SHALL be a conformance claim for each modality. For example, a converged device that supports machine readable documents, fingerprint (according to §7.6) and iris (according to §7.8) might claim “WS-Biometric Devices Conformance Level 2, WS-Biometric Devices Fingerprint Conformance Level 3L, and WS-Biometric Devices Iris Conformance Level 1.”

7.5 Operations & Conformance Levels

Table 9 shows three levels of conformance to this specification. An ‘X’ represents that the operation requires functionality and implementation. For operations that lack an identifier, the service should implement the operation minimally by always returning success and related arbitrary data. Sending success and arbitrary data removes any concern from clients whether or not certain operations are supported by removing the responsibility of functionality and implementation from the implementer/service.

Table 9. Operations required for each conformance level

Operation	Conformance Level	1	2	3
Register (§6.4)		X		
Unregister (§6.5)		X		
Try Lock (§6.6)		X		
Steal Lock (§6.7)		X		
Unlock (§6.8)		X		
Get Service Information (§6.9)		X	X	X
Initialize (§6.10)		X	X	X
Get Configuration (§6.11)		X	X	X
Set Configuration (§6.12)		X	X	
Capture (§6.13)		X	X	X
Download (§6.14)		X	X	X
Get Download Information (§6.15)		X	X	X
Thrifty Download (§6.16)		X	X	
Cancel (§6.17)		X	X	

7.5.1.1 Additional Supported Operations

Operation	Identifier
Live Preview (§5)	L

2229

2230 **7.6 Fingerprint Service Information**

2231 **7.6.1 Submodality**

Formal Name	submodality
Description	A distinct subtype of fingerprint modality, supported by the sensor.
Data Type	xs:string [XMSCHEMA-2]
Required	Yes
Allowed Values	RightThumbFlat RightIndexFlat RightMiddleFlat RightRingFlat RightLittleFlat LeftThumbFlat LeftIndexFlat LeftMiddleFlat LeftRingFlat LeftLittleFlat LeftSlap RightSlap ThumbsSlap RightThumbRolled RightIndexRolled RightMiddleRolled RightRingRolled RightLittleRolled LeftThumbRolled LeftIndexRolled LeftMiddleRolled LeftRingRolled LeftLittleRolled

2232 **7.6.2 Image Size**

Formal Name	fingerprintImageSize
Description	The width and height of a resulting fingerprint image, in pixels. If this value is calculated after capture, this shall be the maximum width and height of a resulting image.
Data Type	resolution [§3.9]
Required	Yes
Allowed Values	The width element can be any positive integer value.

The height element can be any positive integer value.
The unit element, if defined, must be “pixel” or “pixels”.

2233

2234 7.6.3 Image Content Type

Formal Name	fingerprintImageContentType
Description	The data format of the resulting fingerprint image.
Data Type	xs:string [XMSCHEMA-2]
Required	Yes
Allowed Values	Any string value conformant with Appendix B, §B.2.

2235

2236 7.6.4 Image Density

Formal Name	fingerprintImageDensity
Description	The pixel density of a resulting image represented in pixels per inch (PPI).
Data Type	xs:int [XMSCHEMA-2]
Required	Yes
Allowed Values	Any positive integer value.

2237

2238 7.7 Face Service Information

2239 7.7.1 Submodality

Formal Name	submodality
Description	A distinct subtype of face modality, supported by the sensor.
Data Type	xs:string [XMSCHEMA-2]
Required	Yes
Allowed Values	Face2d Face3d

2240 7.7.2 Image Size

Formal Name	faceImageSize
Description	The width and height of a resulting face image, in pixels. If this value is calculated after capture, this <i>must</i> be the maximum width and height of a resulting image.
Data Type	resolution [§3.9]
Required	Yes

Allowed Values The width element can be any positive integer value.
The height element can be any positive integer value.
The unit element, if defined, must be “pixel” or “pixels”.

2241

2242 7.7.3 Image Content Type

Formal Name	faceImageContentType
Description	The data format of the resulting face image.
Data Type	xs:string [XMSCHEMA-2]
Required	Yes
Allowed Values	Any string value conformant with Appendix B, §B.2.

2243

2244 7.8 Iris Service Information

2245 7.8.1 Submodality

Formal Name	submodality
Description	A distinct subtype of iris modality, supported by the sensor.
Data Type	xs:string [XMSCHEMA-2]
Required	Yes
Allowed Values	LeftIris RightIris BothIrises

2246 7.8.2 Image Size

Formal Name	irisImageSize
Description	The width and height of a resulting iris image, in pixels. If this value is calculated after capture, this must be the maximum width and height of a resulting image.
Data Type	resolution [§3.9]
Required	Yes
Allowed Values	The width element can be any positive integer value. The height element can be any positive integer value. The unit element, if defined, must be “pixel” or “pixels”.

2247

2248

7.8.3 Image Content Type

Formal Name	irisImageContentType
Description	The data format of the resulting iris image.
Data Type	xs:string [XMSCHEMA-2]
Required	Yes
Allowed Values	Any string value conformant with Appendix B, §B.2.

Appendix A. Parameter Details (Normative)

A.1 About

This appendix details the individual parameters available from a *get service info* operation. For each parameter, the following information is listed:

- The formal parameter name
- The expected data type of the parameter's value
- If a the service is required to implement the parameter

A.2 Connection Parameters

The parameters listed in this subsection (§A.2) describe how the service handles session lifetimes and registrations.

A.2.1 Last Updated

Formal Name	lastUpdated
Data Type	xs:dateTime [XMSCHEMA-2]
Required	Yes

This parameter provides a timestamp of when the service last *updated* the common info parameters (this parameter notwithstanding). The timestamp *must* include time zone information. Implementers *should* expect clients to use this timestamp to detect if any cached values of the (other) common info parameters may have changed.

A.2.2 Inactivity Timeout

Formal Name	inactivityTimeout
Data Type	xs:nonNegativeInteger [XMSCHEMA-2]
Required	Yes

This parameter describes how long, in *seconds*, a session can be inactive before it *may* be automatically closed by the service. A value of '0' indicates that the service never drops sessions due to inactivity.

Inactivity time is measured *per session*. Services *must* measure it as the time elapsed between (a) the time at which a client initiated the session's most recent operation and (b) the current time. Services *must* only use the session id to determine a session's inactivity time. For example, a service does not maintain different inactivity timeouts for requests that use the same session id, but originate from two different IP addresses. Services *may* wait longer than the inactivity timeout to drop a session, but *must not* drop inactive sessions any sooner than the *inactivityTimeout* parameter indicates.

A.2.3 Maximum Concurrent Sessions

Formal Name	maximumConcurrentSessions
Data Type	xs:positiveInteger [XMSCHEMA-2]

Required	Yes
-----------------	-----

2274 This parameter describes the maximum number of concurrent sessions a service can maintain. Upon
2275 startup, a service *must* have zero concurrent sessions. When a client registers successfully (§6.4), the
2276 service increases its count of concurrent sessions by one. After successful unregistration (§6.5), the
2277 service decreases its count of concurrent sessions by one .

A.2.4 Least Recently Used (LRU) Sessions Automatically Dropped

Formal Name	autoDropLRUSessions
--------------------	---------------------

Data Type	xs:boolean [XMSCHEMA-2]
------------------	-------------------------

Required	Yes
-----------------	-----

2279 This parameter describes whether or not the service automatically unregisters the least-recently-used
2280 session when the service has reached its maximum number of concurrent sessions. If *true*, then upon
2281 receiving a registration request, the service *may* drop the least-recently used session if the maximum
2282 number of concurrent sessions has already been reached. If *false*, then any registration request that
2283 would cause the service to exceed its maximum number of concurrent sessions results in failure. The
2284 service *shall not* drop a session that currently holds the lock unless the session's inactivity is outside of
2285 the inactivity timeout (§A.2.2) threshold.

A.3 Timeout Parameters

A.3.1 About

2288 Clients *should not* block indefinitely on any operation. However, since different services *may* differ
2289 significantly in the time they require to complete an operation, clients require a means to determine
2290 appropriate timeouts. The timeouts in this subsection describe how long a *service* waits until the service
2291 either returns `sensorTimeout` or initiates a service-side cancellation (§6.17.3.2). Services *may* wait longer
2292 than the times reported here, but, (under normal operations) *must not* report a `sensorTimeout` or initiate
2293 a cancellation before the reported time elapses. In other words, a client *should* be able to use these
2294 timeouts to help determine a reasonable upper bound on the time required for sensor operations.

2295 These timeouts do not include any round-trip and network delay—clients *should* add an additional
2296 window to accommodate delays unique to that particular client-server relationship.

A.3.2 Initialization Timeout

Formal Name	initializationTimeout
--------------------	-----------------------

Data Type	xs:positiveInteger [XMSCHEMA-2]
------------------	---------------------------------

Required	Yes
-----------------	-----

2298 This parameter describes how long, in *milliseconds*, a service will wait for a target biometric sensor to
2299 perform initialization before it returns `sensorTimeout` (§6.10.5.11) or initiates a service-side cancellation
2300 (§6.17.3.2).

A.3.3 Get Configuration Timeout

Formal Name	getConfigurationTimeout
--------------------	-------------------------

Data Type	xs:positiveInteger [XMSCHEMA-2]
Required	Yes

2302 This parameter describes how long, in *milliseconds*, a service will wait for a target biometric sensor to
 2303 retrieve its configuration before it returns `sensorTimeout` (§6.11.5.13) or initiates a service-side
 2304 cancellation (§6.17.3.2).

2305 A.3.4 Set Configuration Timeout

Formal Name	setConfigurationTimeout
Data Type	xs:positiveInteger [XMSCHEMA-2]
Required	Yes

2306 This parameter describes how long, in *milliseconds*, a service will wait for a target biometric sensor to set
 2307 its configuration before it returns `sensorTimeout` (§6.12.5.12) or initiates a service-side cancellation
 2308 (§6.17.3.2).

2309 A.3.5 Capture Timeout

Formal Name	captureTimeout
Data Type	xs:positiveInteger [XMSCHEMA-2]
Required	Yes

2310 This parameter describes how long, in *milliseconds*, a service will wait for a target biometric sensor to
 2311 perform biometric acquisition before it returns `sensorTimeout` (§6.12.5.12) or initiates a service-side
 2312 cancellation (§6.17.3.2).

2313 A.3.6 Post-Acquisition Processing Time

Formal Name	postAcquisitionProcessingTime
Data Type	xs:nonNegativeInteger [XMSCHEMA-2]
Required	Yes

2314 This parameter describes an upper bound on how long, in *milliseconds*, a service takes to perform post-
 2315 acquisition processing. A client *should not* expect to be able to download captured data *before* this time
 2316 has elapsed. Conversely, this time also describes how long after a capture a server is permitted to return
 2317 `preparingDownload` for the provided capture ids. A value of zero ('0') indicates that the service includes
 2318 any post-acquisition processing within the capture operation or that no post-acquisition processing is
 2319 performed.

2320 A.3.7 Lock Stealing Prevention Period

Formal Name	lockStealingPreventionPeriod
Data Type	xs:nonNegativeInteger [XMSCHEMA-2]
Required	Yes

2321 This parameter describes the length, in *milliseconds*, of the lock stealing prevention period (§6.7.3.3).

A.4 Storage Parameters

A.4.1 About

The parameters described in this section (§A.4) describe how the service stores captured biometric data.

A.4.2 Maximum Storage Capacity

Formal Name	maximumStorageCapacity
Data Type	xs:positiveInteger [XMSCHEMA-2]
Required	Yes

This parameter describes how much data, in bytes, the service is capable of storing.

A.4.3 Least-Recently Used Capture Data Automatically Dropped

Formal Name	lruCaptureDataAutomaticallyDropped
Data Type	xs:boolean [XMSCHEMA-2]
Required	Yes

This parameter describes whether or not the service automatically deletes the least-recently-used capture to stay within its maximum storage capacity. If *true*, the service *may* automatically delete the least-recently used biometric data to accommodate for new data. If *false*, then any operation that would require the service to exceed its storage capacity would fail.

A.5 Sensor Parameters

The following parameters describe information about the sensor and its supporting features

A.5.1 Modality

Formal Name	modality
Data Type	xs:string [XMSCHEMA-2]
Required	Yes

This parameter describes which modality or modalities are supported by the sensor.

Table 10 enumerates the list of modalities, as defined in [CBEFF2010], which provides the valid values for this field for currently identified modalities. Implementations are not limited to the following values, but *must* use them if such modality is exposed. For example, if an implementation is exposing fingerprint capture capability, “Finger” *shall* be used. If an implementation is exposing an unlisted modality, it *may* use another value.

Table 10. Valid modalities

Modality Value	Description
Scent	Information about the scent left by a subject
DNA	Information about a subject’s DNA
Ear	A subject’s ear image

Face	An image of the subject's face, either in two or three dimensions
Finger	An image of one of more of the subject's fingerprints
Foot	An image of one or both of the subject's feet.
Vein	Information about a subject's vein pattern
HandGeometry	The geometry of an subject's hand
Iris	An image of one of both of the subject's irises
Retina	An image of one or both of the subject's retinas
Voice	Information about a subject's voice
Gait	Information about a subject's gait or ambulatory movement
Keystroke	Information about a subject's typing patterns
LipMovement	Information about a subject's lip movements
SignatureSign	Information about a subject's signature or handwriting

2342

2343 **A.5.2 Submodality**

Formal Name	submodality
Data Type	xs:string [XMSCHEMA-2]
Required	Yes

2344 This parameter describes which submodalities are supported by the sensor. See §7 for submodality

2345 requirements for a particular modality.

Appendix B. Content Type Data (Normative)

B.1 About

This appendix contains a catalog of content types for use in conformance profiles and parameters. When appropriate, the following identified data formats *must* be used.

B.2 General Type

application/xml	Extensible Markup Language (XML) [XML]
text/plain	Plaintext [RFC2046]
text/xml	Extensible Markup Language (XML) [XML]

B.3 Image Formats

Refer to [CMediaType] for more information regarding a registered image type.

image/jpeg	Joint Photographics Experts Group [JPEG]
image/png	Portable Network Graphics [PNG]
image/tiff	Tagged Image File Format [TIFF]
image/x-ms-bmp	Windows OS/2 Bitmap Graphics [BMP]
image/x-wsq	Wavelet Scalar Quantization (WSQ) [WSQ]

B.4 Video Formats

Refer to [CMediaType] for more information regarding a registered video type.

multipart/x-mixed-replace	multipart/x-mixed-replace [HTML5] (§12.2)
video/h264	H.264 Video Compression [H264]
video/mpeg	Moving Pictures Experts Group [MPEG]
video/quicktime	QuickTime File Format [QTFF]
video/x-avi	Audio Video Interleave [AVI]
video/x-ms-asf	Advanced Systems Format [ASF]
video/x-ms-asx	Advanced Stream Redirector [ASX]
video/x-ms-wmv	Windows Media Video [ASF]

B.5 Audio Formats

Refer to [CMediaType] for more information regarding a registered audio type.

audio/3gpp	3rd Generation Partnership Project Multimedia files [3GPP]
audio/3gpp2	3rd Generation Partnership Project Multimedia files [3GPP2]
audio/mpeg	Moving Pictures Experts Group [MPEG1]
audio/ogg	Vorbis OGG Audio File [OGG]
audio/x-aiff	Audio Interchange File Format [AIFF]
audio/x-ms-wav	Waveform Audio File Format [WAVE]
audio/x-ms-wma	Windows Media Audio [ASF]
audio/x-sphere	NIST Speech Header Resources [SPHERE]

2360

2361 **B.6 General Biometric Formats**

x-biometric/x-ansi-nist-itl-2000	Information Technology: American National Standard for Information Systems—Data Format for the Interchange of Fingerprint, Facial, & Scar Mark & Tattoo (SMT) Information [AN2K]
x-biometric/x-ansi-nist-itl-2007	Information Technology: American National Standard for Information Systems—Data Format for the Interchange of Fingerprint, Facial, & Other Biometric Information – Part 1 [AN2K7]
x-biometric/x-ansi-nist-itl-2008	Information Technology: American National Standard for Information Systems—Data Format for the Interchange of Fingerprint, Facial, & Other Biometric Information – Part 2: XML Version [AN2K8]
x-biometric/x-ansi-nist-itl-2011	Information Technology: American National Standard for Information Systems—Data Format for the Interchange of Fingerprint, Facial & Other Biometric Information [AN2K11]
x-biometric/x-cbeff-2010	Common Biometric Exchange Formats Framework with Support for Additional Elements [CBEFF2010]

2362

2363 **B.7 ISO / Modality-Specific Formats**

x-biometric/x-iso-19794-2-05	Finger Minutiae Data [BDIF205]
x-biometric/x-iso-19794-3-06	Finger Pattern Spectral Data [BDIF306]
x-biometric/x-iso-19794-4-05	Finger Image Data [BDIF405]
x-biometric/x-iso-19794-5-05	Face Image Data [BDIF505]
x-biometric/x-iso-19794-6-05	Iris Image Data [BDIF605]
x-biometric/x-iso-19794-7-07	Signature/Sign Time Series Data [BDIF707]
x-biometric/x-iso-19794-8-06	Finger Pattern Skeletal Data [BDIF806]
x-biometric/x-iso-19794-9-07	Vascular Image Data [BDIF907]
x-biometric/x-iso-19794-10-07	Hand Geometry Silhouette Data [BDIF1007]

2364

Appendix C. XML Schema (Informative)

The XML Schema for WS-Biometric Devices is presented here for completeness and for the sake of convenience to the reader. The electronic version of this schema is authoritative and can be located at <http://docs.oasis-open.org/biometrics/ns/ws-bd-1.0>

```
<?xml version="1.0"?>
<xs:schema xmlns:wsbd="http://docs.oasis-open.org/biometrics/ns/ws-bd-1.0"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  targetNamespace="http://docs.oasis-open.org/biometrics/ns/ws-bd-1.0"
  elementFormDefault="qualified">

  <xs:element name="configuration" type="wsbd:Dictionary" nillable="true"/>
  <xs:element name="result" type="wsbd:Result" nillable="true"/>

  <xs:complexType name="Result">
    <xs:sequence>

Appendix D. Security (Informative)

D.1 About

This section is an informative appendix that provides security control recommendations for systems that include the use of WS-Biometric Devices.

Security requirements are context and organizational dependent. However, by providing general guidance, the OASIS Biometrics TC hopes to provide a common baseline that can be used to help ensure interoperability among components that leverage WS-Biometric Devices. If the approach to security varies widely among WS-BD enabled components, there is significantly less chance that off-the-shelf products will interoperate. This appendix is not a comprehensive security standard. Therefore, updates to security guidance incorporated by reference should take precedence to any recommendation made here. In addition, security recommendations tend to be continuously updated, evolved, and improved; always seek the latest version of any of the referenced security specifications.

Further, the security controls described here are specific to the WS-Biometric Devices protocols and the components using it. It is assumed controls described here are only part of the overall security posture that a system comprises.

D.2 References

The following references are used in this Appendix and can provide more specific security guidance for the identified technology.

D.3 Overview

WS-Biometric Devices components are only useful in the context of the system within which they participate. Therefore, recommended security controls are defined with respect to two orthogonal characteristics of those enclosing systems:

1. An *overall sensitivity level* of *low* (L), *medium* (M), or *high* (H) defines a set of recommended security controls. These levels roughly, but not directly, correspond to those defined in [SP 800-60]. The 800-60 level accompanies other information as inputs for determining the set of recommended controls specific for WS-BD. For the sake of disambiguation, “L,” “M,” or “H” will refer to a set of controls recommended by this appendix.
2. For each sensitivity level, a set of controls is recommended to be applied at a particular layer of abstraction. For each sensitivity level, recommendations are made for controls to be applied at the *network*, *transport* and/or *application* level. These levels roughly, but not directly, correspond to the network, transport, and application layers defined in the OSI model [OSI].

D.4 Control Set Determination

The following criteria are recommended for helping users and system owners in identifying a recommended set of security controls.

D.4.1 “L” Security Controls Criteria

The set of “L” controls are recommended if, for a given system, each of the following three clauses are true:

1. The system is used in a *non-production* environment **or** has an overall NIST SP 800-60 sensitivity of “Low”
2. All WS-Biometric Devices clients and servers reside within the same trusted network
3. The network that provides the WS-Biometric Devices interconnectivity network is completely isolated **or** otherwise security separated from untrusted networks with a strong buffer such as a comprehensive network firewall.

Examples that may qualify for “L” security controls are the use of WS-Biometric devices:

- In product development, testing, or other research where no real biometric data is stored or captured
- Across physical or logical components that are within an embedded device with other physical or logical controls that make it difficult to access or surreptitiously monitor the channels that carry WS-Biometric Devices traffic.

D.4.2 “M” Security Controls Criteria

The set of “M” controls are recommended if, for a given system, each of the following three clauses are true:

1. The system is used in a *production* environment **or** the system has an overall NIST SP 800-60 sensitivity of “Medium”
2. All WS-Biometric Devices clients and servers reside within the same trusted network

2543 3. The system's network is either completely isolated or otherwise security separated from untrusted
2544 networks with a buffer such as a firewall.

2545 Examples that may qualify for "M" security controls are the use of WS-Biometric devices:

- 2546 • In an identification enrollment station, where WS-Biometric Devices is used as a "wire
2547 replacement" for other less interoperable connectors. The WS-Biometric Devices network could
2548 be composed solely of the enrollment workstation and a biometric device with an Ethernet cable
2549 between them.
- 2550 • In a border screening application in which attended workstations in physically secure locations
2551 are used to submit biometrics to various law enforcement watch lists.

2552 D.4.3 "H" Security Controls Criteria

2553 The set of "H" controls are recommended if the overall system has an NIST SP 800-60 sensitivity of
2554 "High" or if WS-Biometric Devices is used across an untrusted network.

2555 D.5 Recommended & Candidate Security Controls

2556 The following table outlines the candidate & recommended security controls. *Recommended* security
2557 controls are likely to be relevant and beneficial for all systems of a particular category. *Candidate* controls
2558 are those that are likely to more application and implementation specific.

2559 Candidate controls are marked with an asterisk (*). For example, in all "L" systems, any wireless
2560 networking should use WPA-2 Personal with 256-bit strength encryption (or better), and is therefore
2561 *recommended*. However, the use of TLS is a *candidate* since an "L" system might comprise a
2562 communications channel that is physically isolated or otherwise embedded in a system. In that case,
2563 foregoing TLS may be an acceptable tradeoff.

2564 There may be a degree of redundancy among these controls; for example, multiple layers of encryption.
2565 However, using multiple layers of security also affords more granular policy enforcement. For example,
2566 IPSEC may allow the communications among one set of systems, but TLS client certificates would restrict
2567 WS-Biometric Devices communications to a particularly trustworthy subset.

Security Control Set		L	M	H
Network Layer	Wired	None	802.1x and/or IPSEC*	IPSEC
	Wireless	WPA-2 Personal	WPA-2 Enterprise	WPA-2 Enterprise
Transport Layer		TLS [SP 800-52]	TLS [SP 800-52]	TLS with client certificates [SP 800-52]
Application Layer		None	Biometric payload encryption with AES [FIPS 197]*	Full payload encryption with AES [FIPS 197]

2568

2569 D.5.1 "L" Security Controls

2570 **Network.** No network security controls are recommended for wired networks. For wireless networks,
2571 WPA-2, personal or enterprise mode is recommended.

2572 **Transport.** TLS as described in [SP 800-52]; the use of client certificates is optional.

2573 **Application.** No application layer security control is recommended.

2574 **D.5.2 “M” Security Controls**

2575 **Network.** Networks should be secured with 802.1x [802.1x] and/or IPSEC [Error! Reference source not
2576 found.].

2577 **Transport.** TLS as described in [SP 800-52]; the use of client certificates is optional.

2578 **Application.** All biometric data (the contents of a Result’s sensorData) should be encrypted with AES as
2579 described in [FIPS 197] and [SP 800-38A].

2580 **D.5.3 “H” Security Controls**

2581 **Network.** Networks should be secured with an IPSEC [SP 800-77].

2582 **Transport.** TLS with client certificates as described in [SP 800-52].

2583 **Application.** All biometric data (the contents of a Result’s sensorData) should be encrypted with AES as
2584 described in [FIPS 197] and [SP 800-38A].

Appendix E. Acknowledgments (Informative)

The following individuals have participated in the creation of this specification and are gratefully acknowledged:

Participants:

- *Almog Aley-Raz, Nuance*
- Mr. Jeremiah Bruce, US Department of Homeland Security
- *Mr. Doron Cohen, SafeNet, Inc.*
- Robin Cover, OASIS
- Matthias de Haan, Tandent Vision Science, Inc
- *Mr. Francisco Diez-Jimeno, Carlos III University of Madrid*
- Dr. Jeff Dunne, Johns Hopkins University Applied Physics Laboratory
- Mr. Chet Ensign, OASIS
- Mr. Sander Fieten, Individual
- Richard Friedhoff, Tandent Vision Science, Inc
- Bob Gupta, Viometric, LLC
- Emily Jay, NIST
- *Mr. Ken Kamakura, Fujitsu Limited*
- Mr. Kevin Mangold, NIST
- Dr. Ross Micheals, NIST
- *Derek Northrope, Fujitsu Limited*
- *Mr Tony Pham, Bank of America*
- Dr. Raul Sanchez-Reillo, Carlos III University of Madrid
- *Mrs. Dee Schur, OASIS*
- Mr. Jeffrey Shultz, US Department of Defense (DoD)
- Casey Smith, Tandent Vision Science, Inc
- Mr. Kevin Strickland, Tandent Vision Science, Inc
- Cathy Tilton, Daon
- Mr. Ryan Triplett, Booz Allen Hamilton
- *Ms. Maria Vachino, Johns Hopkins University Applied Physics Laboratory*
- *Mr. Steven Venable, Lockheed Martin*
- Anne Wang, 3M HIS
- Youngrock Yoon, Tandent Vision Science, Inc

Authors of initial NIST specification

- Ross J. Micheals
- Kevin Mangold
- Matt Aronoff
- Kristen Greene
- Kayee Kwong
- Karen Marshall

Acknowledgments listed in initial NIST specification

- Biometric Standards Working Group, Department of Defense
- Michael Albright, Vision and Security Technology Laboratory, University of Colorado at Colorado Springs

- 2631 • Senaka Balasuriya, SolidBase Consulting
- 2632 • Terrance Boulton, Vision and Security Technology Laboratory, University of Colorado at Colorado Springs
- 2633
- 2634 • Leslie Collica, Information Technology Laboratory, National Institute of Standards and Technology
- 2635 • Tod Companion, Science & Technology Directorate, Department of Homeland Security
- 2636 • Bert Coursey, Science & Technology Directorate, Department of Homeland Security
- 2637 • Nick Crawford, Government Printing Office
- 2638 • Donna Dodson, Information Technology Laboratory, National Institute of Standards and Technology
- 2639 • Valerie Evanoff, Biometric Center of Excellence, Federal Bureau of Investigation
- 2640 • Rhonda Farrell, Booz Allen Hamilton
- 2641 • Michael Garris, Information Technology Laboratory, National Institute of Standards and Technology
- 2642 • Phillip Griffin, Booz Allen Hamilton
- 2643 • Dwayne Hill, Biometric Standards Working Group, Department of Defense
- 2644 • Rick Lazarick, Computer Sciences Corporation
- 2645 • John Manzo, Biometric Center of Excellence, Federal Bureau of Investigation
- 2646 • Charles Romine, Information Technology Laboratory, National Institute of Standards and Technology
- 2647 • James St. Pierre, Information Technology Laboratory, National Institute of Standards and Technology
- 2648 • Scott Swann, Federal Bureau of Investigation
- 2649 • Ashit Talukder, Information Technology Laboratory, National Institute of Standards and Technology
- 2650 • Cathy Tilton, Daon Inc.
- 2651 • Ryan Triplett, Biometric Standards Working Group, Department of Defense

Appendix F. Revision History (Informative)

Revision	Date	Editor(s)	Changes Made
Working Draft 01	26 March 2013	Ross Micheals	Initial working draft based on NIST specification.
Working Draft 02	06 September 2013	Kevin Mangold, Ross Micheals	Incorporated methods of exposing a live preview endpoint(s). Updated schema namespace.
Working Draft 03	04 March 2014	Kevin Mangold, Ross Micheals	Draft implementation of conformance profiles and security guidance.
Working Draft 04	02 April 2014	Ross Micheals	Completed security guidance appendix.
Working Draft 05	July 2014	Kevin Mangold, Ross Micheals	Harmonized security guidance and appendix; updated security appendix to reflect updated NIST Special Publications.
Working Draft 06	August 2014	Ross Micheals	Completed basic conformance profiles and prepared manuscript for consideration by the TC as a Committee Specification Draft. Corrected minor typos and made minor cosmetic fixes.
Committee Specification Draft 01	September 2014	Ross Micheals	No substantive changes from WD 06
Committee Specification Draft 02	October 2014	Kevin Mangold, Ross Micheals	Made major improvements and clarifications based on public comments, cleaned up document formatting
