Technical Committee:
OASIS Biometric Services (BIOSERV) TC
Chair:
Kevin Mangold (kevin.mangold@nist.gov), NIST
Editors:
Kevin Mangold (kevin.mangold@nist.gov), NIST
Karen Marshall (karen.marshall@nist.gov), NIST

Additional artifacts:
This prose specification is one component of a Work Product that also includes:
- XML schemas: http://docs.oasis-open.org/bioserv/BIAS/v2.0/cs01/schemas/

Related work:
This specification replaces or supersedes:
- Biometric Identity Assurance Services (BIAS) SOAP Profile Version 1.0 Plus Errata 02.

This specification is related to:
  http://www.iso.org/iso/catalogue_detail.htm?csnumber=53228

Declared XML namespace:
- http://docs.oasis-open.org/bioserv/ns/bias-2.0
Abstract:
BIAS defines biometric services used for identity assurance that are invoked over a services-based framework. It is intended to provide a generic set of biometric and identity-related functions and associated data definitions to allow remote access to biometric services.

Status:
This document was last revised or approved by the OASIS Biometric Services (BIOSERV) TC on the above date. The level of approval is also listed above. Check the “Latest version” location noted above for possible later revisions of this document. Any other numbered Versions and other technical work produced by the Technical Committee (TC) are listed at https://www.oasis-open.org/committees/tc_home.php?wg_abbrev=bioserv#technical.

TC members should send comments on this specification to the TC’s email list. Others should send comments to the TC’s public comment list, after subscribing to it by following the instructions at the “Send A Comment” button on the TC’s web page at https://www.oasis-open.org/committees/tc_home.php?wg_abbrev=bioserv/.

This Committee Specification is provided under the RAND Mode of the OASIS IPR Policy, the mode chosen when the Technical Committee was established. For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the TC’s web page (https://www.oasis-open.org/committees/bioserv/ipr.php).

Note that any machine-readable content (Computer Language Definitions) declared Normative for this Work Product is provided in separate plain text files. In the event of a discrepancy between any such plain text file and display content in the Work Product's prose narrative document(s), the content in the separate plain text file prevails.

Citation format:
When referencing this specification the following citation format should be used:

1 Introduction

1.0 IPR Policy

This Committee Specification is provided under the RAND Mode of the OASIS IPR Policy, the mode chosen when the Technical Committee was established.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the TC’s web page (https://www.oasis-open.org/committees/bioserv/ipr.php).

1.1 Purpose/Scope

This Organization for the Advancement of Structured Information Standards (OASIS) Biometric Identity Assurance Services (BIAS) profile specifies how to use the eXtensible Markup Language (XML) [XML10] defined in ISO/IEC 30108-1:2015, Information technology — Biometric Identity Assurance Services [ISO/IEC-BIAS] to invoke Simple Object Access Protocol (SOAP) -based services that implement BIAS operations. These SOAP-based services enable an application to invoke biometric identity assurance operations remotely in a Services Oriented Architecture (SOA) infrastructure.

Not included in the scope of BIAS is the incorporation of biometric authentication as an integral component of an authentication or security protocol. (However, BIAS services may be leveraged to implement biometric authentication in the future.)

1.2 Overview

In addition to this introduction, this standard includes the following:

- Clause 2 presents the design concepts and architecture for invoking SOAP-based services that implement BIAS operations.
- Clause 3 presents the namespaces necessary to implement this profile, ISO/IEC BIAS data elements, and identifies relationships to external data definitions.
- Clause 4 specifies the content of the BIAS messages.
- Clause 5 presents the BIAS message structure, as well as rules and considerations for its application.
- Clause 6 presents information on error handling.
- Clause 7 specifies conformance requirements.
- Annexes include the OASIS BIAS XML schema/sample Web Service Definition Language (WSDL), use cases, sample code, acknowledgements, and the revision history of this profile.

1.3 Background

In late 2005/early 2006, a gap was identified in the existing biometric standards portfolio with respect to biometric services. The Biometric Identity Assurance Services standard proposal was for a collaborative effort between government and private industry to provide a services-based framework for delivering identity assurance capabilities, allowing for platform and application independence. This standard proposal required the attention of two major technical disciplines: biometrics and service architectures. The expertise of both disciplines was required to ensure the standard was technically sound, market relevant, and achieved widespread adoption. The International Standards Organization and the International Electrotechnical Commission (ISO/IEC) provided the standards leadership relevant to biometrics, defining the “taxonomy” of biometric operations and data elements. OASIS provided the standards leadership relevant to service architectures with an initial focus on web services, defining the schema and SOAP messaging.
The driving requirements of the BIAS standard proposal were to provide the ability to remotely invoke biometric operations across an SOA infrastructure; to provide business level operations without constraining the application/business logic that implements those operations; to be as generic as possible — technology, framework, & application domain independent; and to provide basic capabilities that can be used to construct higher level, aggregate/composite operations.

1.4 Relationship to Other Standards

This OASIS BIAS profile comprises a companion standard to ISO/IEC 30108-1:2015, Information technology — Biometric Identity Assurance Services, which defines the BIAS requirements and taxonomy, specifying the identity assurance operations and the associated data elements. This OASIS BIAS profile specifies the design concepts and architecture, data model and data dictionary, message structure and rules, and error handling necessary to invoke SOAP-based services that implement BIAS operations.

Together, the BIAS standard and the BIAS profile provide an open framework for deploying and remotely invoking biometric-based identity assurance capabilities that can be readily accessed across an SOA infrastructure.

This relationship allows the leveraging of the biometrics and web services expertise of the two standards development organizations. Existing standards are available in both domains and many of these standards will provide the foundation and underlying capabilities upon which the biometric services depend.

1.5 Terminology

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in [RFC2119].

The following additional terms and definitions are used:

Note: The terms and definitions specified in ISO/IEC 30801-1 [ISO/IEC-BIAS] also apply to this Standard.

BIAS operation and data element names are not defined here, but in their respective sections.
Simple Object Access Protocol
SSL
Secure Sockets Layer
TLS
Transport Layer Security
UDDI
Universal Description, Discovery, and Integration
URI
Uniform Resource Identifier
VPN
Virtual Private Network
WSDL
Web Services Description Language
WSS
Web Services Security
XML
eXtensible Markup Language
CBEFF
Common Biometric Exchange Formats Framework - data elements and BIR formats specified in ISO/IEC 19785-1
BIAS implementation
software entity that is capable of creating, processing, sending, and receiving BIAS messages
BIAS endpoint
runtime entity, identified by an endpoint URI/IRI, capable of sending and receiving BIAS messages, and containing a running BIAS implementation
BIAS message
message that can be sent from a BIAS endpoint to another BIAS endpoint through a BIAS link channel
BIAS request message
BIAS message conveying a request for an action to be performed by the receiving BIAS endpoint
BIAS response message
BIAS message conveying a response to a prior BIAS request message

Design Concepts and Architecture (non-normative)

2.1 Philosophy

Rather than define a totally new and unique messaging protocol for biometric services, this specification instead defines a method for using existing biometric and Web services standards to exchange biometric data and perform biometric operations.

2.2 Context

Today, biometric systems are being developed which collect, process, store and match biometric data for a variety of purposes. In many cases, data and/or capabilities need to be shared between systems or systems serve a number of different client stakeholders. As architectures move towards services-based frameworks, access to these biometric databases and services is via a Web services front-end. However, lack of standardization in this area has led implementers to develop customized services for each system/application.

BIAS is intended to provide a common, yet flexible, Web services interface that can be used within both closed and open SOA systems. Figure 1, below, depicts the context in which the BIAS messages will be implemented.

Figure 1. BIAS Context

The clients (requesters) may use standard discovery mechanisms (i.e., UDDI directories) to discover the BIAS service provider (implementation) or, particularly in closed systems, the URI/IRI and WSDL for the service provider may be known a priori by the client BIAS application developer.

2.3 Architecture

BIAS Web services are intended to be used within systems employing a services framework, such as a services-oriented architecture (SOA) (although implementations are not limited to this environment). As such, it is recognized that the clients may interact directly with the BIAS service provider or layers may exist between the client and the service provider, for example as an ESB or other application layer.

The BIAS Architecture as shown in Figure 2, in which:
A Client request to the BIAS Web services may be triggered by a human interaction OR any proxy system such as an ESB.

- Client sends and receives SOAP messages that conform to the BIAS schemas
- Calls to the BIAS implementation use OASIS Service Interfaces and Bindings (via WSDL)
- The BIAS implementation maps the service call to the appropriate internal API or set of APIs and returns data according to the service interface.

Note that services are represented as circles.

![Diagram of BIAS Architecture](image)

**Figure 2. Representative BIAS Architecture**

**NOTE:** It is possible that BIAS may also be used between the service provider and the managed resource (e.g., a biometric matcher).

At the heart of the BIAS SOAP Profile are the concepts of BIAS messages and endpoints.

**BIAS implementation**

A BIAS implementation is a software entity that is capable of creating, processing, sending, and receiving BIAS messages. This standard does not define requirements for the BIAS implementation other than defining the messages and protocols used by the endpoints.

**BIAS messages**
A BIAS message is a one that can be sent from a BIAS endpoint to another BIAS endpoint over a TCP/IP link.

**BIAS endpoints**

A BIAS endpoint is a runtime entity, uniquely identified and accessed by an endpoint URI/IRI [URI] [IRI], capable of sending and receiving BIAS messages.

NOTE: When not publicly and directly exposed, the endpoints for purposes of this specification are the BIAS service provider exposing BIAS services and the component that directly interacts with that service provider, e.g., the business application or ESB, rather than the ultimate end client requester.
3 Data Dictionary

This section describes the BIAS data elements used within BIAS messages (as defined in Clause 4).

Common data elements are defined for use in one or more operations. These include common data types
or return codes. BIAS data elements are defined in ISO/IEC 30108-1. The elements, complex types and
simple types described for the BIAS messages belong to the following namespace: http://docs.oasis-
open.org/bias/ns/bias-2.0/. See Annex A for the XML schema.

NOTE: Biographic and biometric data included in a native XML format MAY contain elements
referencing external namespaces (e.g., ansi-nist).

3.1 Documentation Conventions

Each common element has a section describing its content. Likewise, each operation has a section
describing the request and response messages and the associated input and output parameters. The
input and output of each message and the comment elements are detailed in a table as described in the
figure below. Each field that forms part of the message request/response is detailed in the table.

<table>
<thead>
<tr>
<th>Header Name</th>
<th>Description</th>
<th>Values</th>
<th>Value Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>The name of the field.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Type</td>
<td>The XML schema type of the field.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>#</td>
<td>The cardinality of the field</td>
<td>1</td>
<td>One occurrence</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0..1</td>
<td>Zero or one occurrence</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0..*</td>
<td>Zero or more occurrences</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1..*</td>
<td>One or more occurrences</td>
</tr>
<tr>
<td>?</td>
<td>Defines if the field must be present.</td>
<td>Y</td>
<td>Yes – is always required</td>
</tr>
<tr>
<td></td>
<td></td>
<td>N</td>
<td>No – is not always required, an optional field.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>C</td>
<td>Conditional – requirement is dependent on system or message conditions.</td>
</tr>
<tr>
<td>Meaning</td>
<td>Gives a short description of the field’s use</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Figure 3. BIAS Message Input/Output Dictionary Table Headings

Fields Hierarchy Explained:

To denote the field hierarchy the symbol \( \uparrow \) is used to denote the child-of relationship.

3.2 Common Elements

3.2.1 ApplicationIdentifier

<table>
<thead>
<tr>
<th>Type:</th>
<th>string</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description:</td>
<td>Identifies an application.</td>
</tr>
<tr>
<td>Min Length:</td>
<td>1</td>
</tr>
<tr>
<td>Max Length:</td>
<td>255</td>
</tr>
</tbody>
</table>

3.2.2 ApplicationUserIdentifier

<table>
<thead>
<tr>
<th>Type:</th>
<th>string</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description:</td>
<td>Identifies an application user or instance.</td>
</tr>
<tr>
<td>Min Length:</td>
<td>1</td>
</tr>
<tr>
<td>Max Length:</td>
<td>255</td>
</tr>
</tbody>
</table>

3.2.3 BaseBIRType

<table>
<thead>
<tr>
<th>Type:</th>
<th>Schema complexType</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description:</td>
<td>Base type for all BIR subtypes; see BinaryBIR, URI_BIR, and XML_BIR for currently available types.</td>
</tr>
</tbody>
</table>

3.2.4 BIASBiometricDataType

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>BIASBiometricDataType</td>
<td></td>
<td></td>
<td></td>
<td>Wraps the various BIAS biometric types. The operations that use this type specify which elements are required.</td>
</tr>
<tr>
<td>↑ BIRList</td>
<td>CBEFF_BIR_ListType</td>
<td>0..1</td>
<td>N</td>
<td>A list of CBEFF-BIR elements.</td>
</tr>
<tr>
<td>↑ BIR</td>
<td>CBEFF_BIR_Type</td>
<td>0..1</td>
<td>N</td>
<td>Contains biometric information in either a non-XML or an XML representation.</td>
</tr>
<tr>
<td>↑ InputBIR</td>
<td>CBEFF_BIR_Type</td>
<td>0..1</td>
<td>N</td>
<td>Maps to specific ISO/IEC BIAS elements as required by that specification.</td>
</tr>
<tr>
<td>↑ ReferenceBIR</td>
<td>CBEFF_BIR_Type</td>
<td>0..1</td>
<td>N</td>
<td>Maps to specific ISO/IEC BIAS elements as required by that specification.</td>
</tr>
<tr>
<td>↑ BiometricDataList</td>
<td>BiometricDataListType</td>
<td>0..1</td>
<td>N</td>
<td>A list of biometric data elements.</td>
</tr>
</tbody>
</table>
### 3.2.5 BIASFaultCode

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>String</td>
<td>Error code referenced in a SOAP fault.</td>
</tr>
</tbody>
</table>

#### BIASFaultCode Enumeration Values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNKNOWN_ERROR</td>
<td>The service failed for an unknown reason.</td>
</tr>
<tr>
<td>UNSUPPORTED_CAPABILITY</td>
<td>A requested capability is not supported by the service implementation.</td>
</tr>
<tr>
<td>INVALID_INPUT</td>
<td>The data in a service input parameter is invalid.</td>
</tr>
<tr>
<td>BIR_QUALITY_ERROR</td>
<td>Biometric sample quality is too poor for the service to succeed.</td>
</tr>
<tr>
<td>INVALID_BIR</td>
<td>The input BIR is empty or in an invalid or unrecognized format.</td>
</tr>
<tr>
<td>BIR_SIGNATURE_FAILURE</td>
<td>The service could not validate the signature, if used, on the input BIR.</td>
</tr>
<tr>
<td>BIR_DECRIPTION_FAILURE</td>
<td>The service could not decrypt an encrypted input BIR.</td>
</tr>
<tr>
<td>INVALID_ENCOUNTER_ID</td>
<td>The input encounter ID is empty or in an invalid format.</td>
</tr>
<tr>
<td>INVALID_SUBJECT_ID</td>
<td>The input subject ID is empty or in an invalid format.</td>
</tr>
<tr>
<td>UNKNOWN_SUBJECT</td>
<td>The subject referenced by the input subject ID does not exist.</td>
</tr>
<tr>
<td>UNKNOWN_GALLERY</td>
<td>The gallery referenced by the input gallery ID does not exist.</td>
</tr>
<tr>
<td>UNKNOWN_ENCOUNTER</td>
<td>The encounter referenced by the input encounter ID does not exist.</td>
</tr>
<tr>
<td>UNKNOWN_BIOGRAPHIC_FORMAT</td>
<td>The biographic data format is not known or not supported.</td>
</tr>
<tr>
<td>UNKNOWN_IDENTITY_CLAIM</td>
<td>The identity referenced by the input identity claim does not exist.</td>
</tr>
<tr>
<td>INVALID_IDENTITY_CLAIM</td>
<td>The identity claim requested is already in use.</td>
</tr>
<tr>
<td>NONEXISANT_DATA</td>
<td>The data requested for deletion does not exist.</td>
</tr>
<tr>
<td>UNKNOWN_DOCUMENT_CATEGORY</td>
<td>The data requested does not exist.</td>
</tr>
<tr>
<td>INVALID_TOKEN</td>
<td>The data requested does not exist.</td>
</tr>
<tr>
<td>TOKEN_EXPIRED</td>
<td>The data requested does not exist.</td>
</tr>
<tr>
<td>DUPLICATE_ENCOUNTER</td>
<td>The input encounter ID for a new encounter already exists for that subject.</td>
</tr>
<tr>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>IDENTIFICATION_RESULT_NOT_YET_AVAILABLE</td>
<td>The result of an asynchronous identification process is not yet available.</td>
</tr>
</tbody>
</table>

### 3.2.6 BIASFaultDetail

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>BIASFaultDetail</td>
<td></td>
<td>Y</td>
<td></td>
<td>Defines the error information associated with a SOAP fault.</td>
</tr>
<tr>
<td>BIASFaultType</td>
<td>BIASFaultCode</td>
<td>1</td>
<td>Y</td>
<td>References an error code.</td>
</tr>
<tr>
<td>BIASFaultMessage</td>
<td>string</td>
<td>1</td>
<td>Y</td>
<td>Provides a brief explanation of the fault.</td>
</tr>
<tr>
<td>BIASFaultDescription</td>
<td>string</td>
<td>0..1</td>
<td>N</td>
<td>Provides detailed information about a BIAS fault, such as trace details.</td>
</tr>
</tbody>
</table>

### 3.2.7 BIASIdentity

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>BIASIdentity</td>
<td></td>
<td>Y</td>
<td></td>
<td>Defines a single element for encapsulating the data associated with an Identity. Includes the Identity’s reference identifiers, biographic data, and biometric data. The operations that use this type specify which elements are required.</td>
</tr>
<tr>
<td>SubjectID</td>
<td>BIASIDType</td>
<td>0..1</td>
<td>C</td>
<td>A system unique identifier for a subject. Required as input to many operations.</td>
</tr>
<tr>
<td>IdentityClaim</td>
<td>BIASIDType</td>
<td>0..1</td>
<td>N</td>
<td>An identifier by which a subject is known to a particular gallery or population group.</td>
</tr>
<tr>
<td>EncounterID</td>
<td>BIASIDType</td>
<td>0..1</td>
<td>C</td>
<td>The identifier of an encounter associated with the subject. Required for encounter-centric models.</td>
</tr>
<tr>
<td>EncounterList</td>
<td>EncounterListType</td>
<td>0..1</td>
<td>N</td>
<td>A list of encounters associated with a subject.</td>
</tr>
<tr>
<td>BiographicData</td>
<td>BiographicDataType</td>
<td>0..1</td>
<td>N</td>
<td>An Identity’s biographic data.</td>
</tr>
<tr>
<td>BiometricData</td>
<td>BIASBiometricDataType</td>
<td>0..1</td>
<td>N</td>
<td>An Identity’s biometric data.</td>
</tr>
</tbody>
</table>
### 3.2.8 BIASIDType

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>BIASIDType</td>
<td>string</td>
<td></td>
<td></td>
<td>A BIAS Identifier.</td>
</tr>
</tbody>
</table>

### 3.2.9 BinaryBIR

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>BinaryBIR</td>
<td>BaseBIRTType</td>
<td>Y</td>
<td></td>
<td>Defines a BIR type of Binary</td>
</tr>
<tr>
<td></td>
<td>base64Binary</td>
<td>1</td>
<td>Y</td>
<td>BIR information in base64 binary format</td>
</tr>
</tbody>
</table>

### 3.2.10 BiographicDataItemType

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>BiographicDataItemType</td>
<td>Y</td>
<td></td>
<td>Defines a single biographic data element.</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>string</td>
<td>1</td>
<td>Y</td>
<td>The name of the biographic data item.</td>
</tr>
<tr>
<td>Type</td>
<td>string</td>
<td>1</td>
<td>Y</td>
<td>The data type for the biographic data item.</td>
</tr>
<tr>
<td>Value</td>
<td>string</td>
<td>0..1</td>
<td>N</td>
<td>The value assigned to the biographic data item.</td>
</tr>
</tbody>
</table>

**NOTE:** This element can be used to transmit scanned identity documents or document information (e.g., passports, driver’s license, birth certificates, utility bills, etc. required to establish an identity).

### 3.2.11 BiographicDataItemListType

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>BiographicDataItemListType</td>
<td>Y</td>
<td></td>
<td>Defines a list of biographic data elements.</td>
<td></td>
</tr>
<tr>
<td>BiographicDataItem</td>
<td>BiographicDataItemType</td>
<td>1..*</td>
<td>Y</td>
<td>Data structure containing information about a biographic record.</td>
</tr>
</tbody>
</table>

### 3.2.12 BiographicDataListType

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>BiographicDataListType</td>
<td>Y</td>
<td></td>
<td>Defines a list of biographic data.</td>
<td></td>
</tr>
<tr>
<td>BiographicData</td>
<td>BiographicDataType</td>
<td>0..*</td>
<td>N</td>
<td>Data structure containing information about a biographic record.</td>
</tr>
</tbody>
</table>

### 3.2.13 BiographicDataSetType

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>BiographicDataSetType</td>
<td>Y</td>
<td></td>
<td>Defines a set of biographic data that is formatted according to the specified format.</td>
<td></td>
</tr>
<tr>
<td>Field</td>
<td>Type</td>
<td>#</td>
<td>?</td>
<td>Meaning</td>
</tr>
<tr>
<td>---------</td>
<td>------------</td>
<td>---</td>
<td>---</td>
<td>---------</td>
</tr>
<tr>
<td>name</td>
<td>string</td>
<td>1</td>
<td>Y</td>
<td>The name of the biographic data format. Use these names for common formats: FBI-EFTS [EFTS], FBI-EBTS [EBTS-FBI], DOD-EBTS [EBTS-DOD], INT-I [INT-I], NIEM [NIEM], xNAL [xNAL], HR-XML [HR-XML].</td>
</tr>
<tr>
<td>version</td>
<td>string</td>
<td>0..1</td>
<td>N</td>
<td>The version of the biographic data format (e.g., “7.1” for FBI-EFTS or “2.0” for NIEM).</td>
</tr>
<tr>
<td>type</td>
<td>string</td>
<td>1</td>
<td>Y</td>
<td>The biographic data format type. Use these types for common formats: ASCII (e.g., for non-XML versions of FBI-EFTS, FBI-EBTS, DOD-EBTS, or INT-I), XML (e.g., for NIEM, xNAL, and HR-XML or future versions of FBI-EBTS).</td>
</tr>
<tr>
<td>unspecified</td>
<td>any</td>
<td>0..*</td>
<td>N</td>
<td>Biographic data formatted according to a specific format.</td>
</tr>
</tbody>
</table>

NOTE: Biographic data formats are not limited to those listed. The string value is not enumerated. If one of the common types are used, it MUST be indicated by the specified name values; however, the service provider MAY offer other formats. See ISO/IEC 30108 for further information.

### 3.2.14 BiographicDataType

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>BiographicDataType</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>LastName</td>
<td>string</td>
<td>0..1</td>
<td>N</td>
<td>The last name of a subject.</td>
</tr>
<tr>
<td>FirstName</td>
<td>string</td>
<td>0..1</td>
<td>N</td>
<td>The first name of a subject.</td>
</tr>
<tr>
<td>BiographicDataItemList</td>
<td>BiographicDataItemListType</td>
<td>0..1</td>
<td>N</td>
<td>A list of biographic data elements.</td>
</tr>
<tr>
<td>BiographicDataItem</td>
<td>BiographicDataItemType</td>
<td>1..*</td>
<td>Y</td>
<td>A single biographic data element.</td>
</tr>
<tr>
<td>BiographicDataSet</td>
<td>BiographicDataSetType</td>
<td>0..1</td>
<td>N</td>
<td>A set of biographic data information.</td>
</tr>
</tbody>
</table>

NOTE: The implementer is given three choices for encoding biographic data:

- Encode only first and last name using the defined fields within BiographicDataType
- Define a list of biographic data elements using the BiographicDataItemListType
• Use a pre-defined set of biographic data (e.g., as specified in another standard) using the BiographicDataSetType.

See also ISO/IEC 30108-1, section 8.1 for further information.

### 3.2.15 BiometricDataType

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>BiometricDataType</td>
<td></td>
<td>Y</td>
<td></td>
<td>Provides descriptive information about biometric data, such as the biometric type, subtype, and format, contained in the BDB of the CBEFF-BIR.</td>
</tr>
<tr>
<td>BiometricType</td>
<td>oasis_cbeff:MultipleTypesType</td>
<td>1</td>
<td>Y</td>
<td>The type of biological or behavioral data stored in the biometric record, as defined by CBEFF.</td>
</tr>
<tr>
<td>BiometricTypeCount</td>
<td>positiveInteger</td>
<td>0..1</td>
<td>N</td>
<td>The number of biometric records having the biometric type recorded in the biometric type field.</td>
</tr>
<tr>
<td>BiometricSubType</td>
<td>oasis_cbeff:SubtypeType</td>
<td>0..1</td>
<td>N</td>
<td>More specifically defines the type of biometric data stored in the biometric record, as defined by CBEFF.</td>
</tr>
<tr>
<td>BDBFormatOwner</td>
<td>positiveInteger</td>
<td>1</td>
<td>Y</td>
<td>Identifies the standards body, working group, industry consortium, or other CBEFF biometric organization that has defined the format for the biometric data.</td>
</tr>
<tr>
<td>BDBFormatType</td>
<td>positiveInteger</td>
<td>1</td>
<td>Y</td>
<td>Identifies the specific biometric data format specified by the CBEFF biometric organization recorded in the BDB Format Owner field.</td>
</tr>
</tbody>
</table>

### 3.2.16 BiometricDataListType

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>BiometricDataListType</td>
<td></td>
<td>Y</td>
<td></td>
<td>A list of biometric data elements.</td>
</tr>
<tr>
<td>BiometricDataRecord</td>
<td>BiometricDataType</td>
<td>0..*</td>
<td>N</td>
<td>Data structure containing information about a biometric record.</td>
</tr>
</tbody>
</table>
### 3.2.17 CandidateListResultType

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CandidateListResultType</td>
<td></td>
<td>Y</td>
<td></td>
<td>Defines a set of candidates, utilizing the CandidateType to represent each element in the set.</td>
</tr>
<tr>
<td>🡁 CandidateList</td>
<td>CandidateListType</td>
<td>1</td>
<td>Y</td>
<td>The candidate list.</td>
</tr>
</tbody>
</table>

### 3.2.18 CandidateListType

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CandidateListType</td>
<td></td>
<td>Y</td>
<td></td>
<td>Defines a set of candidates, utilizing the CandidateType to represent each element in the set.</td>
</tr>
<tr>
<td>🡁 Candidate</td>
<td>CandidateType</td>
<td>0..*</td>
<td>N</td>
<td>A single candidate.</td>
</tr>
</tbody>
</table>

### 3.2.19 CandidateType

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CandidateType</td>
<td></td>
<td>Y</td>
<td></td>
<td>Defines a single candidate as a possible match in response to a biometric identification request.</td>
</tr>
<tr>
<td>🡁 ScoreList</td>
<td></td>
<td>0..1</td>
<td>N</td>
<td>A list of comparison(s) scores and optionally the type and subtype of the relating biometric</td>
</tr>
<tr>
<td>🡁 Score</td>
<td>ScoreType</td>
<td>1</td>
<td>Y</td>
<td>The match score.</td>
</tr>
<tr>
<td>🡁 Rank</td>
<td>integer</td>
<td>1</td>
<td>Y</td>
<td>The rank of the candidate in relation to other candidates for the same biometric identification operation.</td>
</tr>
<tr>
<td>🡁 Identity</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>SubjectID</td>
<td>BIASIDType</td>
<td>0..1</td>
<td>Y</td>
<td>The identifier of the subject.</td>
</tr>
<tr>
<td>BiographicData</td>
<td>BiographicDataType</td>
<td>0..1</td>
<td>N</td>
<td>Biographic data associated with the candidate match.</td>
</tr>
<tr>
<td>BIRList</td>
<td>CBEFF_BIR_ListType</td>
<td>1</td>
<td>Y</td>
<td>Biometric data associated with the candidate match.</td>
</tr>
</tbody>
</table>

### 3.2.20 CapabilityListType

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CapabilityListType</td>
<td></td>
<td>Y</td>
<td></td>
<td>Defines a set of capabilities.</td>
</tr>
<tr>
<td>🡁 Capability</td>
<td>CapabilityType</td>
<td>0..*</td>
<td>N</td>
<td>A single capability.</td>
</tr>
</tbody>
</table>
### 3.2.21 CapabilityName

<table>
<thead>
<tr>
<th>Type</th>
<th>string</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>A list of capability items.</td>
</tr>
</tbody>
</table>

#### CapabilityName Enumeration Values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AggregateInputDataOptional</td>

</table>
| MatchScore         | Identifies the use of match scores returned by the implementing system.  

The Capability Value shall be set to the end-of-score-range that signifies a match.  

The Capability Supporting Value shall be set to the end-of-score-range that signifies a no-match.  

The Capability Additional Info shall be set to the biometric type (defined by the XML Patron Format in ISO/IEC 19785-3) that corresponds to the match score range. |
| QualityAlgorithm   | A quality algorithm vendor and algorithm vendor product ID supported by the implementing system.  

The Capability Value shall contain the algorithm vendor.  

The Capability Supporting Value shall contain the algorithm vendor product ID.  

The Capability Additional Info shall be set to the biometric type (defined by the XML Patron Format in ISO/IEC 19785-3) that corresponds to the quality algorithm.  

The Capability Description shall contain the software version of the quality algorithm. |
| SupportedBiometric | A biometric type supported by the implementing system.  

The Capability Value shall be set to the biometric type, as defined by the ZML Patron Format in ISO/IEC 19785-3 (for example, the biometric type for face is represented a “face”).  

The Capability Supporting Value shall indicate if the implementing system supports matching for the biometric type, using one of the following values:  

“1” (identification)  
“2” (verification)  
“3” (identification and verification)  
“4” (no comparison supported) |

<td>0..1</td>
<td>N</td>
<td>Contains information about the security block, if used, in a simple CBEFF-BIR.</td>
</tr>
<tr>
<td>BIR</td>
<td>BaseBIRType</td>
<td>1</td>
<td>Y</td>
<td>One of the following sub-elements must be present: BinaryBIR, URI_BIR, or XML_BIR.</td>
</tr>
</tbody>
</table>

NOTE: The implementer is given three choices for encoding a BIR:

- As an XML BIR (following the XML Patron format as specified in Annex B)
- As a reference to a URI (from which the receiver would retrieve the actual BIR)
- As a complete Base64 encoded binary (non-XML) BIR.

The latter two alternatives can use any CBEFF Patron Format. The optional BIR Information provides a mechanism for exposing metadata associated with a BIR format that is not easily decoded (i.e., a non-XML BIR). See section 5.3 for more information on handling of binary data within BIAS and ISO/IEC 30108, Clause 8.2, for more information on representing biometric data.

NOTE:

(1) XML BIRs MUST conform to the XML patron format in Annex B; however, non-XML (binary) and URI BIRs MAY implement any CBEFF patron format.

(2) It is RECOMMENDED that only registered CBEFF patron formats be used; however, in closed systems, this may not be required.

### 3.2.25 Classification

**Type:** string

**Description:** The result of a classification.

### 3.2.26 ClassificationAlgorithmType

**Type:** string

**Description:** Type of classification algorithm that was used to perform the classification.

<td>VendorIdentifier</td>
<td>1</td>
<td>Y</td>
<td>The vendor of the quality algorithm used to determine the quality score.</td>
</tr>
<tr>
<td>AlgorithmVendorProductID</td>
<td>ProductID</td>
<td>1</td>
<td>Y</td>
<td>The vendor's ID for the algorithm used to determine the quality.</td>
</tr>
<tr>
<td>AlgorithmVersion</td>
<td>VersionType</td>
<td>0..1</td>
<td>N</td>
<td>The version of the algorithm used to determine the quality.</td>
</tr>
</tbody>
</table>

### 3.2.47 ResponseStatus

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ResponseStatus</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Return</td>
<td>ReturnCode</td>
<td>1</td>
<td>Y</td>
<td>The return code indicates the return status of the operation.</td>
</tr>
<tr>
<td>Message</td>
<td>string</td>
<td>0..1</td>
<td>N</td>
<td>A short message corresponding to the return code.</td>
</tr>
</tbody>
</table>

### 3.2.48 ReturnCode

**Type:** unsignedLong  
**Description:** Return value specifying success or other condition.

#### ReturnCode Enumeration Values

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Success</td>
</tr>
</tbody>
</table>

### 3.2.49 ScoreType

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ScoreType</td>
<td></td>
<td></td>
<td></td>

<td>Defines a BIR type of Binary</td>
</tr>
<tr>
<td>↑ XML</td>
<td>Oasis_cbeff:BIRTType</td>
<td>1</td>
<td>Y</td>
<td>BIR information in XML format</td>
</tr>
</tbody>
</table>
4 BIAS Messages

This section describes the BIAS messages implementing BIAS operations as defined in ISO/IEC 30108-1:2015. The operations are listed alphabetically, with each operation containing a request and a response message. The tables follow the conventions described in section 3.1.

4.1 Primitive Operations

4.1.1 AddSubjectToGallery

AddSubjectToGalleryRequest
AddSubjectToGalleryResponse

The AddSubjectToGallery operation registers a subject to a given gallery or population group. As an OPTIONAL parameter, the value of the claim to identity by which the subject is known to the gallery MAY be specified. This claim to identity MUST be unique across the gallery. If no claim to identity is specified, the subject ID (assigned with the CreateSubject operation) will be used as the claim to identity. In the encounter-centric model, the encounter ID associated with the subject’s biometrics that will be added to the gallery MUST be specified. Additionally, the service provider implementation is responsible for the creation and management of galleries. For this purpose, services are not exposed to the requester.

Request Message

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>AddSubjectToGallery</td>
<td></td>
<td></td>

<td>A short message corresponding to the return code.</td>
</tr>
</tbody>
</table>
The CheckQuality operation returns a quality score for a given biometric or a specified subject. Either a biometric sample or a subject ID MUST be provided. The biometric input is provided in a CBEFF basic structure or CBEFF record, which in this specification is called a CBEFF-BIR. The algorithm vendor and algorithm vendor product ID MAY be optionally provided in order to request a particular algorithm’s use in calculating the biometric quality. If an algorithm vendor is provided, then the algorithm vendor product ID is REQUIRED. If no algorithm vendor is provided, the implementing system will provide the algorithm vendor and algorithm vendor product ID that were used to calculate the biometric quality as output parameters.

Algorithm Vendors are registered with the ISO Biometric Registration Authority. They are assigned unique identifiers as outlined in ISO/IEC 19785-2. Algorithm Product IDs are assigned by the registered algorithm vendor.

4.1.3 ClassifyBiometricData

ClassifyBiometricDataRequest

ClassifyBiometricDataResponse

The ClassifyBiometricData operation attempts to classify a biometric sample. For example, a fingerprint biometric sample may be classified as a whorl, loop, or arch (or other classification classes and subclasses). If no classification algorithm is input, then the BIAS service provider will make the selection.

To obtain the types of classification algorithms and classes, see the QueryCapabilities operation.

4.1.4 CreateEncounter

CreateEncounterRequest

CreateEncounterResponse

The CreateEncounter operation creates a new encounter record for a subject and associates an encounter ID to that record. If an encounter ID is not supplied by the requester, the service generates an encounter ID that uniquely identifies the encounter within the subject record. The CreateEncounter operation is performed prior to a SetBiographicData, SetBiometricData, or SetDocumentData operation.

In encounter mode, for match operations, the BIAS service provider will create the encounter and will set the encounter type to “recognition”. Normally the BIAS implementation will assign the encounter ID. However, if a requester assigns the encounter ID, it should be used unless it duplicates an existing encounter ID. If that happens an error should be returned.

**4.1.5 CreateSubject**

The CreateSubject operation creates a new subject record and associates a subject ID to that record. As an optional parameter, the subject ID MAY be specified by the caller. If no subject ID is specified, the CreateSubject operation will generate one. UUIDs should be used for Subject IDs when universal uniqueness is required.

### DeleteBiographicData

4.1.6 DeleteBiographicDataRequest

4.1.6 DeleteBiographicDataResponse

The DeleteBiographicData operation erases all of the biographic data associated with a given subject record. In the encounter-centric model the operation erases all of the biographic data associated with a given encounter, and therefore the encounter ID MUST be specified. If no encounter ID is specified, or it is null, biographic data will be removed from all encounters. If a gallery is specified, biographic data will be deleted from that gallery only.
When deleting data, BIAS implementations MAY completely erase the information in order to prevent the
ability to reconstruct a record in whole or in part, or they MAY track and record the deleted information for
auditing and/or quality control purposes.

4.1.7 DeleteBiometricData

The DeleteBiometricData operation erases all of the biometric data associated with a given subject record. In the encounter-centric model the operation erases all of the biometric data associated with a given encounter, and therefore the encounter ID MUST be specified. If no encounter ID is specified, or it is null, biometric data will be removed from all encounters. If a gallery is specified, biometric data will be deleted from that gallery only. If a biometric type(s) is specified, then only biometric data of that type will be deleted.

When deleting data, BIAS implementations MAY completely erase the information in order to prevent the ability to reconstruct a record in whole or in part, or they MAY track and record the deleted information for auditing and/or quality control purposes.

4.1.8 DeleteDocumentData

DeleteDocumentDataRequest
DeleteDocumentDataResponse
The DeleteDocumentData operation erases all of the document data of the specified category(ies) associated with a given subject record. In the encounter-centric model the service erases all of the
document data associated with a given encounter, and therefore the encounter ID MUST be specified. If no
encounter ID is specified, or it is null, document data will be removed from all encounters. If no
categories are specified, then all categories (for the specified encounters) will be deleted.

When deleting data, BIAS implementations MAY completely erase the information in order to prevent the
ability to reconstruct a record in whole or in part, or they may track and record the deleted information for
auditing and/or quality control purposes.

### 4.1.10 DeleteSubject

#### DeleteSubjectRequest

#### DeleteSubjectResponse

The DeleteSubject operation deletes an existing subject record and, in an encounter-centric model, any associated encounter information from the system. This operation also removes the subject from any registered galleries.

When deleting a subject, BIAS implementations MAY completely erase the subject information in order to prevent the ability to reconstruct a record or records in whole or in part, or they MAY track and record the deleted information for auditing and/or quality control purposes.

526 4.1.11 DeleteSubjectFromGallery

527 DeleteSubjectFromGalleryRequest

528 DeleteSubjectFromGalleryResponse
The DeleteSubjectFromGallery operation removes the registration of a subject from a gallery or population group. The subject is identified by either the subject ID or the claim to identity that was specified in the AddSubjectToGallery operation.

### 4.1.12 GetIdentifySubjectResults

- **GetIdentifySubjectResultsRequest**
- **GetIdentifySubjectResultsResponse**

The GetIdentifySubjectResults operation retrieves the identification results for the specified token. This operation is used in conjunction with the IdentifySubject operation. If the IdentifySubject operation is implemented as an asynchronous service, the implementing system returns a token and the GetIdentifySubjectResults operation is used to poll for the results of the original IdentifySubject request.

BIR | CBEFF_BIR_Type | 0..* | N | CBEFF structure containing information about a biometric sample.

### 4.1.13 IdentifySubject

**IdentifySubjectRequest**

**IdentifySubjectResponse**

The IdentifySubject operation performs an identification search against a given gallery for a given biometric, returning a rank-ordered candidate list of a given maximum size. Note that multiple scores/candidates is already incorporated as a score comes with a CandidateType which is a member of CandidateList.

If the IdentifySubject operation is implemented as a synchronous service, the implementing system immediately processes the request and returns the results in the candidate list. If the IdentifySubject operation is implemented as an asynchronous service, the implementing system returns a token, which is an indication that the request is being handled asynchronously. In this case, the GetIdentifySubjectResults operation is used to poll for the results of the IdentifySubject request.

Gallery ID must not be used in conjunction with Gallery parameter. Gallery must not be used in conjunction with Gallery ID parameter. However, Gallery ID or Gallery MUST be present.

### Request Message

**Field** | **Type** | **#** | **?** | **Meaning**
--- | --- | --- | --- | ---
IdentifySubject | | | Y | Perform an identification search against a given gallery for a given biometric.
IdentifySubjectRequest | | 1 | Y |

</tbody>
</table>

NOTES:

(1) In the event that the number of candidates exceeding the threshold exceeds the MaxListSize, the system will determine which candidate is included in the last position of the rank ordered candidate list (i.e., in the event of a tie).

(2) Requesters MAY NOT change the system thresholds.

4.1.14 ListBiographicData

ListBiographicDataRequest
The ListBiographicData operation lists the biographic data elements stored for a subject using the Biographic Data Elements output parameter. Note that no actual biographic data is returned by this operation (see the RetrieveBiographicData operation to obtain the biographic data). In the encounter-centric model, an encounter ID MAY be specified to indicate that only the biographic data elements stored for that encounter should be returned. If an encounter ID is not specified and encounter data exists for the subject, the operation returns the list of encounter IDs which contain biographic data using the Encounter List output parameter, and the Biographic Data Element List output parameter is empty.

**4.1.15 ListBiometricData**

**ListBiometricDataRequest**
ListBiometricDataResponse

The ListBiometricData operation lists the biometric data elements stored for a subject using the Biometric Data List output parameter. Note that no actual biometric data is returned by this operation (see the RetrieveBiometricData operation to obtain the biometric data). In the encounter-centric model, an encounter ID MAY be specified to indicate that only the biometric data elements stored for that encounter should be returned. If an encounter ID is not specified and encounter data exists for the subject, the operation returns the list of encounter IDs which contain biometric data using the Encounter List output parameter, and the Biometric Data List output parameter is empty.

An optional parameter MAY be used to indicate a filter on the list of returned data. Such a filter may indicate that only biometric types should be listed (e.g., face, finger, iris, etc.) or that only biometric subtypes for a particular biometric type should be listed (e.g., all fingerprints: left slap, right index, etc.). If a filter is not specified, all biometric type and biometric subtype information must both be listed (e.g., left index finger, right iris, face frontal, etc.).

#### 4.1.16 ListDocumentData

**ListDocumentDataRequest**

**ListDocumentDataResponse**

The ListDocumentData operation lists the document categories stored for a subject using the Document Data List output parameter. Note that no other document data is returned by this operation (see the RetrieveDocumentData operation to obtain document data by category.) In the encounter-centric model, an encounter ID may be specified to indicate that only the document data elements stored for that encounter should be returned. If an encounter ID is not specified and encounter data exists for the subject, the operation must return the list of encounter IDs which contain document data using the Encounter List Output parameter, and the Document Data List output parameter must be empty.

### 4.1.17 PerformFusion

The PerformFusion operation accepts either match score or match decision information and creates a fused match result. The `FusionInformationListType`, through the `FusionInformationType`, provides specific elements for match score input and match decision input for a single identity, while the `FusionIdentityListType` provides the ability to submit multiple identities to the Perform Fusion operation. The fusion method and processes are left to the implementing system.

### 4.1.18 QueryCapabilities

**QueryCapabilitiesRequest**

**QueryCapabilitiesResponse**

The QueryCapabilities operation returns a list of the capabilities, options, galleries, etc. that are supported by the BIAS implementation. Refer to Annex A in the ISO/IEC BIAS [ISO/IEC-BIAS] standard for conformance requirements regarding which capability names an implementation must use in the QueryCapabilities operation. If the implementing system does not support a capability item, the Capability Value can be set to null in the response.

Proprietary and additional information may be returned by returning capabilities that are not part of those capabilities enumerated in the Capability Name section 3.2.21. When returning capabilities not enumerated in section 3.2.21, the Capability Description should describe the capability. For each
capability enumerated in section 3.2.21, the Capability Name should be set to the name in the value column.

### 4.1.19 RetrieveBiographicData

**RetrieveBiographicDataRequest**

**RetrieveBiographicDataResponse**

The RetrieveBiographicData operation retrieves the biographic data associated with a subject ID. In the encounter-centric model, the encounter ID MAY be specified and the operation will return the set of biographic data associated with that encounter (the list contains a single set). If the encounter ID is not specified in the encounter-centric model, the operation returns the list of biographic information associated with the most recent encounter. If no gallery ID is specified, a list of biographic information from all galleries will be returned.

4.1.20 RetrieveBiometricData

RetrieveBiometricDataRequest
RetrieveBiometricDataResponse
The RetrieveBiometricData operation retrieves the biometric data associated with a subject ID. In the encounter-centric model, the encounter ID MAY be specified and the operation will return the biometric data associated with that encounter. If the encounter ID is not specified in the encounter-centric model, the operation returns the biometric information associated with the most recent encounter. The operation provides an OPTIONAL input parameter to specify that only biometric data of a certain type should be retrieved.

**4.1.21 RetrieveDocumentData**

The RetrieveDocumentData operation retrieves the list of document data associated with a subject ID for the category(ies) specified. In the encounter-centric model, the encounter ID MAY be specified and the operation returns the list of document data associated with that encounter. If the encounter ID is not specified in the encounter-centric model, the operation returns the list of document information associated with the most recent encounter for which document data exist. If no gallery ID is specified, document data...
from all galleries must be returned. If no document category is specified, all documents associated with
the subject (and encounter ID, if present) must be returned.

4.1.22 SetBiographicData

SetBiographicDataRequest

SetBiographicDataResponse

The SetBiographicData operation associates biographic data to a given subject record. The identity model of the system determines whether the biographic information should replace any existing biographic information (person-centric model) or if a new encounter should be created and associated with the subject (encounter-centric model). For encounter-centric models, the encounter ID MAY be specified by the caller in order to link biographic with biometric and/or document information (assuming biometric and/or document information was previously associated using the SetBiometricData and/or SetDocumentData operations). If the encounter ID is omitted for the encounter-centric model, the operation returns a system-assigned encounter ID.

For encounter-based systems, the Create Encounter operation should be called prior to Set Biographic Data and/or Set Document Data. The Encounter ID assigned as a result should be used as input to this operation.

#### 4.1.23 SetBiometricData

The SetBiometricData operation associates biometric data to a given subject record. The identity model of the system determines whether the biometric information should replace any existing biometric information (person-centric model) or if a new encounter should be created and associated with the subject (encounter-centric model). For encounter-centric models, the encounter ID MAY be specified by the caller in order to link biometric with biographic and/or document information (assuming biographic and/or document information was previously associated using the SetBiographicData and/or SetDocumentData operation). If the encounter ID is omitted for the encounter-centric model, the operation returns a system-assigned encounter ID.

For encounter-based systems, the Create Encounter operation should be called prior to Set Biometric Data. The Encounter ID assigned as a result should be used as input to this operation.

### 4.1.24 SetDocumentData

**SetDocumentDataRequest**

**SetDocumentDataResponse**

The SetDocumentData operation associates identity document data to a given subject record. The identity model of the system determines whether the document information should replace any existing document information for the same document category (person-centric model) or if a new encounter should be created and associated with the subject (encounter-centric model). For encounter-centric models, the encounter ID MAY be specified by the caller in order to link document with biographic and/or biometric information (assuming biographic and/or biometric information was previously associated using the SetBiographicData and/or SetBiometricData operation). If the encounter ID is omitted for the encounter-centric model, the operation returns a system-assigned encounter ID.

4.1.27 UpdateBiometricData

UpdateBiometricDataRequest
UpdateBiometricDataResponse

The UpdateBiometricData operation updates the biometric data for an existing subject record. The operation includes an OPTIONAL parameter indicating if the new biometric sample should be merged with the existing biometric sample. If this parameter is set to “False” or is not used in the request, the operation replaces the existing biometric sample with the new biometric sample. The “merge” process is determined by the implementation. It may be accomplished by adding the sample to a multi-sample record or by performing some level of biometric fusion (for example, feature or sample level fusion). In the encounter-centric model, the encounter ID MUST be specified.

#### 4.1.29 VerifySubject

**VerifySubjectRequest**

The VerifySubject operation performs a 1:1 verification match between a given biometric and either a claim to identity in a given gallery or another provided biometric. As such either the Identity Claim or Reference BIR input parameters are REQUIRED.

In the encounter-centric model, for match operations, it is not necessary to explicitly create an encounter. The BIAS service provider will create the encounter and will set the encounter type to "recognition".

### 4.2 Aggregate Operations

#### 4.2.1 Delete

The Delete operation deletes an existing subject or, in an encounter-centric model, an existing encounter from the system. This may be accomplished in a number of different ways according to system requirements and/or resources. If the Delete operation is implemented as a synchronous service, the implementing system immediately processes the request and returns the results in the Return Data parameter. If the Delete operation is implemented as an asynchronous service, the implementing system returns a token in the Token parameter, which is an indication that the request is being handled asynchronously. In this case, the GetDeletionResults operation is used to poll for the results of the Delete request.

4.2.2 Enrol

The Enrol operation adds a new subject or, in an encounter-centric model, a new encounter to the system. This may be accomplished in a number of different ways according to system requirements and/or resources. If the Enrol operation is implemented as a synchronous service, the implementing system immediately processes the request and returns the results in the Return Data parameter. If the Enrol operation is implemented as an asynchronous service, the implementing system returns a non-zero
token in the Token parameter, which is an indication that the request is being handled asynchronously. In this case, the GetEnrolResults operation is used to poll for the results of the Enrol request.

If the identity model is encounter-centric, the encounter ID may optionally be specified by the caller. If the encounter ID is omitted the operation returns a system-assigned encounter ID.

### 4.2.8 Identify

#### IdentifyRequest

The Identify operation performs an identification function according to system requirements and/or resources. If the Identify operation is implemented as a synchronous service, the implementing system immediately processes the request and returns the results in the Return Data parameter. If the Identify operation is implemented as an asynchronous service, the implementing system returns a non-zero token in the Token parameter, which is an indication that the request is being handled asynchronously. In this case, the GetIdentifyResults operation is used to poll for the results of the Identify request.

### 4.2.10 Update

**UpdateRequest**

**UpdateResponse**

The Update operation updates specified information about a subject, or in an encounter-centric model about an encounter. In a person-centric model, this operation can be used to update both biographic, biometric and document information for a subject record. In an encounter-centric model, this operation can be used to update biographic, biometric and/or document information for either a single encounter or all encounters. Either a subject ID or encounter ID MUST be specified.

4.2.11 Verify

VerifyRequest

VerifyResponse

The Verify operation performs a 1:1 verification function according to system requirements and/or resources. Either the Identity Claim or Reference BIR input parameters are REQUIRED. If the Verify operation is implemented as a synchronous service, the implementing system immediately processes the request and returns the results in the Return Data parameter. If the Verify operation is implemented as an asynchronous service, the implementing system returns a non-zero token in the Token parameter, which is an indication that the request is being handled asynchronously. In this case, the GetVerifyResults operation is used to poll for the results of the Verify request.

In encounter mode, for match operations, the BIAS service provider will create the encounter and will set the encounter type to “recognition”. Additionally, the encounter ID may optionally be specified by the caller. If the encounter ID is omitted for the encounter-centric model, the service should return a system-assigned encounter ID.

5 Message structure and rules

BIAS operations and data elements are defined in XML in the ISO/IEC 30108 BIAS standard. This OASIS standard further specifies the full XML schema (see Annex A) and specifies how this XML is packaged and exchanged as SOAP messages.

Annex A provides a WSDL of operations and structures aggregated from all the conformance classes, both synchronous and asynchronous. A specific implementation’s WSDL must only expose its respective operations and structures. For example, for a Class 5-only conformant implementation, all of the primitive operations must not be exposed as operations (with the exception of QueryCapabilities) unless that functionality is supported. Additionally, the WSDL exposed by an implementation shall not contain instances of xsd:any, xsd:anyType, or xsd:anyAttribute; these instances must be replaced with explicit schema contents. An example is the XML complex type, InformationType, which has xsd:any as its only child. This type is used to represent implementation-specific input data and return data. The children of InformationType must be replaced with explicit content. Doing so removes the ability to transmit unexpected or arbitrary data. Also, it provides a clear definition of information that a client needs to provide to the server, or expect to receive, to optimally perform an operation.

SOAP 1.1 messages consist of three elements: an envelope, header data, and a message body. BIAS request-response elements MUST be enclosed within the SOAP message body. The general structure of the BIAS SOAP message is shown in Figure 4, below. The data model for BIAS is addressed in Section 3 and BIAS messages in Section 4.

Figure 4. BIAS SOAP Structure

Biometric data, regardless of native format, is carried as a binary structure. As such, options exist on how this data is carried within the SOAP structure. It can be carried as embedded Base-64 objects or [XOP] can be used – this standard allows for either method (See section 5.3).

5.1 Purpose and constraints

This document defines a SOAP profile describing how the XML elements defined in ISO/IEC 30108 are to be used as the payload of a SOAP message and the rules for structuring and exchanging such messages. Philosophical tenets include:
923 • SOAP messages will carry BIAS XML [XML10] payloads.
924 • SOAP messages will follow WS-I and will deviate only when absolutely necessary.
925 • Message structures and interchanges will be kept as simple as possible – “nice to have”
926 features will be addressed in future revisions.
927 • XML schemas will be produced based on ISO/IEC 30108.
928 • BIAS will support a broad range of application domains.
929 • BIAS will allow for a variety of biometric and biographic data formats to be used
930 • Only the SOAP messaging will be defined – no message protocols or client/server agents
931 will be defined.
932 • Basic usage/formatting rules (beyond WS-I) will be defined.
933 • Existing biometric and Web services standards will be leveraged wherever possible.
934 • Sample WSDL and use cases will be provided as an aid in implementation.
935 • Use of basic SOAP will allow all other compatible WS* standards (and discovery
936 mechanisms) to be used in conjunction with BIAS messaging.
937 • BIAS will support both secure (i.e., using existing security mechanisms such as WS-
938 Security, SAML, etc,) and non-secure implementations.
939 • Generic biometric operations will be defined – use of biometrics within a Web services
940 authentication protocol is not addressed.
941 • OASIS namespace rules will be followed, though some external schemas MAY also be
942 referenced.

5.2 Message requirements
943 BIAS SOAP messages MUST conform to [WS-I-Basic] and [WS-I-Bind]. A single BIAS SOAP message
944 MUST contain only one BIAS service request (or single BIAS service response). Binary components of
945 BIAS messages are already Base-64 encoded and therefore do not need to be conveyed as SOAP
946 attachments (though XOP MAY be utilized).
947 The system model used for BIAS conversations over SOAP is a simple request-response model. BIAS
948 comprises both synchronous and asynchronous operations, with the majority being of the former type.
949 Asynchronous operations are implemented through message pairs. That is, there are separate messages
950 to request the operation and to request the results of the operation. These have been defined for those
951 operations that are likely to take significant time to complete. For example, an identify operation can be
952 implemented as either a synchronous or asynchronous service as follows:
The basic process for using SOAP for BIAS operations is:

1. A system entity acting as a BIAS requester transmits a BIAS request element within the body of a SOAP message to a system entity acting as a BIAS responder. The BIAS requester MUST NOT include more than one BIAS request per SOAP message or include any additional XML elements in the SOAP body.

2. The BIAS responder MUST return either a BIAS response element within the body of another SOAP message or generate a SOAP fault. The BIAS responder MUST NOT include more than one BIAS response per SOAP message or include any additional XML elements in the SOAP body. If a BIAS responder cannot, for some reason, process a BIAS request, it MUST generate a SOAP fault. (SOAP 1.1 faults and fault codes are discussed in [SOAP11] section 5.1.)

3. On receiving a BIAS response in a SOAP message, the BIAS requester MUST NOT send a fault code or other error messages to the BIAS responder. Since the format for the message interchange is a simple request-response pattern, adding additional items such as error conditions would needlessly complicate the protocol.

5.3 Handling binary data

BIAS messages frequently contain binary data (e.g., biometric data, scanned identity documents, etc.). Two methods are provided for dealing with this:

- Embedded Base64 encoding
- XOP [XOP]

Use of SOAP with Attachments (SWA) is deprecated.
### 5.3.1 Base64 encoding

This method is the default method for including binary data. Binary data is Base64 encoded and included between the tags in the XML SOAP body for the appropriate data elements. Data elements using this method are indicated as such in the schema.

As an example, the CBEFF_BIR_Type includes, as one of the BIR types, BinaryBIR of type base64binary.

```xml
<xsd:element name="BinaryBIR" type="xsd:base64Binary" />
```

However, even an XML_BIR as defined within [CBEFF3], contains a biometric data block (BDB) which may be entirely binary (most common),

```xml
<xsd:element name="bdb" type="xsd:base64Binary" minOccurs="0"/>
```

or contain an element which is binary (e.g., an image within an XML BDB).

### 5.3.2 Use of XOP

When XOP is used, the binary content is replaced with a reference (URI) to an attachment (i.e., MIME) which contains that “stripped” content via an xop:include. The advantage of this method is overall message size during transmission since the overhead of the embedded Base64 is not present (since the MIME attachment contains the native binary format).

Use of XOP is generally transparent to the developer, other than in how they configure their toolset. Most frameworks support this; however, there is a possibility of mismatch if the transmitter supports and uses XOP but the receiver does not.

### 5.4 Discovery

BIAS implementers (service providers) MUST provide WSDL [WSDL11] to describe their implementations. This WSDL MAY or may not be made public via a standard discovery mechanism (such as UDDI) or other method.

In addition, it is REQUIRED that the BIAS implementation include the QueryCapabilities operation to provide dynamic information regarding BIAS capabilities, options, galleries, etc. that are supported.

### 5.5 Identifying operations

Receivers of BIAS SOAP messages require a method of easily identifying the operation being requested (or response being provided). This SHOULD be possible without the receiver needing to infer it from the sum of the elements provided within the body of the SOAP message. The BIAS SOAP profile allows for two methods of identifying BIAS operations:

- Explicit named element in body of the SOAP message
- Use of WS-Addressing Action element

#### 5.5.1 Operation name element

The BIAS message sender (requester) will include within the body of the BIAS SOAP message an XML element `<BIASOperationName>`. The receiver (service provider) can search for this tag within a received BIAS SOAP message to determine what operation is being requested. There is no requirement related to the ordering of this element within the message, though it is RECOMMENDED that it be included early in the message to aid in human readability.

An example of this method for the CreateSubject operation is shown below:
5.5.2 WS-Addressing Action

WS-Addressing [WS-Addr] provides a mechanism for including action information inside any SOAP message. The information is in the SOAP Header. The WS-Addressing ‘Action’ element is used to indicate the intent of the message. The value is a URI/IRI identifying that intent; however, there are no restrictions on the format or specificity of the URI/IRI nor a requirement that it can be resolved. Adoption of this option also requires that the WS-Addressing ‘To’, ‘ReplyTo’, and ‘MessageID’ elements are supplied, as they are mandatory elements in a request-reply message pattern as used within BIAS. Response messages would also need to use WS-Addressing, requiring the ‘To’ (matching the ‘ReplyTo’ element in the request), ‘RelatesTo’ (matching the ‘MessageID’ element in the request), and ‘RelationshipType’ (default value to “wsa:Reply”) elements.

Use of WS-Addressing is OPTIONAL in this profile as is this method of using the ‘Action’ field for this purpose. However, when BIAS is used within an environment using WS-Addressing, it is RECOMMENDED that this approach for use of the ‘Action’ field to carry the BIAS operation name is employed, either alone or in combination with the BIASOperationName approach described in section 5.5.1.

An example for a message request for the CreateSubject operation would look like the following:

```xml
POST /bias HTTP/1.1
Host: www.acme.com
Content-Type: application/soap+xml; charset="utf-8"
Content-Length: nnnn
SOAPAction: ""
<?xml version="1.0"?>
<soap:Envelope xmlns:soap="http://www.w3.org/2003/05/soap-envelope">
    <soap:Body>
        <tns:CreateSubjectRequest xmlns:tns="http://docs.oasis-open.org/bias/bias-1.0/">
            <tns:GenericRequestParameters>
                <tns:Application>BIAS Application</tns:Application>
                <tns:ApplicationUser>BIAS User</tns:ApplicationUser>
                <tns:BIASOperationName>CreateSubject</tns:BIASOperationName>
            </tns:GenericRequestParameters>
            <tns:Identity>
                <tns:SubjectID>123456789</tns:SubjectID>
            </tns:Identity>
        </tns:CreateSubjectRequest>
    </soap:Body>
</soap:Envelope>
```
5.6 Security

The end-points that exchange SOAP messages (or handle the contents of the BIAS operations) are expected to be protected and trusted such that message-level security mechanisms may not be required. The use of SSL (HTTPS) or VPN technology that provides end-point to end-point security is RECOMMENDED and MAY be sufficient in some cases. Other mechanisms such as Signed XML or WSS [WSS] could also be implemented.

Unless stated otherwise, the following security statements apply to all BIAS bindings.

5.6.1 Use of SSL 3.0 or TLS 1.0

Unless otherwise specified, in any BIAS binding’s use of SSL 3.0 [SSL3] or TLS1.0 [RFC2246], servers MUST authenticate clients using a X.509 v3 certificate [X509]. The client MUST establish server identity based on contents of the certificate (typically through examination of the certificate’s subject DN field, subjectAltName attribute, etc.).

Use of transport level security in the form of SSL or TLS is OPTIONAL but highly RECOMMENDED. Use of these mechanisms alone may not be sufficient for end-to-end integrity and confidentiality, however (see 5.6.3 and 5.6.4 below).

5.6.2 Data Origin Authentication

Authentication of both the BIAS requester and the BIAS responder associated with a message is OPTIONAL and depends on the environment of use: Authentication mechanisms available at the SOAP message exchange layer or from the underlying substrate protocol (for example, in many bindings the SSL/TLS or HTTP protocol) MAY be utilized to provide data origin authentication.

Transport authentication will not meet end-to-end origin authentication requirements in bindings where the BIAS SOAP message passes through an intermediary – in this case, message authentication is RECOMMENDED.

Note that SAML [SAML] MAY be used as the mechanism for parties to authenticate to one another.

5.6.3 Message Integrity

Message integrity of both BIAS requests and BIAS responses is OPTIONAL and depends on the environment of use. The security layer in the underlying substrate protocol or a mechanism at the SOAP message exchange layer MAY be used to ensure message integrity.
Transport integrity will not meet end-to-end integrity requirements in bindings where the BIAS SOAP message passes through an intermediary – in this case, message integrity is RECOMMENDED.

### 5.6.4 Message Confidentiality

Message confidentiality of both BIAS requests and BIAS responses is OPTIONAL and depends on the environment of use. The security layer in the underlying substrate protocol or a mechanism at the SOAP message exchange layer MAY be used to ensure message confidentiality.

Transport confidentiality will not meet end-to-end confidentiality requirements in bindings where the BIAS SOAP message passes through an intermediary.

NOTE: Biometric and biographic data is likely to contain personal information the confidentiality of which SHOULD be protected accordingly. See ISO/IEC 30108, section 6.5 for further discussion.

### 5.6.5 CBEFF BIR security features

Within BIAS, biometric data is transferred within a CBEFF BIR (as defined in ISO/IEC 19785-1). CBEFF provides for the optional encryption of the Biometric Data Block (BDB) of the BIR and for the integrity of the entire BIR. If implemented, this is indicated in the BIR header. The BIR structure defines an optional Security Block which MAY contain a digital signature (or message authentication code), encryption parameters (e.g., key name, algorithm, etc.), and/or other security related data. Such protections are associated with an individual BIR and are separate from any other protections provided at the message level.

### 5.6.6 Security Considerations

Before deployment, each combination of authentication, message integrity, and confidentiality mechanisms SHOULD be analyzed for vulnerability in the context of the specific protocol exchange and the deployment environment.

Special care should be given to the impact of possible caching on security.

IETF RFC 2617 [RFC2617] describes possible attacks in the HTTP environment when basic or message digest authentication schemes are used.

Many of the security considerations identified in [SAML SEC] MAY also apply.

ISO/IEC 19092 [BIO SEC] describes a security framework for biometric systems including a minimum set of security requirements addressing integrity, authenticity, and confidentiality of biometric information during transmission and storage. These SHOULD be considered as part of an overall risk management approach.

NOTE: The requirements of ISO/IEC 19092, though useful across many application domains, are required for most biometric system implementations in the financial services environment. Application of this standard would make the requirements of sections 5.5.3 through 5.5.5 mandatory rather than optional. This is highly RECOMMENDED for any high security environment or where privacy concerns exist.

### 5.6.7 Security of Stored Data

This specification does not address security considerations for stored data. It is the purview of the BIAS service provider to implement security mechanisms and protect data at rest as per their own security policies.

### 5.6.8 Key Management

This specification does not address key management considerations with respect to implementation of cryptographic security mechanisms (e.g., for authenticity, integrity, or confidentiality).
5.7 Use with other WS* standards

The intent of specifying SOAP bindings for BIAS messages is to enable the full range of existing Web services standards to be able to be applied. Some may be normative while others can be optionally applied (i.e., WS-Security, WS-Addressing). Still others may require additional profiling to be used in an interoperable manner (e.g., WS-Notification); this is left to a future revision. However, the intent is to avoid specifying anything in the first, base version that would preclude the use of such standards in the future.

5.8 Tailoring

This standard provides for a common method of implementing biometric Web services; however, it does not guarantee interoperability in a specific application. In some cases further tailoring or profiling of this standard may be required in order to further constrain the implementation options available.

NOTE: As an example, BIAS allows for a number of different biographic and biometric data formats to be used, whereas a given application/domain MAY wish to limit this to a small set or just one of each type. Other examples (not comprehensive) include:

- Identification of a subset of BIAS operations to be used
- Specification of security features to be implemented (e.g., SSL, CBEFF BIR encryption, etc.)
- Choice of operation name identification method
- Choice of BIR type to be used (XML, non-XML, or URI)
- Further definition of aggregate operations
- Use (or not) of the encounter model
- Use (or not) of asynchronous operations
- Process sequences
- Implementation specific values (e.g., Transform operations/controls)
6 Error handling

There are two levels of errors that can be returned in an error response: system and service errors.

- System-level errors occur when the implementing system cannot service a request. They could result due to an internal logic error or because the implementing system does not support a particular request.

- Service-level errors occur when there is a problem transmitting or representing the service request. They could result due to an invalid service request or because of a communications error.

The ISO/IEC BIAS standard defines the error condition codes for system-level errors.

- If successful, a response message (containing a return code) will be generated.

- If unsuccessful, a SOAP fault message (containing a fault code) will be generated.

6.1 BIAS operation return codes

If a BIAS operation is successful, a response (service output) will be sent to the requester by the service provider. Each response message contains a response status (see section 3.2.37) and return code (see section 3.2.38) along with any response data as defined for that operation, if any. A response code of '0' indicates success.

6.2 SOAP fault codes

If a BIAS operation is unsuccessful, no BIAS response message is sent. Instead a SOAP fault message is returned.

Every Web service (operation) described in the BIAS WSDL may result in a fault message that will be returned in the response by the service provider in the event of an error. The fault message contains a FaultCode element as defined by the SOAP 1.1 specification (see section 3.2.5). The fault message MUST contain a Detail element in a common format, as described by the BIASFault element (see section 3.2.6).

The schema provided in Annex A defines “BIASFaultCode” and “BIASFaultDetail” types as well as “BIASFault”, “BIASFaultType”, “BIASFaultMessage” and “BIASFaultDescription” elements.

The list of defined BIAS fault codes is provided in section 3.2.5. Note that BIAS service providers MAY define additional fault codes unique to their service.

NOTE: See also section 5.2 for additional information on message returns and faults.
7 Conformance

Implementations claiming conformance to this standard, MUST implement, at a minimum, all mandatory requirements and provisions set forth in sections 3, 4, 5 and 6 listed for the target conformance class(es). If such implementations claim conformance to any OPTIONAL requirements and provisions stated in sections 3, 4, 5 and 6, these requirements and provisions MUST be implemented as set forth in these sections.

ISO/IEC 30108 [ISO/IEC-BIAS] (Annex A) specifies seven BIAS conformance classes. In this document, these classes are outlined at a high level; more detailed information can be found in ISO/IEC 30108 [ISO/IEC-BIAS]. For each class, a set of mandatory BIAS operations is identified in order for implementations (BIAS service providers) to claim conformance. These categories are:

- Class 1: Full Primitive Services Implementation
- Class 2: Full Aggregate Services Implementation
- Class 3: Limited Primitive Services Implementation
- Class 4: Minimum Primitive Services Implementation
- Class 5: Minimum Aggregate Services Implementation
- Class 6: Matcher Primitive Services Implementation
- Class 7: Matcher Aggregate Services Implementation

Required operations and capabilities are described in Table 7.1 below.

- **X** – Required
- **C*** – Conditionally required if associated implementation is asynchronous
- **C** – Conditionally required if implementation uses encounter-centric model

In addition, the minimum capability information to be returned in response to a Query Capabilities request (the only mandatory BIAS operation across all 5 classes) is specified for each class.

These conformance classes and their associated requirements apply to this BIAS SOAP Profile.

There are no minimum set of operations required to be implemented by BIAS requesters; however, any operations implemented must conform to the requirements of sections 3 and 4 and those requirements within section 5 that are mandatory and are not specific to BIAS responders.

Appendix B. Use Cases (non-normative)

The intent of this annex is to provide operational sequence diagrams / flow charts that show how the higher level usage scenarios within [ISO/IEC-BIAS] could be implemented using the BIAS SOAP profile. The following use cases are given:

- Verification (synchronous/aggregate)
- Verification (asynchronous/aggregate)
- Verification (primitive)
- Identification (primitive)
- Enrolment (aggregate)
- Enrolment (primitive)

B.1 Verification Use Case

This use case uses the aggregate Verify operation in which a single request results in some set of operations (in this case, a series of primitive BIAS operations) being performed by the BIAS service provider.

Note that 1. CheckQuality, TransformBiometricData, VerifySubject can be exposed as interfaces of BIAS server agent.
B.2 Asynchronous Verification Use Case

In this use case, the requester issues two requests – the BIAS Verify request to initiate the operation followed by a BIAS GetVerifyResult request to retrieve the results of that operation.

Note that 1. CheckQuality, TransformBiometricData, VerifySubject can be exposed as interfaces of BIAS server agent.
**B.3 Primitive Verification Use Case**

In this use case, the verification operation is performed as a series of requests using the BIAS primitive operations. In this case, the client rather than the service provider controls the workflow of the higher level operation.
B.4 Identification Use Case

This use case uses the aggregate Identify operation in which a single request results in some set of operations (in this case, a series of primitive BIAS operations) being performed by the BIAS service provider.

Note that
1. CheckQuality, TransformBiometricData, IdentifySubject can be exposed as interfaces of BIAS server agent.
B.5 Biometric Enrolment Use Case

This use case uses the aggregate Enrol operation in which a single request results in some set of operations (in this case, a series of primitive BIAS operations) being performed by the BIAS service provider.

Here, if the result of the IdentifySubject is no matches found, then the subject is added to the gallery. If a match had been found then other logic may have been applied (e.g., return candidate list, add encounter for existing subject, etc.).
B.6 Primitive Enrolment Use Case

In this use case, the enrolment operation is performed as a series of requests using the BIAS primitive operations. In this case, the client rather than the service provider controls the workflow of the higher level operation.
Appendix C. Samples (non-normative)

C.1 Create Subject Request/Response Example

ISO/IEC BIAS Specification

```xml
<interface name="CreateSubject">
  <parameter name="SubjectID" type="xs:string" direction="inout" use="optional" />
  <parameter name="Return" type="xs:unsignedLong" direction="out" />
</interface>
```

OASIS BIAS Examples

**Simple Create Subject Request:**

```
POST /bias HTTP/1.1
Host: www.acme.com
Content-Type: application/soap+xml; charset="utf-8"
Content-Length: nnnn
SOAPAction: "CreateSubject"
<?xml version="1.0"?>
<soap:Envelope xmlns:soap="http://www.w3.org/2003/05/soap-envelope">
  <soap:Body>
    <tns:CreateSubject xmlns:tns="http://docs.oasis-open.org/bias/bias-1.0/">
    </tns:CreateSubject>
  </soap:Body>
</soap:Envelope>
```

**Create Subject Request with SubjectID Parameter:**

```
POST /bias HTTP/1.1
Host: www.acme.com
Content-Type: application/soap+xml; charset="utf-8"
Content-Length: nnnn
SOAPAction: "CreateSubject"
<?xml version="1.0"?>
<soap:Envelope xmlns:soap="http://www.w3.org/2003/05/soap-envelope">
  <soap:Body>
    <tns:CreateSubject xmlns:tns="http://docs.oasis-open.org/bias/bias-1.0/">
      <tns:Identity>
        <tns:SubjectID>123456789</tns:SubjectID>
      </tns:Identity>
    </tns:CreateSubject>
  </soap:Body>
</soap:Envelope>
```

**Create Subject Request with Optional OASIS BIAS Content:**

```
POST /bias HTTP/1.1
Host: www.acme.com
```

Simple Create Subject Response:
HTTP/1.1 200 OK
Content-Type: application/soap+xml; charset="utf-8"
Content-Length: nnnn
<?xml version="1.0"?>
<soap:Envelope xmlns:soap="http://www.w3.org/2003/05/soap-envelope">
  <soap:Body>
    <tns:CreateSubject xmlns:tns="http://docs.oasis-open.org/bias/bias-1.0/">
      <tns:GenericRequestParameters>
        <tns:Application>BIAS Application</tns:Application>
        <tns:ApplicationUser>BIAS User</tns:ApplicationUser>
      </tns:GenericRequestParameters>
      <tns:Identity>
        <tns:SubjectID>123456789</tns:SubjectID>
      </tns:Identity>
    </tns:CreateSubject>
  </soap:Body>
</soap:Envelope>

Create Subject Response with Optional OASIS BIAS Content:
HTTP/1.1 200 OK
Content-Type: application/soap+xml; charset="utf-8"
Content-Length: nnnn
<?xml version="1.0"?>
<soap:Envelope xmlns:soap="http://www.w3.org/2003/05/soap-envelope">
  <soap:Body>
    <tns:CreateSubjectResponse xmlns:tns="http://docs.oasis-open.org/bias/bias-1.0/">
      <tns:ResponseStatus>
        <tns:Return>0</tns:Return>
      </tns:ResponseStatus>
      <tns:Identity>
        <tns:SubjectID>123456789</tns:SubjectID>
      </tns:Identity>
    </tns:CreateSubjectResponse>
  </soap:Body>
</soap:Envelope>
<tns:ResponseStatus>
  <tns:Return>0</tns:Return>
  <tns:Message>Subject ID 123456789 successfully created.</tns:Message>
</tns:ResponseStatus>
<tns:Identity>
  <tns:SubjectID>123456789</tns:SubjectID>
</tns:Identity>
</tns:CreateSubjectResponse>
</soap:Body>
</soap:Envelope>

C.2 Set Biographic Data Request/Response Example

ISO/IEC BIAS Specification

<interface name="SetBiographicData">
  <parameter name="SubjectID" type="xs:string" direction="in" />
  <parameter name="IdentityModel" type="IdentityModelType" direction="in" />
  <parameter name="EncounterID" type="xs:string" direction="inout" use="optional" />
  <parameter name="BiographicData" type="BiographicDataType" direction="in" />
  <parameter name="Return" type="xs:unsignedLong" direction="out" />
</interface>

OASIS BIAS Examples

Set Biographic Data Request:
POST /bias HTTP/1.1
Host: www.acme.com
Content-Type: application/soap+xml; charset="utf-8"
Content-Length: nnnn
SOAPAction: "SetBiographicData"
<?xml version="1.0"?>
<soap:Envelope xmlns:soap="http://www.w3.org/2003/05/soap-envelope">
  <soap:Body>
    <tns:SetBiographicData xmlns:tns="http://docs.oasis-open.org/bias/bias-1.0/">
      <tns:Identity>
        <tns:SubjectID>123456789</tns:SubjectID>
        <tns:BiographicData>
          <tns:BiographicDataItem>
            <tns:Name>Last</tns:Name>
            <tns:Type>string</tns:Type>
            <tns:Value>Doe</tns:Value>
          </tns:BiographicDataItem>
        </tns:BiographicData>
      </tns:Identity>
    </tns:SetBiographicData>
  </soap:Body>
</soap:Envelope>
Set Biographic Data Response:
HTTP/1.1 200 OK
Content-Type: application/soap+xml; charset=utf-8
Content-Length: nnnn
<?xml version="1.0"?><soap:Envelope xmlns:soap="http://www.w3.org/2003/05/soap-envelope">
  <soap:Body>
    <tns:SetBiographicDataResponse xmlns:tns="http://docs.oasis-open.org/bias/bias-1.0/">
      <tns:ResponseStatus>
        <tns:Return>0</tns:Return>
      </tns:ResponseStatus>
    </tns:SetBiographicDataResponse>
  </soap:Body>
</soap:Envelope>

C.3 Set Biometric Data Request/Response Example

ISO/IEC BIAS Specification

<interface name="SetBiometricData">
  <parameter name="SubjectID" type="xs:string" direction="in"/>
  <parameter name="IdentityModel" type="IdentityModelType" direction="in"/>
  <parameter name="EncounterID" type="xs:string" direction="inout" use="optional"/>
  <parameter name="BIRList" type="CBEFF_BIR_ListType" direction="in"/>
  <parameter name="Return" type="xs:unsignedLong" direction="out"/>
</interface>

OASIS BIAS Examples

Set Biometric Data Request:
POST /bias HTTP/1.1
Host: www.acme.com
Content-Type: application/soap+xml; charset=utf-8
Content-Length: nnnn
SOAPAction: “SetBiometricData”
<?xml version="1.0"?><soap:Envelope xmlns:soap="http://www.w3.org/2003/05/soap-envelope">
  <soap:Body>
    <tns:SetBiometricData>
Set Biometric Data Response:
HTTP/1.1 200 OK
Content-Type: application/soap+xml; charset="utf-8"
Content-Length: nnnn
<?xml version="1.0"?>
<soap:Envelope xmlns:soap="http://www.w3.org/2003/05/soap-envelope">
  <soap:Body>
    <tns:SetBiometricDataResponse xmlns:tns="http://docs.oasis-open.org/bias/bias-1.0/">
      <tns:ResponseStatus>
        <tns:Return>0</tns:Return>
      </tns:ResponseStatus>
    </tns:SetBiometricDataResponse>
  </soap:Body>
</soap:Envelope>
# Appendix D. Acknowledgements

The following individuals have participated in the creation of this specification and are gratefully acknowledged:

## Participants:

<table>
<thead>
<tr>
<th>Name</th>
