
Abstract:
This document defines mechanisms for PKCS #11 that are no longer in general use.

Status:
This document was last revised or approved by the OASIS PKCS 11 TC on the above date. The level of approval is also listed above. Check the “Latest version” location noted above for possible later revisions of this document. Any other numbered Versions and other technical work produced by the Technical Committee (TC) are listed at https://www.oasis-open.org/committees/tc_home.php?wg_abbrev=pkcs11#technical.

TC members should send comments on this specification to the TC’s email list. Others should send comments to the TC’s public comment list, after subscribing to it by following the instructions at the “Send A Comment” button on the TC’s web page at https://www.oasis-open.org/committees/tc_home.php?wg_abbrev=pkcs11/.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (https://www.oasis-open.org/committees/pkcs11/ipr.php).

Citation format:
When referencing this specification the following citation format should be used:

Copyright © OASIS Open 2014. All Rights Reserved.

All capitalized terms in the following text have the meanings assigned to them in the OASIS Intellectual Property Rights Policy (the “OASIS IPR Policy”). The full Policy may be found at the OASIS website.

This document and translations of it may be copied and furnished to others, and derivative works that comment on or otherwise explain it or assist in its implementation may be prepared, copied, published, and distributed, in whole or in part, without restriction of any kind, provided that the above copyright notice and this section are included on all such copies and derivative works. However, this document itself may not be modified in any way, including by removing the copyright notice or references to OASIS, except as needed for the purpose of developing any document or deliverable produced by an OASIS Technical Committee (in which case the rules applicable to copyrights, as set forth in the OASIS IPR Policy, must be followed) or as required to translate it into languages other than English.

The limited permissions granted above are perpetual and will not be revoked by OASIS or its successors or assigns.

This document and the information contained herein is provided on an "AS IS" basis and OASIS DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY OWNERSHIP RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

OASIS requests that any OASIS Party or any other party that believes it has patent claims that would necessarily be infringed by implementations of this OASIS Committee Specification or OASIS Standard, to notify OASIS TC Administrator and provide an indication of its willingness to grant patent licenses to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification.

OASIS invites any party to contact the OASIS TC Administrator if it is aware of a claim of ownership of any patent claims that would necessarily be infringed by implementations of this specification by a patent holder that is not willing to provide a license to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification. OASIS may include such claims on its website, but disclaims any obligation to do so.

OASIS takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on OASIS procedures with respect to rights in any document or deliverable produced by an OASIS Technical Committee can be found on the OASIS website. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this OASIS Committee Specification or OASIS Standard, can be obtained from the OASIS TC Administrator. OASIS makes no representation that any information or list of intellectual property rights will at any time be complete, or that any claims in such list are, in fact, Essential Claims.

The name “OASIS” is a trademark of OASIS, the owner and developer of this specification, and should be used only to refer to the organization and its official outputs. OASIS welcomes reference to, and implementation and use of, specifications, while reserving the right to enforce its marks against misleading uses. Please see https://www.oasis-open.org/policies-guidelines/trademark for above guidance.

1 Introduction

1.1 Description of this Document
This document defines historical PKCS#11 mechanisms, that is, mechanisms that were defined for earlier
versions of PKCS #11 but are no longer in general use

All text is normative unless otherwise labeled.

1.2 Terminology
The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD
NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described
in [RFC2119].

1.3 Definitions
For the purposes of this standard, the following definitions apply. Please refer to [PKCS#11-Base] for
further definitions

BATON    MISSI’s BATON block cipher.
CAST      Entrust Technologies’ proprietary symmetric block cipher
CAST3     Entrust Technologies’ proprietary symmetric block cipher
CAST5     Another name for Entrust Technologies’ symmetric block cipher
CAST128   CAST128 is the preferred name.
          Entrust Technologies’ symmetric block cipher.
CDMF      Commercial Data Masking Facility, a block encipherment method
          specified by International Business Machines Corporation and
          based on DES.
CMS       Cryptographic Message Syntax (see RFC 3369)
DES       Data Encryption Standard, as defined in FIPS PUB 46-3
ECB       Electronic Codebook mode, as defined in FIPS PUB 81.
FASTHASH  MISSI’s FASTHASH message-digesting algorithm.
IDEA      Ascom Systec’s symmetric block cipher.
IV        Initialization Vector.
JUNIPER   MISSI’s JUNIPER block cipher.
KEA       MISSI’s Key Exchange Algorithm.
LYNKS     A smart card manufactured by SPYRUS.
MAC       Message Authentication Code
MD2       RSA Security’s MD2 message-digest algorithm, as defined in RFC
          6149.
MD5       RSA Security’s MD5 message-digest algorithm, as defined in RFC
          1321.

## 2 Mechanisms

### 2.1 PKCS #11 Mechanisms

A mechanism specifies precisely how a certain cryptographic process is to be performed. PKCS #11 implementations MAY use one or more mechanisms defined in this document.

The following table shows which Cryptoki mechanisms are supported by different cryptographic operations. For any particular token, of course, a particular operation MAY support only a subset of the mechanisms listed. There is also no guarantee that a token which supports one mechanism for some operation supports any other mechanism for any other operation (or even supports that same mechanism for any other operation). For example, even if a token is able to create RSA digital signatures with the **CKM_RSA_PKCS** mechanism, it may or may not be the case that the same token MAY also perform RSA encryption with **CKM_RSA_PKCS**.

</table>

1. SR = SignRecover, VR = VerifyRecover.
2. Single-part operations only.
3. Mechanism MUST only be used for wrapping, not unwrapping.

The remainder of this section presents in detail the mechanisms supported by Cryptoki and the parameters which are supplied to them.
In general, if a mechanism makes no mention of the \textit{ulMinKeyLen} and \textit{ulMaxKeyLen} fields of the CK\_MECHANISM\_INFO structure, then those fields have no meaning for that particular mechanism.

### 2.2 FORTEZZA timestamp

The FORTEZZA timestamp mechanism, denoted \texttt{CKM\_FORTEZZA\_TIMESTAMP}, is a mechanism for single-part signatures and verification. The signatures it produces and verifies are DSA digital signatures over the provided hash value and the current time.

**It has no parameters.**

Constraints on key types and the length of data are summarized in the following table. The input and output data MAY begin at the same location in memory.

\textit{Table 2, FORTEZZA Timestamp: Key and Data Length}

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input Length</th>
<th>Output Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Sign(^1)</td>
<td>DSA private key</td>
<td>20</td>
<td>40</td>
</tr>
<tr>
<td>C_Verify(^1)</td>
<td>DSA public key</td>
<td>20,40(^2)</td>
<td>N/A</td>
</tr>
</tbody>
</table>

\(^1\) Single-part operations only
\(^2\) Data length, signature length

For this mechanism, the \textit{ulMinKeySize} and \textit{ulMaxKeySize} fields of the CK\_MECHANISM\_INFO structure specify the supported range of DSA prime sizes, in bits.

### 2.3 KEA

#### 2.3.1 Definitions

This section defines the key type “CKK\_KEA” for type CK\_KEY\_TYPE as used in the CKA\_KEY\_TYPE attribute of key objects.

Mechanisms:

\begin{verbatim}
    CKM\_KEA\_KEY\_PAIR\_GEN
    CKM\_KEA\_KEY\_DERIVE
\end{verbatim}

#### 2.3.2 KEA mechanism parameters

##### 2.3.2.1 CK\_KEA\_DERIVE\_PARAMS; CK\_KEA\_DERIVE\_PARAMS\_PTR

\texttt{CK\_KEA\_DERIVE\_PARAMS} is a structure that provides the parameters to the \texttt{CKM\_KEA\_DERIVE} mechanism. It is defined as follows:

\begin{verbatim}
typedef struct CK\_KEA\_DERIVE\_PARAMS {
    CK\_BBOOL isSender;
    CK\_ULONG ulRandomLen;
    CK\_BYTE\_PTR pRandomA;
    CK\_BYTE\_PTR pRandomB;
    CK\_ULONG ulPublicDataLen;
    CK\_BYTE\_PTR pPublicData;
    } CK\_KEA\_DERIVE\_PARAMS;
\end{verbatim}

The fields of the structure have the following meanings:
isSender Option for generating the key (called a TEK). The value
is CK_TRUE if the sender (originator) generates the 
TEK, CK_FALSE if the recipient is regenerating the TEK

ulRandomLen the size of random Ra and Rb in bytes

pRandomA pointer to Ra data

pRandomB pointer to Rb data

ulPublicDataLen other party’s KEA public key size

pPublicData pointer to other party’s KEA public key value

**CK KEA_DERIVE_PARAMS_PTR** is a pointer to a **CK KEA DERIVE_PARAMS**.

### 2.3.3 KEA public key objects

KEA public key objects (object class **CKO_PUBLIC_KEY**, key type **CKK KEA**) hold KEA public keys. The following table defines the KEA public key object attributes, in addition to the common attributes defined for this object class:

**Table 3, KEA Public Key Object Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Data type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CKA_PRIME</td>
<td>Big integer</td>
<td>Prime $p$ (512 to 1024 bits, in steps of 64 bits)</td>
</tr>
<tr>
<td>CKA_SUBPRIME</td>
<td>Big integer</td>
<td>Subprime $q$ (160 bits)</td>
</tr>
<tr>
<td>CKA_BASE</td>
<td>Big integer</td>
<td>Base $g$ (512 to 1024 bits, in steps of 64 bits)</td>
</tr>
<tr>
<td>CKA_VALUE</td>
<td>Big integer</td>
<td>Public value $y$</td>
</tr>
</tbody>
</table>

Refer to [PKCS #11-Base] table 15 for footnotes

The **CKA_PRIME**, **CKA_SUBPRIME** and **CKA_BASE** attribute values are collectively the “KEA domain parameters”.

The following is a sample template for creating a KEA public key object:

```c
CK_OBJECT_CLASS class = CKO_PUBLIC_KEY;
CK_KEY_TYPE keyType = CKK KEA;
CK_UTF8CHAR label[] = “A KEA public key object”;
CK_BYTE prime[] = {...};
CK_BYTE subprime[] = {...};
CK_BYTE base[] = {...};
CK_BYTE value[] = {...};
CK_ATTRIBUTE template[] = {
    {CKA_CLASS, &class, sizeof(class)},
    {CKA_KEY_TYPE, &keyType, sizeof(keyType)},
    {CKA_TOKEN, &true, sizeof(true)},
    {CKA_LABEL, label, sizeof(label)-1},
    {CKA_PRIME, prime, sizeof(prime)},
    {CKA_SUBPRIME, subprime, sizeof(subprime)},
    {CKA_BASE, base, sizeof(base)},
    {CKA_VALUE, value, sizeof(value)}
};
```
2.3.4 KEA private key objects

KEA private key objects (object class CKO_PRIVATE_KEY, key type CKK_KEA) hold KEA private keys. The following table defines the KEA private key object attributes, in addition to the common attributes defined for this object class:

Table 4, KEA Private Key Object Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Data type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CKA_PRIME</td>
<td>Big integer</td>
<td>Prime ( p ) (512 to 1024 bits, in steps of 64 bits)</td>
</tr>
<tr>
<td>CKA_SUBPRIME</td>
<td>Big integer</td>
<td>Subprime ( q ) (160 bits)</td>
</tr>
<tr>
<td>CKA_BASE</td>
<td>Big integer</td>
<td>Base ( g ) (512 to 1024 bits, in steps of 64 bits)</td>
</tr>
<tr>
<td>CKA_VALUE</td>
<td>Big integer</td>
<td>Private value ( x )</td>
</tr>
</tbody>
</table>

Refer to [PKCS #11-Base] table 15 for footnotes

The CKA_PRIME, CKA_SUBPRIME and CKA_BASE attribute values are collectively the "KEA domain parameters".

Note that when generating a KEA private key, the KEA parameters are not specified in the key's template. This is because KEA private keys are only generated as part of a KEA key pair, and the KEA parameters for the pair are specified in the template for the KEA public key.

The following is a sample template for creating a KEA private key object:

```c
CK_OBJECT_CLASS class = CKO_PRIVATE_KEY;
CK_KEY_TYPE keyType = CKK_KEA;
CK_UTF8CHAR label[] = "A KEA private key object";
CK_BYTE subject[] = {...};
CK_BYTE id[] = {123};
CK_BYTE prime[] = {...};
CK_BYTE subprime[] = {...};
CK_BYTE base[] = {...};
CK_BYTE value[] = {...};
CK_BBOOL true = CK_TRUE;
CK_ATTRIBU template[] = {
    {CKA_CLASS, &class, sizeof(class)},
    {CKA_KEY_TYPE, &keyType, sizeof(keyType)},Algorithm, as defined by NISTS
    {CKA_TOKEN, &true, sizeof(true)},
    {CKA_LABEL, label, sizeof(label) -1},
    {CKA_SUBJECT, subject, sizeof(subject)},
    {CKA_ID, id, sizeof(id)},
    {CKA_SENSITIVE, &true, sizeof(true)},
    {CKA_DERIVE, &true, sizeof(true)},
    {CKA_PRIME, prime, sizeof(prime)},
    {CKA_SUBPRIME, subprime, sizeof(subprime)},
    {CKA_BASE, base, sizeof(base)},
    {CKA_VALUE, value, sizeof(value)}
};
```

2.3.5 KEA key pair generation

The KEA key pair generation mechanism, denoted CKM_KEA_KEY_PAIR_GEN, generates key pairs for the Key Exchange Algorithm, as defined by NIST's "SKIPJACK and KEA Algorithm Specification Version 2.0", 29 May 1998.

It does not have a parameter.

The mechanism generates KEA public/private key pairs with a particular prime, subprime and base, as specified in the CKA_PRIME, CKA_SUBPRIME, and CKA_BASE attributes of the template for the public
key. Note that this version of Cryptoki does not include a mechanism for generating these KEA domain
parameters.

The mechanism contributes the CKA_CLASS, CKA_KEY_TYPE and CKA_VALUE attributes to the new
public key and the CKA_CLASS, CKA_KEY_TYPE, CKA_PRIME, CKA_SUBPRIME, CKA_BASE, and
CKA_VALUE attributes to the new private key. Other attributes supported by the KEA public and private
key types (specifically, the flags indicating which functions the keys support) MAY also be specified in the
templates for the keys, or else are assigned default initial values.

For this mechanism, the ulMinKeySize and ulMaxKeySize fields of the CK_MECHANISM_INFO structure
specify the supported range of KEA prime sizes, in bits.

2.3.6 KEA key derivation

The KEA key derivation mechanism, denoted CKM_DEA_DERIVE, is a mechanism for key derivation
based on KEA, the Key Exchange Algorithm, as defined by NIST's "SKIPJACK and KEA Algorithm

It has a parameter, a CK_KEA_DERIVE_PARAMS structure.

This mechanism derives a secret value, and truncates the result according to the CKA_KEY_TYPE
attribute of the template and, if it has one and the key type supports it, the CKA_VALUE_LEN attribute of
the template. (The truncation removes bytes from the leading end of the secret value.) The mechanism
contributes the result as the CKA_VALUE attribute of the new key; other attributes required by the key
type must be specified in the template.

As defined in the Specification, KEA MAY be used in two different operational modes: full mode and e-
mail mode. Full mode is a two-phase key derivation sequence that requires real-time parameter
exchange between two parties. E-mail mode is a one-phase key derivation sequence that does not
require real-time parameter exchange. By convention, e-mail mode is designated by use of a fixed value
of one (1) for the KEA parameter Rb (pRandomB).

The operation of this mechanism depends on two of the values in the supplied
CK_KEA_DERIVE_PARAMS structure, as detailed in the table below. Note that in all cases, the data
buffers pointed to by the parameter structure fields pRandomA and pRandomB must be allocated by the
caller prior to invoking C_DeriveKey. Also, the values pointed to by pRandomA and pRandomB are
represented as Cryptoki "Big integer" data (i.e., a sequence of bytes, most significant byte first).

Table 5, KEA Parameter Values and Operations

<table>
<thead>
<tr>
<th>Value of boolean isSender</th>
<th>Value of big integer pRandomB</th>
<th>Token Action (after checking parameter and template values)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CK_TRUE</td>
<td>0</td>
<td>Compute KEA Rb value, store it in pRandomA, return CKR_OK. No derived key object is created.</td>
</tr>
<tr>
<td>CK_TRUE</td>
<td>1</td>
<td>Compute KEA Rb value, store it in pRandomA, derive key value using e-mail mode, create key object, return CKR_OK.</td>
</tr>
<tr>
<td>CK_TRUE</td>
<td>&gt;1</td>
<td>Compute KEA Rb value, store it in pRandomA, derive key value using full mode, create key object, return CKR_OK.</td>
</tr>
<tr>
<td>CK_FALSE</td>
<td>0</td>
<td>Compute KEA Rb value, store it in pRandomB, return CKR_OK. No derived key object is created.</td>
</tr>
<tr>
<td>CK_FALSE</td>
<td>1</td>
<td>Derive key value using e-mail mode, create key object, return CKR_OK.</td>
</tr>
<tr>
<td>CK_FALSE</td>
<td>&gt;1</td>
<td>Derive key value using full mode, create key object, return CKR_OK.</td>
</tr>
</tbody>
</table>

Note that the parameter value pRandomB == 0 is a flag that the KEA mechanism is being invoked to
calculate the party's public random value (Rb, for sender or recipient, respectively), not to derive a
key. In these cases, any object template supplied as the `C_DeriveKey pTemplate` argument should be ignored.

This mechanism has the following rules about key sensitivity and extractability:

- The `CKA_SENSITIVE` and `CKA_EXTRACTABLE` attributes in the template for the new key MAY both be specified to be either `CK_TRUE` or `CK_FALSE`. If omitted, these attributes each take on some default value.
- If the base key has its `CKA_ALWAYS_SENSITIVE` attribute set to `CK_FALSE`, then the derived key MUST as well. If the base key has its `CKA_ALWAYS_SENSITIVE` attribute set to `CK_TRUE`, then the derived has its `CKA_ALWAYS_SENSITIVE` attribute set to the same value as its `CKA_SENSITIVE` attribute.
- Similarly, if the base key has its `CKA_NEVER_EXTRACTABLE` attribute set to `CK_FALSE`, then the derived key MUST, too. If the base key has its `CKA_NEVER_EXTRACTABLE` attribute set to `CK_TRUE`, then the derived key has its `CKA_NEVER_EXTRACTABLE` attribute set to the opposite value from its `CKA_EXTRACTABLE` attribute.

For this mechanism, the `ulMinKeySize` and `ulMaxKeySize` fields of the `CK_MECHANISM_INFO` structure specify the supported range of KEA prime sizes, in bits.

2.4 RC2

2.4.1 Definitions

RC2 is a block cipher which is trademarked by RSA Security. It has a variable keysizse and an additional parameter, the “effective number of bits in the RC2 search space”, which MAY take on values in the range 1-1024, inclusive. The effective number of bits in the RC2 search space is sometimes specified by an RC2 “version number”; this “version number” is not the same thing as the “effective number of bits”, however. There is a canonical way to convert from one to the other.

This section defines the key type “CKK_RC2” for type `CK_KEY_TYPE` as used in the `CKA_KEY_TYPE` attribute of key objects.

Mechanisms:

- `CKM_RC2_KEY_GEN`
- `CKM_RC2_ECB`
- `CKM_RC2_CBC`
- `CKM_RC2_MAC`
- `CKM_RC2_MAC_GENERAL`
- `CKM_RC2_CBC_PAD`

2.4.2 RC2 secret key objects

RC2 secret key objects (object class `CKO_SECRET_KEY`, key type `CKK_RC2`) hold RC2 keys. The following table defines the RC2 secret key object attributes, in addition to the common attributes defined for this object class:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Data type</th>
<th>Meaning</th>
</tr>
</thead>
</table>

* Note that the rules regarding the `CKA_SENSITIVE`, `CKA_EXTRACTABLE`, `CKA_ALWAYS_SENSITIVE`, and `CKA_NEVER_EXTRACTABLE` attributes have changed in version 2.11 to match the policy used by other key derivation mechanisms such as `CKM_SSL3_MASTER_KEY_DERIVE`. 
Refer to [PKCS #11-Base] table 15 for footnotes.

The following is a sample template for creating an RC2 secret key object:

```c
CK_OBJECT_CLASS class = CKO_SECRET_KEY;
CK_KEY_TYPE keyType = CKK_RC2;
CK_UTF8CHAR label[] = "An RC2 secret key object";
CK_BYTE value[] = {…};
CK_BBOOL true = CK_TRUE;
CK_ATTRIBUTE template[] = {
    {CKA_CLASS, &class, sizeof(class)},
    {CKA_KEY_TYPE, &keyType, sizeof(keyType)},
    {CKA_TOKEN, &true, sizeof(true)},
    {CKA_LABEL, label, sizeof(label) - 1},
    {CKA_ENCRYPT, &true, sizeof(true)},
    {CKA_VALUE, value, sizeof(value)}
};
```

### 2.4.3 RC2 mechanism parameters

#### 2.4.3.1 CK_RC2_PARAMS; CK_RC2_PARAMS_PTR

CK_RC2_PARAMS provides the parameters to the CKM_RC2_ECB and CKM_RC2_MAC mechanisms. It holds the effective number of bits in the RC2 search space. It is defined as follows:

```c
typedef CK_ULONG CK_RC2_PARAMS;
```

CK_RC2_PARAMS_PTR is a pointer to a CK_RC2_PARAMS.

#### 2.4.3.2 CK_RC2_CBC_PARAMS; CK_RC2_CBC_PARAMS_PTR

CK_RC2_CBC_PARAMS is a structure that provides the parameters to the CKM_RC2_CBC and CKM_RC2_CBC_PAD mechanisms. It is defined as follows:

```c
typedef struct CK_RC2_CBC_PARAMS {
    CK_ULONG ulEffectiveBits;
    CK_BYTE iv[8];
} CK_RC2_CBC_PARAMS;
```

The fields of the structure have the following meanings:

- `ulEffectiveBits` the effective number of bits in the RC2 search space
- `iv` the initialization vector (IV) for cipher block chaining mode

CK_RC2_CBC_PARAMS_PTR is a pointer to a CK_RC2_CBC_PARAMS.

#### 2.4.3.3 CK_RC2_MAC_GENERAL_PARAMS; CK_RC2_MAC_GENERAL_PARAMS_PTR

CK_RC2_MAC_GENERAL_PARAMS is a structure that provides the parameters to the CKM_RC2_MAC mechanism. It is defined as follows:

```c
typedef struct CK_RC2_MAC_GENERAL_PARAMS {
    CK_ULONG ulEffectiveBits;
    CK_ULONG ulMacLength;
} CK_RC2_MAC_GENERAL_PARAMS;
```
The fields of the structure have the following meanings:

\(\text{ulEffectiveBits}\) the effective number of bits in the RC2 search space

\(\text{ulMacLength}\) length of the MAC produced, in bytes

\textbf{CK\_RC2\_MAC\_GENERAL\_PARAMS\_PTR} is a pointer to a \textbf{CK\_RC2\_MAC\_GENERAL\_PARAMS}.

\subsection*{2.4.4 RC2 key generation}

The RC2 key generation mechanism, denoted \textbf{CKM\_RC2\_KEY\_GEN}, is a key generation mechanism for RSA Security’s block cipher RC2.

It does not have a parameter.

The mechanism generates RC2 keys with a particular length in bytes, as specified in the \textbf{CKA\_VALUE\_LEN} attribute of the template for the key.

The mechanism contributes the \textbf{CKA\_CLASS}, \textbf{CKA\_KEY\_TYPE}, and \textbf{CKA\_VALUE} attributes to the new key. Other attributes supported by the RC2 key type (specifically, the flags indicating which functions the key supports) MAY be specified in the template for the key, or else are assigned default initial values.

For this mechanism, the \textit{ulMinKeySize} and \textit{ulMaxKeySize} fields of the \textbf{CK\_MECHANISM\_INFO} structure specify the supported range of RC2 key sizes, in bits.

\subsection*{2.4.5 RC2-ECB}

RC2-ECB, denoted \textbf{CKM\_RC2\_ECB}, is a mechanism for single- and multiple-part encryption and decryption; key wrapping; and key unwrapping, based on RSA Security’s block cipher RC2 and electronic codebook mode as defined in FIPS PUB 81.

It has a parameter, a \textbf{CK\_RC2\_PARAMS}, which indicates the effective number of bits in the RC2 search space.

This mechanism MAY wrap and unwrap any secret key. Of course, a particular token MAY not be able to wrap/unwrap every secret key that it supports. For wrapping, the mechanism encrypts the value of the \textbf{CKA\_VALUE} attribute of the key that is wrapped, padded on the trailing end with up to seven null bytes so that the resulting length is a multiple of eight. The output data is the same length as the padded input data. It does not wrap the key type, key length, or any other information about the key; the application must convey these separately.

For unwrapping, the mechanism decrypts the wrapped key, and truncates the result according to the \textbf{CKA\_KEY\_TYPE} attribute of the template and, if it has one, and the key type supports it, the \textbf{CKA\_VALUE\_LEN} attribute of the template. The mechanism contributes the result as the \textbf{CKA\_VALUE} attribute of the new key; other attributes required by the key type must be specified in the template.

Constraints on key types and the length of data are summarized in the following table:

\begin{table}[h]
\centering
\begin{tabular}{|c|c|c|c|c|}
\hline
Function & Key type & Input length & Output length & Comments \\
\hline
C\_Encrypt & RC2 & Multiple of 8 & Same as input length & No final part \\
\hline
C\_Decrypt & RC2 & Multiple of 8 & Same as input length & No final part \\
\hline
C\_WrapKey & RC2 & Any & Input length rounded up to multiple of 8 & \\
\hline
C\_UnwrapKey & RC2 & Multiple of 8 & Determined by type of key being unwrapped or \textbf{CKA\_VALUE\_LEN} & \\
\hline
\end{tabular}
\end{table}
For this mechanism, the \texttt{ulMinKeySize} and \texttt{ulMaxKeySize} fields of the \texttt{CK_MECHANISM_INFO} structure specify the supported range of RC2 effective number of bits.

### 2.4.6 RC2-CBC

RC2_CBC, denoted \texttt{CKM_RC2_CBC}, is a mechanism for single- and multiple-part encryption and decryption; key wrapping; and key unwrapping, based on RSA Security's block cipher RC2 and cipher-block chaining mode as defined in FIPS PUB 81.

It has a parameter, a \texttt{CK_RC2_CBC_PARAMS} structure, where the first field indicates the effective number of bits in the RC2 search space, and the next field is the initialization vector for cipher block chaining mode.

This mechanism MAY wrap and unwrap any secret key. Of course, a particular token MAY not be able to wrap/unwrap every secret key that it supports. For wrapping, the mechanism encrypts the value of the \texttt{CKA_VALUE} attribute of the key that is wrapped, padded on the trailing end with up to seven null bytes so that the resulting length is a multiple of eight. The output data is the same length as the padded input data. It does not wrap the key type, key length, or any other information about the key; the application must convey these separately.

For unwrapping, the mechanism decrypts the wrapped key, and truncates the result according to the \texttt{CKA_KEY_TYPE} attribute of the template and, if it has one, and the key type supports it, the \texttt{CKA_VALUE_LEN} attribute of the template. The mechanism contributes the result as the \texttt{CKA_VALUE} attribute of the new key; other attributes required by the key type must be specified in the template.

Constraints on key types and the length of data are summarized in the following table:

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>RC2</td>
<td>Multiple of 8</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_Decrypt</td>
<td>RC2</td>
<td>Multiple of 8</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_WrapKey</td>
<td>RC2</td>
<td>Any</td>
<td>Input length rounded up to multiple of 8</td>

</tr>
<tr>
<td>C_UnwrapKey</td>
<td>RC2</td>
<td>Multiple of 8</td>
<td>Determined by type of key being unwrapped or \texttt{CKA_VALUE_LEN}</td>
<td></td>
</tr>
</tbody>
</table>

For this mechanism, the \texttt{ulMinKeySize} and \texttt{ulMaxKeySize} fields of the \texttt{CK_MECHANISM_INFO} structure specify the supported range of RC2 effective number of bits.

### 2.4.7 RC2-CBC with PKCS padding

RC2-CBC with PKCS padding, denoted \texttt{CKM_RC2_CBC_PAD}, is a mechanism for single- and multiple-part encryption and decryption; key wrapping; and key unwrapping, based on RSA Security's block cipher RC2; cipher-block chaining mode as defined in FIPS PUB 81; and the block cipher padding method detailed in PKCS #7.

It has a parameter, a \texttt{CK_RC2_CBC_PARAMS} structure, where the first field indicates the effective number of bits in the RC2 search space, and the next field is the initialization vector.

The PKCS padding in this mechanism allows the length of the plaintext value to be recovered from the ciphertext value. Therefore, when unwrapping keys with this mechanism, no value should be specified for the \texttt{CKA_VALUE_LEN} attribute.

In addition to being able to wrap and unwrap secret keys, this mechanism MAY wrap and unwrap RSA, Diffie-Hellman, X9.42 Diffie-Hellman, EC (also related to ECDSA) and DSA private keys (see [PKCS #11-Curr], Miscellaneous simple key derivation mechanisms for details). The entries in the table below...
for data length constraints when wrapping and unwrapping keys do not apply to wrapping and
unwrapping private keys.

Constraints on key types and the length of data are summarized in the following table:

Table 9, RC2-CBC with PKCS Padding: Key and Data Length

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>RC2</td>
<td>Any</td>
<td>Input length rounded up to multiple of 8</td>
</tr>
<tr>
<td>C_Decrypt</td>
<td>RC2</td>
<td>Multiple of 8</td>
<td>Between 1 and 8 bytes shorter than input length</td>
</tr>
<tr>
<td>C_WrapKey</td>
<td>RC2</td>
<td>Any</td>
<td>Input length rounded up to multiple of 8</td>
</tr>
<tr>
<td>C_UnwrapKey</td>
<td>RC2</td>
<td>Multiple of 8</td>
<td>Between 1 and 8 bytes shorter than input length</td>
</tr>
</tbody>
</table>

For this mechanism, the ulMinKeySize and ulMaxKeySize fields of the CK_MECHANISM_INFO structure specify the supported range of RC2 effective number of bits.

2.4.8 General-length RC2-MAC

General-length RC2-MAC, denoted CKM_RC2_MAC_GENERAL, is a mechanism for single-and multiple-part signatures and verification, based on RSA Security's block cipher RC2 and data authorization as defined in FIPS PUB 113.

It has a parameter, a CK_RC2_MAC_GENERAL_PARAMS structure, which specifies the effective number of bits in the RC2 search space and the output length desired from the mechanism.

The output bytes from this mechanism are taken from the start of the final RC2 cipher block produced in the MACing process.

Constraints on key types and the length of data are summarized in the following table:

Table 10, General-length RC2-MAC: Key and Data Length

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Data length</th>
<th>Signature length</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Sign</td>
<td>RC2</td>
<td>Any</td>
<td>0-8, as specified in parameters</td>
</tr>
<tr>
<td>C_Verify</td>
<td>RC2</td>
<td>Any</td>
<td>0-8, as specified in parameters</td>
</tr>
</tbody>
</table>

For this mechanism, the ulMinKeySize and ulMaxKeySize fields of the CK_MECHANISM_INFO structure specify the supported range of RC2 effective number of bits.

2.4.9 RC2-MAC

RC2-MAC, denoted by CKM_RC2_MAC, is a special case of the general-length RC2-MA mechanism (see Section 2.4.8). Instead of taking a CK_RC2_MAC_GENERAL_PARAMS parameter, it takes a CK_RC2_PARAMS parameter, which only contains the effective number of bits in the RC2 search space.

RC2-MAC produces and verifies 4-byte MACs.

Constraints on key types and the length of data are summarized in the following table:

Table 11, RC2-MAC: Key and Data Length

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Data length</th>
<th>Signature length</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Sign</td>
<td>RC2</td>
<td>Any</td>
<td>4</td>
</tr>
<tr>
<td>C_Verify</td>
<td>RC2</td>
<td>Any</td>
<td>4</td>
</tr>
</tbody>
</table>

For this mechanism, the ulMinKeySize and ulMaxKeySize fields of the CK_MECHANISM_INFO structure specify the supported range of RC2 effective number of bits.
2.5 RC4

2.5.1 Definitions

This section defines the key type “CKK_RC4” for type CK_KEY_TYPE as used in the CKA_KEY_TYPE attribute of key objects.

Mechanisms

<table>
<thead>
<tr>
<th>Mechanism</th>
</tr>
</thead>
<tbody>
<tr>
<td>CKM_RC4_KEY_GEN</td>
</tr>
<tr>
<td>CKM_RC4</td>
</tr>
</tbody>
</table>

2.5.2 RC4 secret key objects

RC4 secret key objects (object class CKO_SECRET_KEY, key type CKK_RC4) hold RC4 keys. The following table defines the RC4 secret key object attributes, in addition to the common attributes defined for this object class:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Data type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CKA_VALUE</td>
<td>Byte array</td>
<td>Key value (1 to 256 bytes)</td>
</tr>
<tr>
<td>CKA_VALUE_LEN</td>
<td>CK_ULONG</td>
<td>Length in bytes of key value</td>
</tr>
</tbody>
</table>

Refer to [PKCS #11-Base] table 15 for footnotes.

The following is a sample template for creating an RC4 secret key object:

```c
CK_OBJECT_CLASS class = CKO_SECRET_KEY;
CK_KEY_TYPE keyType = CKK_RC4;
CK_UTF8CHAR label[] = "An RC4 secret key object";
CK_BYTE value[] = {…};
CK_BBOOL true – CK_TRUE;
CK_ATTRIBUTE template[] = {
    {CKA_CLASS, &class, sizeof(class)},
    {CKA_KEY_TYPE, &keyType, sizeof(keyType)},
    {CKA_TOKEN, &true, sizeof(true)},
    {CKA_LABEL, label, sizeof(label)-1},
    {CKA_ENCRYPT, &true, sizeof(true)},
    {CKA_VALUE, value, sizeof(value)}
};
```

2.5.3 RC4 key generation

The RC4 key generation mechanism, denoted CKM_RC4_KEY_GEN, is a key generation mechanism for RSA Security’s proprietary stream cipher RC4.

It does not have a parameter.

The mechanism generates RC4 keys with a particular length in bytes, as specified in the CKA_VALUE_LEN attribute of the template for the key.

The mechanism contributes the CKA_CLASS, CKA_KEY_TYPE, and CKA_VALUE attributes to the new key. Other attributes supported by the RC4 key type (specifically, the flags indicating which functions the key supports) MAY be specified in the template for the key, or else are assigned default initial values.

For this mechanism, the ulMinKeySize and ulMaxKeySize fields of the CK_MECHANISM_INFO structure specify the supported range of RC4 key sizes, in bits.
2.5.4 RC4 mechanism

RC4, denoted **CKM_RC4**, is a mechanism for single- and multiple-part encryption and decryption based on RSA Security’s proprietary stream cipher RC4.

It does not have a parameter.

Constraints on key types and the length of input and output data are summarized in the following table:

*Table 13, RC4: Key and Data Length*

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>RC4</td>
<td>Any</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_Decrypt</td>
<td>RC4</td>
<td>Any</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
</tbody>
</table>

For this mechanism, the *ulMinKeySize* and *ulMaxKeySize* fields of the **CK_MECHANISM_INFO** structure specify the supported range of RC4 key sizes, in bits.

2.6 RC5

2.6.1 Definitions

RC5 is a parameterizable block cipher patented by RSA Security. It has a variable wordsize, a variable keysize, and a variable number of rounds. The blocksize of RC5 is equal to twice its wordsize.

This section defines the key type “**CKK_RC5**” for type **CK_KEY_TYPE** as used in the **CKA_KEY_TYPE** attribute of key objects.

Mechanisms:

- **CKM_RC5_KEY_GEN**
- **CKM_RC5_ECB**
- **CKM_RC5_CBC**
- **CKM_RC5_MAC**
- **CKM_RC5_MAC_GENERAL**
- **CMK_RC5_CBC_PAD**

2.6.2 RC5 secret key objects

RC5 secret key objects (object class **CKO_SECRET_KEY**, key type **CKK_RC5**) hold RC5 keys. The following table defines the RC5 secret key object attributes, in addition to the common attributes defined for this object class.

*Table 14, RC5 Secret Key Object*

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Data type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CKA_VALUE</strong></td>
<td>Byte array</td>
<td>Key value (0 to 255 bytes)</td>
</tr>
<tr>
<td><strong>CKA_VALUE_LEN</strong></td>
<td>CK_ULONG</td>
<td>Length in bytes of key value</td>
</tr>
</tbody>
</table>

Refer to [PKCS #11-Base] table 15 for footnotes

The following is a sample template for creating an RC5 secret key object:

```c
CK_OBJECT_CLASS class = CKO_SECRET_KEY;
CK_KEY_TYPE keyType = CKK_RC5;
CK_UTF8CHAR label[] = "An RC5 secret key object";
CK_BYTE value[] = {...};
CK_BBOOL true = CK_TRUE;
```
CK_ATTRIBUTE template[] = {
    {CKA_CLASS, &class, sizeof(class)},
    {CKA_KEY_TYPE, &keyType, sizeof(keyType)},
    {CKA_TOKEN, &true, sizeof(true)},
    {CKA_LABEL, label, sizeof(label) - 1},
    {CKA_ENCRYPT, &true, sizeof(true)},
    {CKA_VALUE, val, sizeof(value)}
};

2.6.3 RC5 mechanism parameters

2.6.3.1 CK_RC5_PARAMS; CK_RC5_PARAMS_PTR

CK_RC5_PARAMS provides the parameters to the CKM_RC5_ECB and CKM_RC5_MAC mechanisms. It is defined as follows:

typedef struct CK_RC5_PARAMS {
    CK_ULONG ulWordsize;
    CK_ULONG ulRounds;
} CK_RC5_PARAMS;

The fields of the structure have the following meanings:

ulWordsize wordsize of RC5 cipher in bytes
ulRounds number of rounds of RC5 encryption

CK_RC5_PARAMS_PTR is a pointer to a CK_RC5_PARAMS.

2.6.3.2 CK_RC5_CBC_PARAMS; CK_RC5_CBC_PARAMS_PTR

CK_RC5_CBC_PARAMS is a structure that provides the parameters to the CKM_RC5_CBC and CKM_RC5_CBC_PAD mechanisms. It is defined as follows:

typedef struct CK_RC5_CBC_PARAMS {
    CK_ULONG ulWordsize;
    CK_ULONG ulRounds;
    CK_BYTE_PTR pIv;
    CK_ULONG ulIvLen;
} CK_RC5_CBC_PARAMS;

The fields of the structure have the following meanings:

ulWordSize wordsize of RC5 cipher in bytes
ulRounds number of rounds of RC5 encryption
pIV pointer to initialization vector (IV) for CBC encryption
ulIVLen length of initialization vector (must be same as blocksize)

CK_RC5_CBC_PARAMS_PTR is a pointer to a CK_RC5_CBC_PARAMS.

2.6.3.3 CK_RC5_MAC_GENERAL_PARAMS;

CK_RC5_MAC_GENERAL_PARAMS_PTR

CK_RC5_MAC_GENERAL_PARAMS is a structure that provides the parameters to the CKM_RC5_MAC_GENERAL mechanism. It is defined as follows:
typedef struct CK_RC5_MAC_GENERAL_PARAMS {
    CK_ULONG ulWordsize;
    CK_ULONG ulRounds;
    CK_ULONG ulMacLength;
} CK_RC5_MAC_GENERAL_PARAMS;

The fields of the structure have the following meanings:

- **ulWordSize**: wordsize of RC5 cipher in bytes
- **ulRounds**: number of rounds of RC5 encipherment
- **ulMacLength**: length of the MAC produced, in bytes

**CK_RC5_MAC_GENERAL_PARAMS_PTR** is a pointer to a **CK_RC5_MAC_GENERAL_PARAMS**.

### 2.6.4 RC5 key generation

The RC5 key generation mechanism, denoted **CKM_RC5_KEY_GEN**, is a key generation mechanism for RSA Security’s block cipher RC5.

It does not have a parameter.

The mechanism generates RC5 keys with a particular length in bytes, as specified in the **CKA_VALUE_LEN** attribute of the template for the key.

The mechanism contributes the **CKA_CLASS**, **CKA_KEY_TYPE**, and **CKA_VALUE** attributes to the new key. Other attributes supported by the RC5 key type (specifically, the flags indicating which functions the key supports) MAY be specified in the template for the key, or else are assigned default initial values.

For this mechanism, the **ulMinKeySize** and **ulMaxKeySize** fields of the **CK_MECHANISM_INFO** structure specify the supported range of RC5 key sizes, in bytes.

### 2.6.5 RC5-ECB

RC5-ECB, denoted **CKM_RC5_ECB**, is a mechanism for single- and multiple-part encryption and decryption; key wrapping; and key unwrapping, based on RSA Security’s block cipher RC5 and electronic codebook mode as defined in FIPS PUB 81.

It has a parameter, **CK_RC5_PARAMS**, which indicates the wordsize and number of rounds of encryption to use.

This mechanism MAY wrap and unwrap any secret key. Of course, a particular token MAY not be able to wrap/unwrap every secret key that it supports. For wrapping, the mechanism encrypts the value of the **CKA_VALUE** attribute of the key that is wrapped, padded on the trailing end with null bytes so that the resulting length is a multiple of the cipher blocksize (twice the wordsize). The output data is the same length as the padded input data. It does not wrap the key type, key length, or any other information about the key; the application must convey these separately.

For unwrapping, the mechanism decrypts the wrapped key, and truncates the result according to the **CKA_KEY_TYPE** attributes of the template and, if it has one, and the key type supports it, the **CKA_VALUE_LEN** attribute of the template. The mechanism contributes the result as the **CKA_VALUE** attribute of the new key; other attributes required by the key type must be specified in the template.

Constraints on key types and the length of data are summarized in the following table:

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>RC5</td>
<td>Multiple of blocksize</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>Function</td>
<td>Key type</td>
<td>Input length</td>
<td>Output length</td>
<td>Comments</td>
</tr>
<tr>
<td>----------------</td>
<td>----------</td>
<td>-------------------------------</td>
<td>-------------------------------</td>
<td>---------------------------------------------------</td>
</tr>
<tr>
<td>C_Decrypt</td>
<td>RC5</td>
<td>Multiple of blocksize</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_WrapKey</td>
<td>RC5</td>
<td>Any</td>
<td>Input length rounded up to multiple of blocksize</td>
<td></td>
</tr>
<tr>
<td>C_UnwrapKey</td>
<td>RC5</td>
<td>Multiple of blocksize</td>
<td>Determined by type of key being unwrapped or CKA_VALUE_LEN</td>
<td></td>
</tr>
</tbody>
</table>

For this mechanism, the ulMinKeySize and ulMaxKeySize fields of the CK_MECHANISM_INFO structure specify the supported range of RC5 key sizes, in bytes.

### 2.6.6 RC5-CBC

RC5-CBC, denoted **CKM_RC5_CBC**, is a mechanism for single- and multiple-part encryption and decryption; key wrapping; and key unwrapping, based on RSA Security’s block cipher RC5 and cipher-block chaining mode as defined in FIPS PUB 81.

It has a parameter, a **CK_RC5_CBC_PARAMS** structure, which specifies the wordsize and number of rounds of encryption to use, as well as the initialization vector for cipher block chaining mode.

This mechanism MAY wrap and unwrap any secret key. Of course, a particular token MAY not be able to wrap/unwrap every secret key that it supports. For wrapping, the mechanism encrypts the value of the CKA_VALUE attribute of the key that is wrapped, padded on the trailing end with up to seven null bytes so that the resulting length is a multiple of eight. The output data is the same length as the padded input data. It does not wrap the key type, key length, or any other information about the key; the application must convey these separately.

For unwrapping, the mechanism decrypts the wrapped key, and truncates the result according to the CKA_KEY_TYPE attribute for the template, and, if it has one, and the key type supports it, the CKA_VALUE_LEN attribute of the template. The mechanism contributes the result as the CKA_VALUE attribute of the new key; other attributes required by the key type must be specified in the template.

Constraints on key types and the length of data are summarized in the following table:

**Table 16, RC5-CBC Key and Data Length**

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>RC5</td>
<td>Multiple of blocksize</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_Decrypt</td>
<td>RC5</td>
<td>Multiple of blocksize</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_WrapKey</td>
<td>RC5</td>
<td>Any</td>
<td>Input length rounded up to multiple of blocksize</td>
<td></td>
</tr>
<tr>
<td>C_UnwrapKey</td>
<td>RC5</td>
<td>Multiple of blocksize</td>
<td>Determined by type of key being unwrapped or CKA_VALUE_LEN</td>
<td></td>
</tr>
</tbody>
</table>

For this mechanism, the ulMinKeySize and ulMaxKeySize fields of the CK_MECHANISM_INFO structure specify the supported range of RC5 key sizes, in bytes.

### 2.6.7 RC5-CBC with PKCS padding

RC5-CBC with PKCS padding, denoted **CKM_RC5_CBC_PAD**, is a mechanism for single- and multiple-part encryption and decryption; key wrapping; and key unwrapping, based on RSA Security’s block cipher RC5; cipher block chaining mode as defined in FIPS PUB 81; and the block cipher padding method detailed in PKCS #7.
It has a parameter, a **CK_RC5_CBC_PARA** structure, which specifies the wordsize and number of rounds of encryption to use, as well as the initialization vector for cipher block chaining mode.

The PKCS padding in this mechanism allows the length of the plaintext value to be recovered from the ciphertext value. Therefore, when unwrapping keys with this mechanism, no value should be specified for the **CKA_VALUE_LEN** attribute.

In addition to being able to wrap an unwrap secret keys, this mechanism MAY wrap and unwrap RSA, Diffie-Hellman, X9.42 Diffie-Hellman, EC (also related to ECDSA) and DSA private keys. The entries in the table below for data length constraints when wrapping and unwrapping keys do not apply to wrapping and unwrapping private keys.

Constraints on key types and the length of data are summarized in the following table:

**Table 17, RC5-CBC with PKCS Padding: Key and Data Length**

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>RC5</td>
<td>Any</td>
<td>Input length rounded up to multiple of blocksize</td>
</tr>
<tr>
<td>C_Decrypt</td>
<td>RC5</td>
<td>Multiple of blocksize</td>
<td>Between 1 and blocksize bytes shorter than input length</td>
</tr>
<tr>
<td>C_WrapKey</td>
<td>RC5</td>
<td>Any</td>
<td>Input length rounded up to multiple of blocksize</td>
</tr>
<tr>
<td>C_UnwrapKey</td>
<td>RC5</td>
<td>Multiple of blocksize</td>
<td>Between 1 and blocksize bytes shorter than input length</td>
</tr>
</tbody>
</table>

For this mechanism, the *ulMinKeySize* and *ulMaxKeySize* fields of the **CK_MECHANISM_INFO** structure specify the supported range of RC5 key sizes, in bytes.

### 2.6.8 General-length RC5-MAC

General-length RC5-MAC, denoted **CKM_RC5_MAC_GENERAL**, is a mechanism for single- and multiple-part signatures and verification, based on RSA Security's block cipher RC5 and data authentication as defined in FIPS PUB 113.

It has a parameter, a **CK_RC5_MAC_GENERAL_PARAMS** structure, which specifies the wordsize and number of rounds of encryption to use and the output length desired from the mechanism.

The output bytes from this mechanism are taken from the start of the final RC5 cipher block produced in the MACing process.

Constraints on key types and the length of data are summarized in the following table:

**Table 18, General-length RC2-MAC: Key and Data Length**

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Data length</th>
<th>Signature length</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Sign</td>
<td>RC5</td>
<td>Any</td>
<td>0-blocksize, as specified in parameters</td>
</tr>
<tr>
<td>C_Verify</td>
<td>RC5</td>
<td>Any</td>
<td>0-blocksize, as specified in parameters</td>
</tr>
</tbody>
</table>

For this mechanism, the *ulMinKeySize* and *ulMaxKeySize* fields of the **CK_MECHANISM_INFO** structure specify the supported range of RC5 key sizes, in bytes.

### 2.6.9 RC5-MAC

RC5-MAC, denoted by **CKM_RC5_MAC**, is a special case of the general-length RC5-MAC mechanism.

Instead of taking a **CK_RC5_MAC_GENERAL_PARAMS** parameter, it takes a **CK_RC5_PARAMS** parameter. RC5-MAC produces and verifies MACs half as large as the RC5 blocksize.

Constraints on key types and the length of data are summarized in the following table:

**Table 19, RC5-MAC: Key and Data Length**
<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Data length</th>
<th>Signature length</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Sign</td>
<td>RC5</td>
<td>Any</td>
<td>RC5 wordsize = [blocksize/2]</td>
</tr>
<tr>
<td>C_Verify</td>
<td>RC5</td>
<td>Any</td>
<td>RC5 wordsize = [blocksize/2]</td>
</tr>
</tbody>
</table>

For this mechanism, the *ulMinKeySize* and *ulMaxKeySize* fields of the **CK_MECHANISM_INFO** structure specify the supported range of RC5 key sizes, in bytes.

### 2.7 General block cipher

#### 2.7.1 Definitions

For brevity’s sake, the mechanisms for the DES, CAST, CAST3, CAST128 (CAST5), IDEA and CDMF block ciphers are described together here. Each of these ciphers has the following mechanisms, which are described in a templated form.

This section defines the key types “CKK_DES”, “CKK_CAST”, “CKK_CAST3”, “CKK_CAST5” (deprecated in v2.11), “CKK_CAST128”, “CKK_IDEA” and “CKK_CDMF” for type CK_KEY_TYPE as used in the CKA_KEY_TYPE attribute of key objects.

Mechanisms:

```
CKM_DES_KEY_GEN
CKM_DES_ECB
CKM_DES_CBC
CKM_DES_MAC
CKM_DES_MAC_GENERAL
CKM_DES_CBC_PAD
CKM_CDMF_KEY_GEN
CKM_CDMF_ECB
CKM_CDMF_CBC
CKM_CDMF_MAC
CKM_CDMF_MAC_GENERAL
CKM_CDMF_CBC_PAD
CKM_DES_OFB64
CKM_DES_OFB8
CKM_DES_CFB64
CKM_DES_CFB8
CKM_CAST_KEY_GEN
CKM_CAST_ECB
CKM_CAST_CBC
CKM_CAST_MAC
CKM_CAST_MAC_GENERAL
CKM_CAST_CBC_PAD
CKM_CAST3_KEY_GEN
CKM_CAST3_ECB
CKM_CAST3_CBC
CKM_CAST3_MAC
CKM_CAST3_MAC_GENERAL
```
2.7.2 DES secret key objects

DES secret key objects (object class CKO_SECRET_KEY, key type CKK_DES) hold single-length DES keys. The following table defines the DES secret key object attributes, in addition to the common attributes defined for this object class:

Table 20, DES Secret Key Object

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Data type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CKA_VALUE</td>
<td>Byte array</td>
<td>Key value (8 bytes long)</td>
</tr>
</tbody>
</table>

Refer to [PKCS #11-Base] table 15 for footnotes

DES keys MUST have their parity bits properly set as described in FIPS PUB 46-3. Attempting to create or unwrap a DES key with incorrect parity MUST return an error.

The following is a sample template for creating a DES secret key object:

```c
CK_OBJECT_CLASS class = CKO_SECRET_KEY;
CK_KEY_TYPE keyType = CKK_DES;
CK_UTF8CHAR label[] = "A DES secret key object";
CK_BYTE value[8] = {...};
CK_BBOOL true = CK_TRUE;
CK_ATTRIBUTE template[] = {
    {CKA_CLASS, &class, sizeof(class)},
    {CKA_KEY_TYPE, &keyType, sizeof(keyType)},
    {CKA_TOKEN, &true, sizeof(true)},
    {CKA_LABEL, label, sizeof(label)-1},
    {CKA_ENCRYPT, &true, sizeof(true)},
    {CKA_VALUE, value, sizeof(value)}
};
```

CKA_CHECK_VALUE: The value of this attribute is derived from the key object by taking the first three bytes of the ECB encryption of a single block of null (0x00) bytes, using the default cipher associated with the key type of the secret key object.
2.7.3 CAST secret key objects

CAST secret key objects (object class \texttt{CKO\_SECRET\_KEY}, key type \texttt{CKK\_CAST}) hold CAST keys. The following table defines the CAST secret key object attributes, in addition to the common attributes defined for this object class:

\begin{table}[h]
\centering
\begin{tabular}{|l|l|l|}
\hline
\textbf{Attribute} & \textbf{Data type} & \textbf{Meaning} \\
\hline
\texttt{CKA\_VALUE} & \texttt{Byte array} & Key value (1 to 8 bytes) \\
\hline
\texttt{CKA\_VALUE\_LEN} & \texttt{CK\_ULONG} & Length in bytes of key value \\
\hline
\end{tabular}
\caption{CAST Secret Key Object Attributes}
\end{table}

Refer to [PKCS #11-Base] table 15 for footnotes.

The following is a sample template for creating a CAST secret key object:

\begin{verbatim}
CK\_OBJECT\_CLASS class = CKO\_SECRET\_KEY;
CK\_KEY\_TYPE keyType = CKK\_CAST;
CK\_UTF8CHAR label[] = "A CAST secret key object";
CK\_BYTE value[] = { ... };
CK\_BBOOL true = CK\_TRUE;
CK\_ATTRIBUTE template[] = {
    {CKA\_CLASS, &class, sizeof(class)},
    {CKA\_KEY\_TYPE, &keyType, sizeof(keyType)},
    {CKA\_LABEL, label, sizeof(label) - 1},
    {CKA\_VALUE, value, sizeof(value)}
};
\end{verbatim}

2.7.4 CAST3 secret key objects

CAST3 secret key objects (object class \texttt{CKO\_SECRET\_KEY}, key type \texttt{CKK\_CAST3}) hold CAST3 keys. The following table defines the CAST3 secret key object attributes, in addition to the common attributes defines for this object class:

\begin{table}[h]
\centering
\begin{tabular}{|l|l|l|}
\hline
\textbf{Attribute} & \textbf{Data type} & \textbf{Meaning} \\
\hline
\texttt{CKA\_VALUE} & \texttt{Byte array} & Key value (1 to 8 bytes) \\
\hline
\texttt{CKA\_VALUE\_LEN} & \texttt{CK\_ULONG} & Length in bytes of key value \\
\hline
\end{tabular}
\caption{CAST3 Secret Key Object Attributes}
\end{table}

Refer to [PKCS #11-Base] table 15 for footnotes.

The following is a sample template for creating a CAST3 secret key object:

\begin{verbatim}
CK\_OBJECT\_CLASS class = CKO\_SECRET\_KEY;
CK\_KEY\_TYPE keyType = CKK\_CAST3;
CK\_UTF8CHAR label[] = "A CAST3 secret key object";
CK\_BYTE value[] = { ... };
CK\_BBOOL true = CK\_TRUE;
CK\_ATTRIBUTE template[] = {
    {CKA\_CLASS, &class, sizeof(class)},
    {CKA\_KEY\_TYPE, &keyType, sizeof(keyType)},
    {CKA\_LABEL, label, sizeof(label) - 1},
    {CKA\_VALUE, value, sizeof(value)}
};
\end{verbatim}
2.7.5 CAST128 (CAST5) secret key objects

CAST128 (also known as CAST5) secret key objects (object class `CKO_SECRET_KEY`, key type `CKK_CAST128` or `CKK_CAST5`) hold CAST128 keys. The following table defines the CAST128 secret key object attributes, in addition to the common attributes defines for this object class:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Data type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CKA_VALUE1,4,6,7</td>
<td>Byte array</td>
<td>Key value (1 to 16 bytes)</td>
</tr>
<tr>
<td>CKA_VALUE_LEN2,3,6</td>
<td>CK_ULONG</td>
<td>Length in bytes of key value</td>
</tr>
</tbody>
</table>

Refer to [PKCS #11-Base] table 15 for footnotes.

The following is a sample template for creating a CAST128 (CAST5) secret key object:

```c
CK_OBJECT_CLASS class = CKO_SECRET_KEY;
CK_KEY_TYPE keyType = CKK_CAST128;
CK_UTF8CHAR label[] = "A CAST128 secret key object";
CK_BYTE value[] = {...};
CK_BBOOL true = CK_TRUE;
CK_ATTRIBUTE template[] = {
    {CKA_CLASS, &class, sizeof(class)},
    {CKA_KEY_TYPE, &keyType, sizeof(keyType)},
    {CKA_TOKEN, &true, sizeof(true)},
    {CKA_LABEL, label, sizeof(label)-1},
    {CKA_ENCRYPT, &true, sizeof(true)},
    {CKA_VALUE, value, sizeof(value)}
};
```

2.7.6 IDEA secret key objects

IDEA secret key objects (object class `CKO_SECRET_KEY`, key type `CKK_IDEA`) hold IDEA keys. The following table defines the IDEA secret key object attributes, in addition to the common attributes defines for this object class:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Data type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CKA_VALUE1,4,6,7</td>
<td>Byte array</td>
<td>Key value (16 bytes long)</td>
</tr>
</tbody>
</table>

Refer to [PKCS #11-Base] table 15 for footnotes.

The following is a sample template for creating an IDEA secret key object:

```c
CK_OBJECT_CLASS class = CKO_SECRET_KEY;
CK_KEY_TYPE keyType = CKK_IDEA;
CK_UTF8CHAR label[] = "An IDEA secret key object";
CK_BYTE value[16] = {...};
CK_BBOOL true = CK_TRUE;
CK_ATTRIBUTE template[] = {
    {CKA_CLASS, &class, sizeof(class)},
    {CKA_KEY_TYPE, &keyType, sizeof(keyType)},
    {CKA_TOKEN, &true, sizeof(true)},
    {CKA_LABEL, label, sizeof(label)-1},
    {CKA_ENCRYPT, &true, sizeof(true)},
    {CKA_VALUE, value, sizeof(value)}
};
```
2.7.7 CDMF secret key objects

IDEA secret key objects (object class CKO_SECRET_KEY, key type CKK_CDMF) hold CDMF keys. The following table defines the CDMF secret key object attributes, in addition to the common attributes defines for this object class:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Data type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CKA_VALUE[^1,^4,^6,^7]</td>
<td>Byte array</td>
<td>Key value (8 bytes long)</td>
</tr>
</tbody>
</table>

Refer to [PKCS #11-Base] table 15 for footnotes

CDMF keys MUST have their parity bits properly set in exactly the same fashion described for DES keys in FIPS PUB 46-3. Attempting to create or unwrap a CDMF key with incorrect parity MUST return an error.

The following is a sample template for creating a CDMF secret key object:

```c
CK_OBJECT_CLASS class = CKO_SECRET_KEY;
CK_KEY_TYPE keyType = CKK_CDMF;
CK_UTF8CHAR label[] = "A CDMF secret key object";
CK_BYTE value[8] = {...};
CK_BBOOL true = CK_TRUE;
CK_ATTRIBUTE template[] = {
    {CKA_CLASS, &class, sizeof(class)},
    {CKA_KEY_TYPE, &keyType, sizeof(keyType)},
    {CKA_TOKEN, &true, sizeof(true)},
    {CKA_LABEL, label, sizeof(label)-1},
    {CKA_ENCRYPT, &true, sizeof(true)},
    {CKA_VALUE, value, sizeof(value)}
};
```

2.7.8 General block cipher mechanism parameters

2.7.8.1 CK_MAC_GENERAL_PARAMS; CK_MAC_GENERAL_PARAMS_PTR

CK_MAC_GENERAL_PARAMS provides the parameters to the general-length MACing mechanisms of the DES, DES3 (triple-DES), CAST, CAST3, CAST128 (CAST5), IDEA, CDMF and AES ciphers. It also provides the parameters to the general-length HMACing mechanisms (i.e., MD2, MD5, SHA-1, SHA-256, SHA-384, SHA-512, RIPEMD-128 and RIPEMD-160) and the two SSL 3.0 MACing mechanisms, (i.e., MD5 and SHA-1). It holds the length of the MAC that these mechanisms produce. It is defined as follows:

```c
typedef CK_ULONG CK_MAC_GENERAL_PARAMS;
```

CK_MAC_GENERAL_PARAMS_PTR is a pointer to a CK_MAC_GENERAL_PARAMS.

2.7.9 General block cipher key generation

Cipher `<NAME>` has a key generation mechanism, "<NAME> key generation", denoted by CKM_<NAME>_KEY_GEN.

This mechanism does not have a parameter.

The mechanism contributes the CKA_CLASS, CKA_KEY_TYPE, and CKA_VALUE attributes to the new key. Other attributes supported by the key type (specifically, the flags indicating which functions the key supports) MAY be specified in the template for the key, or else are assigned default initial values.

When DES keys or CDMF keys are generated, their parity bits are set properly, as specified in FIPS PUB 46-3. Similarly, when a triple-DES key is generated, each of the DES keys comprising it has its parity bits set properly.
When DES or CDMF keys are generated, it is token-dependent whether or not it is possible for “weak” or “semi-weak” keys to be generated. Similarly, when triple-DES keys are generated, it is token-dependent whether or not it is possible for any of the component DES keys to be “weak” or “semi-weak” keys.

When CAST, CAST3, or CAST128 (CAST5) keys are generated, the template for the secret key must specify a **CKA_VALUE_LEN** attribute.

For this mechanism, the **ulMinKeySize** and **ulMaxKeySize** fields of the **CK_MECHANISM_INFO** structure MAY be used. The CAST, CAST3, and CAST128 (CAST5) ciphers have variable key sizes, and so for the key generation mechanisms for these ciphers, the **ulMinKeySize** and **ulMaxKeySize** fields of the **CK_MECHANISM_INFO** structure specify the supported range of key sizes, in bytes. For the DES, DES3 (triple-DES), IDEA and CDMF ciphers, these fields and not used.

### 2.7.10 General block cipher ECB

Cipher <NAME> has an electronic codebook mechanism, “<NAME>-ECB”, denoted **CKM_<NAME>_ECB**. It is a mechanism for single- and multiple-part encryption and decryption; key wrapping; and key unwrapping with <NAME>.

It does not have a parameter.

This mechanism MAY wrap and unwrap any secret key. Of course, a particular token MAY not be able to wrap/unwrap every secret key that it supports. For wrapping, the mechanism encrypts the value of the **CKA_VALUE** attribute of the key that is wrapped, padded on the trailing end with null bytes so that the resulting length is a multiple of <NAME>’s blocksize. The output data is the same length as the padded input data. It does not wrap the key type, key length or any other information about the key; the application must convey these separately.

For unwrapping, the mechanism decrypts the wrapped key, and truncates the result according to the **CKA_KEY_TYPE** attribute of the template and, if it has one, and the key type supports it, the **CKA_VALUE_LEN** attribute of the template. The mechanism contributes the result as the **CKA_VALUE** attribute of the new key; other attributes required by the key must be specified in the template.

Constraints on key types and the length of data are summarized in the following table:

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>&lt;NAME&gt;</td>
<td>Multiple of blocksize</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_Decrypt</td>
<td>&lt;NAME&gt;</td>
<td>Multiple of blocksize</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_WrapKey</td>
<td>&lt;NAME&gt;</td>
<td>Any</td>
<td>Input length rounded up to multiple of blocksize</td>
<td></td>
</tr>
<tr>
<td>C_UnwrapKey</td>
<td>&lt;NAME&gt;</td>
<td>Any</td>
<td>Determined by type of key being unwrapped or <strong>CKA_VALUE_LEN</strong></td>
<td></td>
</tr>
</tbody>
</table>

For this mechanism, the **ulMinKeySize** and **ulMaxKeySize** fields of the **CK_MECHANISM_INFO** structure MAY be used. The CAST, CAST3, and CAST128 (CAST5) ciphers have variable key sizes, and so for these ciphers, the **ulMinKeySize** and **ulMaxKeySize** fields of the **CK_MECHANISM_INFO** structure specify the supported range of key sizes, in bytes. For the DES, DES3 (triple-DES), IDEA and CDMF ciphers, these fields are not used.

### 2.7.11 General block cipher CBC

Cipher <NAME> has a cipher-block chaining mode, “<NAME>-CBC”, denoted **CKM_<NAME>_CBC**. It is a mechanism for single- and multiple-part encryption and decryption; key wrapping; and key unwrapping with <NAME>.
It has a parameter, an initialization vector for cipher block chaining mode. The initialization vector has the same length as <NAME>’s blocksize.

Constraints on key types and the length of data are summarized in the following table:

Table 27, General Block Cipher CBC; Key and Data Length

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>&lt;NAME&gt;</td>
<td>Multiple of blocksize</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_Decrypt</td>
<td>&lt;NAME&gt;</td>
<td>Multiple of blocksize</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_WrapKey</td>
<td>&lt;NAME&gt;</td>
<td>Any</td>
<td>Input length rounded up to multiple of blocksize</td>
<td></td>
</tr>
<tr>
<td>C_UnwrapKey</td>
<td>&lt;NAME&gt;</td>
<td>Any</td>
<td>Determined by type of key being unwrapped or CKA_VALUE_LEN</td>
<td></td>
</tr>
</tbody>
</table>

For this mechanism, the ulMinKeySize and ulMaxKeySize fields of the CK_MECHANISM_INFO structure MAY be used. The CAST, CAST3, and CAST128 (CAST5) ciphers have variable key sizes, and so for these ciphers, the ulMinKeySize and ulMaxKeySize fields of the CK_MECHANISM_INFO structure specify the supported range of key sizes, in bytes. For the DES, DES3 (triple-DES), IDEA, and CDMF ciphers, these fields are not used.

2.7.12 General block cipher CBC with PKCS padding

Cipher <NAME> has a cipher-block chaining mode with PKCS padding, “<NAME>-CBC with PKCS padding”, denoted CKM_<NAME>_CBC_PAD. It is a mechanism for single- and multiple-part encryption and decryption; key wrapping; and key unwrapping with <NAME>. All ciphertext is padded with PKCS padding.

It has a parameter, an initialization vector for cipher block chaining mode. The initialization vector has the same length as <NAME>’s blocksize.

The PKCS padding in this mechanism allows the length of the plaintext value to be recovered from the ciphertext value. Therefore, when unwrapping keys with this mechanism, no value should be specified for the CKA_VALUE_LEN attribute.

In addition to being able to wrap and unwrap secret keys, this mechanism MAY wrap and unwrap RSA, Diffie-Hellman, X9.42 Diffie-Hellman, EC (also related to ECDSA) and DSA private keys. The entries in the table below for data length constraints when wrapping and unwrapping keys to not apply to wrapping and unwrapping private keys.

Constraints on key types and the length of data are summarized in the following table:

Table 28, General Block Cipher CBC with PKCS Padding: Key and Data Length

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>&lt;NAME&gt;</td>
<td>Any</td>
<td>Input length rounded up to multiple of blocksize</td>
</tr>
<tr>
<td>C_Decrypt</td>
<td>&lt;NAME&gt;</td>
<td>Multiple of blocksize</td>
<td>Between 1 and blocksize bytes shorter than input</td>
</tr>
<tr>
<td>C_WrapKey</td>
<td>&lt;NAME&gt;</td>
<td>Any</td>
<td>Input length rounded up to multiple of blocksize</td>
</tr>
<tr>
<td>C_UnwrapKey</td>
<td>&lt;NAME&gt;</td>
<td>Multiple of blocksize</td>
<td>Between 1 and blocksize bytes shorter than input</td>
</tr>
</tbody>
</table>
For this mechanism, the ulMinKeySize and ulMaxKeySize fields of the CK_MECHANISM_INFO structure MAY be used. The CAST, CAST3 and CAST128 (CAST5) ciphers have variable key sizes, and so for these ciphers, the ulMinKeySize and ulMaxKeySize fields of the CK_MECHANISM_INFO structure specify the supported range of key sizes, in bytes. For the DES, DES3 (triple-DES), IDEA, and CDMF ciphers, these fields are not used.

### 2.7.13 General-length general block cipher MAC

Cipher <NAME> has a general-length MACing mode, “General-length <NAME>-MAC”, denoted CKM_<NAME>_MAC_GENERAL. It is a mechanism for single- and multiple-part signatures and verification, based on the <NAME> encryption algorithm and data authentication as defined in FIPS PUB 113.

It has a parameter, a CK_MAC_GENERAL_PARAMS, which specifies the size of the output.

The output bytes from this mechanism are taken from the start of the final cipher block produced in the MACing process.

Constraints on key types and the length of input and output data are summarized in the following table:

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Data length</th>
<th>Signature length</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Sign</td>
<td>&lt;NAME&gt;</td>
<td>Any</td>
<td>0-blocksize, depending on parameters</td>
</tr>
<tr>
<td>C_Verify</td>
<td>&lt;NAME&gt;</td>
<td>Any</td>
<td>0-blocksize, depending on parameters</td>
</tr>
</tbody>
</table>

For this mechanism, the ulMinKeySize and ulMaxKeySize fields of the CK_MECHANISM_INFO structure MAY be used. The CAST, CAST3, and CAST128 (CAST5) ciphers have variable key sizes, and so for these ciphers, the ulMinKeySize and ulMaxKeySize fields of the CK_MECHANISM_INFO structure specify the supported range of key sizes, in bytes. For the DES, DES3 (triple-DES), IDEA, and CDMF ciphers, these fields are not used.

### 2.7.14 General block cipher MAC

Cipher <NAME> has a MACing mechanism, “<NAME>-MAC”, denoted CKM_<NAME>_MAC. This mechanism is a special case of the CKM_<NAME>_MAC_GENERAL mechanism described above. It produces an output of size half as large as <NAME>’s blocksize.

This mechanism has no parameters.

Constraints on key types and the length of data are summarized in the following table:

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Data length</th>
<th>Signature length</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Sign</td>
<td>&lt;NAME&gt;</td>
<td>Any</td>
<td>[blocksize/2]</td>
</tr>
<tr>
<td>C_Verify</td>
<td>&lt;NAME&gt;</td>
<td>Any</td>
<td>[blocksize/2]</td>
</tr>
</tbody>
</table>

For this mechanism, the ulMinKeySize and ulMaxKeySize fields of the CK_MECHANISM_INFO structure MAY be used. The CAST, CAST3, and CAST128 (CAST5) ciphers have variable key sizes, and so for these ciphers, the ulMinKeySize and ulMaxKeySize fields of the CK_MECHANISM_INFO structure specify the supported range of key sizes, in bytes. For the DES, DES3 (triple-DES), IDEA, and CDMF ciphers, these fields are not used.
2.8 SKIPJACK

2.8.1 Definitions

This section defines the key type “CKK_SKIPJACK” for type CK_KEY_TYPE as used in the CKA_KEY_TYPE attribute of key objects.

Mechanisms:

- CKM_SKIPJACK_KEY_GEN
- CKM_SKIPJACK_ECB64
- CKM_SKIPJACK_CBC64
- CKM_SKIPJACK_OFB64
- CKM_SKIPJACK_CFB64
- CKM_SKIPJACK_CFB32
- CKM_SKIPJACK_CFB16
- CKM_SKIPJACK_CFB8
- CKM_SKIPJACK_WRAP
- CKM_SKIPJACK_PRIVATE_WRAP
- CKM_SKIPJACK_RELAYX

2.8.2 SKIPJACK secret key objects

SKIPJACK secret key objects (object class CKO_SECRET_KEY, key type CKK_SKIPJACK) holds a single-length MEK or a TEK. The following table defines the SKIPJACK secret object attributes, in addition to the common attributes defined for this object class:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Data type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CKA_VALUE</td>
<td>Byte array</td>
<td>Key value (12 bytes long)</td>
</tr>
</tbody>
</table>

Refer to [PKCS #11-Base] table 15 for footnotes

SKIPJACK keys have 16 checksum bits, and these bits must be properly set. Attempting to create or unwrap a SKIPJACK key with incorrect checksum bits MUST return an error.

It is not clear that any tokens exist (or ever will exist) which permit an application to create a SKIPJACK key with a specified value. Nonetheless, we provide templates for doing so.

The following is a sample template for creating a SKIPJACK MEK secret key object:

```c
CK_OBJECT_CLASS class = CKO_SECRET_KEY;
CK_KEY_TYPE keyType = CKK_SKIPJACK;
CK_UTF8CHAR label[] = "A SKIPJACK MEK secret key object";
CK_BYTE value[12] = {...};
CK_BBOOL true = CK_TRUE;
CK_ATTRIBUTE template[] = {
    {CKA_CLASS, &class, sizeof(class)},
    {CKA_KEY_TYPE, &keyType, sizeof(keyType)},
    {CKA_TOKEN, &true, sizeof(true)},
    {CKA_LABEL, label, sizeof(label)-1},
    {CKA_ENCRYPT, &true, sizeof(true)},
    {CKA_VALUE, value, sizeof(value)}
};
```

The following is a sample template for creating a SKIPJACK TEK secret key object:
CK_OBJECT_CLASS class = CKO_SECRET_KEY;
CK_KEY_TYPE keyType = CKK_SKIPJACK;
CK_UTF8CHAR label[] = "A SKIPJACK TEK secret key object";
CK_BYTE value[12] = {...};
CK_BBOOL true = CK_TRUE;
CK_ATTRIBUTE template[] = {
    {CKA_CLASS, &class, sizeof(class)},
    {CKA_KEY_TYPE, &keyType, sizeof(keyType)},
    {CKA_TOKEN, &true, sizeof(true)},
    {CKA_LABEL, label, sizeof(label)-1},
    {CKA_ENCRYPT, &true, sizeof(true)},
    {CKA_WRAP, &true, sizeof(true)},
    {CKA_VALUE, value, sizeof(value)}
};

2.8.3 SKIPJACK Mechanism parameters

2.8.3.1 CK_SKIPJACK_PRIVATE_WRAP_PARAMS;
CK_SKIPJACK_PRIVATE_WRAP_PARAMS_PTR

CK_SKIPJACK_PRIVATE_WRAP_PARAMS is a structure that provides the parameters to the
CKM_SKIPJACK_PRIVATE_WRAP mechanism. It is defined as follows:

typedef struct  CK_SKIPJACK_PRIVATE_WRAP_PARAMS {
    CK_ULONG ulPasswordLen;
    CK_BYTE_PTR pPassword;
    CK_ULONG ulPublicDataLen;
    CK_BYTE_PTR pPublicData;
    CK_ULONG ulPandGLen;
    CK_ULONG ulQLen;
    CK_ULONG ulRandomLen;
    CK_BYTE_PTR pRandomA;
    CK_BYTE_PTR pPrimeP;
    CK_BYTE_PTR pBaseG;
    CK_BYTE_PTR pSubprimeQ;
} CK_SKIPJACK_PRIVATE_WRAP_PARAMS;

The fields of the structure have the following meanings:

ulPasswordLen length of the password
pPassword pointer to the buffer which contains the user-supplied password
ulPublicDataLen other party’s key exchange public key size
pPublicData pointer to other party’s key exchange public key value
ulPandGLen length of prime and base values
ulQLen length of subprime value
ulRandomLen size of random Ra, in bytes
pPrimeP pointer to Prime, p, value
pBaseG pointer to Base, b, value
pSubprimeQ pointer to Subprime, q, value

**CK_SKIPJACK_PRIVATE_WRAP_PARAMS_PTR** is a pointer to a **CK_PRIVATE_WRAP_PARAMS**.

### 2.8.3.2 CK_SKIPJACK_RELAYX_PARAMS;
**CK_SKIPJACK_RELAYX_PARAMS_PTR**

**CK_SKIPJACK_RELAYX_PARAMS** is a structure that provides the parameters to the **CKM_SKIPJACK_RELAYX** mechanism. It is defined as follows:

```c
typedef struct CK_SKIPJACK_RELAYX_PARAMS {
    CK_ULONG ulOldWrappedXLen;
    CK_BYTE_PTR pOldWrappedX;
    CK_ULONG ulOldPasswordLen;
    CK_BYTE_PTR pOldPassword;
    CK_ULONG ulOldPublicDataLen;
    CK_BYTE_PTR pOldPublicData;
    CK_ULONG ulOldRandomLen;
    CK_BYTE_PTR pOldRandomA;
    CK_ULONG ulNewPasswordLen;
    CK_BYTE_PTR pNewPassword;
    CK_ULONG ulNewPublicDataLen;
    CK_BYTE_PTR pNewPublicData;
    CK_ULONG ulNewRandomLen;
    CK_BYTE_PTR pNewRandomA;
} CK_SKIPJACK_RELAYX_PARAMS;
```

The fields of the structure have the following meanings:

- **ulOldWrappedLen**: length of old wrapped key in bytes
- **pOldWrappedX**: pointer to old wrapper key
- **ulOldPasswordLen**: length of the old password
- **pOldPassword**: pointer to the buffer which contains the old user-supplied password
- **ulOldPublicDataLen**: old key exchange public key size
- **pOldPublicData**: pointer to old key exchange public key value
- **ulOldRandomLen**: size of old random Ra in bytes
- **pOldRandomA**: pointer to old Ra data
- **ulNewPasswordLen**: length of the new password
- **pNewPassword**: pointer to the buffer which contains the new user-supplied password
- **ulNewPublicDataLen**: new key exchange public key size
- **pNewPublicData**: pointer to new key exchange public key value
ulNewRandomLen  size of new random Ra in bytes

pNewRandomA  pointer to new Ra data

CK_SKIPJACK_RELAYX_PARAMS_PTR is a pointer to a CK_SKIPJACK_RELAYX_PARAMS.

2.8.4 SKIPJACK key generation

The SKIPJACK key generation mechanism, denoted CKM_SKIPJACK_KEY_GEN, is a key generation mechanism for SKIPJACK. The output of this mechanism is called a Message Encryption Key (MEK).

It does not have a parameter.

The mechanism contributes the CKA_CLASS, CKA_KEY_TYPE, and CKA_VALUE attributes to the new key.

2.8.5 SKIPJACK-ECB64

SKIPJACK-ECB64, denoted CKM_SKIPJACK_ECB64, is a mechanism for single- and multiple-part encryption and decryption with SKIPJACK in 64-bit electronic codebook mode as defined in FIPS PUB 185.

It has a parameter, a 24-byte initialization vector. During an encryption operation, this IV is set to some value generated by the token – in other words, the application cannot specify a particular IV when encrypting. It MAY, of course, specify a particular IV when decrypting.

Constraints on key types and the length of data are summarized in the following table:

Table 32, SKIPJACK-ECB64: Data and Length

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>SKIPJACK</td>
<td>Multiple of 8</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_Decrypt</td>
<td>SKIPJACK</td>
<td>Multiple of 8</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
</tbody>
</table>

2.8.6 SKIPJACK-CBC64

SKIPJACK-CBC64, denoted CKM_SKIPJACK_CBC64, is a mechanism for single- and multiple-part encryption and decryption with SKIPJACK in 64-bit output feedback mode as defined in FIPS PUB 185.

It has a parameter, a 24-byte initialization vector. During an encryption operation, this IV is set to some value generated by the token – in other words, the application MAY NOT specify a particular IV when encrypting. It MAY, of course, specify a particular IV when decrypting.

Constraints on key types and the length of data are summarized in the following table:

Table 33, SKIPJACK-CBC64: Data and Length

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>SKIPJACK</td>
<td>Multiple of 8</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_Decrypt</td>
<td>SKIPJACK</td>
<td>Multiple of 8</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
</tbody>
</table>

2.8.7 SKIPJACK-OFB64

SKIPJACK-OFB64, denoted CKM_SKIPJACK_OFB64, is a mechanism for single- and multiple-part encryption and decryption with SKIPJACK in 64-bit output feedback mode as defined in FIPS PUB 185.

It has a parameter, a 24-byte initialization vector. During an encryption operation, this IV is set to some value generated by the token – in other words, the application MAY NOT specify a particular IV when encrypting. It MAY, of course, specify a particular IV when decrypting.
Constraints on key types and the length of data are summarized in the following table:

### Table 34, SKIPJACK-OFB64: Data and Length

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>SKIPJACK</td>
<td>Multiple of 8</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_Decrypt</td>
<td>SKIPJACK</td>
<td>Multiple of 8</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
</tbody>
</table>

### 2.8.8 SKIPJACK-CFB64

SKIPJACK-CFB64, denoted CKM_SKIPJACK_CFB64, is a mechanism for single- and multiple-part encryption and decryption with SKIPJACK in 64-bit cipher feedback mode as defined in FIPS PUB 185.

It has a parameter, a 24-byte initialization vector. During an encryption operation, this IV is set to some value generated by the token – in other words, the application MAY NOT specify a particular IV when encrypting. It MAY, of course, specify a particular IV when decrypting.

Constraints on key types and the length of data are summarized in the following table:

### Table 35, SKIPJACK-CFB64: Data and Length

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>SKIPJACK</td>
<td>Multiple of 8</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_Decrypt</td>
<td>SKIPJACK</td>
<td>Multiple of 8</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
</tbody>
</table>

### 2.8.9 SKIPJACK-CFB32

SKIPJACK-CFB32, denoted CKM_SKIPJACK_CFB32, is a mechanism for single- and multiple-part encryption and decryption with SKIPJACK in 32-bit cipher feedback mode as defined in FIPS PUB 185.

It has a parameter, a 24-byte initialization vector. During an encryption operation, this IV is set to some value generated by the token – in other words, the application MAY NOT specify a particular IV when encrypting. It MAY, of course, specify a particular IV when decrypting.

Constraints on key types and the length of data are summarized in the following table:

### Table 36, SKIPJACK-CFB32: Data and Length

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>SKIPJACK</td>
<td>Multiple of 4</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_Decrypt</td>
<td>SKIPJACK</td>
<td>Multiple of 4</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
</tbody>
</table>

### 2.8.10 SKIPJACK-CFB16

SKIPJACK-CFB16, denoted CKM_SKIPJACK_CFB16, is a mechanism for single- and multiple-part encryption and decryption with SKIPJACK in 16-bit cipher feedback mode as defined in FIPS PUB 185.

It has a parameter, a 24-byte initialization vector. During an encryption operation, this IV is set to some value generated by the token – in other words, the application MAY NOT specify a particular IV when encrypting. It MAY, of course, specify a particular IV when decrypting.

Constraints on key types and the length of data are summarized in the following table:

### Table 37, SKIPJACK-CFB16: Data and Length

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>SKIPJACK</td>
<td>Multiple of 4</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
</tbody>
</table>
2.8.11 SKIPJACK-CFB8

SKIPJACK-CFB8, denoted CKM_SKIPJACK_CFB8, is a mechanism for single- and multiple-part encryption and decryption with SKIPJACK in 8-bit cipher feedback mode as defined in FIPS PUB 185. It has a parameter, a 24-byte initialization vector. During an encryption operation, this IV is set to some value generated by the token — in other words, the application MAY NOT specify a particular IV when encrypting. It MAY, of course, specify a particular IV when decrypting.

Constraints on key types and the length of data are summarized in the following table:

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>SKIPJACK</td>
<td>Multiple of 4</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_Decrypt</td>
<td>SKIPJACK</td>
<td>Multiple of 4</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
</tbody>
</table>

2.8.12 SKIPJACK-WRAP

The SKIPJACK-WRAP mechanism, denoted CKM_SKIPJACK_WRAP, is used to wrap and unwrap a secret key (MEK). It MAY wrap or unwrap SKIPJACK, BATON, and JUNIPER keys. It does not have a parameter.

2.8.13 SKIPJACK-PRIVATE-WRAP

The SKIPJACK-PRIVATE-WRAP mechanism, denoted CKM_SKIPJACK_PRIVATE_WRAP, is used to wrap and unwrap a private key. It MAY wrap KEA and DSA private keys. It has a parameter, a CK_SKIPJACK_PRIVATE_WRAP_PARAMS structure.

2.8.14 SKIPJACK-RELAYX

The SKIPJACK-RELAYX mechanism, denoted CKM_SKIPJACK_RELAYX, is used with the C_WrapKey function to “change the wrapping” on a private key which was wrapped with the SKIPJACK-PRIVATE-WRAP mechanism (See Section 2.8.13). It has a parameter, a CK_SKIPJACK_RELAYX_PARAMS structure.

Although the SKIPJACK-RELAYX mechanism is used with C_WrapKey, it differs from other key-wrapping mechanisms. Other key-wrapping mechanisms take a key handle as one of the arguments to C_WrapKey; however for the SKIPJACK_RELAYX mechanism, the [always invalid] value 0 should be passed as the key handle for C_WrapKey, and the already-wrapped key should be passed in as part of the CK_SKIPJACK_RELAYX_PARAMS structure.

2.9 BATON

2.9.1 Definitions

This section defines the key type “CKK_BATON” for type CK_KEY_TYPE as used in the CKA_KEY_TYPE attribute of key objects.

Mechanisms:

- CKM_BATON_KEY_GEN
- CKM_BATON_ECB128
- CKM_BATON_ECB96
2.9.2 BATON secret key objects

BATON secret key objects (object class 
CKO_SECRET_KEY, key type CKK_BATON) hold single-length
BATON keys. The following table defines the BATON secret key object attributes, in addition to the
common attributes defined for this object class:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Data type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CKA_VALUE</td>
<td>Byte array</td>
<td>Key value (40 bytes long)</td>
</tr>
</tbody>
</table>

Refer to [PKCS #11-Base] table 15 for footnotes

BATON keys have 160 checksum bits, and these bits must be properly set. Attempting to create or
unwrap a BATON key with incorrect checksum bits MUST return an error.

It is not clear that any tokens exist (or will ever exist) which permit an application to create a BATON key
with a specified value. Nonetheless, we provide templates for doing so.

The following is a sample template for creating a BATON MEK secret key object:

```c
CK_OBJECT_CLASS class = CKO_SECRET_KEY;
CK_KEY_TYPE keyType = CKK_BATON;
CK_UTF8CHAR label[] = "A BATON MEK secret key object";
CK_BYTE value[40] = {…};
CK_BBOOL true = CK_TRUE;
CK_ATTRIBUTE template[] = {
    {CKA_CLASS, &class, sizeof(class)},
    {CKA_KEY_TYPE, &keyType, sizeof(keyType)},
    {CKA_TOKEN, &true, sizeof(true)},
    {CKA_LABEL, label, sizeof(label)-1},
    {CKA_VALUE, value, sizeof(value)}
};
```

The following is a sample template for creating a BATON TEK secret key object:

```c
CK_OBJECT_CLASS class = CKO_SECRET_KEY;
CK_KEY_TYPE keyType = CKK_BATON;
CK_UTF8CHAR label[] = "A BATON TEK secret key object";
CK_BYTE value[40] = {…};
CK_BBOOL true = CK_TRUE;
CK_ATTRIBUTE template[] = {
    {CKA_CLASS, &class, sizeof(class)},
    {CKA_KEY_TYPE, &keyType, sizeof(keyType)},
    {CKA_TOKEN, &true, sizeof(true)},
    {CKA_LABEL, label, sizeof(label)-1},
    {CKA_ENCRYPT, &true, sizeof(true)},
    {CKA_WRAP, &true, sizeof(true)},
    {CKA_VALUE, value, sizeof(value)}
};
```

2.9.3 BATON key generation

The BATON key generation mechanism, denoted 
CKM_BATON_KEY_GEN, is a key generation
mechanism for BATON. The output of this mechanism is called a Message Encryption Key (MEK).
It does not have a parameter.

The mechanism contributes the `CKA_CLASS`, `CKA_KEY_TYPE`, and `CKA_VALUE` attributes to the new key.

### 2.9.4 BATON-ECB128

BATON-ECB128, denoted `CKM_BATON_ECB128`, is a mechanism for single- and multiple-part encryption and decryption with BATON in 128-bit electronic codebook mode.

It has a parameter, a 24-byte initialization vector. During an encryption operation, this IV is set to some value generated by the token – in other words, the application MAY NOT specify a particular IV when encrypting. It MAY, of course, specify a particular IV when decrypting.

Constraints on key types and the length of data are summarized in the following table:

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>BATON</td>
<td>Multiple of 16</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_Decrypt</td>
<td>BATON</td>
<td>Multiple of 16</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
</tbody>
</table>

### 2.9.5 BATON-ECB96

BATON-ECB96, denoted `CKM_BATON_ECB96`, is a mechanism for single- and multiple-part encryption and decryption with BATON in 96-bit electronic codebook mode.

It has a parameter, a 24-byte initialization vector. During an encryption operation, this IV is set to some value generated by the token – in other words, the application MAY NOT specify a particular IV when encrypting. It MAY, of course, specify a particular IV when decrypting.

Constraints on key types and the length of data are summarized in the following table:

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>BATON</td>
<td>Multiple of 12</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_Decrypt</td>
<td>BATON</td>
<td>Multiple of 12</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
</tbody>
</table>

### 2.9.6 BATON-CBC128

BATON-CBC128, denoted `CKM_BATON_CBC128`, is a mechanism for single- and multiple-part encryption and decryption with BATON in 128-bit cipher-block chaining mode.

It has a parameter, a 24-byte initialization vector. During an encryption operation, this IV is set to some value generated by the token – in other words, the application MAY NOT specify a particular IV when encrypting. It MAY, of course, specify a particular IV when decrypting.

Constraints on key types and the length of data are summarized in the following table:

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>BATON</td>
<td>Multiple of 16</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_Decrypt</td>
<td>BATON</td>
<td>Multiple of 16</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
</tbody>
</table>
2.9.7 BATON-COUNTER

BATON-COUNTER, denoted \texttt{CKM\_BATON\_COUNTER}, is a mechanism for single- and multiple-part encryption and decryption with BATON in counter mode.

It has a parameter, a 24-byte initialization vector. During an encryption operation, this IV is set to some value generated by the token — in other words, the application MAY NOT specify a particular IV when encrypting. It MAY, of course, specify a particular IV when decrypting.

Constraints on key types and the length of data are summarized in the following table:

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>BATON</td>
<td>Multiple of 16</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_Decrypt</td>
<td>BATON</td>
<td>Multiple of 16</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
</tbody>
</table>

2.9.8 BATON-SHUFFLE

BATON-SHUFFLE, denoted \texttt{CKM\_BATON\_SHUFFLE}, is a mechanism for single- and multiple-part encryption and decryption with BATON in shuffle mode.

It has a parameter, a 24-byte initialization vector. During an encryption operation, this IV is set to some value generated by the token — in other words, the application MAY NOT specify a particular IV when encrypting. It MAY, of course, specify a particular IV when decrypting.

Constraints on key types and the length of data are summarized in the following table:

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>BATON</td>
<td>Multiple of 16</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_Decrypt</td>
<td>BATON</td>
<td>Multiple of 16</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
</tbody>
</table>

2.9.9 BATON WRAP

The BATON wrap and unwrap mechanism, denoted \texttt{CKM\_BATON\_WRAP}, is a function used to wrap and unwrap a secret key (MEK). It MAY wrap and unwrap SKIPJACK, BATON and JUNIPER keys.

It has no parameters.

When used to unwrap a key, this mechanism contributes the \texttt{CKA\_CLASS}, \texttt{CKA\_KEY\_TYPE}, and \texttt{CKA\_VALUE} attributes to it.

2.10 JUNIPER

2.10.1 Definitions

This section defines the key type “CKK\_JUNIPER” for type CK\_KEY\_TYPE as used in the \texttt{CA\_KEY\_TYPE} attribute of key objects.

Mechanisms:

- \texttt{CKM\_JUNIPER\_KEY\_GEN}
- \texttt{CKM\_JUNIPER\_ECB128}
- \texttt{CKM\_JUNIPER\_CBC128}
- \texttt{CKM\_JUNIPER\_COUNTER}
- \texttt{CKM\_JUNIPER\_SHUFFLE}
2.10.2 JUNIPER secret key objects

JUNIPER secret key objects (object class CKO_SECRET_KEY, key type CKK_JUNIPER) hold single-length JUNIPER keys. The following table defines the BATON secret key object attributes, in addition to the common attributes defined for this object class:

Table 45, JUNIPER Secret Key Object

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Data type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CKA_VALUE</td>
<td>Byte array</td>
<td>Key value (40 bytes long)</td>
</tr>
</tbody>
</table>

Refer to [PKCS #11-Base] table 15 for footnotes

JUNIPER keys have 160 checksum bits, and these bits must be properly set. Attempting to create or unwrap a BATON key with incorrect checksum bits MUST return an error.

It is not clear that any tokens exist (or will ever exist) which permit an application to create a BATON key with a specified value. Nonetheless, we provide templates for doing so.

The following is a sample template for creating a JUNIPER MEK secret key object:

```c
CK_OBJECT_CLASS class = CKO_SECRET_KEY;
CK_KEY_TYPE keyType = CKK_JUNIPER;
CK_UTF8CHAR label[] = "A JUNIPER MEK secret key object";
CK_BYTE value[40] = {...};
CK_BBOOL true = CK_TRUE;
CK_ATTRIBUTE template[] = {
    {CKA_CLASS, &class, sizeof(class)},
    {CKA_KEY_TYPE, &keyType, sizeof(keyType)},
    {CKA_TOKEN, &true, sizeof(true)},
    {CKA_LABEL, label, sizeof(label)-1},
    {CKA_ENCRYPT, &true, sizeof(true)},
    {CKA_VALUE, value, sizeof(value)}
};
```

The following is a sample template for creating a JUNIPER TEK secret key object:

```c
CK_OBJECT_CLASS class = CKO_SECRET_KEY;
CK_KEY_TYPE keyType = CKK_JUNIPER;
CK_UTF8CHAR label[] = "A JUNIPER TEK secret key object";
CK_BYTE value[40] = {...};
CK_BBOOL true = CK_TRUE;
CK_ATTRIBUTE template[] = {
    {CKA_CLASS, &class, sizeof(class)},
    {CKA_KEY_TYPE, &keyType, sizeof(keyType)},
    {CKA_TOKEN, &true, sizeof(true)},
    {CKA_LABEL, label, sizeof(label)-1},
    {CKA_ENCRYPT, &true, sizeof(true)},
    {CKA_WRAP, &true, sizeof(true)},
    {CKA_VALUE, value, sizeof(value)}
};
```

2.10.3 JUNIPER key generation

The JUNIPER key generation mechanism, denoted CKM_JUNIPER_KEY_GEN, is a key generation mechanism for JUNIPER. The output of this mechanism is called a Message Encryption Key (MEK).

It does not have a parameter.

The mechanism contributes the CKA_CLASS, CKA_KEY_TYPE, and CKA_VALUE attributes to the new key.
2.10.4 JUNIPER-ECB128

JUNIPER-ECB128, denoted CKM_JUNIPER_ECB128, is a mechanism for single- and multiple-part encryption and decryption with JUNIPER in 128-bit electronic codebook mode.

It has a parameter, a 24-byte initialization vector. During an encryption operation, this IV is set to some value generated by the token – in other words, the application MAY NOT specify a particular IV when encrypting. It MAY, of course, specify a particular IV when decrypting.

Constraints on key types and the length of data are summarized in the following table. For encryption and decryption, the input and output data (parts) MAY begin at the same location in memory.

Table 46, JUNIPER-ECB128: Data and Length

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>JUNIPER</td>
<td>Multiple of 16</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_Decrypt</td>
<td>JUNIPER</td>
<td>Multiple of 16</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
</tbody>
</table>

2.10.5 JUNIPER-CBC128

JUNIPER-CBC128, denoted CKM_JUNIPER_CBC128, is a mechanism for single- and multiple-part encryption and decryption with JUNIPER in 128-bit cipher block chaining mode.

It has a parameter, a 24-byte initialization vector. During an encryption operation, this IV is set to some value generated by the token – in other words, the application MAY NOT specify a particular IV when encrypting. It MAY, of course, specify a particular IV when decrypting.

Constraints on key types and the length of data are summarized in the following table. For encryption and decryption, the input and output data (parts) MAY begin at the same location in memory.

Table 47, JUNIPER-CBC128: Data and Length

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>JUNIPER</td>
<td>Multiple of 16</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_Decrypt</td>
<td>JUNIPER</td>
<td>Multiple of 16</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
</tbody>
</table>

2.10.6 JUNIPER-COUNTER

JUNIPER-COUNTER, denoted CKM_JUNIPER_COUNTER, is a mechanism for single- and multiple-part encryption and decryption with JUNIPER in counter mode.

It has a parameter, a 24-byte initialization vector. During an encryption operation, this IV is set to some value generated by the token – in other words, the application MAY NOT specify a particular IV when encrypting. It MAY, of course, specify a particular IV when decrypting.

Constraints on key types and the length of data are summarized in the following table. For encryption and decryption, the input and output data (parts) MAY begin at the same location in memory.

Table 48, JUNIPER-COUNTER: Data and Length

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Encrypt</td>
<td>JUNIPER</td>
<td>Multiple of 16</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
<tr>
<td>C_Decrypt</td>
<td>JUNIPER</td>
<td>Multiple of 16</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
</tbody>
</table>

2.10.7 JUNIPER-SHUFFLE

JUNIPER-SHUFFLE, denoted CKM_JUNIPER_SHUFFLE, is a mechanism for single- and multiple-part encryption and decryption with JUNIPER in shuffle mode.
It has a parameter, a 24-byte initialization vector. During an encryption operation, this IV is set to some value generated by the token – in other words, the application MAY NOT specify a particular IV when encrypting. It MAY, of course, specify a particular IV when decrypting.

Constraints on key types and the length of data are summarized in the following table. For encryption and decryption, the input and output data (parts) MAY begin at the same location in memory.

Table 49. JUNIPER-SHUFFLE: Data and Length

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Input length</th>
<th>Output length</th>
<th>Comments</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>C_Decrypt</td>
<td>JUNIPER</td>
<td>Multiple of 16</td>
<td>Same as input length</td>
<td>No final part</td>
</tr>
</tbody>
</table>

2.10.8 JUNIPER WRAP

The JUNIPER wrap and unwrap mechanism, denoted CKM_JUNIPER_WRAP, is a function used to wrap and unwrap an MEK. It MAY wrap or unwrap SKIPJACK, BATON and JUNIPER keys.

It has no parameters.

When used to unwrap a key, this mechanism contributes the CKA_CLASS, CKA_KEY_TYPE, and CKA_VALUE attributes to it.

2.11 MD2

2.11.1 Definitions

Mechanisms:

CKM_MD2
CKM_MD2_HMAC
CKM_MD2_HMAC_GENERAL
CKM_MD2_KEY_DERIVATION

2.11.2 MD2 digest

The MD2 mechanism, denoted CKM_MD2, is a mechanism for message digesting, following the MD2 message-digest algorithm defined in RFC 6149.

It does not have a parameter.

Constraints on the length of data are summarized in the following table:

Table 50. MD2: Data Length

<table>
<thead>
<tr>
<th>Function</th>
<th>Data length</th>
<th>Digest Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Digest</td>
<td>Any</td>
<td>16</td>
</tr>
</tbody>
</table>

2.11.3 General-length MD2-HMAC

The general-length MD2-HMAC mechanism, denoted CKM_MD2_HMAC_GENERAL, is a mechanism for signatures and verification. It uses the HMAC construction, based on the MD2 hash function. The keys it uses are generic secret keys.

It has a parameter, a CK_MAC_GENERAL_PARAMS, which holds the length in bytes of the desired output. This length should be in the range 0-16 (the output size of MD2 is 16 bytes). Signatures (MACs) produced by this mechanism MUST be taken from the start of the full 16-byte HMAC output.
### Table 51, General-length MD2-HMAC: Key and Data Length

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Data length</th>
<th>Signature length</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Sign</td>
<td>Generic secret</td>
<td>Any</td>
<td>0-16, depending on parameters</td>
</tr>
<tr>
<td>C_Verify</td>
<td>Generic secret</td>
<td>Any</td>
<td>0-16, depending on parameters</td>
</tr>
</tbody>
</table>

#### 2.11.4 MD2-HMAC

The MD2-HMAC mechanism, denoted **CKM_MD2_HMAC**, is a special case of the general-length MD2-HMAC mechanism in Section 2.11.3.

It has no parameter, and produces an output of length 16.

#### 2.11.5 MD2 key derivation

MD2 key derivation, denoted **CKM_MD2_KEY_DERIVATION**, is a mechanism which provides the capability of deriving a secret key by digesting the value of another secret key with MD2.

The value of the base key is digested once, and the result is used to make the value of the derived secret key.

- If no length or key type is provided in the template, then the key produced by this mechanism MUST be a generic secret key. Its length MUST be 16 bytes (the output size of MD2).
- If no key type is provided in the template, but a length is, then the key produced by this mechanism MUST be a generic secret key of the specified length.
- If no length was provided in the template, but a key type is, then that key type must have a well-defined length. If it does, then the key produced by this mechanism MUST be of the type specified in the template. If it doesn’t, an error MUST be returned.
- If both a key type and a length are provided in the template, the length must be compatible with that key type. The key produced by this mechanism MUST be of the specified type and length.

If a DES, DES2, or CDMF key is derived with this mechanism, the parity bits of the key MUST be set properly.

If the requested type of key requires more than 16 bytes, such as DES2, an error is generated.

This mechanism has the following rules about key sensitivity and extractability:

- The **CKA_SENSITIVE** and **CKA_EXTRACTABLE** attributes in the template for the new key MAY both be specified to be either CK_TRUE or CK_FALSE. If omitted, these attributes each take on some default value.
- If the base key has its **CKA_ALWAYS_SENSITIVE** attribute set to CK_FALSE, then the derived key MUST as well. If the base key has its **CKA_ALWAYS_SENSITIVE** attribute set to CK_TRUE, then the derived key has its **CKA_ALWAYS_SENSITIVE** attribute set to the same value as its **CKA_SENSITIVE** attribute.
- Similarly, if the base key has its **CKA_NEVER_EXTRACTABLE** attribute set to CK_FALSE, then the derived key MUST, too. If the base key has its **CKA_NEVER_EXTRACTABLE** attribute set to CK_TRUE, then the derived key has its **CKA_NEVER_EXTRACTABLE** attribute set to the opposite value from its **CKA_EXTRACTABLE** attribute.

#### 2.12 MD5

##### 2.12.1 Definitions

Mechanisms:

- CKM_MD5
- CKM_MD5_HMAC
2.12.2 MD5 Digest
The MD5 mechanism, denoted CKM_MD5, is a mechanism for message digesting, following the MD5 message-digest algorithm defined in RFC 1321. It does not have a parameter. Constraints on the length of input and output data are summarized in the following table. For single-part digesting, the data and the digest MAY begin at the same location in memory.

<table>
<thead>
<tr>
<th>Function</th>
<th>Data length</th>
<th>Digest length</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Digest</td>
<td>Any</td>
<td>16</td>
</tr>
</tbody>
</table>

2.12.3 General-length MD5-HMAC
The general-length MD5-HMAC mechanism, denoted CKM_MD5_HMAC_GENERAL, is a mechanism for signatures and verification. It uses the HMAC construction, based on the MD5 hash function. The keys it uses are generic secret keys. It has a parameter, a CK_MAC_GENERAL_PARAMS, which holds the length in bytes of the desired output. This length should be in the range 0-16 (the output size of MD5 is 16 bytes). Signatures (MACs) produced by this mechanism MUST be taken from the start of the full 16-byte HMAC output.

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Data length</th>
<th>Signature length</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Sign</td>
<td>Generic secret</td>
<td>Any</td>
<td>0-16, depending on parameters</td>
</tr>
<tr>
<td>C_Verify</td>
<td>Generic secret</td>
<td>Any</td>
<td>0-16, depending on parameters</td>
</tr>
</tbody>
</table>

2.12.4 MD5-HMAC
The MD5-HMAC mechanism, denoted CKM_MD5_HMAC, is a special case of the general-length MD5-HMAC mechanism in Section 2.12.3. It has no parameter, and produces an output of length 16.

2.12.5 MD5 key derivation
MD5 key derivation denoted CKM_MD5_KEY_DERIVATION, is a mechanism which provides the capability of deriving a secret key by digesting the value of another secret key with MD5. The value of the base key is digested once, and the result is used to make the value of derived secret key.

- If no length or key type is provided in the template, then the key produced by this mechanism MUST be a generic secret key. Its length MUST be 16 bytes (the output size of MD5).
- If no key type is provided in the template, but a length is, then the key produced by this mechanism MUST be a generic secret key of the specified length.
- If no length was provided in the template, but a key type is, then that key type must have a well-defined length. If it does, then the key produced by this mechanism MUST be of the type specified in the template. If it doesn’t, an error MUST be returned.
- If both a key type and a length are provided in the template, the length must be compatible with that key type. The key produced by this mechanism MUST be of the specified type and length.
If a DES, DES2, or CDMF key is derived with this mechanism, the parity bits of the key MUST be set properly.

If the requested type of key requires more than 16 bytes, such as DES3, an error is generated.

This mechanism has the following rules about key sensitivity and extractability.

- The CKA_SENSITIVE and CKA_EXTRACTABLE attributes in the template for the new key MAY both be specified to either CK_TRUE or CK_FALSE. If omitted, these attributes each take on some default value.

- If the base key has its CKA_ALWAYS_SENSITIVE attribute set to CK_FALSE, then the derived key MUST as well. If the base key has its CKA_ALWAYS_SENSITIVE attribute set to CK_TRUE, then the derived key has its CKA_ALWAYS_SENSITIVE attribute set to the same value as its CKA_SENSITIVE attribute.

- Similarly, if the base key has its CKA_NEVER_EXTRACTABLE attribute set to CK_FALSE, then the derived key MUST, too. If the base key has its CKA_NEVER_EXTRACTABLE attribute set to CK_TRUE, then the derived key has its CKA_NEVER_EXTRACTABLE attribute set to the opposite value from its CKA_EXTRACTABLE attribute.

### 2.13 FASTHASH

#### 2.13.1 Definitions

Mechanisms:

- CKM_FASTHASH

#### 2.13.2 FASTHASH digest

The FASTHASH mechanism, denoted CKM_FASTHASH, is a mechanism for message digesting, following the U.S. government’s algorithm.

It does not have a parameter.

Constraints on the length of input and output data are summarized in the following table:

<table>
<thead>
<tr>

### 2.14 PKCS #5 and PKCS #5-style password-based encryption (PBD)

#### 2.14.1 Definitions

The mechanisms in this section are for generating keys and IVs for performing password-based encryption. The method used to generate keys and IVs is specified in PKCS #5.

Mechanisms:

- CKM_PBE_MD2_DES_CBC
- CKM_PBE_MD5_DES_CBC
- CKM_PBE_MD5_CAST_CBC
- CKM_PBE_MD5_CAST3_CBC
- CKM_PBE_MD5_CAST5_CBC
- CKM_PBE_MD5_CAST128_CBC
- CKM_PBE_SHA1_CAST5_CBC
- CKM_PBE_SHA1.Cast128_CBC
2.14.2 Password-based encryption/authentication mechanism parameters

2.14.2.1 CK_PBE_PARAMS; CK_PBE_PARAMS_PTR

CK_PBE_PARAMS is a structure which provides all of the necessary information required by the CKM_PBE mechanisms (see PKCS #5 and PKCS #12 for information on the PBE generation mechanisms) and the CKM_PBA_SHA1_WITH_SHA1_HMAC mechanism. It is defined as follows:

```c
typedef struct CK_PBE_PARAMS {
    CK_BYTE_PTR pInitVector;
    CK_UTF8CHAR_PTR pPassword;
    CK_ULONG ulPasswordLen;
    CK_BYTE_PTR pSalt;
    CK_ULONG ulSaltLen;
    CK_ULONG ulIteration;
} CK_PBE_PARAMS;
```

The fields of the structure have the following meanings:

- `pInitVector` pointer to the location that receives the 8-byte initialization vector (IV), if an IV is required
- `pPassword` points to the password to be used in the PBE key generation
- `ulPasswordLen` length in bytes of the password information
- `pSalt` points to the salt to be used in the PBE key generation
- `ulSaltLen` length in bytes of the salt information
- `ulIteration` number of iterations required for the generation

CK_PBE_PARAMS_PTR is a pointer to a CK_PBE_PARAMS.

2.14.3 MD2-PBE for DES-CBC

MD2-PBE for DES-CBC, denoted CKM_PBE_MD2_DES_CBC, is a mechanism used for generating a DES secret key and an IV from a password and a salt value by using the MD2 digest algorithm and an iteration count. This functionality is defined in PKCS #5 as PBKDF1.

It has a parameter, a CK_PBE_PARAMS structure. The parameter specifies the input information for the key generation process and the location of the application-supplied buffer which receives the 8-byte IV generated by the mechanism.

2.14.4 MD5-PBE for DES-CBC

MD5-PBE for DES-CBC, denoted CKM_PBE_MD5_DES_CBC, is a mechanism used for generating a DES secret key and an IV from a password and a salt value by using the MD5 digest algorithm and an iteration count. This functionality is defined in PKCS #5 as PBKDF1.
It has a parameter, a `CK_PBE_PARAMS` structure. The parameter specifies the input information for the key generation process and the location of the application-supplied buffer which receives the 8-byte IV generated by the mechanism.

### 2.14.5 MD5-PBE for CAST-CBC

MD5-PBE for CAST-CBC, denoted `CKM_PBE_MD5_CAST_CBC`, is a mechanism used for generating a CAST secret key and an IV from a password and a salt value by using the MD5 digest algorithm and an iteration count. This functionality is analogous to that defined in PKCS #5 PBKDF1 for MD5 and DES.

It has a parameter, a `CK_PBE_PARAMS` structure. The parameter specifies the input information for the key generation process and the location of the application-supplied buffer which receives the 8-byte IV generated by the mechanism.

The length of the CAST key generated by this mechanism MAY be specified in the supplied template; if it is not present in the template, it defaults to 8 bytes.

### 2.14.6 MD5-PBE for CAST3-CBC

MD5-PBE for CAST3-CBC, denoted `CKM_PBE_MD5_CAST3_CBC`, is a mechanism used for generating a CAST3 secret key and an IV from a password and a salt value by using the MD5 digest algorithm and an iteration count. This functionality is analogous to that defined in PKCS #5 PBKDF1 for MD5 and DES.

It has a parameter, a `CK_PBE_PARAMS` structure. The parameter specifies the input information for the key generation process and the location of the application-supplied buffer which receives the 8-byte IV generated by the mechanism.

The length of the CAST3 key generated by this mechanism MAY be specified in the supplied template; if it is not present in the template, it defaults to 8 bytes.

### 2.14.7 MD5-PBE for CAST128-CBC (CAST5-CBC)

MD5-PBE for CAST128-CBC (CAST5-CBC), denoted `CKM_PBE_MD5_CAST128_CBC` or `CKM_PBE_MD5_CAST5_CBC`, is a mechanism used for generating a CAST128 (CAST5) secret key and an IV from a password and a salt value by using the MD5 digest algorithm and an iteration count. This functionality is analogous to that defined in PKCS #5 PBKDF1 for MD5 and DES.

It has a parameter, a `CK_PBE_PARAMS` structure. The parameter specifies the input information for the key generation process and the location of the application-supplied buffer which receives the 8-byte IV generated by the mechanism.

The length of the CAST128 (CAST5) key generated by this mechanism MAY be specified in the supplied template; if it is not present in the template, it defaults to 8 bytes.

### 2.14.8 SHA-1-PBE for CAST128-CBC (CAST5-CBC)

SHA-1-PBE for CAST128-CBC (CAST5-CBC), denoted `CKM_PBE_SHA1_CAST128_CBC` or `CKM_PBE_SHA1_CAST5_CBC`, is a mechanism used for generating a CAST128 (CAST5) secret key and an IV from a password and salt value using the SHA-1 digest algorithm and an iteration count. This functionality is analogous to that defined in PKCS #5 PBKDF1 for MD5 and DES.

It has a parameter, a `CK_PBE_PARAMS` structure. The parameter specifies the input information for the key generation process and the location of the application-supplied buffer which receives the 8-byte IV generated by the mechanism.

The length of the CAST128 (CAST5) key generated by this mechanism MAY be specified in the supplied template; if it is not present in the template, it defaults to 8 bytes.
2.15 PKCS #12 password-based encryption/authentication mechanisms

2.15.1 Definitions

The mechanisms in this section are for generating keys and IVs for performing password-based encryption or authentication. The method used to generate keys and IVs is based on a method that was specified in PKCS #12.

We specify here a general method for producing various types of pseudo-random bits from a password, p; a string of salt bits, s; and an iteration count, c. The “type” of pseudo-random bits to be produced is identified by an identification byte, ID, described at the end of this section.

Let H be a hash function built around a compression function \( \mathbb{Z}^* \times \mathbb{Z}^* \rightarrow \mathbb{Z}^* \) (that is, \( H \) has a chaining variable and output of length \( u \) bits, and the message input to the compression function of \( H \) is \( v \) bits). For MD2 and MD5, \( u=128 \) and \( v=512 \); for SHA-1, \( u=160 \) and \( v=512 \).

We assume here that \( u \) and \( v \) are both multiples of 8, as are the lengths in bits of the password and salt strings and the number \( n \) of pseudo-random bits required. In addition, \( u \) and \( v \) are of course nonzero.

1. Construct a string, \( D \) (the “diversifier”), by concatenating \( v/8 \) copies of \( ID \).

2. Concatenate copies of the salt together to create a string \( S \) of length \( v \lceil s/v \rceil \) bits (the final copy of the salt MAY be truncated to create \( S \)). Note that if the salt is the empty string, then so is \( S \).

3. Concatenate copies of the password together to create a string \( P \) of length \( v \lceil P/v \rceil \) bits (the final copy of the password MAY be truncated to create \( P \)). Note that if the password is the empty string, then so is \( P \).

4. Set \( i=S||P \) to be the concatenation of \( S \) and \( P \).

5. Set \( j=\lceil n/u \rceil \).

6. For \( i=1, 2, \ldots, j \), do the following:
   a. Set \( A_i=H(D||I) \), the \( c_n \) hash of \( D||I \). That is, compute the hash of \( D||I \); compute the hash of that hash; etc.; continue in this fashion until a total of \( c \) hashes have been computed, each on the result of the previous hash.
   b. Concatenate copies of \( A_i \) to create a string \( B \) of length \( v \) bits (the final copy of \( A_i \) MAY be truncated to create \( B \)).
   c. Treating \( I \) as a concatenation \( l_0, I, \ldots, l_k-1 \) of \( v \)-bit blocks, where \( k=\lceil s/v \rceil + \lceil P/v \rceil \), modify \( I \) by setting \( l_{j}=\left( l_{j}+B_{j+1} \right) \mod 2^{v} \) for each \( j \). To perform this addition, treat each \( v \)-bit block as a binary number represented most-significant bit first

7. Concatenate \( A_1, A_2, \ldots, A_j \) together to form a pseudo-random bit string, \( A \).

8. Use the first \( n \) bits of \( A \) as the output of this entire process.

When the password-based encryption mechanisms presented in this section are used to generate a key and IV (if needed) from a password, salt, and an iteration count, the above algorithm is used. To generate a key, the identifier byte \( ID \) is set to the value 1; to generate an IV, the identifier byte \( ID \) is set to the value 2.

When the password-based authentication mechanism presented in this section is used to generate a key from a password, salt and an iteration count, the above algorithm is used. The identifier \( ID \) is set to the value 3.

2.15.2 SHA-1-PBE for 128-bit RC4

SHA-1-PBE for 128-bit RC4, denoted **CKM_PBE_SHA1_RC4_128**, is a mechanism used for generating a 128-bit RC4 secret key from a password and a salt value by using the SHA-1 digest algorithm and an iteration count. The method used to generate the key is described above.

It has a parameter, a **CK_PBE_PARAMS** structure. The parameter specifies the input information for the key generation process. The parameter also has a field to hold the location of an application-supplied...
buffer which receives an IV; for this mechanism, the contents of this field are ignored, since RC4 does not require an IV.

The key produced by this mechanism will typically be used for performing password-based encryption.

### 2.15.3 SHA-1_PBE for 40-bit RC4

SHA-1-PBE for 40-bit RC4, denoted **CKM_PBE_SHA1_RC4_40**, is a mechanism used for generating a 40-bit RC4 secret key from a password and a salt value by using the SHA-1 digest algorithm and an iteration count. The method used to generate the key is described above.

It has a parameter, a **CK_PBE_PARAMS** structure. The parameter specifies the input information for the key generation process. The parameter also has a field to hold the location of an application-supplied buffer which receives an IV; for this mechanism, the contents of this field are ignored, since RC4 does not require an IV.

The key produced by this mechanism will typically be used for performing password-based encryption.

### 2.15.4 SHA-1_PBE for 128-bit RC2-CBC

SHA-1-PBE for 128-bit RC2-CBC, denoted **CKM_PBE_SHA1_RC2_128_CBC**, is a mechanism used for generating a 128-bit RC2 secret key from a password and a salt value by using the SHA-1 digest algorithm and an iteration count. The method used to generate the key and IV is described above.

It has a parameter, a **CK_PBE_PARAMS** structure. The parameter specifies the input information for the key generation process and the location of an application-supplied buffer which receives the 8-byte IV generated by the mechanism.

When the key and IV generated by this mechanism are used to encrypt or decrypt, the effective number of bits in the RC2 search space should be set to 128. This ensures compatibility with the ASN.1 Object Identifier **pbeWithSHA1And128BitRC2-CBC**.

The key and IV produced by this mechanism will typically be used for performing password-based encryption.

### 2.15.5 SHA-1_PBE for 40-bit RC2-CBC

SHA-1-PBE for 40-bit RC2-CBC, denoted **CKM_PBE_SHA1_RC2_40_CBC**, is a mechanism used for generating a 40-bit RC2 secret key from a password and a salt value by using the SHA-1 digest algorithm and an iteration count. The method used to generate the key and IV is described above.

It has a parameter, a **CK_PBE_PARAMS** structure. The parameter specifies the input information for the key generation process and the location of an application-supplied buffer which receives the 8-byte IV generated by the mechanism.

When the key and IV generated by this mechanism are used to encrypt or decrypt, the effective number of bits in the RC2 search space should be set to 40. This ensures compatibility with the ASN.1 Object Identifier **pbeWithSHA1And40BitRC2-CBC**.

The key and IV produced by this mechanism will typically be used for performing password-based encryption.

### 2.16 RIPE-MD

#### 2.16.1 Definitions

Mechanisms:

- **CKM_RIPEMD128**
- **CKM_RIPEMD128_HMAC**
- **CKM_RIPEMD128_HMAC_GENERAL**
- **CKM_RIPEMD160**
2.16.2 RIPE-MD 128 Digest
The RIPE-MD 128 mechanism, denoted CKM_RIPEMD128, is a mechanism for message digesting, following the RIPE-MD 128 message-digest algorithm. It does not have a parameter.
Constraints on the length of data are summarized in the following table:

<table>
<thead>
<tr>
<th>Function</th>
<th>Data length</th>
<th>Digest length</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Digest</td>
<td>Any</td>
<td>16</td>
</tr>
</tbody>
</table>

2.16.3 General-length RIPE-MD 128-HMAC
The general-length RIPE-MD 128-HMAC mechanism, denoted CKM_RIPEMD128_HMAC_GENERAL, is a mechanism for signatures and verification. It uses the HMAC construction, based on the RIPE-MD 128 hash function. The keys it uses are generic secret keys. It has a parameter, a CK_MAC_GENERAL_PARAMS, which holds the length in bytes of the desired output. This length should be in the range 0-16 (the output size of RIPE-MD 128 is 16 bytes). Signatures (MACs) produced by this mechanism MUST be taken from the start of the full 16-byte HMAC output.

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Data length</th>
<th>Signature length</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Sign</td>
<td>Generic secret</td>
<td>Any</td>
<td>0-16, depending on parameters</td>
</tr>
<tr>
<td>C_Verify</td>
<td>Generic secret</td>
<td>Any</td>
<td>0-16, depending on parameters</td>
</tr>
</tbody>
</table>

2.16.4 RIPE-MD 128-HMAC
The RIPE-MD 128-HMAC mechanism, denoted CKM_RIPEMD128_HMAC, is a special case of the general-length RIPE-MD 128-HMAC mechanism in Section 2.16.3. It has no parameter, and produces an output of length 16.

2.16.5 RIPE-MD 160
The RIPE-MD 160 mechanism, denoted CKM_RIPEMD160, is a mechanism for message digesting, following the RIPE-MD 160 message-digest defined in ISO-10118. It does not have a parameter.
Constraints on the length of data are summarized in the following table:

<table>
<thead>
<tr>
<th>Function</th>
<th>Data length</th>
<th>Digest length</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Digest</td>
<td>Any</td>
<td>20</td>
</tr>
</tbody>
</table>
2.16.6 General-length RIPE-MD 160-HMAC

The general-length RIPE-MD 160-HMAC mechanism, denoted `CKM_RIPEMD160_HMAC_GENERAL`, is a mechanism for signatures and verification. It uses the HMAC construction, based on the RIPE-MD 160 hash function. The keys it uses are generic secret keys.

It has a parameter, a `CK_MAC_GENERAL_PARAMS`, which holds the length in bytes of the desired output. This length should be in the range 0-20 (the output size of RIPE-MD 160 is 20 bytes). Signatures (MACs) produced by this mechanism MUST be taken from the start of the full 20-byte HMAC output.

Table 58, General-length RIPE-MD 160-HMAC: Data and Length

<table>
<thead>
<tr>
<th>Function</th>
<th>Key type</th>
<th>Data length</th>
<th>Signature length</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_Sign</td>
<td>Generic secret</td>
<td>Any</td>
<td>0-20, depending on parameters</td>
</tr>
<tr>
<td>C_Verify</td>
<td>Generic secret</td>
<td>Any</td>
<td>0-20, depending on parameters</td>
</tr>
</tbody>
</table>

2.16.7 RIPE-MD 160-HMAC

The RIPE-MD 160-HMAC mechanism, denoted `CKM_RIPEMD160_HMAC`, is a special case of the general-length RIPE-MD 160HMAC mechanism in Section 2.16.6.

It has no parameter, and produces an output of length 20.

2.17 SET

2.17.1 Definitions

Mechanisms:

`CKM_KEY_WRAP_SET_OAEP`

2.17.2 SET mechanism parameters

2.17.2.1 CK_KEY_WRAP_SET_OAEP_PARAMS;

`CK_KEY_WRAP_SET_OAEP_PARAMS_PTR`

`CK_KEY_WRAP_SET_OAEP_PARAMS` is a structure that provides the parameters to the `CKM_KEY_WRAP_SET_OAEP` mechanism. It is defined as follows:

```
typedef struct CK_KEY_WRAP_SET_OAEP_PARAMS {
    CK_BYTE bBC;
    CK_BYTE_PTR pX;
    CK_ULONG ulXLen;
} CK_KEY_WRAP_SET_OAEP_PARAMS;
```

The fields of the structure have the following meanings:

- `bBC` block contents byte
- `pX` concatenation of hash of plaintext data (if present) and extra data (if present)
- `ulXLen` length in bytes of concatenation of hash of plaintext data (if present) and extra data (if present). 0 if neither is present.

`CK_KEY_WRAP_SET_OAEP_PARAMS_PTR` is a pointer to a `CK_KEY_WRAP_SET_OAEP_PARAMS`.

2.17.3 OAEP key wrapping for SET

The OAEP key wrapping for SET mechanism, denoted `CKM_KEY_WRAP_SET_OAEP`, is a mechanism for wrapping and unwrapping a DES key with an RSA key. The hash of some plaintext data and/or some extra data MAY be wrapped together with the DES key. This mechanism is defined in the SET protocol specifications.

It takes a parameter, a `CK_KEY_WRAP_SET_OAEP_PARAMS` structure. This structure holds the "Block Contents" byte of the data and the concatenation of the hash of plaintext data (if present) and the extra data to be wrapped (if present). If neither the hash nor the extra data is present, this is indicated by the `ulXLen` field having the value 0.

When this mechanism is used to unwrap a key, the concatenation of the hash of plaintext data (if present) and the extra data (if present) is returned following the convention described [PKCS #11-Curr].

Miscellaneous simple key derivation mechanisms. Note that if the inputs to `C_UnwrapKey` are such that the extra data is not returned (e.g. the buffer supplied in the `CK_KEY_WRAP_SET_OAEP_PARAMS` structure is `NULL_PTR`), then the unwrapped key object MUST NOT be created, either.

Be aware that when this mechanism is used to unwrap a key, the `bBC` and `pX` fields of the parameter supplied to the mechanism MAY be modified.

If an application uses `C_UnwrapKey` with `CKM_KEY_WRAP_SET_OAEP`, it may be preferable for it simply to allocate a 128-byte buffer for the concatenation of the hash of plaintext data and the extra data (this concatenation MUST NOT be larger than 128 bytes), rather than calling `C_UnwrapKey` twice. Each call of `C_UnwrapKey` with `CKM_KEY_WRAP_SET_OAEP` requires an RSA decryption operation to be performed, and this computational overhead MAY be avoided by this means.

2.18 LYNKS

2.18.1 Definitions

Mechanisms:

`CKM_KEY_WRAP_LYNKS`

2.18.2 LYNKS key wrapping

The LYNKS key wrapping mechanism, denoted `CKM_KEY_WRAP_LYNKS`, is a mechanism for wrapping and unwrapping secret keys with DES keys. It MAY wrap any 8-byte secret key, and it produces a 10-byte wrapped key, containing a cryptographic checksum.

It does not have a parameter.

To wrap an 8-byte secret key `K` with a DES key `W`, this mechanism performs the following steps:

1. Initialize two 16-bit integers, `sum1` and `sum2`, to 0
2. Loop through the bytes of `K` from first to last.
3. Set `sum1` = `sum1` + the key byte (treat the key byte as a number in the range 0-255).
4. Set `sum2` = `sum2` + `sum1`.
5. Encrypt `K` with `W` in ECB mode, obtaining an encrypted key, `E`.
6. Concatenate the last 6 bytes of `E` with `sum2`, representing `sum2` most-significant bit first. The result is an 8-byte block, `T`.
7. Encrypt `T` with `W` in ECB mode, obtaining an encrypted checksum, `C`.
8. Concatenate `E` with the last 2 bytes of `C` to obtain the wrapped key.

When unwrapping a key with this mechanism, if the cryptographic checksum does not check out properly, an error is returned. In addition, if a DES key or CDMF key is unwrapped with this mechanism, the parity bits on the wrapped key must be set appropriately. If they are not set properly, an error is returned.
3 PKCS #11 Implementation Conformance

An implementation is a conforming implementation if it meets the conditions specified in one or more server profiles specified in [PKCS #11-Prof].

A PKCS #11 implementation SHALL be a conforming PKCS #11 implementation.

If a PKCS #11 implementation claims support for a particular profile, then the implementation SHALL conform to all normative statements within the clauses specified for that profile and for any subclauses to each of those clauses.
