### Technical Committee:

OASIS Digital Signature Services TC

### Chair(s):

Nick Pope, Thales eSecurity

Juan Carlos Cruellas, Centre d'aplicacions avançades d'Internet (UPC)

### Editor:

Andreas Kuehne, *individual*

### Abstract:

This document profiles the OASIS DSS core protocols and the Asynchronous Processing Abstract Profile of the OASIS Digital Signature Services for the purpose of creating code-signing signatures.

### Status:

This document was last revised or approved by the OASIS Digital Signature Services TC on the above date. The level of approval is also listed above. Check the current location noted above for possible later revisions of this document. This document is updated periodically on no particular schedule.

Technical Committee members should send comments on this specification to the Technical Committee's email list. Others should send comments to the Technical Committee by using the "Send A Comment" button on the Technical Committee's web page at <http://www.oasis-open.org/committees/dss>.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (<http://www.oasis-open.org/committees/dss/ipr.php>).

The non-normative errata page for this specification is located at <http://www.oasis-open.org/committees/dss>.

## Notices

40 OASIS takes no position regarding the validity or scope of any intellectual property or other rights  
41 that might be claimed to pertain to the implementation or use of the technology described in this  
42 document or the extent to which any license under such rights might or might not be available;  
43 neither does it represent that it has made any effort to identify any such rights. Information on  
44 OASIS's procedures with respect to rights in OASIS specifications can be found at the OASIS  
45 website. Copies of claims of rights made available for publication and any assurances of licenses  
46 to be made available, or the result of an attempt made to obtain a general license or permission  
47 for the use of such proprietary rights by implementors or users of this specification, can be  
48 obtained from the OASIS Executive Director.

49 OASIS invites any interested party to bring to its attention any copyrights, patents or patent  
50 applications, or other proprietary rights which may cover technology that may be required to  
51 implement this specification. Please address the information to the OASIS Executive Director.

52 Copyright © OASIS® 1993–2007. All Rights Reserved. OASIS trademark, IPR and other policies  
53 apply.

54 This document and translations of it may be copied and furnished to others, and derivative works  
55 that comment on or otherwise explain it or assist in its implementation may be prepared, copied,  
56 published and distributed, in whole or in part, without restriction of any kind, provided that the  
57 above copyright notice and this paragraph are included on all such copies and derivative works.  
58 However, this document itself may not be modified in any way, such as by removing the copyright  
59 notice or references to OASIS, except as needed for the purpose of developing OASIS  
60 specifications, in which case the procedures for copyrights defined in the OASIS Intellectual  
61 Property Rights document must be followed, or as required to translate it into languages other  
62 than English.

63 The limited permissions granted above are perpetual and will not be revoked by OASIS or its  
64 successors or assigns.

65 This document and the information contained herein is provided on an "AS IS" basis and OASIS  
66 DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO  
67 ANY WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE  
68 ANY RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A  
69 PARTICULAR PURPOSE.

70 The names "OASIS" are trademarks of OASIS, the owner and developer of this specification, and  
71 should be used only to refer to the organization and its official outputs. OASIS welcomes  
72 reference to, and implementation and use of, specifications, while reserving the right to enforce  
73 its marks against misleading uses. Please see <http://www.oasis-open.org/who/trademark.php> for  
74 above guidance.

## 101 1 Introduction

102 The DSS signing and verifying protocols are defined in **[DSS Core]** and asynchronous  
103 processing for DSS messages are defined in **[DSS Async]**. As defined in those documents,  
104 these protocols have a fair degree of flexibility and extensibility. This is an abstract profile of  
105 **[DSS Core]** and **[DSS Async]**. It also profiles the processing rules followed by clients and  
106 servers when using these protocols.

107 The resulting profile is an *abstract profile*. Further profiles will build on this one to provide a basis  
108 for implementation and interoperability.

109 The following sections provide guidance to interpreting the rest of this document.

### 110 1.1 Notation

111 The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD",  
112 "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this specification are to be  
113 interpreted as described in IETF RFC 2119 **[RFC 2119]**. These keywords are capitalized when  
114 used to unambiguously specify requirements over protocol features and behavior that affect the  
115 interoperability and security of implementations. When these words are not capitalized, they are  
116 meant in their natural-language sense.

117 This specification uses the following typographical conventions in text: `<ns:Element>`,  
118 `Attribute`, **Datatype**, `OtherCode`.

### 119 1.2 Namespaces

120 The structures described in this specification are contained in the schema file **[CS-XSD]**. All  
121 schema listings in the current document are excerpts from the schema file. In the case of a  
122 disagreement between the schema file and this document, the schema file takes precedence.

123 This schema is associated with the following XML namespace:

```
124 urn:oasis:names:tc:dss:1.0:profiles:codesigning:1.0
```

125 If a future version of this specification is needed, it will use a different namespace.

126 Conventional XML namespace prefixes are used in this document:

- 127 • The prefix `dsscs:` (or no prefix) stands for the DSS code-signing namespace **[CS-XSD]**.
- 128 • The prefix `dss:` stands for the DSS core namespace **[Core-XSD]**.
- 129 • The prefix `async:` stands for this profiles namespace **[Async-XSD]**.
- 130 • The prefix `ds:` stands for the W3C XML Signature namespace **[XMLSig]**.

131 Applications MAY use different namespace prefixes, and MAY use whatever namespace  
132 defaulting/scoping conventions they desire, as long as they are compliant with the Namespaces  
133 in XML specification **[XML-ns]**.

## 154 **1.4 Overview (Non-normative)**

155 The DSS signing and verifying protocols are defined in **[DSS Core]**. Asynchronous processing of  
 156 DSS signing and verification protocols are defined in **[DSS Async]**. As defined in that document,  
 157 these protocols have a fair degree of flexibility and extensibility.

158 This specification provides an abstract profile of the DSS signing messages for the case where  
 159 the object or input document that is being signed is a software program that can be executed on a  
 160 computing platform. The software program may be in source form, or in compiled form. The  
 161 process for signing these software programs is referred to as code-signing. Code-signing allows  
 162 the recipient of a software program to receive assurances regarding the origin and integrity of the  
 163 program. The recipient may use this information to make a trust decision on whether to install or  
 164 execute a software program.

165 Traditionally the task of generating the signature on the software program is left to the software  
 166 developer. However it may not always be appropriate to combine the roles of the software  
 167 developer and the code-signer. By centralizing the generation of signatures in the code-signing  
 168 process, the role of the software developer and the code signer is easily separated. This has the  
 169 advantage that keys used for signing software programs can be better managed, access to the  
 170 keys can be better controlled, audit trails can be centrally kept, event records can be reliably  
 171 archived and signing policies can be rigorously enforced.

172 In the centralized code-signing model, the software developer is responsible for the creation and  
 173 development of a program. The software developer may also perform some basic testing of the  
 174 software program. Before distributing the software program, the software developer may need to  
 175 have the software program digitally signed to convey assurances regarding the origin and  
 176 authenticity of the software program to the receiving platform or user. In order to obtain a  
 177 signature the software developer contacts the code-signing service and requests a signature for  
 178 the software program. Part of this request may include authentication information to allow the  
 179 code-signing service to make a decision on whether the software developer is authorized to  
 180 request a signature for the software program. The request may also include the software program  
 181 in source form, compiled form or both. The centralized code-signing server may then generate a  
 182 signature. Generation of the signature may be subject to numerous criteria, including whether the  
 183 software developer is authorized to request the signature and whether the software program  
 184 conforms to the norms and standards set by the code-signing service. The code-signing service  
 185 may decline to generate a signature if all of its criteria and conditions are not met. The exact  
 186 criteria for generating a signature are subject to the policies of the code-signing service and are  
 187 beyond the scope of this document and may be further specified as part of a concrete profile.  
 188 Once the signature is generated, the result is returned to the software developer and the signed  
 189 software program may be distributed.

190 Depending on the policies and criteria of the code-signing service, there may be a substantial  
 191 delay between the time of submission of the software program and the time of signature

192 generation. This delay may make synchronous message exchange impractical and necessitate  
193 the use of asynchronous message exchange. The use of asynchronous message exchange  
194 allows the software developer to submit the request to the code-signing service, without receiving  
195 an immediate response containing the signature. The code signing service responds by  
196 acknowledging the receipt of the request. The software developer may then periodically poll the  
197 code-signing service to retrieve the signed software program, or may retrieve the signed software  
198 program once it receives a notification from the code-signing server.

199 This asynchronous behavior can be achieved by combining the **[DSS Core]** with the **[DSS**  
200 **Async]** profile. The object for which the signature is requested is included under  
201 `<InputDocuments>`. The server may respond synchronously with a `<dss:SignResponse>`  
202 message. If the server can not fulfill the code-signing request synchronously, it responds with a  
203 `<dss:ResultMajor>` code indicating that the request is pending and the  
204 `<dss:SignatureObject>` element is left undefined, as specified in **[DSS Async]**. If the  
205 signature request is processed asynchronously, the client may request the signature from the  
206 server using the `<async:PendingRequest>` message. The client may poll the server  
207 periodically by sending this message, or it may send the message in response to a notification  
208 received. The server may respond to the `<async:PendingRequest>` message by either  
209 indicating that the request is still pending or it may return the signature or signed software  
210 program. Either of these will be part of the `<dss:SignResponse>` message.

211 This document profiles and extends the **[DSS Core]** and **[DSS Async]** specifications to enable  
212 the code-signing scenarios sketched.

213 This document does not provide a profile of the DSS verification messages and does not specify  
214 a notification mechanism. Notification are currently not included within the **[DSS Async]**  
215 specification.

---

## 216 2 Profile Features

### 217 2.1 Identifier

218 **urn:oasis:names:tc:dss:1.0:profiles:codesigning:1.0**

219 A server implementing this profile MAY support asynchronous processing as defined in the  
220 asynchronous processing profile as defined in [DSS Async].

221 The client MUST implement asynchronous processing as defined in [DSS Async] and MUST  
222 include the **urn:oasis:names:tc:dss:1.0:profiles:asynchronousprocessing** identifier in the  
223 <dss:AdditionalProfile> element.

### 224 2.2 Scope

225 This document profiles the DSS signing protocol and Asynchronous Processing Protocol as  
226 defined in [DSS Core] and [DSS Async].

### 227 2.3 Relationship To Other Profiles

228 This profile is based directly on the [DSS Core] and [DSS Async].

229 This profile is an abstract profile which can not be implemented directly, and may be further  
230 profiled.

### 231 2.4 Signature Object

232 This profile is intended to provide a general framework for code-signing signature services and  
233 does not specify or constrain the type of signature object. It is up to future profiles of this abstract  
234 profile to constrain the type of signature object.

### 235 2.5 Transport Binding

236 This profile does not specify or constrain the transport binding.

### 237 2.6 Security Binding

238 This profile does not specify or constrain the security binding.

239

---

240 **3 Profile of Signing Protocol**

241 **3.1 Element <dss:SignRequest>**

242 **3.1.1 Element <dss:OptionalInputs>**

243 None of the optional inputs specified in the **[DSS Core]** are precluded in this abstract profile.

244 The <AdditionalProfile> element **MUST** be present, and **MUST** include the  
245 **urn:oasis:names:tc:dss:1.0:profiles:asynchronousprocessing** identifier.

246 **3.1.2 Element <dss:InputDocuments>**

247 This is an abstract profile and no constraints are imposed on the type of input document for which  
248 a signature may be requested.

249 **3.2 Element <dss:SignResponse>**

250 **3.2.1 Element <dss:Result>**

251 This profile defines no additional <dss:ResultMinor> codes.

252 **3.2.2 Element <dss:OptionalOutputs>**

253 None of the optional outputs specified in the **[DSS Core]** are precluded in this abstract profile.

254 **3.2.3 Element <dss:SignatureObject>**

255 This is an abstract profile and no constraints are imposed on the signature type that may be  
256 returned. If a signature or signed software program is returned, it **MUST** be included under this  
257 element.

258

259

---

260 **4 Profile of Verifying Protocol**

261 This document does not provide a profile of the DSS verification messages.

262

---

263 **5 Profile of Code-signing Signatures**

264 This is an abstract profile and no constraints are imposed on the type of signatures that are  
265 allowed.

## 6 Profile of Server Processing Rules

A DSS server that performs code-signing SHOULD perform the following steps upon receiving a `<dss:SignRequest>`.

- Determine if the requesting user is authorized to submit a `<dss:SignRequest>` or `<async:PendingRequest>` message for the purpose of code-signing request. This decision may be based on the authentication provided by the transport and security bindings.
- If a `<dss:SignRequest>` message is received, the server may respond synchronously by generating the signature according to the concrete code-signing profile and include the requested signature in the `<dss:SignResponse>` message. Alternatively the server may respond with a `<dss:SignResponse>` message containing a `<dss:ResultMajor>` error code of `Pending`, indicating asynchronous processing of the request.. The signature may then be generated at the convenience of the server. The requested signature may then be retrieved by the client using subsequent `<async:PendingRequest>` messages.
- If the `<async:PendingRequest>` message is used to retrieve a signature on a previously submitted software program, the server may use the `OriginalRequestId` attribute to determine if the requested signature has been generated.
  - If the signature is available, the server SHOULD respond with a `<dss:SignResponse>` message containing the requested signature.
  - If the signature request has not been processed, the server SHOULD respond with a `<dss:SignResponse>` message containing a `<ResultMajor>` error code of `Pending`. The client SHOULD submit a `<async:PendingRequest>` at a later time to retrieve the signature.
  - If the signature could not be generated the server SHOULD respond with a `<dss:SignResponse>` message containing a `<ResultMajor>` error code indicating the reason why the signature could not be generated.

## 7 Profile of Client Processing Rules

A DSS client that requests signatures from a DSS code-signing server SHOULD perform the following steps.

- The client MUST support asynchronous processing as defined in **[DSS Async]**.
- The client SHOULD authenticate itself using one of the mechanisms available through the transport or security bindings.
- If this is a new signature request the client MUST submit an original signature request for a software program using the `<dss:SignRequest>` message.
  - If the client receives a `<dss:SignResponse>` message containing the requested signature, the code-signing process is complete
  - If the client receives a `<dss:SignResponse>` message containing a `<ResultMajor>` element indicating that the request is pending, the client retains the `RequestID` attribute and MAY submit a `<async:PendingRequest>` message which MUST include the `OriginalRequestID` attribute. The value of the `OriginalRequestID` attribute MUST be set to the value of the `RequestID` attribute used in the initial signature request.
- If this is a signature retrieval request (i.e. a request to retrieve a signature that was previously requested but not returned) the client MUST use the `<async:PendingRequest>` message which MUST include the `OriginalRequestID` attribute. The value of the `OriginalRequestID` attribute MUST be set to the value of the `RequestID` attribute used in the initial signature request. The client may be required to provide authentication information through a mechanism defined through the transport or security binding.
  - If the client receives a `<dss:SignResponse>` message containing the requested signature, or an error code other than `Pending`, the code-signing process is complete.
  - If the client receives a `<dss:SignResponse>` message containing a `<dss:RequestMajor>` element indicating that the request is still pending, the client MAY re-submit a `<async:PendingRequest>` message at a later time. The `<async:PendingRequest>` message MUST include the `OriginalRequestID` attribute. The value of the `OriginalRequestID` attribute MUST be set to the value of the `RequestID` attribute used in the initial signature request.
