Abstract:

This document specifies the means by which SCA composites and components, as defined in the SCA Assembly Specification [**SCA-Assembly**], connect to and access services using a messaging protocol. The connectivity is based on the Java Messaging Service [**JMS**] and is provided by a binding.jms element which applies to the references and services of an SCA component or composite.

The JMS binding provides JMS-specific details of the connection to the required JMS resources. It supports the use of Queue and Topic type destinations.

The binding is especially well suited for use by services and references of composites that are directly deployed, as opposed to composites that are used as implementations of higher-level components. Services and references of deployed composites become system-level services and references, which are intended to be used by non-SCA clients.

Status:

This document was last revised or approved by the OASIS Service Component Architecture / Bindings (SCA-Bindings) TC on the above date. The level of approval is also listed above. Check the "Latest Version" or "Latest Approved Version" location noted above for possible later revisions of this document.

Technical Committee members should send comments on this specification to the Technical Committee's email list. Others should send comments to the Technical Committee by using the "Send A Comment" button on the Technical Committee's web page at <http://www.oasis-open.org/committees/sca-bindings/>.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (<http://www.oasis-open.org/committees/sca-bindings/ipr.php>).

The non-normative errata page for this specification is located at <http://www.oasis-open.org/committees/sca-bindings/>.

1 Introduction

This document specifies the means by which SCA composites and components, as defined in the SCA Assembly Specification [**SCA-Assembly**], connect to and access services using a messaging protocol. The connectivity is based on the Java Messaging Service [**JMS**] and is provided by a binding.jms element which applies to the references and services of an SCA component or composite.

The JMS binding provides JMS-specific details of the connection to the required JMS resources. It supports the use of Queue and Topic type destinations.

The binding is especially well suited for use by services and references of composites that are directly deployed, as opposed to composites that are used as implementations of higher-level components. Services and references of deployed composites become system-level services and references, which are intended to be used by non-SCA clients.

1.1 Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC Keywords \[RFC2119\]](#).

This specification uses predefined namespace prefixes throughout; they are given in the following list. Note that the choice of any namespace prefix is arbitrary and not semantically significant.

Prefix	Namespace	Notes
xs	"http://www.w3.org/2001/XMLSchema"	Defined by XML Schema 1.0 specification
sca	"http://docs.oasis-open.org/ns/opencsa/sca/200912"	Defined by the SCA specifications

41 **1.3 Non-Normative References**

42 N/A

43 **1.4 Naming Conventions**

44 The naming conventions used by artefacts defined in this specification are:

- 45 • The naming conventions defined by section 1.3 of the [SCA Assembly Specification \[SCA-Assembly\]](#).
- 46 • Where the names of elements and attributes consist partially or wholly of acronyms, the letters of the acronyms use the same case. When the acronym appears at the start of the name of an element or an attribute, or after a period, it is in lower case. If it appears elsewhere in the name of an element or an attribute, it is in upper case. For example, an attribute might be named "uri" or "jndiURL".
- 47 • Where the names of types consist partially or wholly of acronyms, the letters of the acronyms are in all upper case. For example, an XML Schema type might be named "JCABinding" or "MessageID".
- 48 • Values, including local parts of QName values, follow the rules for names of elements and attributes as stated above, with the exception that the letters of acronyms are in all upper case. For example, a value might be "JMSDefault" or "namespaceURI".

¹ Note that this URI scheme is currently in draft. The reference for this specification will be updated when the IETF standard is finalized

55 **2 Messaging Bindings**

56 Messaging bindings form a category of SCA bindings that represent the interaction of SCA composites
57 with messaging providers. It is felt that documenting, and following this pattern is beneficial for
58 implementers of messaging bindings, although it is not strictly necessary.

59 This pattern is embodied in the JMS binding, described later.

60 Messaging bindings utilize operation selector and wire format elements to provide the mapping from the
61 native messaging format to an invocation on the target component. A default operation selection and
62 data binding behavior is identified, along with any associated properties.

63 In addition, each operation can have specific properties defined, that influence the way native messages
64 are processed depending on the operation being invoked.

3 JMS Binding Schema

The JMS binding element is defined by the pseudo-schema in Snippet 3-1.

```
<binding.jms correlationScheme="QName"?
  initialContextFactory="xs:anyURI"?
  jndiURL="xs:anyURI"?
  name="NCName"?
  requires="list of QName"?
  policySets="list of QName"?
  uri="xs:anyURI"? >
  <destination jndiName="xs:anyURI"? type="queue or topic"?
    create="always or never or ifNotExist"?
    <property name="NMTOKEN" type="NMTOKEN"?>*</property>
  </destination>?
  <connectionFactory jndiName="xs:anyURI"?
    create="always or never or ifNotExist"?
    <property name="NMTOKEN" type="NMTOKEN"?>*</property>
  </connectionFactory>?
  <activationSpec jndiName="xs:anyURI"?
    create="always or never or ifNotExist"?
    <property name="NMTOKEN" type="NMTOKEN"?>*</property>
  </activationSpec>?

  <response>
    <destination jndiName="xs:anyURI"? type="queue or topic"?
      create="always or never or ifNotExist"?
      <property name="NMTOKEN" type="NMTOKEN"?>*</property>
    </destination>?
    <connectionFactory jndiName="xs:anyURI"?
      create="always or never or ifNotExist"?
      <property name="NMTOKEN" type="NMTOKEN"?>*</property>
    </connectionFactory>?
    <activationSpec jndiName="xs:anyURI"?
      create="always or never or ifNotExist"?
      <property name="NMTOKEN" type="NMTOKEN"?>*</property>
    </activationSpec>?
    <wireFormat/>?
  </response>?

  <resourceAdapter name="NMTOKEN"?
    <property name="NMTOKEN" type="NMTOKEN"?>*</property>
  </resourceAdapter>?

  <headers type="string"?
    deliveryMode="persistent or nonpersistent"?
    timeToLive="long"?
    priority="0 .. 9"?
    <property name="NMTOKEN" type="NMTOKEN"?>*</property>
  </headers>?

  <messageSelection selector="string"?
    <property name="NMTOKEN" type="NMTOKEN"?>*</property>
  </messageSelection>?

  <operationProperties name="string" nativeOperation="string"?
    <property name="NMTOKEN" type="NMTOKEN"?>*</property>
    <headers type="string"?
      deliveryMode="persistent or nonpersistent"?
      timeToLive="long"?
      priority="0 .. 9"?>
  </operationProperties>?
</binding.jms>
```

```

124         <property name="NMTOKEN" type="NMTOKEN"?>*
125         </headers>?
126     </operationProperties>*
127
128     <wireFormat ... />?
129     <operationSelector ... />?
130 </binding.jms>

```

131 *Snippet 3-1: binding.jms Pseudo-Schema*

132 The binding can be used in one of two ways, either identifying existing [JMS \[JMS\]](#) resources using JNDI
 133 names, or providing the required information to enable the JMS resources to be created.

134 The **binding.jms** element has the attributes:

- 135 • **/binding.jms** – This is the JMS binding element. The element is extensible so that JMS binding
 136 implementers can add additional JMS provider-specific attributes and elements although such
 137 extensions are not guaranteed to be portable across runtimes.
- 138 • **/binding.jms/@uri** – as defined in the [SCA Assembly Specification \[SCA-Assembly\]](#). This attribute
 139 identifies the destination, connection factory or activation spec, and other properties to be used to
 140 send/receive the JMS message. There is an implicit **@create="never"** for the resources referred to
 141 in the **@uri** attribute. Message header properties and the message selector set via the **@uri** attribute
 142 take precedence over those specified in binding elements as defined in section 3.2.

143 **The value of the @uri attribute MUST have the format defined by the IETF URI Scheme for Java™**
 144 **Message Service 1.0 [IETFJMS] [BJM30001].**

145 Snippet 3-2 illustrates the structure of the URI and the set of property names that have specific
 146 semantics:

```

147 jms:jndi:<jms-dest>?
148 jndiURL=<jndi-url> &
149 jndiInitialContextFactory=<jndi-initial-context-factory> &
150 jndiConnectionFactoryName=<Connection-Factory-Name> &
151 deliveryMode=<Delivery-Mode> &
152 timeToLive=<Time-To-Live> &
153 priority=<Priority> &
154 selector=<Message-Selector> &
155 <param-name>=<param-value> & ...

```

156 *Snippet 3-2: JMS URI Structure*

157 **When the @uri attribute is specified, the SCA runtime MUST raise an error if the referenced**
 158 **resources do not already exist [BJM30002].**

159 **When the @uri attribute is specified, the destination element MUST NOT be present [BJM30034].**

- 160 • **/binding.jms/@name** - as defined in the [SCA Assembly Specification \[SCA-Assembly\]](#).
- 161 • **/binding.jms/@requires** - as defined in the [SCA Assembly Specification \[SCA-Assembly\]](#).
- 162 • **/binding.jms/@policySets** - as defined in the [SCA Assembly Specification \[SCA-Assembly\]](#).
- 163 • **/binding.jms/@correlationScheme** – identifies the correlation scheme used when sending reply or
 164 callback messages, default value is **"sca:messageID"**.

165 **If the value of the @correlationScheme attribute is "sca:messageID" the SCA runtime MUST set**
 166 **the correlation ID of replies to the message ID of the corresponding request [BJM30003].**

167 **If the value of the @correlationScheme attribute is "sca:correlationID" the SCA runtime MUST set**
 168 **the correlation ID of replies to the correlation ID of the corresponding request [BJM30004].**

169 **If the value of the @correlationScheme attribute is "sca:none" the SCA runtime MUST NOT set the**
 170 **correlation ID [BJM30005].**

171 **SCA runtimes MAY allow other values of the @correlationScheme attribute to indicate other**
 172 **correlation schemes [BJM30006].**

- 173 • **/binding.jms/@initialContextFactory** – the name of the JNDI initial context factory.
- 174 • **/binding.jms/@jndiURL** – the URL for the JNDI provider.
- 175 • **/binding.jms/destination** – identifies the destination that is to be used to process requests by this
176 binding.
- 177 • **/binding.jms/destination/@type** - the type of the request destination. Valid values are “**queue**” and
178 “**topic**”. The default value is “**queue**”.
- 179 Whatever the value of the **destination/@type** attribute, the runtime MUST ensure a single response
180 is delivered for request/response operations [BJM30010].
- 181 • **binding.jms/destination/@jndiName** – the JNDI name of the JMS Destination that the binding uses
182 to send or receive messages. The behaviour of this attribute is determined by the value of the
183 **@create** attribute as follows:
- 184 – If the **@create** attribute value for a **destination**, **connectionFactory** or **activationSpec** element
185 is “**always**” and the **@jndiName** attribute is present and the resource cannot be created at the
186 location specified by the **@jndiName** attribute then the SCA runtime MUST raise an error
187 [BJM30011].
- 188 If the **@create** attribute value for a **destination**, **connectionFactory** or **activationSpec** element
189 is “**always**” and the **@jndiName** attribute is not present and the resource cannot be created, then
190 the SCA runtime MUST raise an error [BJM30037].
- 191 If the **@jndiName** attribute is omitted this specification places no restriction on the JNDI location
192 of the created resource.
- 193 – If the **@create** attribute value for a **destination**, **connectionFactory** or **activationSpec** element
194 is “**ifNotExist**” then the **@jndiName** attribute MUST specify the location of the possibly existing
195 resource [BJM30012].
- 196 If the **@create** attribute value for a **destination**, **connectionFactory** or **activationSpec** element
197 is “**ifNotExist**” and the resource does not exist at the location identified by the **@jndiName**
198 attribute and cannot be created there then the SCA runtime MUST raise an error [BJM30013].
- 199 If the **@create** attribute value for a **destination**, **connectionFactory** or **activationSpec** element
200 is “**ifNotExist**” and the **@jndiName** attribute refers to an existing resource that is not a JMS
201 Destination of the appropriate type, a JMS connection factory or a JMS activation spec
202 respectively then the SCA runtime MUST raise an error [BJM30014].
- 203 – If the **@create** attribute value for a **destination**, **connectionFactory** or **activationSpec** element
204 is “**never**” and the **@jndiName** attribute is not specified, or the resource is not present at the
205 location identified by the **@jndiName** attribute, or the location refers to a resource of an incorrect
206 type then the SCA runtime MUST raise an error [BJM30015].
- 207 • **/binding.jms/destination/@create** – indicates whether the destination should be created when the
208 containing composite is deployed. Valid values are “**always**”, “**never**” and “**ifNotExist**”. “**always**”
209 indicates that new resources are created for use by this binding; “**never**” indicates that existing
210 resources are used and none created; “**ifNotExist**” indicates that if the resources already exist those
211 are used, otherwise new ones are created. Refer to the **destination/@jndiName** attribute for a
212 detailed definition of each case. The default value is “**ifNotExist**”.
- 213 • **/binding.jms/destination/property** – defines properties to be used to create the destination, if
214 required.
- 215 • **/binding.jms/connectionFactory** – identifies the connection factory that the binding uses to process
216 request messages. The attributes of this element follow the rules defined for the **destination**
217 element.
- 218 A **binding.jms** element MUST NOT include both a **connectionFactory** element and an
219 **activationSpec** element [BJM30017].
- 220 When the **connectionFactory** element is present, then the destination MUST be defined either by
221 the **destination** element or the **@uri** attribute [BJM30018].

- 222 • **/binding.jms/activationSpec** – identifies the activation spec that the binding uses to connect to a
 223 JMS destination to process request messages. The attributes of this element follow the rules defined
 224 for the **destination** element.
- 225 If the **activationSpec** element is present and the destination is also specified via a **destination**
 226 element or the **@uri** attribute then it MUST refer to the same JMS destination as the **activationSpec**
 227 [BJM30019].
- 228 The **activationSpec** element MUST NOT be present when the binding is being used for an SCA
 229 reference [BJM30020].
- 230 • **/binding.jms/response** – defines the resources used for handling response messages (receiving
 231 responses for a reference, and sending responses from a service).
- 232 • **/binding.jms/response/destination** – identifies the destination that is to be used to process
 233 responses by this binding. Attributes follow the rules defined for the parent's **destination** element.
 234 For a service, this destination is used to send responses to messages that have a null value for the
 235 **JMSReplyTo** destination. For a reference, this destination is used to receive reply messages
- 236 • **/binding.jms/response/connectionFactory** – identifies the connection factory that the binding uses
 237 to process response messages. The attributes of this element follow those defined for the
 238 **destination** element.
- 239 A **response** element MUST NOT include both a **connectionFactory** element and an **activationSpec**
 240 element [BJM30021].
- 241 • **/binding.jms/response/activationSpec** – identifies the activation spec that the binding uses to
 242 connect to a JMS destination to process response messages. The attributes of this element follow
 243 those defined for the **destination** element.
- 244 If a **response/destination** and **response/activationSpec** element are both specified they MUST
 245 refer to the same JMS destination [BJM30022].
- 246 The **response/activationSpec** element MUST NOT be present when the binding is being used for an
 247 SCA service [BJM30023].
- 248 • **/binding.jms/response/wireFormat** – identifies the wire format used by responses sent or received
 249 by this binding. This value overrides the **wireFormat** specified at the binding level. Wire formats for
 250 this binding are described in Section 4.
- 251 • **/binding.jms/headers** – this element specifies values to be set for standard JMS headers. These
 252 values apply to requests from a reference and responses from a service. Section 3.2 defines the
 253 priority rules for determining the values for JMS headers and user properties.
- 254 • **/binding.jms/headers/@type, @deliveryMode, @timeToLive, @priority** – specifies the value to
 255 use for the JMS header property JMSType, JMSDeliveryMode, JMSTimeToLive or JMSPriority
 256 respectively. Valid values for **@deliveryMode** are "**persistent**" and "**nonpersistent**", corresponding
 257 to the values defined in the JMS Specification [JMS] for the JMSDeliveryMode message header, with
 258 "**persistent**" being the default; valid values for **@priority** are "**0**" to "**9**", where "**0**" indicates lowest
 259 priority and "**9**" highest priority, with "**4**" being the default; valid values for **@timeToLive** are positive
 260 integers, with 0 indicating unlimited time and being the default value.
- 261 • **/binding.jms/headers/property** – specifies the value and type for the given JMS user property..
- 262 • **/binding.jms/messageSelection** - this element specifies JMS message selection options. This
 263 element applies to a service receiving messages from the request destination or for a reference
 264 receiving messages from the callback or reply-to destination.
- 265 • **/binding.jms/messageSelection/@selector** - specifies the value to use for the JMS message
 266 selector. Section 3.3 defines the priority rules for determining the values for the message selector.
- 267 • **/binding.jms/resourceAdapter** – specifies name, type and properties of the Resource Adapter Java
 268 bean.
- 269 The **resourceAdapter** element MUST be present when JMS resources are to be created for a JMS
 270 provider that implements the JCA 1.5 Specification [JCA15] specification, and is ignored otherwise
 271 [BJM30031].

272 SCA runtimes MAY place restrictions on the properties of the resource adapter Java bean that can be
273 set using the **resourceAdapter** element [BJM30028].

274 For JMS providers that do not implement the JCA 1.5 specification [JCA15], information necessary for
275 resource creation can be added in provider-specific elements or attributes allowed by the extensibility
276 of the **binding.jms** element.

277 • **/binding.jms/operationProperties** – specifies various properties that are specific to the processing
278 of a particular operation.

279 • **/binding.jms/operationProperties/@name** – The name of the operation in the interface.

280 • **/binding.jms/operationProperties/@selectedOperation** – The value generated by the
281 **operationSelector** that corresponds to the operation in the service or reference interface identified
282 by the **operationProperties/@name** attribute. If this attribute is omitted then the value defaults to
283 the value of the **operationProperties/@name** attribute.

284 The value of the **operationProperties/@selectedOperation** attribute MUST be unique across the
285 containing **binding.jms** element [BJM30029].

286 • **/binding.jms/operationProperties/property** – specifies properties specific to this operation. These
287 properties are intended to be used to parameterize the **wireFormat** identified for the binding for a
288 particular operation.

289 The SCA runtime SHOULD make the **operationProperties** element corresponding to the
290 **selectedOperation** available to the **wireFormat** implementation [BJM30030].

291 • **/binding.jms/operationProperties/headers** – this element specifies values to be set for standard
292 JMS headers. These values apply to requests from a reference and responses from a service.
293 Section 3.2 defines the priority rules for determining the values for JMS headers and user properties.

294 • **/binding.jms/operationProperties/headers/@type, @deliveryMode, @timeToLive, @priority** –
295 specifies the value to use for the JMS header property JMSType, JMSDeliveryMode, JMSTimeToLive
296 or JMSPriority, respectively. Refer to the description of the **binding.jms/headers** element for the
297 valid values for these attributes.

298 • **/binding.jms/operationProperties/headers/property** – specifies the value and type for the given
299 JMS user property.

300 • **/binding.jms/wireFormat** – identifies the wire format used by requests and responses sent or
301 received by this binding. Wire formats for this binding are described in Section 4.

302 • **/binding.jms/operationSelector** – identifies the operation selector used when receiving requests for
303 a service. If specified for a reference this provides the default operation selector for callbacks if not
304 specified via a callback service element. Operation selectors for this binding are described in Section
305 3.2.

306 The **binding.jms** element MUST conform to the XML schema defined in **sca-binding-jms-1.1.xsd**
307 [BJM30036].

308 3.1 Extensibility

309 The JMS binding allows further customization of the binding element and its subelements with vendor
310 specific attributes or elements. This is done by providing extension points in the schema; refer to
311 Appendix A, “JMS XML Binding Schema: sca-binding-jms-1.1.xsd” for the locations of these extension
312 points.

313 3.2 JMS Message Headers and User Properties

314 The JMS binding can be configured to specify that JMS headers are set to specific values in messages
315 sent by the SCA runtime. The binding provides several places where JMS message headers and user
316 properties can be specified at different levels of granularity.

317 When sending messages for a JMS binding, the SCA runtime MUST set each of the JMSType,
318 JMSDeliveryMode, JMSTimeToLive and JMSPriority headers to values specified in the binding definition
319 in the following priority order:

- 320 1) the value for the header specified in the *@uri* attribute (highest priority);
- 321 2) the value for the header specified in the *operationProperties/headers* element matching the
322 operation being invoked;
- 323 3) the value for the header specified in the *headers* element;
- 324 4) the default value for the header as specified by the definition of the *binding.jms/headers* element
325 (lowest priority) [BJM30024].

326 When sending messages for a JMS binding, the SCA runtime MUST set each named user property with
327 type and value specified in the binding definition in the following priority order:

- 328 1) the type and value for the named user property specified in an
329 *operationProperties/headers/property* element matching the name of the operation being invoked
330 (highest priority);
- 331 2) the type and value for the named user property specified in a *headers/property* element (lowest
332 priority) [BJM30025].

333 3.3 JMS Message Selection

334 Message selectors can be specified for the JMS binding to receive a specific subset of messages from a
335 given destination, such that only messages that match the selector are delivered to a given JMS binding.
336 This allows more than one JMS binding to share a destination.

337 When receiving messages for a JMS binding, the SCA runtime MUST use a message selector if specified
338 in the binding definition in the following priority order:

- 339 1) the value for the message selector specified in the *@uri* attribute value's "selector" parameter
340 (highest priority);
- 341 2) the value for the message selector specified in the *messageSelection/@selector* attribute;
- 342 3) otherwise no message selector is used (lowest priority) [BJM30026].

343

4 Operation Selectors and Wire Formats

344 In general messaging providers deal with message formats and destinations. There is not usually a built-
345 in concept of “operation” that corresponds to that defined in a [WSDL \[WSDL\]](#) portType. Messages have
346 a wire format which corresponds in some way to the schema of an input or output message of an
347 operation in the interface of a service or reference, however additional information is required in order for
348 an SCA runtime to know how to identify the operation and understand the wire format of messages.

349 The process of identifying the operation to be invoked is *operation selection*; the information that
350 describes the contents of messages is a *wire format*. The **binding** element as described in the [SCA
351 Assembly Specification \[SCA-Assembly\]](#) provides the means to identify specific operation selection via
352 the **operationSelector** element and the wire format of messages received and to be sent using the
353 **wireFormat** element.

354 When the service with a JMS binding receives a message, the SCA runtime resolves the name of the
355 operation in the service's interface that is to be invoked by using the **operationSelector** and
356 **operationProperties** elements defined for the binding. The *resolved operation name* is defined as
357 follows:

- 358 • If the selected operation name generated by the **operationSelector** matches the value of an
359 **operationProperties/@selectedOperation** attribute then the resolved operation name is the value of
360 the **operationProperties/@name** attribute.
- 361 • Otherwise the resolved operation name is the selected operation name generated by the
362 **operationSelector**.

363 When a message is received at an SCA service with JMS binding and the resolved operation name is in
364 the target component's interface, the SCA runtime MUST invoke the target component using the resolved
365 operation name [BJM40010].

366 When a message is received at an SCA service with JMS binding and the resolved operation name is not
367 in the target component's interface the SCA runtime MUST raise an error [BJM40011].

368 No standard means is provided for linking the **wireFormat** or **operationSelector** elements with the
369 runtime components that implement their behavior.

370 The following sections describe the default **operationSelector** and **wireFormat** for a JMS binding.

371 The SCA runtime MUST support the default JMS wire format and operation selector behavior, and MAY
372 provide additional means to override it [BJM40001].

4.1 Default Operation Selection

374 The following defines the **default operation selection algorithm** when receiving a request at a service,
375 or a callback at a reference. When using the default operation selection algorithm, the selected operation
376 name is determined as follows:

- 377 • If there is only one operation on the service's interface, then that operation is the selected operation
378 name;
- 379 • Otherwise, if the JMS user property “**scaOperationName**” is present, then the value of that user
380 property is used as the selected operation name;
- 381 • Otherwise, if the message is a JMS text or bytes message containing XML, then the selected
382 operation name is the local name of the root element of the XML payload;
- 383 • Otherwise, the selected operation name is “**onMessage**”.

384 When a **binding.jms** element specifies the **operationSelector.jmsDefault** element, the SCA runtime
385 MUST use the default operation selection algorithm to determine the selected operation [BJM40008].

386 If no **operationSelector** element is specified then SCA runtimes MUST use
387 **operationSelector.jmsDefault** as the default [BJM40002].

388 4.2 Default Wire Format

389 The default wire format maps between a **JMSMessage** and the object(s) expected by the component
390 implementation. We encourage component implementers to avoid exposure of **JMS [JMS]** APIs to
391 component implementations, however in the case of an existing implementation that expects a
392 **JMSMessage**, this provides for simple reuse of that as an SCA component.

393 When using the default wire format, the message body is mapped to the parameters or return value of the
394 target operation as follows:

- 395 • If there is a single parameter that is a **JMSMessage**, then the **JMSMessage** is passed as is.
- 396 • Otherwise, if the **JMSMessage** is not a JMS text message or bytes message containing XML it is
397 invalid.
- 398 • Otherwise if there is a single parameter, or for the return value, the JMS text or bytes XML payload is
399 the XML serialization of that parameter according to the WSDL schema for the message.
- 400 • Otherwise the multiple parameters are encoded in XML using the document wrapped style, according to
401 the WSDL schema for the message.

402 When a **binding.jms** element specifies the **wireFormat.jmsDefault** element, the SCA runtime MUST use
403 the default wire format [BJM40009].

404 When using the default wire format to send request messages, if there is a single parameter and the
405 interface includes more than one operation, the SCA runtime MUST set the JMS user property
406 "**scaOperationName**" to the name of the operation being invoked [BJM40003].

407 When using the default wire format an SCA runtime MUST be able to receive both JMS text and bytes
408 messages [BJM40005].

409 When using the default wire format an SCA runtime MUST send either a JMS text or a JMS bytes
410 message [BJM40006].

411 When using the default wire format an SCA runtime MAY provide additional configuration to allow
412 selection between JMS text or bytes messages to be sent [BJM40007].

413 If no **wireFormat** element is specified in a JMS binding then SCA runtimes MUST use
414 **wireFormat.jmsDefault** as the default [BJM40004].

415 4.2.1 Example of default wire format

416 For the interface definition in Snippet 4-1:

```
417 <wsdl:definitions name="Coordinates"  
418 targetNamespace="http://tempuri.org/coordinates"  
419 xmlns:tns="http://tempuri.org/coordinates"  
420 xmlns:wsdl="http://schemas.xmlsoap.org/wsdl/"  
421 xmlns:xsd="http://www.w3.org/2001/XMLSchema">  
422 <wsdl:types>  
423 <xsd:schema targetNamespace="http://tempuri.org/coordinates">  
424 <xsd:element name="setCoordinates">  
425 <xsd:complexType>  
426 <xsd:sequence>  
427 <xsd:element name="x" type="xsd:int"/>  
428 <xsd:element name="y" type="xsd:int"/>  
429 </xsd:sequence>  
430 </xsd:complexType>  
431 </xsd:element>  
432 </xsd:schema>  
433 </wsdl:types>  
434  
435 <wsdl:message name="setCoordinatesRequestMsg">  
436 <wsdl:part element="tns:setCoordinates" name="setCoordinatesParameters"/>  
437 </wsdl:message>  
438  
439 <wsdl:portType name="Coordinates">  
440 <wsdl:operation name="setCoordinates">
```

```
441     <wsdl:input message="tns:setCoordinatesRequestMsg"
442               name="setCoordinatesRequest"/>
443     </wsdl:operation>
444 </wsdl:portType>
445 </wsdl:definitions>
```

446 *Snippet 4-1: Example WSDL Interface Definition*

447 When the **setCoordinates** operation is invoked via a reference with a JMS binding that uses the default
448 wire format, the message sent from the JMS binding is a JMS text or bytes message with the content
449 shown in Snippet 4-2:

```
450 <setCoordinates xmlns="http://tempuri.org/coordinates">
451   <x>10</x>
452   <y>5</y>
453 </setCoordinates>
```

454 *Snippet 4-2: JMS Message Content for setCoordinates Operation of Snippet 4-1*

455 5 Policy

456 The JMS binding provides attributes that control the sending of messages, requests from references and
457 replies from services. These values can be set directly on the binding element for a particular service or
458 reference, or they can be set using policy intents. An example of setting these via intents is shown later.

459 **JMS binding implementations MUST support the JMS intent** [BJM50001].

460 **The JMS intent MUST always be included in the *@alwaysProvides* attribute of the JMS *bindingType***
461 [BJM50002]

462 The following standard intents can also be supported by JMS binding implementations, by inclusion in the
463 ***@alwaysProvides*** or ***@mayProvides*** attribute of the JMS ***bindingType***:

- 464 • *atLeastOnce*
- 465 • *atMostOnce*
- 466 • *ordered*

467 The ***atLeastOnce***, ***atMostOnce*** and ***ordered*** intents are defined in the [SCA Policy Specification \[SCA-
468 Policy\]](#) document in section 8, "Reliability Policy".

469 This specification does not define a fixed relationship between the reliability intents and the persistence of
470 JMS messages. Deployers/assemblers can configure a nonpersistent delivery mode via the
471 ***@deliveryMode*** or ***@uri*** attribute, in order to provide higher performance with a decreased quality of
472 service. However a binding.jms element configured with a nonpersistent delivery mode might not be able
473 to satisfy the ***atLeastOnce*** policy intent. The [SCA Policy Specification \[SCA-Policy\]](#) requires that an error
474 be raised if the SCA runtime is unable to support the intents on a binding in combination with the specific
475 configuration of that binding.

476

6 Message Exchange Patterns

477 This section describes the message exchange patterns that are possible when using the JMS binding,
478 including one-way, request/response and callbacks. JMS [JMS] has a looser concept of message
479 exchange patterns than WSDL, so this section explains how JMS messages that are sent and received
480 by the SCA runtime relate to the WSDL input/output messages. Each operation in a WSDL interface is
481 either one-way or request/response. Callback interfaces can include both one-way and request/response
482 operations.

6.1 One-way message exchange (no Callbacks)

483 A one-way message exchange is one where a request message is sent that does not require or expect a
484 corresponding response message. These are represented in WSDL as an operation with an **input**
485 element and no **output** elements and no **fault** elements.

487 For an SCA reference with a JMS binding and unidirectional interface, when a request message is sent
488 as part of a one-way MEP, the SCA runtime SHOULD NOT set the **JMSReplyTo** destination header in
489 the JMS message that it creates, regardless of whether the JMS binding has a **response** element with a
490 **destination** defined [BJM60001].

491 For an SCA service with a JMS binding and unidirectional interface, when a request message is received
492 as part of a one-way MEP, the SCA runtime MUST ignore the **JMSReplyTo** destination header in the
493 JMS message, and not raise an error [BJM60002].

494 The use of one-way exchanges when using a bidirectional interface is described in section 6.4.

6.2 Request/response message exchange (no Callbacks)

496 A request/response message exchange is one where a request message is sent and a response
497 message is expected, possibly identified by its correlation identifier. These are represented in WSDL as
498 an operation with an **input** element and an **output** and/or a **fault** element.

499 For an SCA reference with a JMS binding, when a request message is sent as part of a request/response
500 MEP, and the JMS binding has a **response** element with a **destination** defined, then the SCA runtime
501 MUST use that destination for the **JMSReplyTo** header in the JMS message it creates for the request
502 [BJM60004].

503 For an SCA reference with a JMS binding, when a request message is sent as part of a request/response
504 MEP, and the JMS binding does not have a **response** element with a **destination** defined, the SCA
505 runtime MUST provide an appropriate destination on which to receive response messages and use that
506 destination for the **JMSReplyTo** header in the JMS message it creates for the request [BJM60005].

507 For an SCA reference with a JMS binding that does not have a destination specified via the response
508 element, the SCA runtime MUST either receive response messages as defined by the binding's
509 **@correlationScheme** attribute, or use a unique destination for each request/response interaction
510 [BJM60006].

511 For an SCA reference with a JMS binding that has a destination specified via the response element, the
512 SCA runtime MUST receive response messages as defined by the binding's **@correlationScheme**
513 attribute [BJM60003].

514 For an SCA service with a JMS binding, when a response message is sent as part of a request/response
515 MEP where the request message included a non-null **JMSReplyTo** destination, the SCA runtime MUST
516 send the response message to that destination [BJM60007].

517 For an SCA service with a JMS binding, when a response message is sent as part of a request/response
518 MEP where the request message included a null **JMSReplyTo** destination and the JMS binding includes
519 a **response/destination** element the SCA runtime MUST send the response message to that destination
520 [BJM60008].

521 For an SCA service with a JMS binding, when a response message is sent as part of a request/response
522 MEP where the request message included a null **JMSReplyTo** destination and the JMS binding does not
523 include a **response/destination** then an error SHOULD be raised by the SCA runtime [BJM60009].

524 For an SCA service with a JMS binding, when a response message is sent as part of a request/response
525 MEP the SCA runtime MUST set the correlation identifier in the JMS message that it creates for the
526 response as defined by the JMS binding's **@correlationScheme** attribute [BJM60010].

527 The use of request/response exchanges when using a bidirectional interface is described in section 6.4.

528 6.3 JMS User Properties

529 This protocol assigns specific behavior to JMS user properties:

- 530 • "**scaCallbackDestination**" holds a JMS URI that identifies the Destination to which callback
531 messages are sent, in the format defined by the IETF URI Scheme for Java™ Message Service 1.0
532 [IETFJMS].

533 6.4 Callbacks

534 Callbacks are SCA's way of representing bidirectional interfaces, where messages are sent in both
535 directions between a client and a service. A callback is the invocation of an operation on a service's
536 callback interface. A callback operation can be one-way or request/response. Messages that correspond
537 to one-way or request/response operations on a bidirectional interface use either the
538 **scaCallbackDestination** user property (for request/response) or the **JMSReplyTo** destination (for one-
539 way) to identify the destination to which messages are to be sent when operations are invoked on the
540 callback interface. The use of **JMSReplyTo** for this purpose is to enable interaction with non-SCA JMS
541 applications, as described below.

542 SCA runtimes MUST follow the behavior described in section 6.4 and its subsections when **binding.jms**
543 is used in both the forward and callback directions [BJM60018].

544 SCA runtimes can use different bindings for forward calls and callbacks, however the behavior and
545 requirements on messages is vendor-specific.

546 6.4.1 Invocation of operations on a bidirectional interface

547 For an SCA reference with a JMS binding and a bidirectional interface, when a request message is sent
548 as part of a request/response MEP the SCA runtime MUST set the **scaCallbackDestination** user
549 property in the message it creates to a JMS URI string, in the format defined by the IETF URI Scheme for
550 Java™ Message Service 1.0 [IETFJMS], that identifies the destination to which callback messages are to
551 be sent [BJM60011].

552 For an SCA reference with a JMS binding and bidirectional interface, when a request message is sent as
553 part of a one-way MEP the SCA runtime MUST set the destination to which callback messages are to be
554 sent as the **JMSReplyTo** destination in the message it creates [BJM60012].

555 For an SCA reference with a JMS binding and bidirectional interface, when a request message is sent as
556 part of a request/response MEP, the SCA runtime MUST set the **JMSReplyTo** header in the message it
557 creates as described in section 6.2 [BJM60013].

558 For both one-way and request/response operations, the reference's callback service can be used to
559 identify the destination to which callback messages are to be sent.

560 For an SCA reference with a JMS binding and bidirectional interface, the SCA runtime MUST identify the
561 callback destination from the reference's callback service binding if present, or supply a suitable callback
562 destination if not present [BJM60014].

563 6.4.2 Invocation of operations on a callback interface

564 An SCA service with a callback interface can invoke operations on that callback interface by sending
565 messages to the destination identified by the **scaCallbackDestination** user property, the **JMSReplyTo**
566 destination, or the destination identified by the service's callback reference JMS binding.

567 For an SCA service with a JMS binding, the *callback destination* is identified as follows, in order of
568 priority:

- 569 • The ***scaCallbackDestination*** identified by an earlier request/response operation, if not null;
- 570 • the ***JMSReplyTo*** destination identified by an earlier one-way operation, if not null;
- 571 • the request destination of the service's callback reference JMS binding, if specified

572 For an SCA service with a JMS binding, when a callback request message is sent for either a one-way or
573 request/response MEP, the SCA runtime **MUST** send the callback request message to the callback
574 destination. [BJM60015].

575 For an SCA service with a JMS binding, when a callback request message is sent and no callback
576 destination can be identified then the SCA runtime **SHOULD** raise an error, and **MUST** throw an
577 exception to the caller of the callback operation [BJM60016].

578 For an SCA service with a JMS binding, when a callback request message is sent the SCA runtime
579 **MUST** set the ***JMSReplyTo*** destination in the callback request message as defined in sections 6.1 or 6.2
580 as appropriate for the type of the callback operation invoked [BJM60017].

581 **6.4.3 Use of *JMSReplyTo* for callbacks for non-SCA JMS applications**

582 When interacting with non-SCA JMS applications, the assembler can choose to model a
583 request/response message exchange using a bidirectional interface with a one-way operation in the
584 forward and callback interfaces. In this case it is likely that the non-SCA JMS application does not
585 support the use of the ***scaCallbackDestination*** user property. To support this, for one-way messages
586 the ***JMSReplyTo*** header is used to identify the destination to be used to deliver callback messages, as
587 described in sections 6.4.1 and 6.4.2.

588

7 Examples

589 The following snippets show the **sca.composite** file for the **MyValueComposite** file containing the
590 **service** element for the MyValueService and a **reference** element for the StockQuoteService. Both the
591 service and the reference use a JMS binding.

7.1 Minimal Binding Example

593 Snippet 7-1 shows the JMS binding being used with no further attributes or elements. In this case, it is
594 left to the deployer to identify the resources to which the binding is connected.

```
595 <?xml version="1.0" encoding="UTF-8"?>
596 <composite xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200912"
597     name="MyValueComposite">
598
599     <service name="MyValueService">
600         <interface.java interface="services.myvalue.MyValueService"/>
601         <binding.jms/>
602     </service>
603
604     <reference name="StockQuoteService">
605         <interface.java interface="services.stockquote.StockQuoteService"/>
606         <binding.jms/>
607     </reference>
608 </composite>
```

609 *Snippet 7-1: Minimal Binding Example*

7.2 URI Binding Example

611 Snippet 7-2 shows the JMS binding using the **@uri** attribute to specify the connection type and its
612 information:

```
613 <?xml version="1.0" encoding="UTF-8"?>
614 <composite xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200912"
615     name="MyValueComposite">
616
617     <service name="MyValueService">
618         <interface.java interface="services.myvalue.MyValueService"/>
619         <binding.jms uri="jms:MyValueServiceQueue?
620             activationSpecName=MyValueServiceAS&
621             ... "/>
622     </service>
623
624     <reference name="StockQuoteService">
625         <interface.java interface="services.stockquote.StockQuoteService"/>
626         <binding.jms uri="jms:StockQuoteServiceQueue?
627             connectionFactoryName=StockQuoteServiceQCF&
628             deliveryMode=1&
629             ... "/>
630     </reference>
631 </composite>
```

632 *Snippet 7-2: Binding Example with URI Specified*

7.3 Binding with Existing Resources Example

634 Snippet 7-3 shows the JMS binding using existing resources:

```
635 <?xml version="1.0" encoding="UTF-8"?>
636 <composite xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200912"
637     name="MyValueComposite">
```

```

638
639     <service name="MyValueService">
640         <interface.java interface="services.myvalue.MyValueService"/>
641         <binding.jms>
642             <destination jndiName="MyValueServiceQ" create="never"/>
643             <activationSpec jndiName="MyValueServiceAS" create="never"/>
644         </binding.jms>
645     </service>
646 </composite>

```

647 *Snippet 7-3: Binding Example Using Existing Resources*

648 7.4 Resource Creation Example

649 Snippet 7-4 shows the JMS binding providing information to create JMS resources rather than using
650 existing ones:

```

651 <?xml version="1.0" encoding="UTF-8"?>
652 <composite xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200912"
653     name="MyValueComposite">
654
655     <service name="MyValueService">
656         <interface.java interface="services.myvalue.MyValueService"/>
657         <binding.jms>
658             <destination jndiName="MyValueServiceQueue" create="always">
659                 <property name="prop1" type="string">XYZ</property>
660                 <property name="destName" type="string">MyValueDest</property>
661             </destination>
662             <activationSpec jndiName="MyValueServiceAS" create="always"/>
663             <resourceAdapter jndiName="com.example.JMSRA"/>
664         </binding.jms>
665     </service>
666
667     <reference name="StockQuoteService">
668         <interface.java interface="services.stockquote.StockQuoteService"/>
669         <binding.jms>
670             <destination jndiName="StockQuoteServiceQueue"/>
671             <connectionFactory jndiName="StockQuoteServiceQCF"/>
672             <resourceAdapter name="com.example.JMSRA"/>
673         </binding.jms>
674     </reference>
675 </composite>

```

676 *Snippet 7-4: Binding Example that Creates a Resource*

677 7.5 Request/Response Example

678 Snippet 7-5 shows the JMS binding using existing resources to support request/response operations.
679 The service uses the **JMSReplyTo** destination to send response messages, and does not specify a
680 response queue:

```

681 <?xml version="1.0" encoding="UTF-8"?>
682 <composite xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200912"
683     name="MyValueComposite">
684
685     <service name="MyValueService">
686         <interface.java interface="services.myvalue.MyValueService"/>
687         <binding.jms correlationScheme="sca:messageID">
688             <destination jndiName="MyValueServiceQ" create="never"/>
689             <activationSpec jndiName="MyValueServiceAS" create="never"/>
690         </binding.jms>
691     </service>
692
693     <reference name="StockQuoteService">
694         <interface.java interface="services.stockquote.StockQuoteService"/>

```

```

695     <binding.jms correlationScheme="sca:messageID">
696       <destination jndiName="StockQuoteServiceQueue"/>
697       <connectionFactory jndiName="StockQuoteServiceQCF"/>
698       <response>
699         <destination jndiName="MyValueResponseQueue"/>
700         <activationSpec jndiName="MyValueResponseAS"/>
701       </response>
702     </binding.jms>
703 </reference>
704 </composite>

```

705 *Snippet 7-5: Binding Example with a Response*

706 7.6 Subscription with Selector Example

707 Snippet 7-6 shows how the JMS binding is used in order to consume messages from existing JMS
708 infrastructure. The JMS binding subscribes using selector:

```

709 <?xml version="1.0" encoding="UTF-8"?>
710 <composite xmlns="http://docs.oasis-open.org/ns/opencsa/sca/200912"
711   name="MyValueComposite">
712   <service name="MyValueService">
713     <interface.java interface="services.myvalue.MyValueService"/>
714     <binding.jms>
715       <destination jndiName="MyValueServiceTopic" create="never"/>
716       <connectionFactory jndiName="StockQuoteServiceTCF"
717         create="never"/>
718       <messageSelection selector="Price>1000"/>
719     </binding.jms>
720   </service>
721 </composite>

```

722 *Snippet 7-6: Binding Example with a Selector*

723 7.7 Policy Set Example

724 A policy set defines the manner in which intents map to JMS binding properties. Snippet 7-7 illustrates an
725 example of a policy set that defines values for the **@priority** attribute using the **"priority"** intent, and also
726 allows setting of a value for a user JMS property using the **"log"** intent.

```

727 <policySet name="JMSPolicy"
728   provides="priority log"
729   appliesTo="binding.jms">
730
731   <intentMap provides="priority" default="medium">
732     <qualifier name="high">
733       <headers priority="9"/>
734     </qualifier>
735     <qualifier name="medium">
736       <headers priority="4"/>
737     </qualifier>
738     <qualifier name="low">
739       <headers priority="0"/>
740     </qualifier>
741   </intentMap>
742
743   <intentMap provides="log">
744     <qualifier>
745       <headers>
746         <property name="user_example_log">logged</property>
747       </headers>
748     </qualifier>
749   </intentMap>
750 </policySet>

```

751 *Snippet 7-7: Example Policy Set*

752 Given the policy set in Snippet 7-7, the intents can be required on a service or reference as shown in
753 Snippet 7-8:

```
754 <reference name="StockQuoteService" requires="priority.high log">  
755   <interface.java interface="services.stockquote.StockQuoteService"/>  
756   <binding.jms>  
757     <destination name="StockQuoteServiceQueue"/>  
758     <connectionFactory name="StockQuoteServiceQCF"/>  
759   </binding.jms>  
760 </reference>
```

761 *Snippet 7-8: Binding Example with Intents*

762 8 Conformance

763 The XML schema pointed to by the RDDDL document at the namespace URI, defined by this specification,
764 are considered to be authoritative and take precedence over the XML schema defined in the appendix of
765 this document. There are two categories of artifacts for which this specification defines conformance:

- 766 a) SCA JMS Binding XML Document
- 767 b) SCA Runtime

768 8.1 SCA JMS Binding XML Document

769 An SCA JMS Binding XML document is an SCA Composite Document or an SCA ComponentType
770 Document, as defined by the [SCA Assembly Specification \[SCA-Assembly\]](#) Section 13.1 that uses the
771 ***binding.jms*** element.

772 An SCA JMS Binding XML document MUST be a conformant SCA Composite Document or an SCA
773 ComponentType Document, as defined by the [SCA Assembly Specification \[SCA-Assembly\]](#), and MUST
774 comply with all statements in Appendix B: "Conformance Items" related to elements and attributes in an
775 SCA JMS Binding XML document, notably all "MUST" statements have to be implemented.

776 8.2 SCA Runtime

777 An implementation that claims to conform to the requirements of an SCA Runtime defined in this
778 specification has to meet the following conditions:

- 779 1. The implementation MUST comply with all statements in Appendix B: "Conformance Items"
780 related to an SCA Runtime, notably all "MUST" statements have to be implemented
- 781 2. The implementation MUST conform to the [SCA Assembly Model Specification Version 1.1 \[SCA-
782 Assembly\]](#), and to the [SCA Policy Framework Version 1.1 \[SCA-Policy\]](#)
- 783 3. The implementation MUST reject an SCA JMS Binding XML Document that is not conformant per
784 Section 8.1

A. JMS XML Binding Schema: sca-binding-jms-1.1.xsd

```

```

B. Conformance Items

962 This section contains a list of conformance items for the SCA JMS Binding specification.

Conformance ID	Description
[BJM30001]	The value of the <i>@uri</i> attribute MUST have the format defined by the IETF URI Scheme for Java™ Message Service 1.0 [IETFJMS]
[BJM30002]	When the <i>@uri</i> attribute is specified, the SCA runtime MUST raise an error if the referenced resources do not already exist
[BJM30003]	If the value of the <i>@correlationScheme</i> attribute is " <i>sca:messageID</i> " the SCA runtime MUST set the correlation ID of replies to the message ID of the corresponding request
[BJM30004]	If the value of the <i>@correlationScheme</i> attribute is " <i>sca:correlationID</i> " the SCA runtime MUST set the correlation ID of replies to the correlation ID of the corresponding request
[BJM30005]	If the value of the <i>@correlationScheme</i> attribute is " <i>sca:none</i> " the SCA runtime MUST NOT set the correlation ID
[BJM30006]	SCA runtimes MAY allow other values of the <i>@correlationScheme</i> attribute to indicate other correlation schemes
[BJM30010]	Whatever the value of the <i>destination/@type</i> attribute, the runtime MUST ensure a single response is delivered for request/response operations
[BJM30011]	If the <i>@create</i> attribute value for a <i>destination</i> , <i>connectionFactory</i> or <i>activationSpec</i> element is " <i>always</i> " and the <i>@jndiName</i> attribute is present and the resource cannot be created at the location specified by the <i>@jndiName</i> attribute then the SCA runtime MUST raise an error
[BJM30012]	If the <i>@create</i> attribute value for a <i>destination</i> , <i>connectionFactory</i> or <i>activationSpec</i> element is " <i>ifNotExist</i> " then the <i>@jndiName</i> attribute MUST specify the location of the possibly existing resource
[BJM30013]	If the <i>@create</i> attribute value for a <i>destination</i> , <i>connectionFactory</i> or <i>activationSpec</i> element is " <i>ifNotExist</i> " and the resource does not exist at the location identified by the <i>@jndiName</i> attribute and cannot be created there then the SCA runtime MUST raise an error
[BJM30014]	If the <i>@create</i> attribute value for a <i>destination</i> , <i>connectionFactory</i> or <i>activationSpec</i> element is " <i>ifNotExist</i> " and the <i>@jndiName</i> attribute refers to an existing resource that is not a JMS Destination of the appropriate type, a JMS connection factory or a JMS activation spec respectively then the SCA runtime MUST raise an error
[BJM30015]	If the <i>@create</i> attribute value for a <i>destination</i> , <i>connectionFactory</i> or <i>activationSpec</i> element is " <i>never</i> " and the <i>@jndiName</i> attribute is not specified, or the resource is not present at the location identified by the <i>@jndiName</i> attribute, or the location refers to a resource of an incorrect type then the SCA runtime MUST raise an error
[BJM30017]	A <i>binding.jms</i> element MUST NOT include both a <i>connectionFactory</i> element and an <i>activationSpec</i> element

[BJM30018]	When the connectionFactory element is present, then the destination MUST be defined either by the destination element or the @uri attribute
[BJM30019]	If the activationSpec element is present and the destination is also specified via a destination element or the @uri attribute then it MUST refer to the same JMS destination as the activationSpec
[BJM30020]	The activationSpec element MUST NOT be present when the binding is being used for an SCA reference
[BJM30021]	A response element MUST NOT include both a connectionFactory element and an activationSpec element
[BJM30022]	If a response/destination and response/activationSpec element are both specified they MUST refer to the same JMS destination
[BJM30023]	The response/activationSpec element MUST NOT be present when the binding is being used for an SCA service
[BJM30024]	When sending messages for a JMS binding, the SCA runtime MUST set each of the JMSType, JMSDeliveryMode, JMSTimeToLive and JMSPriority headers to values specified in the binding definition in the following priority order: <ul style="list-style-type: none"> 1) the value for the header specified in the @uri attribute (highest priority); 2) the value for the header specified in the operationProperties/headers element matching the operation being invoked; 3) the value for the header specified in the headers element; 4) the default value for the header as specified by the definition of the binding.jms/headers element (lowest priority)
[BJM30025]	When sending messages for a JMS binding, the SCA runtime MUST set each named user property with type and value specified in the binding definition in the following priority order: <ul style="list-style-type: none"> 1) the type and value for the named user property specified in an operationProperties/headers/property element matching the name of the operation being invoked (highest priority); 2) the type and value for the named user property specified in a headers/property element (lowest priority)
[BJM30026]	When receiving messages for a JMS binding, the SCA runtime MUST use a message selector if specified in the binding definition in the following priority order: <ul style="list-style-type: none"> 1) the value for the message selector specified in the @uri attribute value's "selector" parameter (highest priority); 2) the value for the message selector specified in the messageSelection/@selector attribute; 3) otherwise no message selector is used (lowest priority)
[BJM30028]	SCA runtimes MAY place restrictions on the properties of the resource adapter Java bean that can be set using the resourceAdapter element
[BJM30029]	The value of the operationProperties/@selectedOperation attribute MUST be unique across the containing binding.jms element
[BJM30030]	The SCA runtime SHOULD make the operationProperties element corresponding to the selectedOperation available to the wireFormat implementation

[BJM30031]	The resourceAdapter element MUST be present when JMS resources are to be created for a JMS provider that implements the JCA 1.5 Specification [JCA15] specification, and is ignored otherwise
[BJM30034]	When the @uri attribute is specified, the destination element MUST NOT be present
[BJM30036]	The binding.jms element MUST conform to the XML schema defined in sca-binding-jms-1.1.xsd
[BJM30037]	If the @create attribute value for a destination , connectionFactory or activationSpec element is "always" and the @jndiName attribute is not present and the resource cannot be created, then the SCA runtime MUST raise an error
[BJM40001]	The SCA runtime MUST support the default JMS wire format and operation selector behavior, and MAY provide additional means to override it
[BJM40002]	If no operationSelector element is specified then SCA runtimes MUST use operationSelector.jmsDefault as the default
[BJM40003]	When using the default wire format to send request messages, if there is a single parameter and the interface includes more than one operation, the SCA runtime MUST set the JMS user property " scaOperationName " to the name of the operation being invoked
[BJM40004]	If no wireFormat element is specified in a JMS binding then SCA runtimes MUST use wireFormat.jmsDefault as the default
[BJM40005]	When using the default wire format an SCA runtime MUST be able to receive both JMS text and bytes messages
[BJM40006]	When using the default wire format an SCA runtime MUST send either a JMS text or a JMS bytes message
[BJM40007]	When using the default wire format an SCA runtime MAY provide additional configuration to allow selection between JMS text or bytes messages to be sent
[BJM40008]	When a binding.jms element specifies the operationSelector.jmsDefault element, the SCA runtime MUST use the default operation selection algorithm to determine the selected operation
[BJM40009]	When a binding.jms element specifies the wireFormat.jmsDefault element, the SCA runtime MUST use the default wire format
[BJM40010]	When a message is received at an SCA service with JMS binding and the resolved operation name is in the target component's interface, the SCA runtime MUST invoke the target component using the resolved operation name
[BJM40011]	When a message is received at an SCA service with JMS binding and the resolved operation name is not in the target component's interface the SCA runtime MUST raise an error
[BJM50001]	JMS binding implementations MUST support the JMS intent
[BJM50002]	The JMS intent MUST always be included in the @alwaysProvides attribute of the JMS bindingType
[BJM60001]	For an SCA reference with a JMS binding and unidirectional interface, when a

	request message is sent as part of a one-way MEP, the SCA runtime SHOULD NOT set the JMSReplyTo destination header in the JMS message that it creates, regardless of whether the JMS binding has a response element with a destination defined
[BJM60002]	For an SCA service with a JMS binding and unidirectional interface, when a request message is received as part of a one-way MEP, the SCA runtime MUST ignore the JMSReplyTo destination header in the JMS message, and not raise an error
[BJM60003]	For an SCA reference with a JMS binding that has a destination specified via the response element, the SCA runtime MUST receive response messages as defined by the binding's @correlationScheme attribute
[BJM60004]	For an SCA reference with a JMS binding, when a request message is sent as part of a request/response MEP, and the JMS binding has a response element with a destination defined, then the SCA runtime MUST use that destination for the JMSReplyTo header in the JMS message it creates for the request
[BJM60005]	For an SCA reference with a JMS binding, when a request message is sent as part of a request/response MEP, and the JMS binding does not have a response element with a destination defined, the SCA runtime MUST provide an appropriate destination on which to receive response messages and use that destination for the JMSReplyTo header in the JMS message it creates for the request
[BJM60006]	For an SCA reference with a JMS binding that does not have a destination specified via the response element, the SCA runtime MUST either receive response messages as defined by the binding's @correlationScheme attribute, or use a unique destination for each request/response interaction
[BJM60007]	For an SCA service with a JMS binding, when a response message is sent as part of a request/response MEP where the request message included a non-null JMSReplyTo destination, the SCA runtime MUST send the response message to that destination
[BJM60008]	For an SCA service with a JMS binding, when a response message is sent as part of a request/response MEP where the request message included a null JMSReplyTo destination and the JMS binding includes a response/destination element the SCA runtime MUST send the response message to that destination
[BJM60009]	For an SCA service with a JMS binding, when a response message is sent as part of a request/response MEP where the request message included a null JMSReplyTo destination and the JMS binding does not include a response/destination then an error SHOULD be raised by the SCA runtime
[BJM60010]	For an SCA service with a JMS binding, when a response message is sent as part of a request/response MEP the SCA runtime MUST set the correlation identifier in the JMS message that it creates for the response as defined by the JMS binding's @correlationScheme attribute
[BJM60011]	For an SCA reference with a JMS binding and a bidirectional interface, when a request message is sent as part of a request/response MEP the SCA runtime MUST set the scaCallbackDestination user property in the message it creates to a JMS URI string, in the format defined by the IETF URI Scheme for Java™ Message Service 1.0 [IETFJMS], that identifies the destination to which callback messages are to be sent

[BJM60012]	For an SCA reference with a JMS binding and bidirectional interface, when a request message is sent as part of a one-way MEP the SCA runtime MUST set the destination to which callback messages are to be sent as the JMSReplyTo destination in the message it creates
[BJM60013]	For an SCA reference with a JMS binding and bidirectional interface, when a request message is sent as part of a request/response MEP, the SCA runtime MUST set the JMSReplyTo header in the message it creates as described in section 6.2
[BJM60014]	For an SCA reference with a JMS binding and bidirectional interface, the SCA runtime MUST identify the callback destination from the reference's callback service binding if present, or supply a suitable callback destination if not present
[BJM60015]	For an SCA service with a JMS binding, when a callback request message is sent for either a one-way or request/response MEP, the SCA runtime MUST send the callback request message to the callback destination.
[BJM60016]	For an SCA service with a JMS binding, when a callback request message is sent and no callback destination can be identified then the SCA runtime SHOULD raise an error, and MUST throw an exception to the caller of the callback operation
[BJM60017]	For an SCA service with a JMS binding, when a callback request message is sent the SCA runtime MUST set the JMSReplyTo destination in the callback request message as defined in sections 6.1 or 6.2 as appropriate for the type of the callback operation invoked
[BJM60018]	SCA runtimes MUST follow the behavior described in section 6.4 and its subsections when binding.jms is used in both the forward and callback directions

D. Revision History

969 [optional; should not be included in OASIS Standards]

970

Revision	Date	Editor	Changes Made
1	2007-09-25	Anish Karmarkar	Applied the OASIS template + related changes to the Submission
2	2008-03-12	Simon Holdsworth	Updated text for RFC2119 conformance Updates to resolve following issues: BINDINGS-1 BINDINGS-5 BINDINGS-6 BINDINGS-12 BINDINGS-14 BINDINGS-18 BINDINGS-26 Applied updates discussed at Bindings TC meeting of 27 th March
3	2008-06-19	Simon Holdsworth	* Applied most of the editorial changes from Eric Johnson's review
cd01	2008-08-01	Simon Holdsworth	Updates to resolve following issues: BINDINGS-13 (JMS part) BINDINGS-20 (complete) BINDINGS-30 (JMS part) BINDINGS-32 (JMS part) BINDINGS-33 (complete) BINDINGS-34 (complete) BINDINGS-35 (complete) BINDINGS-38 (JMS part)
cd01-rev1	2008-10-16	Simon Holdsworth	Updated text for RFC2119 conformance throughout Updates to resolve following issues: BINDINGS-41 BINDINGS-46 BINDINGS-47
cd01-rev2	2008-12-01	Simon Holdsworth	Added comments identifying those updates that relate to RFC2119 language (issue 52)
cd01-rev3	2008-12-02	Simon Holdsworth	Final RFC2119 language updates BINDINGS-52

cd01-rev4	2009-01-09	Simon Holdsworth	Updates to resolve following issues: BINDINGS-7 BINDINGS-31 BINDINGS-40 BINDINGS-42 BINDINGS-44 BINDINGS-50
cd02	2009-02-16	Simon Holdsworth	Rename and editorial updates
cd02-rev1	2009-05-22	Simon Holdsworth	Updates to resolve issue BINDINGS-62 (conformance statement numbering) Updated assembly namespace to 200903 Fixed errors in schema
cd02-rev2	2009-05-22	Simon Holdsworth	Updates to resolve following issues: BINDINGS-39 BINDINGS-59 BINDINGS-65 BINDINGS-66 BINDINGS-67 BINDINGS-68 BINDINGS-70 BINDINGS-71
cd02-rev3	2009-06-18	Simon Holdsworth	Editorial concerns addressed Added acknowledgements appendix
cd02-rev4	2009-06-19	Simon Holdsworth	Updates to resolve following issues BINDINGS-74 Some editorial updates Fixed normative statement missed in application of BINDINGS-67
cd02-rev5	2009-06-24	Simon Holdsworth	Updates to resolve following issues BINDINGS-77 Renamed document to old form Removed editorial commentary Editorial fixes around external references; changed all links to hyperlinks
cd02-rev6	2009-06-24	Simon Holdsworth	Fixed application of BINDINGS-74 Fixed broken cross reference Changed ASCII to UTF-8 in examples
cd03	2009-06-29	Simon Holdsworth	Updates to resolve following issues BINDINGS-80 BINDINGS-81

cd03-rev1	2010-01-24	Simon Holdsworth	Editorial fix to XML schema name Updated to resolve following issues BINDINGS-48 BINDINGS-83 BINDINGS-85 BINDINGS-90 BINDINGS-93 BINDINGS-94 BINDINGS-96 BINDINGS-97 BINDINGS-98 BINDINGS-103 BINDINGS-108 BINDINGS-109 BINDINGS-110
cd03-rev2	2010-02-12	Simon Holdsworth	Editorial fixes to cross-references Fix cd03-rev1 change to add BINDINGS-110 Updated to resolve following issues BINDINGS-95 BINDINGS-104 BINDINGS-105 BINDINGS-106
cd03-rev3	2010-02-17	Bryan Aupperle	Add captions to all diagrams
cd03-rev4	2010-02-22	Simon Holdsworth	Updated assembly namespace to 200912 Editorial updates from action items and issues BINDINGS-101 BINDINGS-102 20091015-3: no change to copyright (currently consistent with all other SCA specs) 20091015-8: removed non-normative references section 20091015-9: cleaned up naming conventions section 20091015-10: cleaned up some phrases that used "may" or "allows" 20091015-12: no changes made (currently consistent with all other SCA specs)
cd03-rev5	2010-03-18	Simon Holdsworth	Fixed application of issue BINDINGS-108 Editorial cleanup Changed assembly reference to CD05
cd03-rev6	2010-04-16	Simon Holdsworth	Applied resolution to BINDINGS-128

cd04	2010-04-30	Simon Holdsworth	Rename and fix acknowledgements, fixup for publication
