Abstract:
The Open Data Protocol (OData) enables the creation of REST-based data services, which allow resources, identified using Uniform Resource Locators (URIs) and defined in an Entity Data Model (EDM), to be published and edited by Web clients using simple HTTP messages. This document defines the core semantics and facilities of the protocol.

Status:
This document was last revised or approved by the OASIS Open Data Protocol (OData) TC on the above date. The level of approval is also listed above. Check the “Latest version” location noted above for possible later revisions of this document.

Technical Committee members should send comments on this specification to the Technical Committee’s email list. Others should send comments to the Technical Committee by using the “Send A Comment” button on the Technical Committee’s web page at http://www.oasis-open.org/committees/odata/.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (http://www.oasis-open.org/committees/odata/ipr.php).

Citation format:
When referencing this specification the following citation format should be used:

1 Introduction

The Open Data Protocol (OData) enables the creation of REST-based data services, which allow resources, identified using Uniform Resource Locators (URLs) and defined in a data model, to be published and edited by Web clients using simple HTTP messages. This specification defines the core semantics and the behavioral aspects of the protocol.

The [OData-URL] specification defines a set of rules for constructing URLs to identify the data and metadata exposed by an OData service as well as a set of reserved URL query options.

The [OData-CSDL] specification defines an XML representation of the entity data model exposed by an OData service.

The [OData-Atom] and [OData-JSON] documents specify the format of the resource representations that are exchanged using OData.

1.1 Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].

1.2 Normative References

See link in "Additional artifacts" section on cover page.

See link in "Related work" section on cover page.

See link in "Additional artifacts" section on cover page.

[OData-JSON] OData JSON Format Version 4.0.
See link in "Related work" section on cover page.

See link in "Additional artifacts" section on cover page.

[OData-VocCap] OData Capabilities Vocabulary.
See link in "Additional artifacts" section on cover page.

[OData-VocCore] OData Core Vocabulary.
See link in "Additional artifacts" section on cover page.

1.3 Typographical Conventions

Keywords defined by this specification use this monospaced font.

Normative source code uses this paragraph style.

Some sections of this specification are illustrated with non-normative examples.

Example 1: text describing an example uses this paragraph style

Non-normative examples use this paragraph style.

All examples in this document are non-normative and informative only.

All other text is normative unless otherwise labeled.
2 Overview

The OData Protocol is an application-level protocol for interacting with data via RESTful interfaces. The protocol supports the description of data models and the editing and querying of data according to those models. It provides facilities for:

- **Metadata**: a machine-readable description of the data model exposed by a particular data provider.
- **Data**: sets of data entities and the relationships between them.
- **Querying**: requesting that the service perform a set of filtering and other transformations to its data, then return the results.
- **Editing**: creating, updating, and deleting data.
- **Operations**: invoking custom logic
- **Vocabularies**: attaching custom semantics

The OData Protocol is different from other REST-based web service approaches in that it provides a uniform way to describe both the data and the data model. This improves semantic interoperability between systems and allows an ecosystem to emerge.

Towards that end, the OData Protocol follows these design principles:

- Prefer mechanisms that work on a variety of data stores. In particular, do not assume a relational data model.
- Extensibility is important. Services should be able to support extended functionality without breaking clients unaware of those extensions.
- Follow REST principles.
- OData should build incrementally. A very basic, compliant service should be easy to build, with additional work necessary only to support additional capabilities.
- Keep it simple. Address the common cases and provide extensibility where necessary.
3 Data Model

This section provides a high-level description of the Entity Data Model (EDM): the abstract data model that is used to describe the data exposed by an OData service. An OData Metadata Document is a representation of a service’s data model exposed for client consumption.

The central concepts in the EDM are entities, relationships, entity sets, actions, and functions.

Entities are instances of entity types (e.g. Customer, Employee, etc.).

Entity types are named structured types with a key. They define the named properties and relationships of an entity. Entity types may derive by single inheritance from other entity types.

The key of an entity type is formed from a subset of the primitive properties (e.g. CustomerId, OrderId, LineId, etc.) of the entity type.

Complex types are keyless named structured types consisting of a set of properties. These are value types whose instances cannot be referenced outside of their containing entity. Complex types are commonly used as property values in an entity or as parameters to operations.

Properties declared as part of a structured type’s definition are called declared properties. Instances of structured types may contain additional undeclared dynamic properties. A dynamic property cannot have the same name as a declared property. Entity or complex types which allow clients to persist additional undeclared properties are called open types.

Relationships from one entity to another are represented as navigation properties. Navigation properties are generally defined as part of an entity type, but can also appear on entity instances as undeclared dynamic navigation properties. Each relationship has a cardinality.

Enumeration types are named primitive types whose values are named constants with underlying integer values.

Type definitions are named primitive types with fixed facet values such as maximum length or precision. Type definitions can be used in place of primitive typed properties, for example, within property definitions.

Entity sets are named collections of entities (e.g. Customers is an entity set containing Customer entities). An entity’s key uniquely identifies the entity within an entity set. An entity can be a member of at most one entity set at any given point in time. Entity sets provide entry points into the data model.

Operations allow the execution of custom logic on parts of a data model. Functions are operations that do not have side effects and can be further composed, for example, with additional filter operations, functions or an action. Actions are operations that allow side effects, such as data modification, and cannot be further composed in order to avoid non-deterministic behavior. Actions and functions are either bound to a type, enabling them to be called as members of an instance of that type, or unbound, in which case they are called as static operations. Action imports and function imports enable unbound actions and functions to be called from the service root.

Singletons are single entities which are accessed as children of the entity container.

An OData resource is anything in the model that can be addressed (an entity set, entity, property, or operation).

Refer to [OData-CSDL] for more information on the OData entity data model.

3.1 Annotations

Model and instance elements can be decorated with Annotations.

Annotations can be used to specify an individual fact about an element, such as whether it is read-only, or to define a common concept, such as a person or a movie.

Applied annotations consist of a term (the namespace-qualified name of the annotation being applied), a target (the model or instance element to which the term is applied), and a value. The value may be a static value, or an expression that may contain a path to one or more properties of an annotated entity.
Annotation terms are defined in metadata and have a name and a type. A set of related terms in a common namespace comprises a *Vocabulary*. 
4 Service Model

OData services are defined using a common data model. The service advertises its concrete data model in a machine-readable form, allowing generic clients to interact with the service in a well-defined way.

An OData service exposes two well-defined resources that describe its data model; a service document and a metadata document.

The service document lists entity sets, functions, and singletons that can be retrieved. Clients can use the service document to navigate the model in a hypermedia-driven fashion.

The metadata document describes the types, sets, functions and actions understood by the OData service. Clients can use the metadata document to understand how to query and interact with entities in the service.

In addition to these two “fixed” resources an OData service consists of dynamic resources. The URLs for many of these resources can be computed from the information in the metadata document. See Requesting Data and Data Modification for details.

4.1 Entity-Ids and Entity References

Whereas entities in the Data Model are uniquely identified by their key values within an entity set, entities within a payload are identified by a durable, opaque, globally unique entity-id. The entity-id MUST be an IRI as defined in [RFC3987] and MAY be expressed in payloads and URLs as a relative reference as appropriate. While the client MUST be prepared to accept any IRI, services MUST use valid URIs in this version of the specification since there is currently no lossless representation of an IRI in the OData-EntityId header.

Services are strongly encouraged to use the canonical URL for an entity as defined in [OData-URL] as its entity-id, but clients cannot assume the entity-id can be used to locate the entity unless the Core.DereferenceableIDs term is applied to the entity container, nor can the client assume any semantics from the structure of the entity-id. The canonical resource $entity provides a general mechanism for resolving an entity-id into an entity representation.

Services that use the standard URL conventions for entity-ids annotate their entity container with the term Core.ConventionalIDs, see [OData-VocCore].

Entity references refer to an entity using the entity's entity-id.

4.2 Read URLs and Edit URLs

The read URL of an entity is the URL that can be used to read the entity.

The edit URL of an entity is the URL that can be used to update or delete the entity.

Services are strongly encouraged to use the canonical URL for an entity as defined in [OData-URL] for both the read URL and the edit URL of an entity, with a cast segment to the type of the entity appended to the canonical URL if the type of the entity is derived from the declared type of the entity set. However, clients cannot assume this convention and must use the links specified in the payload according to the appropriate format as the two URLs may be different from one another, or one or both of them may differ from convention.
5 Versioning

Versioning enables clients and services to evolve independently. OData defines semantics for both protocol and data model versioning.

5.1 Protocol Versioning

OData requests and responses are versioned according to the `OData-Version` header.

OData clients include the `OData-MaxVersion` header in requests in order to specify the maximum acceptable response version. Services respond with the maximum supported version that is less than or equal to the requested `OData-MaxVersion`. The syntax of the `OData-Version` and `OData-MaxVersion` header fields is specified in [OData-ABNF].

This version of the specification defines data service version value 4.0.

5.2 Model Versioning

The Data Model exposed by an OData Service defines a contract between the OData service and its clients. Services are allowed to extend their model only to the degree that it does not break existing clients. Breaking changes, such as removing properties or changing the type of existing properties, require that a new service version is provided at a different service root URL for the new model.

The following Data Model additions are considered safe and do not require services to version their entry point.

- Adding a property that is nullable or has a default value and does not conflict with an existing dynamic property
- Adding a navigation property that is nullable or collection-valued and does not conflict with an existing dynamic navigation property
- Adding a new entity type to the model that does not derive from any entity types exposed by existing entity sets, or returned by existing functions or actions
- Adding a new complex type to the model that does not derive from a complex type used within entity types of existing entity sets, or returned by existing functions or actions
- Adding a new entity set
- Adding a new singleton
- Adding an action, a function, an action import, or function import
- Adding an action parameter that is nullable
- Adding a type definition or enumeration
- Adding any annotation to a model element that does not need to be understood by the client in order to correctly interact with the service

Clients SHOULD be prepared for services to make such incremental changes to their model. In particular, clients should be prepared to receive properties not previously defined by the service.

Services SHOULD NOT change their data model depending on the authenticated user. If the data model is user or user group dependent, all changes MUST be safe changes as defined in this section when comparing the full model to the model visible to users with restricted authorizations.
6 Extensibility

The OData protocol supports both user- and version-driven extensibility through a combination of versioning, convention, and explicit extension points.

6.1 Query Option Extensibility

Query options within the request URL can control how a particular request is processed by the service. OData-defined system query options are prefixed with "$". Services may support additional query options not defined in the OData specification, but they MUST NOT begin with the "$" or "@" character. OData services SHOULD NOT require any query options to be specified in a request. Services SHOULD fail any request that contains query options that they do not understand and MUST fail any request that contains unsupported OData query options defined in the version of this specification supported by the service.

6.2 Payload Extensibility

OData supports extensibility in the payload, according to the specific format. Regardless of the format, additional content MUST NOT be present if it needs to be understood by the receiver in order to correctly interpret the payload according to the specified OData-Version header. Thus, clients and services MUST be prepared to handle or safely ignore any content not specifically defined in the version of the payload specified by the OData-Version header.

6.3 Action/Function Extensibility

Actions and Functions extend the set of operations that can be performed on or with a service or resource. Actions can have side-effects. For example, Actions can be used to modify data or to invoke custom operations. Functions MUST NOT have side-effects. Functions can be invoked from a URL that addresses a resource or within an expression to a $filter or $orderby system query option.

Fully qualified action and function names include a namespace or alias prefix. The Edm, odata and geo namespaces are reserved for the use of this specification.

An OData service MUST fail any request that contains actions or functions that it does not understand.

6.4 Vocabulary Extensibility

The set of annotations defined within a schema comprise a vocabulary. Shared vocabularies provide a powerful extensibility point for OData.

Metadata annotations can be used to define additional characteristics or capabilities of a metadata element, such as a service, entity type, property, function, action or parameter. For example, a metadata annotation could define ranges of valid values for a particular property.

Instance annotations can be used to define additional information associated with a particular result, entity, property, or error; for example whether a property is read-only for a particular instance.

Where annotations apply across all instances of a type, services are encouraged to specify the annotation in metadata rather than repeating in each instance of the payload. Where the same annotation is defined at both the metadata and instance level, the instance-level annotation overrides the one specified at the metadata level.

A service MUST NOT require the client to understand custom annotations in order to accurately interpret a response.

OData defines a Core vocabulary with a set of basic terms describing behavioral aspects along with terms that can be used in defining other vocabularies; see [OData-VocCore].
6.5 Header Field Extensibility

OData defines semantics around certain HTTP request and response headers. Services that support a version of OData conform to the processing requirements for the headers defined by this specification for that version.

Individual services may define custom headers. These headers MUST NOT begin with OData. Custom headers SHOULD be optional when making requests to the service. A service MUST NOT require the client to understand custom headers to accurately interpret the response.

6.6 Format Extensibility

An OData service MUST support at least one of [OData-JSON] or [OData-Atom], and MAY support additional formats for both request and response bodies.
7 Formats

The client MAY request a particular response format through the Accept header, as specified in [RFC2616], or through the system query option $format.

In the case that both the Accept header and the $format query option are specified on a request, the value specified in the $format query option MUST be used.

If the service does not support the requested format, it replies with a 406 Not Acceptable error response.

Services SHOULD advertise their supported formats by annotating their entity container with the term Capabilities.SupportedFormats, as defined in [OData-VocCap], listing all available formats and combinations of supported format parameters.

See the format specifications ([OData-JSON], [OData-Atom]) for details.

Client libraries MUST retain the order of objects within an array in JSON responses, and elements in document order for ATOM and XML responses, including CSDL documents.
8 Header Fields

OData defines semantics around the following request and response headers. Additional headers may be specified, but have no unique semantics defined in OData.

8.1 Common Headers

The Content-Type, Content-Length, and OData-Version headers are common between OData requests and responses.

8.1.1 Header Content-Type

As specified in [RFC2616], the format of an individual request or response body MUST be specified in the Content-Type header of the request or response.

See the format-specific specifications ([OData-JSON], [OData-Atom]) for details.

8.1.2 Header Content-Encoding

As specified in [RFC2616], the Content-Encoding header field is used as a modifier to the media-type (as indicated in the Content-Type). When present, its value indicates what additional content codings have been applied to the entity-body.

A service MAY specify a list of acceptable content codings using an annotation with term Capabilities.AcceptableEncodings, see [OData-VocCap].

8.1.3 Header Content-Length

As specified in [RFC2616], a request or response SHOULD include a Content-Length header when the message’s length can be determined prior to being transferred. OData does not add any additional requirements over HTTP for writing Content-Length.

8.1.4 Header OData-Version

OData clients SHOULD use the OData-Version header on a request to specify the version of the protocol used to generate the request.

If present on a request, the service MUST interpret the request according to the rules defined in the specified version of the protocol, or fail the request with a 4xx response code.

If not specified in a request, the service MUST assume the request is generated using the minimum of the OData-MaxVersion, if specified, and the maximum version of the protocol that the service understands.

OData services MUST include the OData-Version header on a response to specify the version of the protocol used to generate the response. The client MUST interpret the response according to the rules defined in the specified version of the protocol.

For more details, see Versioning.

8.2 Request Headers

In addition to the Common Headers, the client may specify any combination of the following request headers.

8.2.1 Header Accept

As specified in [RFC2616], the client MAY specify the set of accepted formats with the Accept Header.
If a media type specified in the Accept header includes a charset format parameter and the request also contains an Accept-Charset header, then the Accept-Charset header MUST be used.

If the media type specified in the Accept header does not include a charset format parameter, then the Content-Type header of the response MUST NOT contain a charset format parameter.

8.2.2 Header Accept-Charset

As specified in [RFC2616], the client MAY specify the set of accepted character sets with the Accept-Charset Header.

8.2.3 Header If-Match

As specified in [RFC2616], a client MAY include an If-Match header in a request to GET, PUT, PATCH or DELETE. The value of the If-Match request header MUST be an ETag value previously retrieved for the entity, or "*" to match any value.

If an entity set is annotated with the term Core.OptimisticConcurrencyControl (see [OData-VocCore]) and the client does not specify an If-Match request header in a Data Modification Request or Action Request, the service MUST respond with a 428 Precondition Required and MUST ensure that no observable change occurs as a result of the request.

If specified, the request MUST only be processed if the specified value matches the current ETag value of the target entity, using the weak comparison function (see [HTTP-Conditional]). If the value does not match the current ETag value of the entity for a Data Modification Request or Action Request, the service MUST respond with 412 Precondition Failed and MUST ensure that no observable change occurs as a result of the request. In the case of an upsert, if the addressed entity does not exist the provided ETag value is considered not to match.

The client MAY include an If-Match header in a PUT or PATCH request in order to ensure that the request is handled as an update and not an upsert.

8.2.4 Header If-None-Match

As specified in [RFC2616], a client MAY include an If-None-Match header in a request to GET, PUT, PATCH or DELETE. The value of the If-None-Match request header MUST be an ETag value previously retrieved for the entity, or "*".

If specified, the request MUST only be processed if the specified value does not match the current ETag value of the entity, using the weak comparison function (see [HTTP-Conditional]). If the value matches the current ETag value of the entity, then for a GET request, the service SHOULD respond with 304 Not Modified, and for a Data Modification Request or Action Request, the service MUST respond with 412 Precondition Failed and MUST ensure that no observable change occurs as a result of the request.

An If-None-Match header with a value of "*" in a PUT or PATCH request results in an upsert request being processed as an insert and not an update.

8.2.5 Header OData-Isolation

The OData-Isolation header specifies the isolation of the current request from external changes. The only supported value for this header is snapshot.

If the service doesn’t support OData-Isolation:snapshot and this header was specified on the request, the service MUST NOT process the request and MUST respond with 412 Precondition Failed.

Snapshot isolation guarantees that all data returned for a request, including multiple requests within a batch or results retrieved across multiple pages, will be consistent as of a single point in time. Only data modifications made within the request (for example, by a data modification request within the same batch)
are visible. The effect is as if the request generates a “snapshot” of the committed data as it existed at the start of the request.

The OData-Isolation header may be specified on a single or batch request. If it is specified on a batch then the value is applied to all statements within the batch.

Next links returned within a snapshot return results within the same snapshot as the initial request; the client is not required to repeat the header on each individual page request.

The OData-Isolation header has no effect on links other than the next link. Navigation links, read links, and edit links return the current version of the data.

A service returns 410 Gone or 404 Not Found if a consumer tries to follow a next link referring to a snapshot that is no longer available.

The syntax of the OData-Isolation header is specified in [OData-ABNF].

A service MAY specify the support for OData-Isolation:snapshot using an annotation with term Capabilities.IsolationSupport, see [OData-VocCap].

8.2.6 Header OData-MaxVersion

Clients SHOULD specify an OData-MaxVersion request header.

If specified the service MUST generate a response with an OData-Version less than or equal to the specified OData-MaxVersion.

If OData-MaxVersion is not specified, then the service SHOULD interpret the request as having an OData-MaxVersion equal to the maximum version supported by the service.

For more details, see Versioning.

8.2.7 Header Prefer

The Prefer header, as defined in [HTTP-Prefer], allows clients to request certain behavior from the service. The service MUST ignore preference values that are either not supported or not know by the service.

The value of the Prefer header is a comma-separated list of preferences. The following subsections describe preferences whose meaning in OData is defined by this specification.

In response to a request containing a Prefer header, the service MAY return the Preference-Applied Header.

8.2.7.1 Preference odata.allow-entityreferences

The odata.allow-entityreferences preference indicates that the service is allowed to return entity references in place of entities that have previously been returned, with at least the properties requested, in the same response (for example, when serializing the expanded results of many-to-many relationships). The service MUST NOT return entity references in place of requested entities if odata.allow-entityreferences has not been specified in the request. The syntax of the odata.allow-entityreferences preference is specified in [OData-ABNF].

In the case the service applies the odata.allow-entityreferences preference it MUST include a Preference-Applied response header containing the odata.allow-entityreferences preference to indicate that entity references MAY be returned in place of entities that have previously been returned.

8.2.7.2 Preference odata.callback

For scenarios in which links returned by the service are used by the client to poll for additional information, the client can specify the odata.callback preference to request that the service notify the client when data is available.
The `odata.callback` preference can be specified:

- when requesting asynchronous processing of a request with the `respond-async` preference, or
- on a GET request to a delta link.

The `odata.callback` preference MUST include the parameter `url` whose value is the URL of a callback endpoint to be invoked by the OData service when data is available. The syntax of the `odata.callback` preference is specified in [OData-ABNF].

For HTTP based callbacks, the OData service executes an HTTP GET request against the specified URL.

Services that support `odata.callback` SHOULD support notifying the client through HTTP. Services can advertise callback support using the `Capabilities.CallbackSupport` annotation term defined in [OData-VocCap].

If the service applies the `odata.callback` preference it MUST include the `odata.callback` preference in the `Preference-Applied` response header.

When the `odata.callback` preference is applied to asynchronous requests, the OData service invokes the callback endpoint once it has finished processing the request. The status monitor resource, returned in the `Location` header of the previously returned 202 Accepted response, can then be used to retrieve the results of the asynchronously executed request.

When the `odata.callback` preference is specified on a GET request to a delta link and there are no changes available, the OData service returns a 202 Accepted response with a `Location` header specifying the delta link to be used to check for future updates. The OData service then invokes the specified callback endpoint once new changes become available.

Combining `respond-async`, `odata.callback` and `odata.track-changes` preferences on a GET request to a delta-link might influence the response in a couple of ways.

- If the service processes the request synchronously, and no updates are available, then the response is the same as if the `respond-async` hadn’t been specified and results in a response as described above.
- If the service processes the request asynchronously, then it responds with a 202 Accepted response specifying the URL to the status monitor resource as it would have with any other asynchronous request. Once the service has finished processing the asynchronous request to the delta link resource, if changes are available it invokes the specified callback endpoint. If no changes are available, the service SHOULD wait to notify the client until changes are available. Once notified, the client uses the status monitor resource from the `Location` header of the previously returned 202 Accepted response to retrieve the results. In case no updates were available after processing the initial request, the result will contain no updates and the client can use the delta-link contained in the result to retrieve the updates that have since become available.

If the consumer specifies the same URL as callback endpoint in multiple requests, the service MAY collate them into a single notification once additional data is available for any of the requests. However, the consumer MUST be prepared to deal with receiving up to as many notifications as it requested.

Example 2: using a HTTP callback endpoint to receive notification

```
Prefer: odata.callback; url="http://myserver/notification/token/12345"
```

### 8.2.7.3 Preference odata.continue-on-error

The `odata.continue-on-error` preference on a batch request is used to request that, upon encountering a request within the batch that returns an error, the service return the error for that request and continue processing additional requests within the batch. The syntax of the `odata.continue-on-error` preference is specified in [OData-ABNF].

If not specified, upon encountering an error the service MUST return the error within the batch and stop processing additional requests within the batch.
A service MAY specify the support for the odata.continue-on-error preference using an annotation with term Capabilities.BatchContinueOnErrorSupported, see [OData-VocCap].

8.2.7.4 Preference odata.include-annotations

The odata.include-annotations preference in a request for data or metadata is used to specify the set of annotations the client requests to be included, where applicable, in the response.

The value of the odata.include-annotations preference is a comma-separated list of namespaces or namespace qualified term names to include or exclude, with "*" representing all. The full syntax of the odata.include-annotations preference is defined in [OData-ABNF].

The most specific identifier always takes precedence. If the same identifier value is requested to both be excluded and included the behavior is undefined; the service MAY return or omit the specified vocabulary but MUST NOT raise an exception.

Example 3: a Prefer header requesting all annotations within a metadata document to be returned

<table>
<thead>
<tr>
<th>Prefer: odata.include-annotations=&quot;*&quot;</th>
</tr>
</thead>
</table>

Example 4: a Prefer header requesting that no annotations are returned

<table>
<thead>
<tr>
<th>Prefer: odata.include-annotations=&quot;-*&quot;</th>
</tr>
</thead>
</table>

Example 5: a Prefer header requesting that all annotations defined under the "display" namespace (recursively) be returned

<table>
<thead>
<tr>
<th>Prefer: odata.include-annotations=&quot;display.*&quot;</th>
</tr>
</thead>
</table>

Example 6: a Prefer header requesting that the annotation with the term name subject within the display namespace be returned if applied

<table>
<thead>
<tr>
<th>Prefer: odata.include-annotations=&quot;display.subject&quot;</th>
</tr>
</thead>
</table>

The odata.include-annotations preference is only a hint to the service. The service MAY ignore the preference and is free to decide whether or not to return annotations not specified in the odata.include-annotations preference.

In the case that the client has specified the odata.include-annotations preference in the request, the service SHOULD include a Preference-Applied response header containing the odata.include-annotations preference to specify the annotations actually included, where applicable, in the response. This value may differ from the annotations requested in the Prefer header of the request.

8.2.7.5 Preference odata.maxpagesize

The odata.maxpagesize preference is used to request that each collection of entities within the response contain no more than the number of entities specified as the positive integer value of this preference. The syntax of the odata.maxpagesize preference is specified in [OData-ABNF].

Example 7: a request for customers and their orders would result in a response containing one collection with customer entities and for every customer a separate collection with order entities. The client could specify odata.maxpagesize=50 in order to request that each page of results contain a maximum of 50 customers, each with a maximum of 50 orders.

If a collection within the result contains more than the specified odata.maxpagesize, the collection SHOULD be a partial set of the results with a next link to the next page of results. The client MAY specify a different value for this preference with every request following a next link.

In the example given above, the result page should include a next link for the customer collection, if there are more than 50 customers, and additional next links for all returned orders collections with more than 50 entities.
If the client has specified the `odata.maxpagesize` preference in the request, and the service limits the number of entities in collections within the response through server-driven paging, the service MAY include a `Preference-Applied` response header containing the `odata.maxpagesize` preference and the maximum page size applied. This value may differ from the value requested by the client.

### 8.2.7.6 Preference `odata.track-changes`

The `odata.track-changes` preference is used to request that the service return a delta link that can subsequently be used to obtain changes (deltas) to this result. The syntax of the `odata.track-changes` preference is specified in [OData-ABNF].

For paged results, the preference MUST be specified on the initial request. Services MUST ignore the `odata.track-changes` preference if applied to the next link.

The delta link MUST NOT be returned prior to the final page of results.

The service includes a `Preference-Applied` response header in the first page of the response containing the `odata.track-changes` preference to signal that changes are being tracked.

A service MAY specify the support for the `odata.track-changes` preference using an annotation with term `Capabilities.ChangeTrackingSupport`, see [OData-VocCap].

### 8.2.7.7 Preference `return=representation and return=minimal`

The `return=representation` and `return=minimal` preferences are defined in [HTTP-Header].

In OData, `return=representation` or `return=minimal` is defined for use with a POST, PUT, or PATCH Data Modification Request other than to a stream property, or to an Action Request. Specifying a preference of `return=representation` or `return=minimal` in a GET or DELETE request, or any request to a stream property, SHOULD return a 4xx Client Error.

A preference of `return=representation` or `return=minimal` is allowed on an individual Data Modification Request or Action Request within a batch, subject to the same restrictions, but SHOULD return a 4xx Client Error if specified on the batch request itself.

A preference of `return=minimal` requests that the service invoke the request but does not return content in the response. The service MAY apply this preference by returning 204 No Content in which case it MAY include a `Preference-Applied` response header containing the `return=minimal` preference.

A preference of `return=representation` requests that the service invokes the request and returns the modified entity. The service MAY apply this preference by returning the successfully modified resource in the body of the response, formatted according to the rules specified for the requested format. In this case the service MAY include a `Preference-Applied` response header containing the `return=representation` preference.

### 8.2.7.8 Preference `respond-async`

The `respond-async` preference, as defined in [HTTP-Header], allows clients to request that the service process the request asynchronously.

If the client has specified `respond-async` in the request, the service MAY process the request asynchronously and return a 202 Accepted response.

The `respond-async` preference MAY be used for batch requests, but the service MUST ignore the `respond-async` preference for individual requests within a batch request.

In the case that the service applies the `respond-async` preference it MUST include a `Preference-Applied` response header containing the `respond-async` preference.

A service MAY specify the support for the `respond-async` preference using an annotation with term `Capabilities.AsynchronousRequestsSupported`, see [OData-VocCap].
Example 8: a service receiving the following header might choose to respond

- asynchronously if the synchronous processing of the request will take longer than 10 seconds
- synchronously after 5 seconds
- asynchronously (ignoring the \texttt{wait} preference)
- synchronously after 15 seconds (ignoring \texttt{respond-async} preference and the \texttt{wait} preference)

| Prefer: respond-async, wait=10 |

8.2.7.9 Preference \texttt{wait}

The \texttt{wait} preference, as defined in \([\text{HTTP-Prefer}]\), is used to establish an upper bound on the length of time, in seconds, the client is prepared to wait for the service to process the request synchronously once it has been received.

If the \texttt{respond-async} preference is also specified, the client requests that the service respond asynchronously after the specified length of time.

If the \texttt{respond-async} preference has not been specified, the service MAY interpret the \texttt{wait} as a request to timeout after the specified period of time.

8.3 Response Headers

In addition to the Common Headers, the following response headers have defined meaning in OData.

8.3.1 Header \texttt{ETag}

A request that returns an individual resource MAY include an \texttt{ETag} header in the response. Services MUST include this header in such a response if they require it to be specified when modifying the resource.

The value specified in the \texttt{ETag} header may be specified in the \texttt{If-Match} or \texttt{If-None-Match} header of a subsequent Data Modification Request or Action Request in order to apply optimistic concurrency in updating, deleting, or invoking the action bound to the entity.

As OData allows multiple formats for representing the same structured information, services SHOULD use weak \texttt{ETags} that only depend on the format-independent entity state is recommended. A strong \texttt{ETag} MUST change whenever the representation of an entity changes, so it has to depend on the Content-Type, the Content-Language, and potentially other characteristics of the response.

An \texttt{ETag} header MAY also be returned on a metadata document request or service document request to allow the client subsequently to make a conditional request for the metadata or service document. Clients can also compare the value of the \texttt{ETag} header returned from a metadata document request to the metadata \texttt{ETag} returned in a response in order to verify the version of the metadata used to generate that response.

8.3.2 Header \texttt{Location}

The \texttt{Location} header MUST be returned in the response from a Create Entity or Create Media Entity request to specify the edit URL, or for read-only entities the read URL, of the created entity, and in responses returning 202 Accepted to specify the URL that the client can use to request the status of an asynchronous request.

8.3.3 Header \texttt{OData-EntityId}

A response to a create operation that returns 204 No Content MUST include an \texttt{OData-EntityId} response header. The value of the header is the entity-id of the entity that was acted on by the request. The syntax of the \texttt{OData-EntityId} preference is specified in \([\text{OData-ABNF}]\).
8.3.4 Header Preference-Applied

In a response to a request that specifies a *Prefer* header, a service MAY include a *Preference-Applied* header, as defined in [HTTP-Prefer], specifying how individual preferences within the request were handled.

The value of the *Preference-Applied* header is a comma-separated list of preferences applied in the response. For more information on the individual preferences, see the *Prefer* header.

8.3.5 Header Retry-After

A service MAY include a *Retry-After* header in 202 *Accepted* and in 3xx *Redirect* responses. The *Retry-After* header specifies the duration of time, in seconds, that the client is asked to wait before retrying the request or issuing a request to the resource returned as the value of the *Location* header.
9 Common Response Status Codes

An OData service MAY respond to any request using any valid HTTP status code appropriate for the request. A service SHOULD be as specific as possible in its choice of HTTP status codes. The following represent the most common success response codes. In some cases, a service MAY respond with a more specific success code.

9.1 Success Responses

The following response codes represent successful requests.

9.1.1 Response Code 200 OK

A request that does not create a resource returns 200 OK if it is completed successfully and the value of the resource is not null. In this case, the response body MUST contain the value of the resource specified in the request URL.

9.1.2 Response Code 201 Created

A Create Entity, Create Media Entity, Create Link or Invoke Action request that successfully creates a resource returns 201 Created. In this case, the response body MUST contain the resource created.

9.1.3 Response Code 202 Accepted

202 Accepted indicates that the Data Service Request has been accepted and has not yet completed executing asynchronously. The asynchronous handling of requests is specified in section 11.6, and in section 11.7.5 for batch requests.

9.1.4 Response Code 204 No Content

A request returns 204 No Content if the requested resource has the null value, or if the service applies a return=minimal preference. In this case, the response body MUST be empty.

As defined in [HTTP-Semantics], a Data Modification Request that responds with 204 No Content MUST NOT include an ETag header unless the request's representation data was saved without any transformation applied to the body (i.e., the resource's new representation data is identical to the representation data received in the PUT request) and the ETag value reflects the new representation.

9.1.5 Response Code 3xx Redirection

As per [RFC2616], a 3xx Redirection indicates that further action needs to be taken by the client in order to fulfill the request. In this case, the response SHOULD include a Location header, as appropriate, with the URL from which the result can be obtained; it MAY include a Retry-After header.

9.1.6 Response Code 304 Not Modified

As per [RFC2616], a 304 Not Modified is returned when the client performs a GET request containing an If-Match or If-None-Match header and the content has not changed. In this case the response SHOULD NOT include other headers in order to prevent inconsistencies between cached entity-bodies and updated headers.

The service MUST ensure that no observable change has occurred to the state of the service as a result of any request that returns a 304 Not Modified.
9.2 Client Error Responses

Error codes in the 4xx range indicate a client error, such as a malformed request. The service MUST ensure that no observable change has occurred to the state of the service as a result of any request that returns an error status code. In the case that a response body is defined for the error code, the body of the error is as defined for the appropriate format.

9.2.1 Response Code 404 Not Found

404 Not Found indicates that the resource specified by the request URL does not exist. The response body MAY provide additional information.

9.2.2 Response Code 405 Method Not Allowed

405 Method Not Allowed indicates that the resource specified by the request URL does not support the request method. In this case the response MUST include an Allow header containing a list of valid request methods for the requested resource as specified in [RFC2616].

9.2.3 Response Code 410 Gone

410 Gone indicates that the requested resource is no longer available. This can happen if a client has waited too long to follow a delta link or a status-monitor-resource link, or a next link on a collection that was requested with snapshot isolation.

9.3 Server Error Responses

As specified in [RFC2616], error codes in the 5xx range indicate service errors.

9.3.1 Response Code 501 Not Implemented

If the client requests functionality not implemented by the OData Service, the service MUST respond with 501 Not Implemented and the response body SHOULD describe the functionality not implemented.

9.4 In-Stream Errors

In the case that the service encounters an error after sending a success status to the client, the service MUST generate an error within the payload, which may leave the response malformed. Clients MUST treat the entire response as being in error.

This specification does not prescribe a particular format for generating errors within a payload.
10 Context URL

The context URL describes the content of the payload.

Request payloads generally do not require context URLs as the type of the payload can generally be determined from the request URL.

For details on how the context URL is used to describe a payload, see the relevant sections in the particular format.

The following subsections describe how the context URL is constructed for each category of payload by providing a context URL template. The context URL template uses the following terms:

- `{context-url}` is the resource path to the `$metadata` document,
- `{entity-set}` is the name of an entity set or path to a containment navigation property,
- `{property-list}` is a parenthesized comma-separated list of properties,
- `{type-name}` is the qualified name of a complex type or entity type,
- `{/type-name}` is an optional type-cast segment containing the qualified name of a derived type prefixed with a forward slash.

The full grammar for the context URL is defined in [OData-ABNF].

10.1 Service Document

Context URL template:

```
{context-url}
```

The context URL of the service document is the context URL of the service.

*Example 9: resource URL and corresponding context URL*

```
http://host/service/
http://host/service/$metadata
```

10.2 Collection of Entities

Context URL template:

```
{context-url}#{entity-set}
```

If all entities in the collection are members of one entity set, its name is the context URL fragment.

*Example 10: resource URL and corresponding context URL*

```
http://host/service/Customers
http://host/service/$metadata#Customers
```

If the entities are contained, then `entity-set` is the top-level entity set followed by the path to the containment navigation property of the containing entity.

*Example 11: resource URL and corresponding context URL for contained entities*

```
http://host/service/Orders(4711)/Items
http://host/service/$metadata#Orders(4711)/Items
```
10.3 Entity

Context URL template:

{context-url}#{entity-set}/$entity

If a response or response part is a single entity of the declared type of an entity set, /$entity is appended to the context URL.

Example 12: resource URL and corresponding context URL

<table>
<thead>
<tr>
<th>URL</th>
<th>Context URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://host/service/Customers(1)">http://host/service/Customers(1)</a></td>
<td><a href="http://host/service/$metadata#Customers/$entity">http://host/service/$metadata#Customers/$entity</a></td>
</tr>
</tbody>
</table>

If the entity is contained, then entity-set is the canonical URL for the containment navigation property of the containing entity, e.g. Orders(4711)/Items.

Example 13: resource URL and corresponding context URL for contained entity

<table>
<thead>
<tr>
<th>URL</th>
<th>Context URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://host/service/Orders(4711)/Items(1)">http://host/service/Orders(4711)/Items(1)</a></td>
<td><a href="http://host/service/$metadata#Orders(4711)/Items/$entity">http://host/service/$metadata#Orders(4711)/Items/$entity</a></td>
</tr>
</tbody>
</table>

10.4 Singleton

Context URL template:

{context-url}#{singleton}

If a response or response part is a singleton, its name is the context URL fragment.

Example 14: resource URL and corresponding context URL

<table>
<thead>
<tr>
<th>URL</th>
<th>Context URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://host/service/Contoso">http://host/service/Contoso</a></td>
<td><a href="http://host/service/$metadata#Contoso">http://host/service/$metadata#Contoso</a></td>
</tr>
</tbody>
</table>

10.5 Collection of Derived Entities

Context URL template:

{context-url}#{entity-set}{/type-name}

If an entity set consists exclusively of derived entities, a type-cast segment is added to the context URL.

Example 15: resource URL and corresponding context URL

<table>
<thead>
<tr>
<th>URL</th>
<th>Context URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://host/service/Customers/Model.VipCustomer">http://host/service/Customers/Model.VipCustomer</a></td>
<td><a href="http://host/service/$metadata#Customers/Model.VipCustomer">http://host/service/$metadata#Customers/Model.VipCustomer</a></td>
</tr>
</tbody>
</table>

10.6 Derived Entity

Context URL template:

{context-url}#{entity-set}{/type-name}/$entity

If a response or response part is a single entity of a type derived from the declared type of an entity set, /<Type>/$entity is appended to the context URL after the type-cast segment.

Example 16: resource URL and corresponding context URL

<table>
<thead>
<tr>
<th>URL</th>
<th>Context URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://host/service/Customers(2)/Model.VipCustomer">http://host/service/Customers(2)/Model.VipCustomer</a></td>
<td><a href="http://host/service/$metadata#Customers/Model.VipCustomer/$entity">http://host/service/$metadata#Customers/Model.VipCustomer/$entity</a></td>
</tr>
</tbody>
</table>
10.7 Collection of Projected Entities

Context URL templates:

{context-url}#{entity-set}{/type-name}{property-list}

If a result contains only a subset of properties, the parenthesized comma-separated list of the selected properties is appended to the {entity-set} after an optional type-cast segment. The shortcut * represents the list of all structural properties.

Example 17: resource URL and corresponding context URL

<table>
<thead>
<tr>
<th>URL</th>
<th>Context URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://host/service/Customers?$select=Address,Orders">http://host/service/Customers?$select=Address,Orders</a></td>
<td><a href="http://host/service/$metadata#Customers(Address,Orders)">http://host/service/$metadata#Customers(Address,Orders)</a></td>
</tr>
</tbody>
</table>

10.8 Projected Entity

Context URL templates:

{context-url}#{entity-set}{/type-name}{property-list}$/entity

If a single entity contains a subset of properties, the parenthesized comma-separated list of the selected properties is appended to the {entity-set} after an optional type-cast segment and prior to appending /$entity. Note that expanded properties are implicitly selected.

Example 18: resource URL and corresponding context URL

<table>
<thead>
<tr>
<th>URL</th>
<th>Context URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://host/service/Customers(1)?$select=Name,Rating">http://host/service/Customers(1)?$select=Name,Rating</a></td>
<td><a href="http://host/service/$metadata#Customers(Name,Rating)/$entity">http://host/service/$metadata#Customers(Name,Rating)/$entity</a></td>
</tr>
</tbody>
</table>

Example 19: resource URL and corresponding context URL

<table>
<thead>
<tr>
<th>URL</th>
<th>Context URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://host/service/Customers$select=Name&amp;$expand=Address/Country">http://host/service/Customers$select=Name&amp;$expand=Address/Country</a></td>
<td><a href="http://host/service/$metadata#Customers(Name,Address/Country)">http://host/service/$metadata#Customers(Name,Address/Country)</a></td>
</tr>
</tbody>
</table>

10.9 Collection of Projected Expanded Entities

Context URL template:

{context-url}#{entity-set}{/type-name}{property-list}

If a navigation property is expanded, the parenthesized comma-separated list of properties contains the expanded navigation property. If the $expand contains a nested $select, the navigation property is suffixed with the parenthesized comma-separated list of properties selected from the related entities. Additionally, if the expansion is recursive for nested children, a plus sign (+) is infixed between the navigation property name and the list of properties.

Example 20: resource URL and corresponding context URL

<table>
<thead>
<tr>
<th>URL</th>
<th>Context URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://host/service/Employees/Sales.Manager?$expand=DirectReports($select=FirstName,LastName;$levels=4)">http://host/service/Employees/Sales.Manager?$expand=DirectReports($select=FirstName,LastName;$levels=4)</a></td>
<td><a href="http://host/service/$metadata#Employees/Sales.Manager(DirectReports+(FirstName,LastName))">http://host/service/$metadata#Employees/Sales.Manager(DirectReports+(FirstName,LastName))</a></td>
</tr>
</tbody>
</table>
10.10 Projected Expanded Entity

Context URL template:

```
{context-url}#{entity-set}{/type-name}{property-list}/$entity
```

If a single entity is expanded and projected, the parenthesized comma-separated list of the selected properties is appended to the (entity-set) after an optional type-cast segment and prior to appending /$entity.

*Example 21: resource URL and corresponding context URL*

<table>
<thead>
<tr>
<th>Resource URL</th>
<th>Context URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://host/service/Employees(1)/Sales.Manager">http://host/service/Employees(1)/Sales.Manager</a>?</td>
<td><a href="http://host/service/$metadata#Employees/Sales.Manager(DirectReports+(FirstName,LastName))/$entity">http://host/service/$metadata#Employees/Sales.Manager(DirectReports+(FirstName,LastName))/$entity</a></td>
</tr>
<tr>
<td>$expand=DirectReports($select=FirstName,LastName;$levels=4)</td>
<td></td>
</tr>
</tbody>
</table>

10.11 Collection of Entity References

Context URL template:

```
{context-url}#Collection($ref)
```

If a response is a collection of entity references, the context URL does not contain the type of the referenced entities.

*Example 22: resource URL and corresponding context URL for a collection of entity references*

<table>
<thead>
<tr>
<th>Resource URL</th>
<th>Context URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://host/service/Customers('ALFKI')/Orders/$ref">http://host/service/Customers('ALFKI')/Orders/$ref</a></td>
<td><a href="http://host/service/$metadata#Collection($ref)">http://host/service/$metadata#Collection($ref)</a></td>
</tr>
<tr>
<td><a href="http://host/service/$metadata#Collection($ref)">http://host/service/$metadata#Collection($ref)</a></td>
<td></td>
</tr>
</tbody>
</table>

10.12 Entity Reference

Context URL template:

```
{context-url}#$ref
```

If a response is a single entity reference, $ref is the context URL fragment.

*Example 23: resource URL and corresponding context URL for a single entity reference*

<table>
<thead>
<tr>
<th>Resource URL</th>
<th>Context URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://host/service/Orders(10643)/Customer/$ref">http://host/service/Orders(10643)/Customer/$ref</a></td>
<td><a href="http://host/service/$metadata#$ref">http://host/service/$metadata#$ref</a></td>
</tr>
</tbody>
</table>

10.13 Collection of Complex or Primitive Types

Context URL template:

```
{context-url}#Collection({type-name})
```

If a response is a collection of complex types or primitive types, the context URL names the type of the property.

*Example 24: resource URL and corresponding context URL*

<table>
<thead>
<tr>
<th>Resource URL</th>
<th>Context URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://host/service/Customers(1)/Hobbies">http://host/service/Customers(1)/Hobbies</a></td>
<td><a href="http://host/service/$metadata#Collection(Edm.String)">http://host/service/$metadata#Collection(Edm.String)</a></td>
</tr>
<tr>
<td><a href="http://host/service/Customers(1)/Hobbies">http://host/service/Customers(1)/Hobbies</a></td>
<td></td>
</tr>
<tr>
<td><a href="http://host/service/$metadata#Collection(Edm.String)">http://host/service/$metadata#Collection(Edm.String)</a></td>
<td></td>
</tr>
</tbody>
</table>
10.14 Complex or Primitive Type

Context URL template:

{context-url}#{type-name}

If a response is a complex type or primitive type, the context URL contains the fully qualified type of the property.

Example 25: resource URL and corresponding context URL

<table>
<thead>
<tr>
<th>URL</th>
<th>Context URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://host/service/Customers(1)/Name">http://host/service/Customers(1)/Name</a></td>
<td><a href="http://host/service/$metadata#Edm.String">http://host/service/$metadata#Edm.String</a></td>
</tr>
</tbody>
</table>

10.15 Operation Result

Context URL templates:

{context-url}#{entity-set}
{context-url}#{entity-set}/$entity
{context-url}#Collection({type-name})
{context-url}#{type-name}

If the response from an action or function is a collection of entities or a single entity that is a member of an entity set, the context URL identifies the entity set, otherwise it identifies the type returned by the operation. The context URL will correspond to one of the former examples.

Example 26: resource URL and corresponding context URL

<table>
<thead>
<tr>
<th>URL</th>
<th>Context URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://host/service/TopFiveCustomers">http://host/service/TopFiveCustomers</a></td>
<td><a href="http://host/service/$metadata#Customers">http://host/service/$metadata#Customers</a></td>
</tr>
<tr>
<td><a href="http://host/service/TopFiveCustomers">http://host/service/TopFiveCustomers</a></td>
<td><a href="http://host/service/$metadata#Customers">http://host/service/$metadata#Customers</a></td>
</tr>
</tbody>
</table>

10.16 Delta Response

Context URL template:

{context-url}#{entity-set}{type-name}{property-list}$/delta

The context URL of a delta response is the same as the context URL of the root entity set, followed by /$delta.

Example 27: resource URL and corresponding context URL

<table>
<thead>
<tr>
<th>URL</th>
<th>Context URL</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://host/service/Customers?$deltaToken=1234">http://host/service/Customers?$deltaToken=1234</a></td>
<td><a href="http://host/service/$metadata#Customers/$delta">http://host/service/$metadata#Customers/$delta</a></td>
</tr>
<tr>
<td><a href="http://host/service/Customers?$deltaToken=1234">http://host/service/Customers?$deltaToken=1234</a></td>
<td><a href="http://host/service/$metadata#Customers/$delta">http://host/service/$metadata#Customers/$delta</a></td>
</tr>
</tbody>
</table>

10.17 Item in a Delta Response

Context URL templates:

{context-url}#{entity-set}/$deletedEntity
{context-url}#{entity-set}/$link
{context-url}#{entity-set}/$deletedLink

In addition to new or changed entities which have the canonical context URL for an entity a delta response can contain deleted entities, new links, and deleted links. They are identified by the corresponding context URL fragment. {entity-set} corresponds to the set of the deleted entity, or source entity for an added or deleted link.
10.18 $all Response

Context URL template:

{context-url}#Collection(Edm.EntityType)

Responses to requests to the virtual collection $all (see [OData-URL]) use the built-in abstract entity type. Each single entity in such a response has its individual context URL that identifies the entity set or singleton.

10.19 $crossjoin Response

Context URL template:

{context-url}#Collection(Edm.ComplexType)

Responses to requests to the virtual collections $crossjoin(...) (see [OData-URL]) use the built-in abstract complex type. Single instances in these responses do not have a context URL.
11 Data Service Requests

11.1 Metadata Requests

An OData service is a self-describing service that exposes metadata defining the entity sets, relationships, entity types, and operations.

11.1.1 Service Document Request

Service documents enable simple hypermedia-driven clients to enumerate and explore the resources offered by the data service.

OData services MUST support returning a service document from the root URL of the service (the service root).

The format of the service document is dependent upon the format selected. For example, in Atom the service document is an AtomPub service document (as specified in [RFC5023]).

11.1.2 Metadata Document Request

An OData Metadata Document is a representation of the data model that describes the data and operations exposed by an OData service.

[OData-CSDL] describes an XML representation for OData metadata documents and provides an XML schema to validate their contents. The media type of the XML representation of an OData metadata document is application/xml.

OData services MUST expose a metadata document that describes the data model exposed by the service. The Metadata Document URL SHOULD be the root URL of the service with $metadata appended. To retrieve this document the client issues a GET request to the metadata document URL.

If a request for metadata does not specify a format preference (via Accept header or $format) then the XML representation MUST be returned.

11.1.3 Metadata Service Document Request

An OData Service MAY expose a Metadata Service. An OData Metadata Service is a representation of the data model that describes the data and operations exposed by an OData service as an OData service with a fixed (meta) data model.

A metadata service MUST use the schema defined in [OData-CSDL]. The root URL of the metadata service is the metadata document URL of the service with a forward slash appended. To retrieve this document the client issues a GET request to the metadata service root URL

11.2 Requesting Data

OData services support requests for data via HTTP GET requests.

The path of the URL specifies the target of the request (for example; the collection of entities, entity, navigation property, scalar property, or operation). Additional query operators, such as filter, sort, page, and projection operations are specified through query options.

This section describes the types of data requests defined by OData. For complete details on the syntax for building requests, see [OData-URL].

OData services are hypermedia driven services that return URLs to the client. If a client subsequently requests the advertised resource and the URL has expired, then the service SHOULD respond with 410 Gone. If this is not feasible, the service MUST respond with 404 Not Found.
The format of the returned data is dependent upon the request and the format specified by the client, either in the Accept header or using the $format query option.

11.2.1 Evaluating System Query Options

OData defines a number of system query options that allow refining the request. The result of the request MUST be as if the system query options were evaluated in the following order.

Prior to applying any server-driven paging:
- $search
- $filter
- $count
- $orderby
- $skip
- $top

After applying any server-driven paging:
- $expand
- $select
- $format

11.2.2 Requesting Individual Entities

To retrieve an individual entity, the client makes a GET request to the read URL of an entity.

The read URL can be obtained from a response payload containing that instance, for example as a self-link in an [OData-Atom] payload. In addition, Services MAY support conventions for constructing a read URL using the entity's key value(s), as described in [OData-URL].

The set of structural or navigation properties to return may be specified through $select or $expand system query options.

Clients MUST be prepared to receive additional properties in an entity or complex type instance that are not advertised in metadata, even for types not marked as open.

Properties that are not available, for example due to permissions, are not returned. In this case, the Core.Permissions annotation, defined in [OData-VocCore] MUST be returned for the property with a value of Core.Permission'None'.

If no entity exists with the key values specified in the request URL, the service responds with 404 Not Found.

11.2.3 Requesting Individual Properties

To retrieve an individual property, the client issues a GET request to the property URL. The property URL is the entity read URL with "/" and the property name appended.

For complex typed properties, the path can be further extended with the name of an individual property of the complex type.

See [OData-URL] for details.

If the property is single-valued and has the null value, the service responds with 204 No Content.

If the property is not available, for example due to permissions, the service responds with 404 Not Found.

Example 28:

http://host/service/Products(1)/Name
11.2.3.1 Requesting a Property's Raw Value using $value

To retrieve the raw value of a primitive type property, the client sends a GET request to the property value URL. See the [OData-URL] document for details.

The Content-Type of the response is determined using the Accept header and the $format system query option. The default format for single primitive values except Edm.Binary and the Edm.Geo types is text/plain.

A $value request for a property that is null results in a 204 No Content response.

If the property is not available, for example due to permissions, the service responds with 404 Not Found.

Example 29:

```
http://host/service/Products(1)/Name/$value
```

11.2.4 Specifying Properties to Return

The $select and $expand system query options enable the client to specify the set of structural properties and navigation properties to include in a response. The service MAY include additional properties not specified in $select and $expand, including properties not defined in the metadata document.

11.2.4.1 System Query Option $select

The $select system query option requests that the service return only the properties, dynamic properties, actions and functions explicitly requested by the client. The service returns the specified content, if available, along with any available expanded navigation properties, and MAY return additional information.

The value of the $select query option is a comma-separated list of properties, qualified action names, qualified function names, the star operator (*), or the star operator prefixed with the namespace or alias of the schema in order to specify all operations defined in the schema.

Example 30: request only the Rating and ReleaseDate for the matching Products

```
http://host/service/Products?$select=Rating,ReleaseDate
```

It is also possible to request all structural properties, including any dynamic properties, using the star operator. The star operator SHOULD NOT introduce navigation properties, actions or functions not otherwise requested.

Example 31:

```
http://host/service/Products?$select=* 
```

Properties of related entities can be specified by including the $select query option within the $expand.

Example 32:

``` 
http://host/service/Products?$expand=Category($select=Name)
```

The properties specified in $select are in addition to any expanded navigation properties.

Example 33: these two requests are equivalent

``` 
http://host/service/Categories?$select=CategoryName&$expand=Products
http://host/service/Categories?$select=CategoryName,Products&$expand=Products
```

It is also possible to request all actions or functions available for each returned entity.

Example 34:
If the $select query option is not specified, the service returns the full set of properties or a default set of properties. The default set of properties MUST include all key properties.

If the service returns less than the full set of properties, either because the client specified a select or because the service returned a subset of properties in the absence of a select, the context URL MUST reflect the set of selected properties and expanded navigation properties.

11.2.4.2 System Query Option $expand

The $expand system query option indicates the related entities that MUST be represented inline. The service MUST return the specified content, and MAY choose to return additional information.

The value of the $expand query option is a comma-separated list of navigation property names, optionally followed either by a parenthesized set of expand options (for filtering, sorting, selecting, paging, or expanding the related entities) or by a /$ref path segment.

For a full description of the syntax used when building requests, see [OData-URL].

Example 35: for each customer entity within the Customers entity set the value of all associated Orders will be represented inline

```plaintext
http://host/service.svc/Customers?$expand=Orders
```

Example 36: for each customer entity within the Customers entity set the references to the associated Orders will be represented inline

```plaintext
http://host/service.svc/Customers?$expand=Orders/$ref
```

11.2.4.2.1 Expand Options

The set of expanded entities can be further refined through the application of expand options, expressed as a semicolon-separated list of system query options, enclosed in parentheses, see [OData-URL].

Allowed system query options are $filter, $select, $orderby, $skip, $top, $count, $search, $expand, and $levels.

Example 37: for each customer entity within the Customers entity set, the value of those associated Orders whose Amount is greater than 100 will be represented inline

```plaintext
http://host/service.svc/Customers?$expand=Orders($filter=Amount gt 100)
```

Example 38: for each order within the Orders entity set, the following will be represented inline:

- The OrderLines associated with the Orders identified by the resource path section of the URL and the products associated to each order line.
- The Customer associated with each order returned.

```plaintext
http://host/service.svc/Orders?$expand=OrderLines($expand=Product),Customer
```

Example 39: for each customer entity in the Customers entity set, the value of all associated InHouseStaff will be represented inline if the entity is of type VipCustomer or a subtype of that. For entities that are not of type VipCustomer, or any of its subtypes, that entity may be returned with no inline representation for the expanded navigation property InHouseStaff (the service can always send more than requested)

```plaintext
http://host/service.svc/Customers?$expand=SampleModel.VipCustomer/InHouseStaff
```
11.2.4.2.1.1 Expand Option $levels

The $levels expand option can be used to specify the number of levels of recursion for a hierarchy in which the related entity type is the same as, or can be cast to, the source entity type. The same expand options are applied at each level of the hierarchy.

Example 40: return each employee from the Employees entity set and, for each employee that is a manager, return all direct reports, recursively to four levels

```
http://contoso.com/HR/Employees?$expand=Model.Manager/DirectReports($levels=4)
```

11.2.5 Querying Collections

OData services support querying collections of entities, complex type instances, and primitive values. The target collection is specified through a URL, and query operations such as filter, sort, paging, and projection are specified as system query options provided as query options. The names of all system query options are prefixed with a dollar ($) character.

An OData service MAY support some or all of the system query options defined. If a data service does not support a system query option, it MUST fail any request that contains the unsupported option and SHOULD return 501 Not Implemented.

11.2.5.1 System Query Option $filter

The $filter system query option restricts the set of items returned.

Example 41: return all Products whose Price is less than $10.00

```
http://host/service/Products?$filter=Price lt 10.00
```

The $count segment may be used within a $filter expression to limit the items returned based on the count of related entities or elements within a collection-valued property.

Example 42: return all Categories with less than 10 products

```
http://host/service/Categories?$filter=Products/$count lt 10
```

The value of the $filter option is a Boolean expression as defined in [OData-ABNF].

11.2.5.1.1 Built-in Filter Operations

OData supports a set of built-in filter operations, as described in this section. For a full description of the syntax used when building requests, see [OData-URL].

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>eq</td>
<td>Equal</td>
<td>Address/City eq 'Redmond'</td>
</tr>
<tr>
<td>ne</td>
<td>Not equal</td>
<td>Address/City ne 'London'</td>
</tr>
<tr>
<td>gt</td>
<td>Greater than</td>
<td>Price gt 20</td>
</tr>
<tr>
<td>ge</td>
<td>Greater than or equal</td>
<td>Price ge 10</td>
</tr>
<tr>
<td>lt</td>
<td>Less than</td>
<td>Price lt 20</td>
</tr>
<tr>
<td>le</td>
<td>Less than or equal</td>
<td>Price le 100</td>
</tr>
<tr>
<td>has</td>
<td>Has flags</td>
<td>Style has Sales.Color'Yellow'</td>
</tr>
<tr>

</tr>
<tr>
<td>( )</td>
<td>Precedence grouping</td>
<td>(Price sub 5) gt 10</td>
</tr>
</tbody>
</table>

### 11.2.5.1.2 Built-in Query Functions

OData supports a set of built-in functions that can be used within $filter operations. The following table lists the available functions. For a full description of the syntax used when building requests, see [OData-URL].

OData does not define an ISNULL or COALESCE operator. Instead, there is a null literal that can be used in comparisons.

<table>
<thead>
<tr>
<th>Function</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>String Functions</strong></td>
<td></td>
</tr>
<tr>
<td>contains</td>
<td>contains('Alfreds',CompanyName)</td>
</tr>
<tr>
<td>endswith</td>
<td>endswith(CompanyName,'Futterkiste')</td>
</tr>
<tr>
<td>startswith</td>
<td>startswith(CompanyName,'Alfr')</td>
</tr>
<tr>

<td>geo.intersects(Position,TargetArea)</td>
</tr>
</tbody>
</table>

### 11.2.5.1.3 Parameter Aliases

Parameter aliases can be used in place of literal values in **function parameters** or within a `filter` or `orderby` expression. Parameters aliases are names beginning with an at sign (@).

Actual parameter values are specified as query options in the query part of the request URL. The query option name is the name of the parameter alias, and the query option value is the value to be used for the specified parameter alias.

*Example 43:* returns all employees whose Region property matches the string parameter value "WA"
Parameter aliases allow the same value to be used multiple times in a request and may be used to reference primitive values, complex, or collection values.

If a parameter alias is not given a value in the Query part of the request URL, the value MUST be assumed to be null.

11.2.5.2 System Query Option $orderby

The $orderby System Query option specifies the order in which entities are returned from the service.

The value of the $orderby System Query option contains a comma-separated list of expressions whose primitive result values are used to sort the results. A special case of such an expression is a property path terminating on a primitive property. A type cast using the qualified entity type name is required to order by a property defined on a derived type.

The expression can include the suffix asc for ascending or desc for descending, separated from the property name by one or more spaces. If asc or desc is not specified, the service MUST order by the specified property in ascending order.

Null values come before non-null values when sorting in ascending order and after non-null values when sorting in descending order.

Example 44: return all Products ordered by release date in ascending order, then by rating in descending order

```
http://host/service/Products?$orderby=ReleaseDate asc, Rating desc
```

Related entities may be ordered by specifying $orderby within the $expand clause.

Example 45: return all Categories, and their Products ordered according to release date and in descending order of rating

```
http://host/service/Categories?$expand=Products($orderby=ReleaseDate asc, Rating desc)
```

$count may be used within a $orderby expression to order the returned entities according to the count of related entities or elements within a collection-valued property.

Example 46: return all Categories ordered by the number of Products within each category

```
http://host/service/Categories?$orderby=Products/$count
```

11.2.5.3 System Query Option $top

The $top System Query option specifies a non-negative integer n that limits the number of items returned from a collection. The service returns the number of available items up to but not greater than the specified value n.

Example 47: return only the first five products of the Products entity set

```
http://host/service/Products?$top=5
```

If no unique ordering is imposed through an $orderby query option, the service MUST impose a stable ordering across requests that include $top.

11.2.5.4 System Query Option $skip

The $skip System Query option specifies a non-negative integer n that excludes the first n items of the queried collection from the result. The service returns items starting at position n+1.

Example 48: return products starting with the 6th product of the Products entity set

```
http://host/service/Products?$skip=5
```
Where $top and $skip are used together, $skip MUST be applied before $top, regardless of the order in which they appear in the request.

Example 49: return the third through seventh products of the Products entity set

```
http://host/service/Products?$top=5&$skip=2
```

If no unique ordering is imposed through an $orderby query option, the service MUST impose a stable ordering across requests that include $skip.

11.2.5.5 System Query Option $count

The $count system query option with a value of true specifies that the total count of entities within a collection matching the request be returned along with the result.

Example 50: return, along with the results, the total number of products in the collection

```
http://host/service/Products?$count=true
```

The count of related entities can be requested by specifying the $count query option within the $expand clause.

Example 51:

```
http://host/service/Categories?$expand=Products($count=true)
```

An $count query option with a value of false (or not specified) hints that the service SHOULD NOT return a count.

The service returns an HTTP Status code of 400 Bad Request if a value other than true or false is specified.

The $count system query option ignores any $top, $skip, or $expand query options, and returns the total count of results across all pages including only those results matching any specified $filter and $search

How the count is encoded in the response body is dependent upon the selected format.

11.2.5.6 System Query Option $search

The $search system query option restricts the result to include only those entities matching the specified search expression. The definition of what it means to match is dependent upon the implementation.

Example 52: return all Products that match the search term "bike"

```
http://host/service/Products?$search=bike
```

The search expression can contain phrases, enclosed in double-quotes.

Example 53: return all Products that match the phrase "mountain bike"

```
http://host/service/Products?$search="mountain bike"
```

The upper case keyword NOT restricts the set of entities to those that do not match the specified term.

Example 54: return all Products that do not match "clothing"

```
http://host/service/Products?$search=NOT clothing
```

Multiple terms within a search expression are separated by a space (implicit AND) or the upper-case keyword AND, indicating that all such terms must be matched.

Example 55: return all Products that match both "mountain" and "bike"

```
http://host/service/Products?$search=mountain AND bike
```
The upper-case keyword OR is used to return entities that satisfy either the immediately preceding or subsequent expression.

**Example 56: return all Products that match either "mountain" or "bike"**

```
http://host/service/Products?$search=mountain OR bike
```

Parentheses within the search expression group together multiple expressions.

**Example 57: return all Products that match either "mountain" or "bike" and do not match clothing**

```
http://host/service/Products?$search=(mountain OR bike) AND NOT clothing
```

The operations within a search expression MUST be evaluated in the following order: grouping operator, NOT operator, AND operator, OR operator.

If both $search and $filter are specified in the same request, only those entities satisfying both criteria are returned.

The value of the $search option is a Boolean expression as defined in [OData-ABNF].

### 11.2.5.7 Server-Driven Paging

Responses that include only a partial set of the entities identified by the request URL MUST contain a link that allows retrieving the next partial set of entities. This link is called a next link; its representation is format-specific. The final partial set of entities MUST NOT contain a next link.

The client can request a maximum page size through the odata.maxpagesize preference. The service may apply this requested page size or implement a page size different than, or in the absence of, this preference.

OData clients MUST treat the URL of the next link as opaque, and MUST NOT append system query options to the URL of a next link. The Accept header MAY be used to specify the desired response format.

OData services may use the reserved system query option $skiptoken when building next links. Its content is opaque, service-specific, and must only follow the rules for URL query parts.

OData clients MUST NOT use the system query option $skiptoken when constructing requests.

### 11.2.6 Requesting Related Entities

To request related entities according to a particular relationship, the client issues a GET request to the source entity’s request URL, followed by a forward slash and the name of the navigation property representing the relationship, to the source entity’s request URL, followed by a forward slash and the name of the navigation property representing the relationship.

If the navigation property does not exist on the entity indicated by the request URL, the service returns 404 Not Found.

If the relationship terminates on a collection, the response MUST be the format-specific representation of the collection of related entities. If no entities are related, the response is the format-specific representation of an empty collection.

If the relationship terminates on a single entity, the response MUST be the format-specific representation of the related single entity. If no entity is related, the service returns 204 No Content.

**Example 58: return the supplier of the product with ID=1 in the Products entity set**

```
http://host/service/Products(1)/Supplier
```

### 11.2.7 Requesting Entity References

To request entity references in place of the actual entities, the client issues a GET request with /$ref appended to the resource path.
If the resource path does not identify an entity or a collection of entities, the service returns 404 Not Found.

If the resource path terminates on a collection, the response MUST be the format-specific representation of a collection of entity references pointing to the related entities. If no entities are related, the response is the format-specific representation of an empty collection.

If the resource path terminates on a single entity, the response MUST be the format-specific representation of an entity reference pointing to the related single entity. If the resource path terminates on a single entity and no such entity exists, the service returns 404 Not Found.

Example 59: collection with an entity reference for each Order related to the Product with ID=0

http://host/service/Products(0)/Orders/$ref

11.2.8 Resolving an Entity-Id

To resolve an entity-id, e.g. obtained in an entity reference, into a representation of the identified entity, the client issues a GET request to the $entity resource which located at the URL /$entity relative to the service root. The entity-id MUST be specified using the system query option $id.

Example 60: return the entity representation for a given entity-id

http://host/service/$entity?$id=http://host/service/Products(0)

A type segment following the $entity resource casts the resource to the specified type. If the identified entity is not of the specified type, or a type derived from the specified type, the service returns 404 Not Found.

The system query options $select and $expand can be specified in GET requests to the $entity resource.

Example 61: return the entity representation for a given entity-id and specify properties to return

http://host/service/$entity?$id=http://host/service/Customers('ALFKI')
 &$select=CompanyName,ContactName&$expand=Orders

11.2.9 Requesting the Number of Elements

To request only the number of elements of a collection of entities or elements of a collection-valued property, the client issues a GET request with /$count appended to the resource path of the collection.

On success, the response body MUST contain the count of entities matching the request after applying any $filter or $search system query options, formatted as a simple scalar integer value with media type text/plain. The returned count MUST NOT be affected by $top, $skip, $orderby, or $expand. Content negotiation using the Accept request header or the $format system query option is not allowed with the path segment /$count.

Example 62: return the number of products in the Products entity set

http://host/service/Products/$count

Example 63: return the number of all products whose Price is less than $10.00

http://host/service/Products/$count?$filter=Price lt 10.00

The /$count segment can be used in combination with the $filter system query option.

Example 64: return all customers with more than five interests

http://host/service/Customers?$filter=Interests/$count gt 5
11.2.10 System Query Option $format

The $format system query option specifies the media type of the response.

The $format query option, if present in a request, MUST take precedence over the value(s) specified in the Accept request header.

The value of the $format query option is a valid internet media type, optionally including parameters.

In addition, format-specific abbreviations may be used, see [OData-Atom] and [OData-JSON], but format parameters MUST NOT be appended to the format abbreviations.

Example 65: the request

```
http://host/service/Orders?$format=application/json;odata.metadata=full
```

is equivalent to a request with an Accept header using the same media type; it requests the set of Order entities represented using the JSON media type including full metadata, as specified in [OData-JSON].

Example 66: the request

```
http://host/service/Orders?$format=json
```

is equivalent to a request with the Accept header set to application/json; it requests the set of Order entities represented using the JSON media type with minimal metadata, as specified in [OData-JSON].

The $format system query option MUST NOT be specified in batch requests as these always use the media type multipart/mixed.

In metadata document requests the values application/atom+xml, application/json, their subtypes and parameterized variants as well as the format-specific abbreviations atom and json are reserved for future versions of this specification.

11.3 Requesting Changes

Services advertise their change-tracking capabilities by annotating entity sets with the Capabilities.ChangeTracking term defined in [OData-VocCap].

Clients request that the service track changes to a result by specifying the odata.track-changes preference on a request. If supported for the request, the service includes a Preference-Applied header in the response containing the odata.track-changes preference and includes a delta link on the last page of results.

11.3.1 Delta Links

Delta links are opaque, service-generated links that the client uses to retrieve subsequent changes to a result.

Delta links are based on a defining query that describes the set of results for which changes are being tracked; for example, the request that generated the results containing the delta link. The delta link encodes the collection of entities for which changes are being tracked, along with a starting point from which to track changes.

If the defining query contains a $filter or $search, the response MUST include only changes to entities matching the specified criteria. Added entities MUST be returned for entities that were added or changed and now match the specified criteria, and deleted entities MUST be returned for entities that are changed to no longer match the criteria of $filter or $search.

The delta link MUST NOT encode any client top or skip value, and SHOULD NOT encode a request for an inline count.

If the defining query includes expanded relationships, the delta link MUST return changes, additions, or deletions to the expanded entities, as well as added or deleted links to expanded entities.
Entities are considered changed if any of the structural properties have changed. Changes to related entities and to streams are not considered a change to the entity containing the stream or navigation property.

If the defining query contains a projection, the generated delta link SHOULD logically include the same projection, such that the delta query only includes fields specified in the projection. Services MAY use the projection to limit the entities returned to those that have changed within the selected fields, but the client MUST be prepared to receive entities returned whether or not the field that changed was specified in the projection.

11.3.2 Using Delta Links

The client requests changes by invoking the GET method on the delta link. The client MUST NOT attempt to append system query options to the delta link. The Accept header MAY be used to specify the desired response format.

The /$count segment can be appended to the path of a delta link in order to get just the number of changes available. The count includes all added, changed, or deleted entities, as well as added or deleted links.

The results of a request against the delta link may span multiple pages but MUST be ordered by the service across all pages in such a way as to guarantee consistency when applied in order to the response which contained the delta link.

Services SHOULD return only changed entities, but MAY return additional entities matching the defining query for which the client will not see a change.

In order to continue tracking changes beyond the current set, the client specifies odata.track-changes on the initial request to the delta link but is not required to repeat it for subsequent pages. The new delta link appears at the end of the last page of changes and MUST return all changes subsequent to the last change of the previous delta link.

If no changes have occurred, the response is an empty collection that contains a delta link for subsequent changes if requested. This delta link MAY be identical to the delta link resulting in the empty collection of changes.

If the delta link is no longer valid, the service responds with 410 Gone, and SHOULD include the URL for refetching the entire set in the Location header of the response.

11.4 Data Modification

Updatable OData services support Create, Update, and Delete operations for some or all exposed entities. Additionally, Actions supported by a service can affect the state of the system.

A successfully completed Data Modification Request must not violate the integrity of the data.

The client may request whether content be returned from a Create, Update, or Delete request, or the invocation of an Action, by specifying the return Prefer header.

11.4.1 Common Data Modification Semantics

Data Modification Requests share the following semantics.

11.4.1.1 Use of ETags for Avoiding Update Conflicts

If an ETag value is specified in an If-Match or If-None-Match header of a Data Modification Request or Action Request, the operation MUST only be invoked if the if-match or if-none-match condition is satisfied.

The ETag value specified in the if-match or if-none-match request header may be obtained from an ETag header of a response for an individual entity, or may be included for an individual entity in a format-specific manner.
11.4.1.2 Handling of DateTimeOffset Values

Services SHOULD preserve the offset of Edm.DateTimeOffset values, if possible. However, where the underlying storage does not support offset services may be forced to normalize the value to some common time zone (i.e. UTC) in which case the result would be returned with that time zone offset. If the service normalizes values, it MUST fail evaluation of the query functions year, month, day, hour, and time for literal values that are not stated in the time zone of the normalized values.

11.4.1.3 Handling of Properties Not Advertised in Metadata

Clients MUST be prepared to receive additional properties in an entity or complex type instance that are not advertised in metadata, even for types not marked as open. By using PATCH when updating entities, clients can ensure that such properties values are not lost if omitted from the update request.

11.4.1.4 Handling of Consistency Constraints

Services may impose cross-entity consistency constraints. Certain referential constraints, such as requiring an entity to be created with related entities can be satisfied through creating or linking related entities when creating the entity. Other constraints might require multiple changes to be specified together in a single atomic change set.

11.4.2 Create an Entity

To create an entity in a collection, the client sends a POST request to that collection’s URL. The POST body MUST contain a single valid entity representation.

An entity may also be created as the result of an Upsert operation.

If the target URL for the collection is a navigation link, the new entity is automatically linked to the source entity of the navigation link.

To create an open entity (an instance of an open type), additional property values beyond those specified in the metadata MAY be sent in the request body. The service MUST treat these as dynamic properties and add them to the created instance.

If the entity being created is not an open entity, additional property values beyond those specified in the metadata SHOULD NOT be sent in the request body. The service MUST fail if unable to persist all property values specified in the request.

Properties computed by the service (annotated with the term Core.Computed, see [OData-VocCore]) and properties that are tied to key properties of the principal entity by a referential constraint, MAY be omitted from the request.

Upon successful completion, the response MUST contain a Location header that contains the edit URL or read URL of the created entity.

Upon successful completion the service MUST respond with either 201 Created, or 204 No Content if the request included a return Prefer header with a value of return=minimal.

11.4.2.1 Link to Related Entities When Creating an Entity

To create a new entity with links to existing entities in a single request, the client includes the entity-ids of the related entities associated with the corresponding navigation properties in the request body.

The representation for binding information is format-specific.

Example 67: using the JSON format the client can create a new manager entity with links to two existing employees by applying the odata.bind annotation to the DirectReports navigation property

```json
{
   "odata.type":"Northwind.Manager",
   "EmployeeID": 1,
   "DirectReports@odata.bind": ["http://host/service/Employees(5)"],
}
"http://host/service/Employees(6)"
]
}

Example 68: using the Atom format the client can create a new manager entity with links to two existing employees by including a navigation link element for each employee in the Atom entry representing the manager

```xml
<entry>
  <id> http://host/service /Employees(1)</id>
  <title type="text" />
  <updated>2011-02-16T01:00:25Z</updated>
  <author><name /></author>
  <link rel="http://docs.oasis-open.org/odata/ns/related/DirectReports" href="http://host/service/Employees(5)" type="application/atom+xml;type=entry" title="Direct Reports" />
  <link rel="http://docs.oasis-open.org/odata/ns/related/DirectReports" href="http://host/service/Employees(6)" type="application/atom+xml;type=entry" title="Direct Reports" />
  <category term="NorthwindModel.Manager" scheme="http://odata.org/scheme" />
  <content type="application/xml">
    <metadata:properties>
      <data:EmployeeID>1</data:EmployeeID>
    </metadata:properties>
  </content>
</entry>
```

Upon successful completion of the operation, the service creates the requested entity and relate it to the requested existing entities.

If the target URL for the collection the entity is created in and binding information provided in the POST body contradicts the implicit binding information provided by the request URL, the request MUST fail and the service respond with 400 Bad Request.

Upon failure of the operation, the service MUST NOT create the new entity. In particular, the service MUST never create an entity in a partially-valid state (with the navigation property unset).

11.4.2.2 Create Related Entities When Creating an Entity

A request to create an entity that includes related entities, represented using the appropriate inline representation, is referred to as a “deep insert”.

If the inline representation contains a value for a computed property or dependent property of a referential constraint, the service MUST ignore that value when creating the related entity.

On success, the service MUST create all entities and relate them. If the request included a `return Prefer header` with a value of `return=representation` and is applied by the service, the response MUST be expanded to at least the level that was present in the deep-insert request.

On failure, the service MUST NOT create any of the entities.

11.4.3 Update an Entity

Services SHOULD support PATCH as the preferred means of updating an entity. PATCH provides more resiliency between clients and services by directly modifying only those values specified by the client.

The semantics of PATCH, as defined in [RFC5789], are to merge the content in the request payload with the [entity’s] current state, applying the update only to those components specified in the request body. Collection properties and primitive properties provided in the payload MUST replace the value of the corresponding property in the entity or complex type. Missing properties of the containing entity or complex property, including dynamic properties, MUST NOT be directly altered.
Services MAY additionally support **PUT**, but should be aware of the potential for data-loss in round-tripping properties that the client may not know about in advance, such as open or added properties, or properties not specified in metadata. Services that support **PUT** MUST replace all values of structural properties with those specified in the request body. Missing structural properties MUST be set to their default values. Missing dynamic structural properties MUST be removed or set to **null**.

Key and other non-updatable properties can be omitted from the request. If the request contains a value for a key or other non-updatable property, the service MUST ignore that value when applying the update. The entity MUST NOT contain related entities as inline content. It MAY contain binding information for navigation properties. For single-valued navigation properties this replaces the relationship. For collection-valued navigation properties this adds to the relationship.

If the entity being updated is open, then additional values for properties beyond those specified in the metadata or returned in a previous request MAY be sent in the request body. The service MUST treat these as dynamic properties.

If the entity being updated is not open, then additional values for properties beyond those specified in the metadata or returned in a previous request SHOULD NOT be sent in the request body. The service MUST fail if unable to persist all property values specified in the request.

On success, the response MUST be a valid success response.

### 11.4.4 Upsert an Entity

An upsert occurs when the client sends an update request to a valid URL that identifies a single entity that does not exist. In this case the service MUST handle the request as a create entity request or fail the request altogether.

Upserts are not supported against media entities. Services MUST fail an update request to a URL that identifies an entity that does not exist.

To ensure that an update request is not treated as an insert, the client MAY specify an **If-Match header** in the update request. The service MUST NOT treat an update request containing an **If-Match header** as an insert.

A **PUT** or **PATCH** request MUST NOT be treated as an update if an **If-None-Match header** is specified with a value of "*".

### 11.4.5 Delete an Entity

A successful **DELETE** request to an entity's edit URL deletes the entity. The request body SHOULD be empty.

On successful completion of the delete, the response MUST be **204 No Content** and contain an empty body.

Services MUST implicitly remove relations to and from an entity when deleting it; clients need not delete the relations explicitly.

Services MAY implicitly delete or modify related entities if required by integrity constraints. If integrity constraints are declared in $metadata using a **ReferentialConstraint** element, services MUST modify affected related entities according to the declared integrity constraints, e.g. by deleting dependent entities, or setting dependent properties to **null** or their default value.

### 11.4.6 Modifying Relationships between Entities

Relationships between entities are represented by navigation properties as described in Data Model. URL conventions for navigation properties are described in [OData-URL].
11.4.6.1 Add a Reference to a Collection-Valued Navigation Property

A successful **POST** request to a navigation property's references collection adds a relationship to an existing entity. The request body MUST contain a single entity reference that identifies the entity to be added. See the appropriate format document for details.

On successful completion, the response MUST be **204 No Content** and contain an empty body.

11.4.6.2 Remove a Reference to an Entity

A successful **DELETE** request to the URL that represents a reference to a related entity removes the relationship to that entity.

For collection-valued navigation properties, the entity reference of the entity to be removed MUST be specified using the $id query string option.

For single-valued navigation properties, the $id query string option MUST NOT be specified.

The **DELETE** request MUST NOT violate any integrity constraints in the data model.

On successful completion, the response MUST be **204 No Content** and contain an empty body.

11.4.6.3 Change the Reference in a Single-Valued Navigation Property

A successful **PUT** request to a single-valued navigation property’s reference resource changes the related entity. The request body MUST contain a single entity reference that identifies the existing entity to be related. See the appropriate format document for details.

On successful completion, the response MUST be **204 No Content** and contain an empty body.

Alternatively, a relationship MAY be updated as part of an update to the source entity by including the required binding information for the new target entity. This binding information is format-specific, see [OData-JSON] and [OData-Atom] for details.

11.4.7 Managing Media Entities

A **media entity** is an entity that represents an out-of-band stream, such as a photograph.

A media entity MUST have a source URL that can be used to read the media stream, and MAY have a media edit URL that can be used to write to the media stream.

Because a media entity has both a media stream and standard entity properties special handling is required.

11.4.7.1 Creating a Media Entity

A **POST** request to a media entity's entity set creates a new media entity. The request body MUST contain the media value (for example, the photograph) whose media type MUST be specified in a **Content-Type** header.

Upon successful completion, the response MUST contain a **Location header** that contains the edit URL of the created entity.

Upon successful completion the service responds with either **201 Created**, or **204 No Content** if the request included a **return Prefer header** with a value of **return=minimal**.

11.4.7.2 Editing a Media Entity Stream

A successful **PUT** request to the media edit URL of a media entity changes the media stream of the entity.

If the entity includes an ETag value for the media stream, the client MUST include an **If-Match** header with the ETag value.

The request body MUST contain the new media value for the entity whose media type MUST be specified in a **Content-Type** header.
If the request to edit a media stream returns a non-empty response body, the response body MUST contain the updated media entity.

11.4.7.3 Deleting a Media Entity

A successful DELETE request to the entity's edit URL deletes the media entity as described in Delete An Entity. Deleting a media entity also deletes the media associated with the entity.

11.4.8 Managing Stream Properties

An entity may have one or more stream properties. Stream properties are properties of type Edm.Stream. The values for stream properties do not appear in the entity payload. Instead, the values are read or written through URLs.

11.4.8.1 Editing Stream Values

A successful PUT request to the edit URL of a stream property changes the media stream associated with that property. If the stream metadata includes an ETag value, the client SHOULD include an If-Match header with the ETag value. The request body MUST contain the new media value for the stream whose media type MUST be specified in a Content-Type header. It may have a Content-Length of zero to set the stream data to empty. Stream properties MAY specify a list of acceptable media types using an annotation with term Core.AcceptableMediaTypes, see [OData-VocCore].

11.4.9 Managing Values and Properties Directly

Values and properties can be explicitly addressed with URLs. This allows them to be individually modified. See [OData-URL] for details on addressing.

11.4.9.1 Update a Primitive Property

A successful PUT request to the edit URL for a primitive property updates the value of the property. The message body MUST contain the new value, formatted as a single property according to the specified format. The same rules apply whether this is a regular property or a dynamic property. Upon successful completion of the update, the response MUST be a valid update response.

11.4.9.2 Set a Value to Null

A successful DELETE request to the edit URL for a primitive property sets the property to null. The request body is ignored and should be empty. A DELETE request to a non-nullable value MUST fail and the service respond with 400 Bad Request. The same rules apply whether the target is the value of a regular property or the value of a dynamic property. A missing dynamic property is defined to be the same as a dynamic property with value null. All dynamic properties are nullable. On success, the service MUST respond with 204 No Content and an empty body. Updating a Primitive Property with a null value also sets the property to null.
11.4.9.3 Update a Complex Type

A successful PATCH request to the edit URL for a complex typed property updates that property. The request body MUST contain a single valid representation for the target complex type. The service MUST directly modify only those properties of the complex type specified in the payload of the PATCH request.

The service MAY additionally support clients sending a PUT request to a URL that specifies a complex type. In this case, the service MUST replace the entire complex property with the values specified in the request body and set all unspecified properties to their default value.

On success, the response MUST be a valid update response.

11.4.9.4 Update a Collection Property

A successful PUT request to the edit URL of a collection property updates that collection. The message body MUST contain the desired new value, formatted as a collection property according to the specified format.

The service MUST replace the entire value with the value supplied in the request body.

Since collection members have no individual identity, PATCH is not supported for collection properties.

On success, the response MUST be a valid update response.

11.5 Operations

Custom operations (Actions and Functions) are represented as Action, ActionImport, Function, and FunctionImport elements in [OData-CSDL].

11.5.1 Binding an Operation to a Resource

Actions and Functions MAY be bound to an entity type, primitive type, complex type, or a collection. The first parameter of a bound operation is the binding parameter.

The namespace- or alias-qualified name of a bound operation may be appended to any URL that identifies a resource whose type matches, or is derived from, the type of the binding parameter. The resource identified by that URL is used as the binding parameter value.

Example 69: the function MostRecentOrder can be bound to any URL that identifies a SampleModel.Customer

```
<Function Name="MostRecentOrder" ReturnType="SampleModel.Order"
  IsBound="true">
  <Parameter Name="customer" Type="SampleModel.Customer" />
</Function>
```

Example 70: invoking the MostRecentOrder function with the value of the binding parameter customer being the entity identified by http://host/service/Customers('ALFKI')

```
http://host/service/Customers('ALFKI')/SampleModel.MostRecentOrder()
```

11.5.2 Advertising Available Operations within a Payload

Services MAY return the available actions and/or functions bound to a particular entity as part of the entity representation within the payload. The representation of an action or function depends on the format. An efficient format that assumes client knowledge of metadata SHOULD NOT include actions and functions in the payload that are available on all instances and whose target URL can be computed via metadata following standard conventions defined in [OData-URL].

Example 71: given a GET request to http://host/service/Customers('ALFKI'), the service might respond with a Customer that includes the SampleEntities.MostRecentOrder function bound to the entity
11.5.3 Functions

Functions are operations exposed by an OData service that MUST return data and MUST have no observable side effects.

11.5.3.1 Invoking a Function

To invoke a function bound to a resource, the client issues a GET request to a function URL. A function URL may be obtained from a previously returned entity representation or constructed by appending the namespace- or alias- qualified function name to a URL that identifies a resource whose type is the same as, or derived from, the type of the binding parameter of the function. The value for the binding parameter is the value of the resource identified by the URL prior to appending the function name, and additional parameter values are specified using inline parameter syntax. If the function URL is obtained from a previously returned entity representation, parameter aliases that are identical to the parameter name preceded by an at (@) sign MUST be used. Clients MUST check if the obtained URL already contains a query part and appropriately precede the parameters either with an ampersand (&) or a question mark (?).

Functions can be used within $filter or $orderby system query options. Such functions can be bound to a resource, as described above, or called directly by specifying the namespace- (or alias-) qualified function name. Parameter values for functions within $filter or $orderby are specified according to the inline parameter syntax.

To invoke a function through a function import the client issues a GET a request to a URL identifying the function import and passing parameter values using inline parameter syntax. The canonical URL for a function import is the service root, followed by the name of the function import. Additional path segments and system query options may be appended to URLs that identify composable functions (or function imports) as appropriate for the type returned by the function or function import.

Services MAY support invoking a function or function import using a PUT, POST, PATCH or DELETE requests where the target of the operation is the result of the function.

Parameter values passed to functions MUST be specified either as a URL literal (for primitive types) or as a JSON formatted OData object (for complex types or collections of primitive types or complex types).

If a collection-valued function has no result for a given parameter value combination, the response is the format-specific representation of an empty collection. If a single-valued function with a nullable return type has no result, the service returns 204 No Content.

If a single-valued function with a non-nullable return type has no result, the service returns 4xx. For functions that return a single entity 404 Not Found is the appropriate response code.

If a request URL contains further path segments after the function URL (including parameters), processing is stopped when the function result requires a 4xx response, and continues otherwise, Function imports MUST NOT be used inside either the $filter or $orderby system query options.

11.5.3.1.1 Inline Parameter Syntax

Parameter values are specified inline by appending a comma-separated list of parameter values, enclosed by parenthesis to the function name.

{  
  "odata.context": "...,
  "@ SampleEntities.MostRecentOrder": {  
    "title": "Most Recent Order",
    "@ target": "Customers('ALFKI')/SampleEntities.MostRecentOrder()"
  },
  "CustomerID": "ALFKI",
  "CompanyName": "Alfreds Futterkiste",
  ...
}
Each parameter value is represented as a name/value pair in the format Name=Value, where Name is the name of the parameter to the function and Value is the parameter value.

Example 72: invoke a Sales.EmployeesByManager function which takes a single ManagerID parameter via the function import EmployeesByManager

```
http://host/service/EmployeesByManager(ManagerID=3)
```

Example 73: return all Customers whose City property returns "Western" when passed to the Sales.SalesRegion function

```
http://host/service/Customer?
$filter=Sales.SalesRegion(City=$it/City) eq "Western"
```

A parameter alias can be used in place of an inline parameter to a function call. The value for the alias is specified as a separate query option using the name of the parameter alias.

Example 74: invoke a Sales.EmployeesByManager function via the function import EmployeesByManager, passing 3 for the ManagerID parameter

```
http://host/service/EmployeesByManager(ManagerID=@p1)?@p1=3
```

11.5.3.2 Function overload resolution

The same function name may be used multiple times within a schema, each with a different set of parameters. The combination of the function name and the unordered list of parameter types and names MUST identify a particular function overload.

All non-bindable overloads MUST have the same return type. Also, all bindable overloads with a given binding parameter type MUST have the same return type.

Clients SHOULD use typed null values (e.g. null'Date') when passing null parameter values in order to disambiguate requests.

If the function is bindable and the binding parameter type is part of an inheritance hierarchy, the function overload is selected based on the type of the URL segment preceding the function name. A type segment can be used to select a function defined on a particular type in the hierarchy, see [OData-URL].

11.5.4 Actions

Actions are operations exposed by an OData service that MAY have side effects when invoked. Actions MAY return data but MUST NOT be further composed.

11.5.4.1 Invoking an Action

To invoke an action bound to a resource, the client issues a POST request to an action URL. An action URL may be obtained from a previously returned entity representation or constructed by appending the namespace (or alias) qualified action name to a URL that identifies a resource whose type is the same as, or derives from, the type of the binding parameter of the action. The value for the binding parameter is the value of the resource identified by the URL prior to appending the action name, and any non-binding parameter values are passed in the request body according to the particular format.

To invoke an action through an action import, the client issues a POST request to a URL identifying the action import. The canonical URL for an action import is the service root, followed by the name of the action import. When invoking an action through an action import all parameter values MUST be passed in the request body according to the particular format.

Any nullable parameter values not specified in the request MUST be assumed to have the null value.

If the action returns results the client SHOULD use content type negotiation to request the results in the desired format, otherwise the default content type will be used.

To request processing of the action only if the binding parameter value, an entity or collection of entities, is unmodified, the client includes the If-Match header with the latest known ETag value for the entity or
collection of entities. The ETag value for a collection as a whole is transported in the ETag header of a collection response.

On success, the response is 201 Created for actions that create entities, 200 OK for actions that return results or 204 No Content for action without a return type. The client can request whether any results from the action be returned using the return Prefer header.

Example 75: invoke the SampleEntities.CreateOrder action using /Customers('ALFKI') as the customer (or binding parameter). The values 2 for the quantity parameter and BLACKFRIDAY for the discountCode parameter are passed in the body of the request

```plaintext
POST http://host/service/Customer('ALFKI')/SampleEntities.CreateOrder
{
  "quantity": 2,
  "discountCode": "BLACKFRIDAY"
}
```

11.5.4.2 Action Overload Resolution

The same action name may be used multiple times within a schema provided there is at most one non-bindable overload, and each bindable overload specifies a different binding parameter type.

If the action is bindable and the binding parameter type is part of an inheritance hierarchy, the action overload is selected based on the type of the URL segment preceding the action name. A type segment can be used to select an action defined on a particular type in the hierarchy, see [OData-URL].

11.6 Asynchronous Requests

A Prefer header with a respond-async preference allows clients to request that the service process a Data Service Request asynchronously.

If the client has specified respond-async in the request, the service MAY process the request asynchronously and return a 202 Accepted response. A service MUST NOT reply to a Data Service Request with 202 Accepted if the request has not included the respond-async preference.

Responses that return 202 Accepted MUST have an empty response body and MUST include a Location header pointing to a status monitor resource that represents the current state of the asynchronous processing in addition to an optional Retry-After header indicating the time, in seconds, the client should wait before querying the service for status.

A GET request to the status monitor resource again returns 202 Accepted response if the asynchronous processing has not finished. This response MUST again include a Location header and MAY include a Retry-After header to be used for a subsequent request. The Location header and optional Retry-After header may or may not contain the same values as returned by the previous request.

A GET request to the status monitor resource returns 200 OK once the asynchronous processing has completed. This response MUST include a Content-Type header with value application/http and a Content-Transfer-Encoding header with value binary as described in [HTTP-Message]. The response body MUST enclose a single HTTP response which is the response to the initial Data Service Request.

A DELETE request sent to the status monitor resource requests that the asynchronous processing be canceled. A 200 OK or to a 204 No Content response indicates that the asynchronous processing has been successfully canceled. A client can request that the DELETE should be executed asynchronously. A 202 Accepted response indicates that the cancellation is being processed asynchronously; the client can use the returned Location header (which MUST be different from the status monitor resource of the initial request) to query for the status of the cancellation. If a delete request is not supported by the service, the service returns 405 Method Not Allowed.
After a successful DELETE request against the status monitor resource, any subsequent GET requests for the same status monitor resource returns 404 Not Found.

If an asynchronous request is cancelled for reasons other than the consumers issuing a DELETE request against the status monitor resource, a GET request to the status monitor resource returns 200 OK with a response body containing a single HTTP response with a status code in the 5xx Server Error range indicating that the operation was cancelled.

The service MUST ensure that no observable change has occurred as a result of a canceled request.

If the client waits too long to request the result of the asynchronous processing, the service responds with a 410 Gone or 404 Not Found.

The status monitor resource URL MUST differ from any other resource URL.

11.7 Batch Requests

Batch requests allow grouping multiple operations into a single HTTP request payload. A batch request is represented as a Multipart MIME v1.0 message [RFC2046], a standard format allowing the representation of multiple parts, each of which may have a different content type (as described in [OData-Atom] and [OData-JSON]), within a single request.

11.7.1 Batch Request Headers

Batch requests are submitted as a single HTTP POST request to the batch endpoint of a service, located at the URL /$batch relative to the service root.

The batch request MUST contain a Content-Type header specifying a content type of multipart/mixed and a boundary specification as defined in [RFC2046] is defined in the Batch Request Body section below.

Batch requests SHOULD contain the applicable OData-Version header.

Example 76:

| POST /service/$batch HTTP/1.1 |
| Host: odata.org |
| OData-Version: 1.0 |
| OData-MaxVersion: 3.0 |
| Content-Type: multipart/mixed;boundary=batch_36522ad7-fc75-4b56-8c71-56071383e77b |

<Batch Request Body>

11.7.2 Batch Request Body

The body of a batch request is made up of a series of individual requests and change sets, each represented as a distinct MIME part (i.e. separated by the boundary defined in the Content-Type header).

The service MUST process the requests within a batch request sequentially. Processing stops on the first error unless the odata.continue-on-error preference is specified.

An individual request in the context of a batch request is a Data request, Data Modification request, Action invocation request, or Function invocation request. A MIME part representing an individual request MUST include a Content-Type header with value application/http and a Content-Transfer-Encoding header with value binary.

Preambles and Epilogues in the MIME payload, as defined in [RFC2046], are valid but are assigned no meaning and thus MUST be ignored by processors of batch requests.
The Request-URI of HTTP requests serialized within MIME part bodies can use one of the following three formats:

- **Absolute URI with schema, host, port, and absolute resource path.**
  
  _Example 77:_
  ```
  GET https://host:1234/path/service/People(1) HTTP/1.1
  ```

- **Absolute resource path and separate Host header.**
  
  _Example 78:_
  ```
  GET /path/service/People(1) HTTP/1.1
  Host: myserver.mydomain.org:1234
  ```

- **Resource path relative to the batch request URI.**
  
  _Example 79:_
  ```
  GET People(1) HTTP/1.1
  ```

Services MUST support all three formats.

Each MIME part body that represents a single request MUST NOT include:

- authentication or authorization related HTTP headers
- Expect, From, Max-Forwards, Range, or TE headers

Processors of batch requests MAY choose to disallow additional HTTP constructs in HTTP requests serialized within MIME part bodies. For example, a processor may choose to disallow chunked encoding to be used by such HTTP requests.

_Example 80: a batch request that contains the following operations in the order listed_

1. A query request
2. _Change Set_ that contains the following requests:
   - Insert entity (with Content-ID = 1)
   - Update request (with Content-ID = 2)
3. A second query request

_Note: For brevity, in the example, request bodies are excluded in favor of English descriptions inside <> brackets and OData-Version headers are omitted._

```
POST /service/$batch HTTP/1.1
Host: host
OData-Version: 4.0
Content-Type: multipart/mixed;boundary=batch_36522ad7-fc75-4b56-8c71-56071383e77b

--batch_36522ad7-fc75-4b56-8c71-56071383e77b
Content-Type: application/http
Content-Transfer-Encoding:binary

GET /service/Customers('ALFKI')
Host: host
```
11.7.3 Change Sets

A change set is an atomic unit of work consisting of an unordered group of one or more Data Modification requests or Action invocation requests. Change sets MUST NOT contain any GET requests or other change sets. The contents of a MIME part representing a change set MUST itself be a multipart MIME document (see [RFC2046]) with one part for each operation that makes up the change set. Each part representing an operation in the change set MUST include the same headers (Content-Type and Content-Transfer-Encoding) and associated values as previously described for query operations. In addition each request within a change set MUST specify a Content-ID header with a value unique within the batch request.

11.7.3.1 Referencing Requests in a Change Set

New entities created by an Insert request within a change set can be referenced by subsequent requests within the same change set by referring to the value of the Content-ID header prefixed with a $ character. When used in this way, $<Content-ID> acts as an alias for the URI that identifies the new entity.
Example 81: a batch request that contains the following operations in the order listed:

A change set that contains the following requests:

- Insert a new entity (with Content-ID = 1)
- Insert a second new entity (references request with Content-ID = 1)

```
POST /service/$batch HTTP/1.1
Host: host
OData-Version: 4.0
Content-Type: multipart/mixed;boundary=batch_36522ad7-fc75-4b56-8c71-56071383e77b

--batch_36522ad7-fc75-4b56-8c71-56071383e77b
Content-Type: multipart/mixed;boundary=changeset_77162fcd-b8da-41ac-a9f8-9357efbbd
Content-Length: ###

--changeset_77162fcd-b8da-41ac-a9f8-9357efbbd
Content-Type: application/http
Content-Transfer-Encoding: binary
Content-ID: 1

POST /service/Customers HTTP/1.1
Host: host
Content-Type: application/atom+xml;type=entry
Content-Length: ###

<AtomPub representation of a new Customer>

--changeset_77162fcd-b8da-41ac-a9f8-9357efbbd
Content-Type: application/http
Content-Transfer-Encoding: binary

POST $1/Orders HTTP/1.1
Host: host
Content-Type: application/atom+xml;type=entry
Content-Length: ###

<AtomPub representation of a new Order>

--changeset_77162fcd-b8da-41ac-a9f8-9357efbbd--

--batch_36522ad7-fc75-4b56-8c71-56071383e77b--
```

11.7.4 Responding to a Batch Request

Requests within a batch are evaluated according to the same semantics used when the request appears outside the context of a batch.

The order of change sets and individual requests in a Batch request is significant. A service MUST process the components of the Batch in the order received. The order of requests within a change set is not significant; a service may process the requests within a change set in any order.

All operations in a change set represent a single change unit so a service MUST successfully process and apply all the requests in the change set or else apply none of them. It is up to the service implementation to define rollback semantics to undo any requests within a change set that may have been applied before another request in that same change set failed and thereby apply this all-or-nothing requirement. The service MAY execute the requests within a change set in any order and MAY return the responses to the individual requests in any order. The service MUST include the Content-ID header in
each response with the same value that the client specified in the corresponding request, so clients can correlate requests and responses.

If the set of request headers of a Batch request are valid (the Content-Type is set to multipart/mixed, etc.) the service MUST return a 200 OK HTTP response code to indicate that the request was accepted for processing, but the processing is yet to be completed. The requests within the body of the batch may subsequently fail or be malformed; however, this enables batch implementations to stream the results.

If the service receives a Batch request with an invalid set of headers it MUST return a 4xx response code and perform no further processing of the request.

A response to a batch request MUST contain a Content-Type header with value multipart/mixed.

Structurally, a batch response body MUST match one-to-one with the corresponding batch request body, such that the same multipart MIME message structure defined for requests is used for responses. There are three exceptions to this rule:

- When a request within a change set fails, the change set response is not represented using the multipart/mixed media type. Instead, a single response, using the application/http media type and a Content-Transfer-Encoding header with a value of binary, is returned that applies to all requests in the change set and MUST be formatted according to the Error Handling defined for the particular response format.

- When an error occurs processing a request and the odata.continue-on-error preference is not specified, processing of the batch is terminated and the error response is the last part of the multi-part response.

- Asynchronously processed batch requests can return interim results and end with a 202 Accepted as the last part of the multi-part response.

A response to a query operation in a batch MUST be formatted exactly as it would have appeared outside of a batch as described in Requesting Data or Invoking a Function, as appropriate.

Example 82: referencing the batch request example 80 above, assume all the requests except the final query request succeed. In this case the response would be

```plaintext
HTTP/1.1 200 Ok
OData-Version: 4.0
Content-Length: ####
Content-Type: multipart/mixed; boundary=b_243234_25424_ef_892u748
--b_243234_25424_ef_892u748
Content-Type: application/http
Content-Transfer-Encoding: binary
HTTP/1.1 200 Ok
Content-Type: application/atom+xml;type=entry
Content-Length: ###
<AtomPub representation of the Customer entity with EntityKey ALFKI>
--b_243234_25424_ef_892u748
Content-Type: multipart/mixed; boundary=cs_12u7hdkin252452345eknd_383673037
Content-Length: ###
--cs_12u7hdkin252452345eknd_383673037
Content-Type: application/http
Content-Transfer-Encoding: binary
Content-ID: 1
```
11.7.5 Asynchronous Batch Requests

Batch requests may be executed asynchronously by including the `respond-async` preference in the `Prefer` header. The service MUST ignore the `respond-async` preference for individual requests within a batch.

After successful execution of the batch request the response to the batch request would be returned in the body of a response to an interrogation request against the status monitor resource URL (see section 11.6 "Asynchronous Requests").

A service MAY return interim results to an asynchronously executing batch. It does this by including a 202 Accepted response as the last part of the multi-part response. The client can use the monitor URL returned in this 202 Accepted response to continue processing the batch response.

Since a change set is executed atomically, 202 Accepted MUST NOT be returned within a change set.

Example 83: referencing the example 80 above again, assume that when interrogating the monitor URL for the first time only the first request in the batch finished processing and all the remaining requests except the final query request succeed. In this case the responses would be

```
HTTP/1.1 200 Ok
OData-Version: 4.0
Content-Length: ###
Content-Type: multipart/mixed;boundary=b_243234_25424_ef_892u748
```
Client makes a second request using the returned monitor URL

HTTP/1.1 200 Ok
OData-Version: 4.0
Content-Length: ###
Content-Type: multipart/mixed; boundary=b_243234_25424Ef_892u748

--b_243234_25424Ef_892u748
Content-Type: application/http
Content-Transfer-Encoding: binary

HTTP/1.1 202 Accepted
Location: http://service-root/async-monitor
Retry-After: ###

--b_243234_25424Ef_892u748--
12 Security Considerations

This section is provided as a service to the application developers, information providers, and users of OData version 4.0 giving some references to starting points for securing OData services as specified. OData is a REST-full multi-format service that depends on other services and thus inherits both sides of the coin, security enhancements and concerns alike from the latter.

For HTTP relevant security implications please cf. the relevant sections of [RFC2616] (15 Security Considerations) and for the HTTP PATCH method [RFC5789] (5. Security Considerations) as starting points.

12.1 Authentication

OData Services requiring authentication SHOULD consider supporting basic authentication as specified in [RFC2617] over HTTPS for the highest level of interoperability with generic clients. They MAY support other authentication methods.
13 Conformance

OData is designed as a set of conventions that can be layered on top of existing standards to provide common representations for common functionality. Not all services will support all of the conventions defined in the protocol; services choose those conventions defined in OData as the representation to expose that functionality appropriate for their scenarios.

To aid in client/server interoperability, this specification defines multiple levels of conformance for an OData Service, as well as the minimal requirements for an OData Client to be interoperable across OData services.

13.1 OData Service Conformance Levels

OData defines three levels of conformance for an OData Service.

Note: The conformance levels are design to correspond to different service scenarios. For example, a service that publishes data compliant with one or more of the OData defined formats may comply with the OData Minimal Conformance Level without supporting any additional functionality. A service that offers more control over the data that the client retrieves may comply with the OData Intermediate Conformance Level. Services that conform to the OData Advanced Conformance Level can expect to interoperate with the most functionality against the broadest range of generic clients. Services can advertise their level of conformance by the OData Conformance Level Annotation.

Note: Services are encouraged to support as much additional functionality beyond their level of conformance as is appropriate for their intended scenario.

13.1.1 OData Minimal Conformance Level

In order to conform to the OData Minimal conformance level, a service:

1. MUST publish a service document at the service root (section 11.1.1)
2. MUST return data according to at least one of the OData defined formats (section 7)
3. MUST support server-driven paging when returning partial results (section 11.2.5.7)
4. MUST return the appropriate OData-Version header (section 8.1.4)
5. MUST conform to the semantics the following headers, or fail the request
   5.1. Accept (section 8.2.1)
   5.2. OData-MaxVersion (section 8.2.6)
6. MUST follow OData guidelines for extensibility (section 6 and all subsections)
7. MUST successfully parse the request according to [OData-ABNF] for any supported system query string options and either follow the specification or return 501 Not Implemented (section 9.3.1) for any unsupported functionality (section 11.2.1)
8. MUST expose only data types defined in [OData-CSDL]
9. MUST NOT require clients to understand any metadata or instance annotations (section 6.4), custom headers (section 6.5), or custom content (section 6.2) in the payload in order to correctly consume the service
10. MUST NOT violate any OData update semantics (section 11.4 and all subsections)
11. MUST NOT violate any other OData-defined semantics
12. SHOULD support $expand (section 11.2.4.2)
13. MAY publish metadata at $metadata according to [OData-CSDL] (section 11.1.2)

In addition, to be considered an Updatable OData Service, the service:

14. MUST include edit links (explicitly or implicitly) for all updatable or deletable resources according to [OData-Atom] and [OData-JSON]
15. MUST support POST of new entities to insertable entity sets (section 11.4.2 and 11.4.2.1)
16. MUST support POST of new related entities to updatable navigation properties (section 11.4.6.1)
17. MUST support POST to $ref to add an existing entity to an updatable related collection (section 11.4.6.1)
18. MUST support PUT to $ref to set an existing single updatable related entity (section 11.4.6.3)
19. MUST support PATCH to all edit links for updatable resources (section 11.4.3)
20. MUST support DELETE to all edit links for deletable resources (section 11.4.5)
21. MUST support DELETE to $ref to remove an entity from an updatable navigation property (section 11.4.6.2)
22. MUST support if-match header in update/delete of any resources returned with an ETag (section 11.4.1.1)
23. MUST return a Location header with the edit link or read link of a created resource (section 11.4.2)
24. MUST include the OData-EntityId header in response to any POST/PATCH that returns 204 No Content (Section 8.3.3)
25. MUST support Upserts (section 11.4.4)
26. SHOULD support PUT and PATCH to an individual primitive (section 11.4.9.1) or complex (section 11.4.9.3) property (respectively)
27. SHOULD support DELETE to set an individual property to null (section 11.4.9.2)
28. SHOULD support deep inserts (section 11.4.2.2)

13.1.2 OData Intermediate Conformance Level

In order to conform to the OData Intermediate Conformance Level, a service:
1. MUST conform to the OData Minimal Conformance Level
2. MUST successfully parse the [OData-ABNF] and either follow the specification or return 501 Not Implemented for any unsupported functionality (section 9.3.1)
3. MUST support $select (section 11.2.4.1)
4. MUST support casting to a derived type according to [OData-URL] if derived types are present in the model
5. MUST support $top (section 11.2.5.3)
6. MUST support /$value on media entities (section 4.10. in [OData-URL]) and individual properties (section 11.2.3.1)
7. MUST support $filter (section 11.2.5.1)
   7.1. MUST support eq, ne filter operations on properties of entities in the requested entity set (section 11.2.5.1.1)
   7.2. MUST support aliases in $filter expressions (section 11.2.5.1.3)
   7.3. SHOULD support additional filter operations (section 11.2.5.1.1) and MUST return 501 Not Implemented for any unsupported filter operations (section 9.3.1)
   7.4. SHOULD support the canonical functions (section 11.2.5.1.2) and MUST return 501 Not Implemented for any unsupported canonical functions (section 9.3.1)
   7.5. SHOULD support $filter on expanded entities (section 11.2.4.2.1)
8. SHOULD publish metadata at $metadata according to [OData-CSDL] (section 11.1.2)
9. SHOULD support the [OData-JS0N] format
10. SHOULD consider supporting basic authentication as specified in [RFC2617] over HTTPS for the highest level of interoperability with generic clients
11. SHOULD support the $search system query option (section 11.2.5.6)
12. SHOULD support the $skip system query option (section 11.2.5.4)
13. SHOULD support the $count system query option (section 11.2.5.5)
14. SHOULD support $expand (section 11.2.4.2)
15. SHOULD support the lambda operators any and all on navigation- and collection-valued properties (section 5.1.1.5 in [OData-URL])
16. SHOULD support the /$count segment on navigation and collection properties (section 11.2.9)
17. SHOULD support $orderby asc and desc on individual properties (section 11.2.5.2)
13.1.3 OData Advanced Conformance Level

In order to conform to the OData Advanced Conformance Level, a service:
1. MUST conform to at least the OData Intermediate Conformance Level
2. MUST publish metadata at $metadata according to [OData-CSDL] (section 11.1.2)
3. MUST support the [OData-JSON] format
4. MUST support the /$count segment on navigation and collection properties (section 11.2.9)
5. MUST support the lambda operators any and all on navigation- and collection-valued properties (section 5.1.1.5 in [OData-URL])
6. MUST support the $skip system query option (section 11.2.5.4)
7. MUST support the $count system query option (section 11.2.5.5)
8. MUST support $orderby asc and desc on individual properties (section 11.2.5.2)
9. MUST support $expand (section 11.2.4.2)
   9.1. MUST support returning references for expanded properties (section 11.2.4.2)
   9.2. MUST support $filter on expanded entities (section 11.2.4.2.1)
   9.3. MUST support cast segment in expand with derived types (section 11.2.4.2.1)
   9.4. SHOULD support $orderby asc and desc on individual properties (section 11.2.4.2.1)
   9.5. SHOULD support the $count system query option for expanded properties (section 11.2.4.2.1)
   9.6. SHOULD support $top and $skip on expanded properties (section 11.2.4.2.1)
   9.7. SHOULD support $search on expanded properties (section 11.2.4.2.1)
   9.8. SHOULD support $levels for recursive expand (section 11.2.4.2.1.1)
10. MUST support the $search system query option (section 11.2.5.6)
11. MUST support batch requests (section 11.7 and all subsections)
12. MUST support the resource path conventions defined in [OData-URL]
13. SHOULD support Asynchronous operations (section 8.2.7.8)
14. SHOULD support Delta change tracking (section 8.2.7.6)
15. SHOULD support cross-join queries defined in [OData-URL]
16. SHOULD support a conforming OData service interface over metadata (section 11.1.3)

13.1.4 OData Conformance Level Annotation

Services can advertise their level of conformance by annotating their entity container with the Capabilities.ConformanceLevel annotation defined in [OData-VocCap].

13.2 Interoperable OData Clients

Interoperable OData Clients can expect to work with OData Services that comply with at least the OData Minimal Conformance Level and implement the [OData-JSON] format. Clients that additionally support [OData-Atom] can expect to interoperate with a broader range of OData Services.

To be generally interoperable, ODATA Clients
1. MUST specify the OData-MaxVersion header in requests (section 8.2.5)
2. MUST specify OData-Version (section 8.1.4) and Content-Type (section 8.1.1) in any request with a payload
3. MUST be a conforming consumer of OData as defined in [OData-JSON]
4. MUST follow redirects (section 9.1.5)
5. MUST correctly handle next links (section 11.2.5.7)
6. MUST support instances returning properties and navigation properties not specified in metadata (section 11.2)
7. MUST generate PATCH requests for updates, if the client supports updates (section 11.4.3)
8. SHOULD support basic authentication as specified in [RFC2617] over HTTPS
9. MAY request entity references in place of entities previously returned in the response (section 11.2.7)
10. MAY support deleted entities, link entities, deleted link entities in a delta response (section 11.3)
11. MAY support asynchronous responses (section 9.1.3)
12. MAY support `odata.metadata=minimal` in a JSON response (see [OData-JSON])
13. MAY support `odata.streaming` in a JSON response (see [OData-JSON])

## Appendix B. Revision History

<table>
<thead>
<tr>
<th>Revision</th>
<th>Date</th>
<th>Editor</th>
<th>Changes Made</th>
</tr>
</thead>
<tbody>
<tr>
<td>Working Draft 01</td>
<td>2012-08-22</td>
<td>Michael Pizzo</td>
<td>Translated Contribution to OASIS format/template</td>
</tr>
<tr>
<td>Committee Specification Draft 01</td>
<td>2013-04-26</td>
<td>Michael Pizzo, Ralf Handl, Martin Zurmuehl</td>
<td>Added Delta support, Asynchronous processing, Upsert</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Aligned and expanded Prefer header preferences</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Simplified data model</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Defined rules and semantics around distributed metadata</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Fleshed out descriptions and examples and addressed numerous editorial and technical issues processed through the TC</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Added Conformance section</td>
</tr>
<tr>
<td>Committee Specification Draft 02</td>
<td>2013-07-01</td>
<td>Michael Pizzo, Ralf Handl, Martin Zurmuehl</td>
<td>Cleaned up action and function overloads and binding, removed old-style function parameter syntax</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Improved asynchronous processing and added callback notifications</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Improved context URL (formerly: metadata URL)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Improved handling of empty results</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Improved description of rules for processing PUT and POST requests, especially deep inserts</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Harmonized $count and $inlinecount</td>
</tr>
<tr>
<td>Committee Specification 01</td>
<td>2013-07-30</td>
<td>Michael Pizzo, Ralf Handl, Martin Zurmuehl</td>
<td>Non-Material Changes</td>
</tr>
</tbody>
