Abstract:

Vendors offer tools to facilitate various activities across the life cycle of a SOA artifact, such as design, assembly, quality assurance, deployment and runtime operation of SOA based applications and business processes. The lack of a standardized information model and interaction protocol for artifacts and their metadata residing in a SOA repository means that tools must be customized for use with each different vendor's SOA repository product. This reduces choice, flexibility and adds costs for customers when choosing tools. This specification defines a SOA artifact data model together with bindings that describe the syntax for interacting with a SOA repository.

Status:

This document was last revised or approved by the OASIS SOA Repository Artifact Model and Protocol (S-RAMP) TC on the above date. The level of approval is also listed above. Check the "Latest version" location noted above for possible later revisions of this document.

Technical Committee members should send comments on this specification to the Technical Committee's email list. Others should send comments to the Technical Committee by using the "Send A Comment" button on the Technical Committee's web page at <http://www.oasis-open.org/committees/s-ramp/>.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (<http://www.oasis-open.org/committees/s-ramp/ipr.php>).

1 **Introduction**

2 The “SOA - Repository Artifact Model and Protocol” (S-RAMP) specification defines a common data
3 model for SOA repositories to facilitate the use of common tooling and sharing of data. It provides a rich
4 representation data model that supports query. It includes binding(s) that document the syntax for
5 interaction with a compliant repository for create, read, update, delete and query operations within the
6 context of each binding. Initially, only one binding will be defined, but others can be added.

7 The specification is organized into multiple documents. This document, the SOA - Repository Artifact
8 Model and Protocol Foundation (hereafter referred to as Foundation) describes the overall goals of S-
9 RAMP and defines the Artifact Type Model and associated schemas for S-RAMP. It also describes the
10 generic query grammar used in S-RAMP. The Foundation document is not specific to any binding. Other
11 documents in this specification provide material specific to a given binding for S-RAMP, including the
12 syntax for interacting with an S-RAMP compliant repository. Those available at the time of this
13 publication are:

- S-RAMP Atom Binding

14 When there is a discrepancy between a binding specific document and this Foundation document, the
15 binding specific document always takes precedence. If there is a discrepancy between schema
16 representations provided in this document and the S-RAMP schemas of record at https://www.oasis-open.org/committees/tc_home.php?wg_abbrev=s-ramp, the schemas of record SHALL take precedence.
17

19 **1.1 Terminology**

20 The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD
21 NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described
22 in [RFC2119].

23 The characters "[" and "]" are used to indicate that contained items are to be treated as a group with
24 respect to cardinality or choice.
25

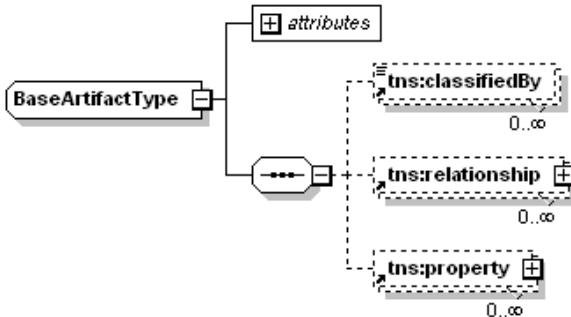

26 **1.2 Diagrams used in this document**

27 **1.2.1 Attributes and elements**

28 S-RAMP uses the XML Schema Language (See <http://www.w3.org/TR/xmlschema-0/>,
29 <http://www.w3.org/TR/xmlschema-1/> and <http://www.w3.org/TR/xmlschema-2/>) and its terminology, such
30 as "sequence" and "choice" to formally describe its data structures. The diagrams¹ used in this
31 specification show the structure and cardinality of the elements used in these structures. Attributes are
32 not shown in the diagrams, but explained in the corresponding documentation.

1 Diagrams provided in this specification were produced by the ©XML Spy editor, Altova GmbH and Altova, Inc.

33 **1.2.2 Element structure**

34
35 The octagonal symbol with the horizontal "dotted" line indicates "sequence of." This diagram says the
36 type `BaseArtifactType` consists of elements `classifiedBy`, `relationship` and `properties`. All three elements
37 are defined in the namespace whose prefix is "s-ramp".
38 The fact that `relationship` and `properties` have a box with a "+" in it at their right-hand end indicates that
39 there is more structure to them than is shown in the diagram.

40 **1.2.3 Cardinality**

41 **1.2.3.1 Optional, one**

42
43 The dashed line indicates that the element `directsOrchestration` is optional. The fact that it is not adorned
44 with some other cardinality indicator (see below) says there can be at most one of them.

45 **1.2.3.2 Mandatory, one**

46
47 There must be exactly one of the element `relatedDocument`.

48 **1.2.3.3 Optional, repeating**

49
50 The element `classifiedBy` is optional and may appear an indeterminate number of times. The number of
51 times it may appear is given by the adornment "`0..∞`", a cardinality indicator meaning "zero to infinity".
52 Other numbers may appear to indicate different cardinalities.

53 **1.2.3.4 Mandatory, repeating**

54
55 The element `policies` must appear at least once and may appear an indeterminate number of times.

56

90 1.5 Problem Statement and Objectives

91 Service Oriented Architecture (SOA) is an architectural approach to designing applications and business
 92 processes by consuming business logic from reusable software components exposed as network
 93 accessible services. In today's environment, vendors offer tools to facilitate various activities across the
 94 life cycle of a SOA artifact, such as design, assembly, quality assurance, deployment and runtime
 95 operation of SOA based applications and business processes. The SOA repository provides the
 96 foundation for all these activities. This specification describes how to represent SOA information models
 97 using artifacts and associated metadata, the Artifact Type Model that defines the artifacts, and the
 98 bindings to interact with the SOA repository, including create, read, update, delete, query, and
 99 subscription for notifications. This approach to providing flexible access to SOA artifacts will facilitate
 100 interoperability and provide customers with more choices of tools that can be used to interoperate with
 101 any S-RAMP compliant SOA repository implementation.

102 1.6 Use Case Scenarios

103 Table 1, Table 2 and Table 3 below provide some examples across different portions of the service
 104 lifecycle for which there are various use cases in which an S-RAMP compliant repository could be used.
 105 This does not necessarily imply that all vendors would support every scenario, or use an S-RAMP
 106 repository in each of these scenarios across all portions of the service lifecycle.

108 *Table 1: Design Time Tool Repository Interaction Use Cases*

115

116

1.7 Design Principles

117 There are several high-level design principles to which S-RAMP has adhered:

- 118 • Use of existing standards where possible (e.g., XML, XML Schema, OWL, XPath2, APP (Atom Publishing Protocol), ASF (Atom Syndication Format), etc.).
- 119 • Vendor neutrality.
- 120 • Does not include governance models, but may be used by them.
- 121 • Driven by use cases.
- 122 • Data model extensibility for new data types, and support for system and user defined metadata.
- 123 • Inclusion of an XML Schema based serialization for its data model.
- 124 • Use of XPath 2 to describe its query grammar.
- 125 • Use of OWL Lite to describe its classification system grammar.
- 126 • Separation of the data model from the bindings that describe the interaction APIs clients use to interact with the repository.

129

1.8 S-RAMP Schemas

130 The schemas for the various S-RAMP Models are provided in the appendices. They closely follow the conceptualized diagrams described in this document. The normative S-RAMP schemas of record define 131 the serialization for S-RAMP.

132 Notable points concerning the schemas in S-RAMP include:

- 133 • Built-in properties are typically represented as attributes.
- 134 • Types based on *BaseArtifactType* use an extension of that type as their base.
- 135 • Where practical, Global Element Declarations are provided.
- 136 • Extensibility in the Core Model is limited to the ##any attribute on most structures.

137 Schemas are provided for serialization purposes and the diagrams define the S-RAMP meta-model.

139

1.9 XML Namespaces

140 The XML namespace URI that MUST be used by implementations of this specification is:

141 <http://docs.oasis-open.org/s-ramp/ns/s-ramp-v1.0>

142 Table 4 lists the XML namespaces that are used in this specification. The choice of any namespace prefix 143 is arbitrary and not semantically significant.

144

145 *Table 4: Prefixes and XML Namespaces Used in this Specification*

Prefix	XML Namespace	Specification(s)
xp2	http://www.w3.org/2005/xpath-functions	XPath 2.0

xsd	http://www.w3.org/2001/XMLSchema	XML Schema [Part 1, 2]

146

147

148 2 Artifact Type Model

149 The S-RAMP Artifact Type Model is a strongly typed data model for SOA repositories that enables
150 interoperability among vendor repository implementations and tooling, within the context of a specific
151 binding. It will also later serve as a foundation for developing data exchange and federation models. The
152 Artifact Type Model is presented here using conceptualized models. Each of these models also has a
153 XML Schema representation available in the Appendices.

154 2.1 Artifact Type Models

155 An artifact in S-RAMP is a container for all of the metadata that describes it. There are 4 major types of
156 artifacts in S-RAMP. Each of these Artifact Types is discussed in more detail in later sections:

- 157 1. **Document Artifact:** Those S-RAMP defined artifacts that correspond to a physical document
158 stored in the repository. Several important document types are pre-defined and have special
159 support in S-RAMP (such as XML Schema or WSDL documents). But any document type can be
160 placed in the repository.
- 161 2. **Logical Model Artifact:** Those S-RAMP defined artifacts that provide a representation of one of
162 the pre-defined logical models (e.g. the SOA model or Service Implementation model).
- 163 3. **Derived Artifact:** Derived Artifacts (e.g., WSDL PortType, or WS-Policy PolicyExpression) are
164 dynamically instantiated by the server as a consequence of publishing a document instance
165 whose type is one of those supported with a Derived Model (see Table 5). These artifacts cannot
166 be created or deleted directly, although clients can edit them to add or remove Generic
167 relationships, properties and classifications. Derived Artifact Models are managed by the server
168 and kept in synchronization with the document object with which they are associated. Derived
169 artifacts provide a metadata model of the content components of a particular document. This
170 allows much more powerful query capabilities at a granularity specific to the internal components
171 of a document, when it is of a format supported with a Derived Model. Refer to Section **Error!**
172 **Reference source not found.** for more information on the query model supported in S-RAMP, as
173 well as to the individual binding document(s) for the query syntax pertaining to each binding.
- 174 4. **Extended Artifact:** These are created by the client in order to support artifact models not pre-
175 defined by the S-RAMP specification. The means by which a client specifies a custom artifact
176 model are beyond the scope of this specification, but some provision is made within the S-RAMP
177 schema to facilitate basic interoperability for such artifacts. Regardless of the internal definition of
178 these artifacts, they SHALL be serialized in S-RAMP as either an instance of
179 *ExtendedArtifactType* (which extends *BaseArtifactType*), or as an instance of *ExtendedDocument*
180 (which extends *DocumentArtifactType*). The latter should be used by clients when the custom
181 artifact contains document content.

182 The pre-defined S-RAMP Artifact Types are organized into a set of logical models as summarized in
183 Table 5 below. Each of these is discussed further in the sections that follow. Note that Derived Artifact
184 Models are currently specified for each of the XSD, WSDL, and WS-Policy document types.

185

186 *Table 5: Pre-Defined Artifact Type Models*

Model	Purpose
Core	Defines the base data types used by the other models, as well as generic types for Documents and XML Documents.
SOA	Defines the artifact data types and relationships which are used to integrate The Open Group's SOA Ontology object model into S-RAMP's data model.
Service Implementation	Defines the artifact data types and relationships used to model the service implementation layer of a SOA environment.

Derived: XSD	Defines logical artifact data types for an XML Schema document.
Derived: WSDL	Defines logical artifact data types for a WSDL document.
Derived: SOAPWSDL	Defines artifact data types for the SOAP binding of a WSDL document.
Derived: Policy	Defines artifact data types for a WS-Policy document.

187 **2.1.1 Artifact Metadata**

188 An artifact can contain three major types of metadata. Each is discussed in detail in the sections that
 189 follow.

- 190 1. **Relationships:** These are directed associations that describe a conceptual link between two
 191 artifact instances. There are several types of relationships, which are defined below in Section
 192 **Error! Reference source not found..**
- 193 2. **Properties:** These describe various named attributes associated with an artifact instance, and
 194 can be built-in or user-defined. Each S-RAMP property MUST have a single name that is unique
 195 to the artifact that it decorates. When present, an S-RAMP property SHALL have a single value.
- 196 3. **Classifications:** These define the classification system for a server, and are imported into a
 197 server as OWL documents. The means by which a client imports the system into the server is
 198 implementation specific and is beyond the scope of this specification. Clients MAY decorate
 199 artifacts with references to specific values in a classification system defined to the server.

200 Note that Artifact Type and Artifact Model values MUST also be unique.

201 **2.1.2 Artifact Relationships**

202 Relationships in S-RAMP are all directed from a source, to a target. Each relationship instance is the
 203 logical triple of the following 3 items of metadata:

- 204 1. **Relationship Type.** This is the name for the type of relationship. A number of these are pre-
 205 defined by S-RAMP in the various Artifact Models (e.g., “includedXsds”, “appliesTo”, ...). There
 206 can be multiple relationship instances of the same Relationship Type.
- 207 2. **Source.** This is a reference to the artifact that is on the source side of the directed relationship.
 208 Relationships are always contained by the Source Artifact that “owns” them.
- 209 3. **Target.** This is a reference to the artifact that is on the target side of the directed relationship.

210 It is possible for a relationship of a given Relationship Type not to have a target, which is termed a
 211 “relationship with no targets”. In this case there is only one relationship instance with that Relationship
 212 Type for a given Source. Such relationships have a target cardinality of “0”. If there is a relationship
 213 instance with a given Relationship Type that does have a target, then there CANNOT also be a
 214 relationship instance with that Relationship Type which has no target.

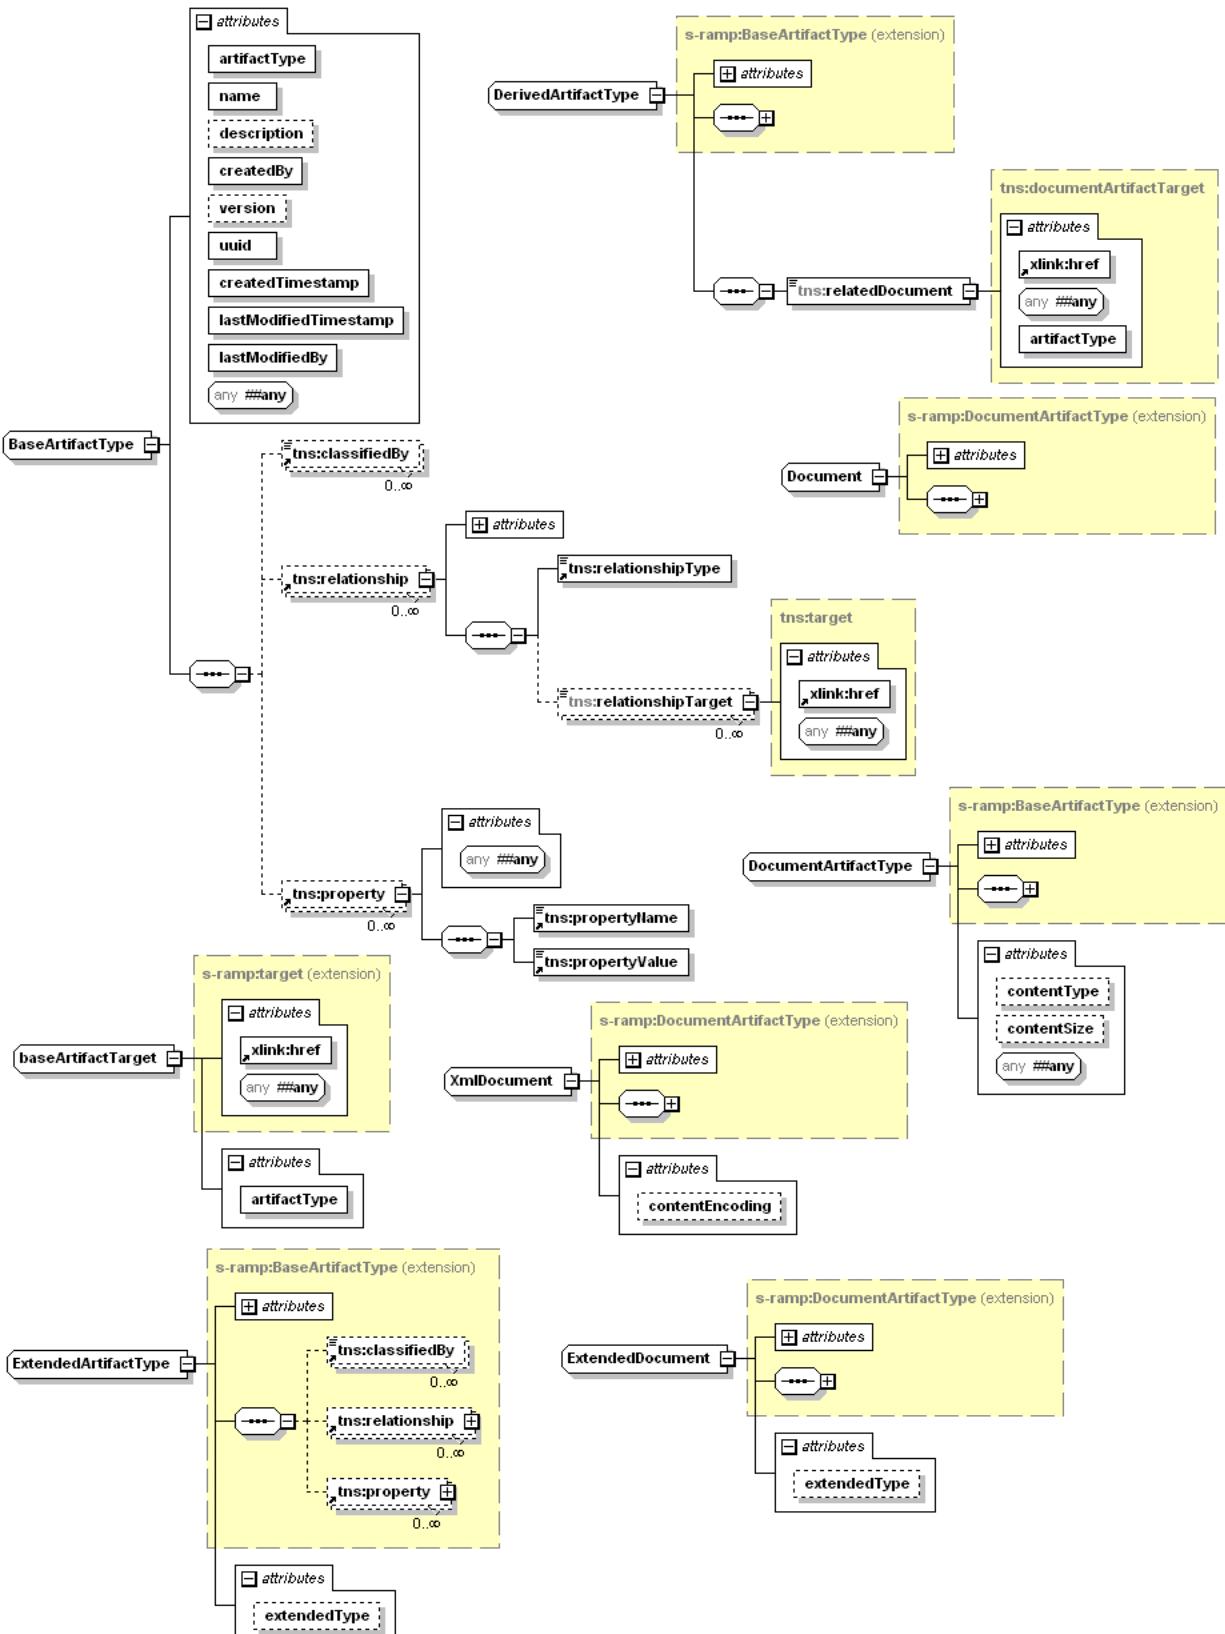

215 There are 4 types of relationships supported in S-RAMP. Refer to the table in Appendix **Error!**
 216 **Reference source not found.** for a complete list of pre-defined relationships, an indication of whether the
 217 relationship is derived, and the model in which it occurs.

- 218 1. **Derived Relationships.** These are pre-defined relationships that cannot be directly created or
 219 deleted by the client. Cardinalities for such relationships are defined in the applicable Derived
 220 Model. All instances of an Artifact Type for which a Derived Relationship is defined, will always
 221 contain that Derived Relationship, even if there are no targets for that relationship. The S-RAMP
 222 serialization of a Derived Relationship uses named elements defined in the schema for the
 223 appropriate Artifact Type definition(s).
- 224 2. **Modeled Relationships.** These refer to the S-RAMP pre-defined relationships that may be
 225 edited by the client. Cardinalities for such relationships are defined in the applicable model (e.g.,
 226 the Service Implementation Model or Core Model). All instances of an Artifact Type for which a
 227 Modeled Relationship is defined, will always contain that Modeled Relationship, even if there are
 228 no targets for that relationship. The S-RAMP serialization of a Modeled Relationship uses named

- elements defined in the schema within the applicable Artifact Type. There are several considerations related to target cardinality of Modeled Relationships:
- **Modeled Relationships with Minimum Cardinality = 0:**
 - Instances of the Source Artifact can be created independently of the Target Artifact.
 - **Modeled Relationships with Minimum Cardinality > 0:**
 - Instances of the Source Artifact cannot be created without the appropriate Target Artifact(s) based upon the required minimum cardinality of the relationship.
 - This can be accomplished by publishing the relevant artifacts at the same time, or by publishing the target artifact(s) first.
 - Actions that result in the deletion of a relationship instance are not permitted if that would result in a violation of the minimum cardinality.
 - **Modeled Relationships with Maximum Cardinality < unbounded:**
 - Relationship instances cannot be created if that would result in a violation of the maximum cardinality limit for the Modeled Relationship.
- Note that in cases where the minimum cardinality equals the maximum cardinality, such a relationship must be created or updated in a single step to avoid intermediate states that would violate these requirements.
3. **Generic Relationships.** These are user-defined ad-hoc directed relationship instances between any two artifacts in S-RAMP. They always have a minimum cardinality of 0 and an unbounded maximum cardinality. The Relationship Type value of a Generic Relationship instance is chosen by the client, but it MUST NOT match any pre-defined Relationship Type values already defined by the S-RAMP Modeled and Derived relationships (see Appendix **Error! Reference source not found.**). The S-RAMP serialization of a Generic Relationship uses the *relationship* structure defined in the Core Model.
 4. **Extended Artifact Modeled Relationships.** Users may define their own extended artifact models, which may include modeled relationships. How and whether such models are supported is beyond the scope of this specification. Such models are called “Extended Models”. Since pre-defined relationships in a model are termed “Modeled”, then in this context they are called “Extended Modeled Relationships”. The S-RAMP serialization of an Extended Modeled Relationship uses the S-RAMP *relationship* structure defined in the Core Model.

2.2 The Core Model

There is a “core” model that defines all the basic Artifact Types used throughout S-RAMP. The Core Model contains abstract base artifacts for document artifacts and derived artifacts (which are associated with certain document types). Most Artifact Types in the other S-RAMP models are extensions of *BaseArtifactType*. Additionally, the Core Model includes the Document and XmlDocument concrete Artifact Types.

265

266 *Figure 1: Conceptualized Model of Core Model Artifacts*

267

268 **Error! Reference source not found.** provides a conceptualized illustration of the Core Model artifacts.
269 In addition, there are a number of support types used by the core and other models. Note that the class
270 attributes in the diagram are essentially built-in properties. The remaining sub-sections provided
271 additional details on the Core Model.

272 **2.2.1 Base Artifact Type**

273 The *BaseArtifactType* is the fundamental abstract type used by all of the artifact models in S-RAMP. It
274 contains all of the common metadata that describes an artifact instance. All artifact instances that are
275 based on the *BaseArtifactType* contain the following metadata.

276 **2.2.1.1 Built-in Properties:**

- 277 • **artifactType**: A required string which is set when a specific type of artifact is created. These
278 artifact types are enumerated in a list of core data types. The enumeration is defined by the
279 baseArtifactEnum.
- 280 • **createdBy**: A required string assigned by the server identifying the user who created the artifact.
281 S-RAMP does not define requirements on this value. These are implementation specific.
- 282 • **createdTimestamp**: A required timestamp which is set by the server at the time an artifact is first
283 published. It conforms to xsd:dateTime, referenced to UTC.
- 284 • **description**: This optional property is used to provide a human consumable description of the
285 artifact instance. This value is set by the client for all non-Derived Artifacts (although
286 implementations MAY support setting it automatically using introspection. Derived Artifact
287 descriptions are set by the server.
- 288 • **lastModifiedBy**: A required string assigned by the server identifying the user who last updated
289 the artifact. S-RAMP does not define requirements on this value. These are implementation
290 specific.
- 291 • **lastModifiedTimestamp**: A required timestamp which is updated by the server each time an
292 artifact instance is modified. It conforms to xsd:dateTime, referenced to UTC.
- 293 • **name**: This required property is used to describe the artifact instance. This value is set by the
294 client for all non-Derived Artifacts (although implementations MAY support setting it automatically
295 using introspection). Derived Artifact names are set by the server.
- 296 • **uuid**: A required unique identifier of an artifact instance in the repository. This value conforms to
297 Type 4 random-number format UUIDs [**UUID**], and is set for the artifact at the time of its creation.
298 The repository will assign a value if the user does not provide one.
- 299 • **version**: An optional string representing the version of the artifact instance. S-RAMP makes no
300 attempt to define formatting rules for this property, which are implementation specific.

301 **2.2.1.2 Generic Properties**

- 302 • **property**: These are optional properties which are defined by the client. They MUST have a
303 single unique name (which SHALL NOT duplicate any other property name of any type, and
304 SHALL NOT duplicate any Relationship Type value). A property name SHALL have 0 or 1 value.

305 **2.2.1.3 Generic Relationships**

- 306 • **relationship**: These are optional relationship(s) defined by the client. A relationship contains a
307 Relationship Type identifying the type of the relationship, and 0 or more target artifact references.
308 Relationship Type values within a relationship SHALL NOT duplicate the name of any property.

309 **2.2.1.4 Classifications**

- 310 • **classifiedBy**: This is a separate class of metadata. It MAY be set by the client with an
311 unbounded upper cardinality limit. Each value SHALL be a URI that references a specific OWL

312 class from a classification system defined to the repository. For more on OWL classification
313 systems in S-RAMP, see Section **Error! Reference source not found.**

314

315 **2.2.2 Document Artifact Types**

316 The *DocumentArtifactType* is the fundamental abstract data type for all documents represented in the
317 repository, and it extends *BaseArtifactType*. This Artifact Type includes several built-in properties:

318 **contentType:**

- 319 • A string indicating the MIME Media type of the content. This is set by the server as part of
320 processing the publication of the document, and cannot be changed by the user.

321 **contentSize:**

- 322 • An integer representing the size of the content in bytes. This is set by the server as part of
323 processing the publication of the document. It cannot be changed by the user.

324 **contentHash:**

- 325 • A string representing the SHA-1 hash of the document's byte contents. This is set by the server
326 as part of processing the publication of the document. It cannot be changed by the user.

327 The Core Model also includes an *XmlDocument* type that all XML based document data types extend.

328 The *Document* type provides a concrete artifact that can be used to represent arbitrary document types
329 (e.g. PDF or Office documents).

330 Documents which have a Derived Model associated with them cannot be updated in the repository. They
331 must be removed and republished.

332 Documents which are the target of a relationship cannot be deleted.

333 **2.2.3 Miscellaneous Types**

334 There are a few miscellaneous classes in the Core Model:

335 **StoredQuery:**

- 336 • This is a special Artifact Type that is used to persist queries in the repository. Additional
337 information on this topic is available in Section **Error! Reference source not found.**, **Error!**
338 **Reference source not found..**

339 **ExtendedArtifactType:**

- 340 • The *ExtendedArtifactType* allows clients to create their own extended artifact model when it is not
341 pre-defined by the S-RAMP specification. The *extendedType* property is intended to provide an
342 indication of the artifact type.

343 **ExtendedDocument:**

- 344 • The *ExtendedDocument* allows clients to create their own extended artifact model when it is not
345 pre-defined by the S-RAMP specification. The *extendedType* property is intended to provide an
346 indication of the artifact type. This differs from the *ExtendedArtifactType* in that it extends
347 *DocumentArtifactType*, thereby inheriting its properties. This type may be used by clients when
348 adding extended artifact model artifacts that contain document content.

349

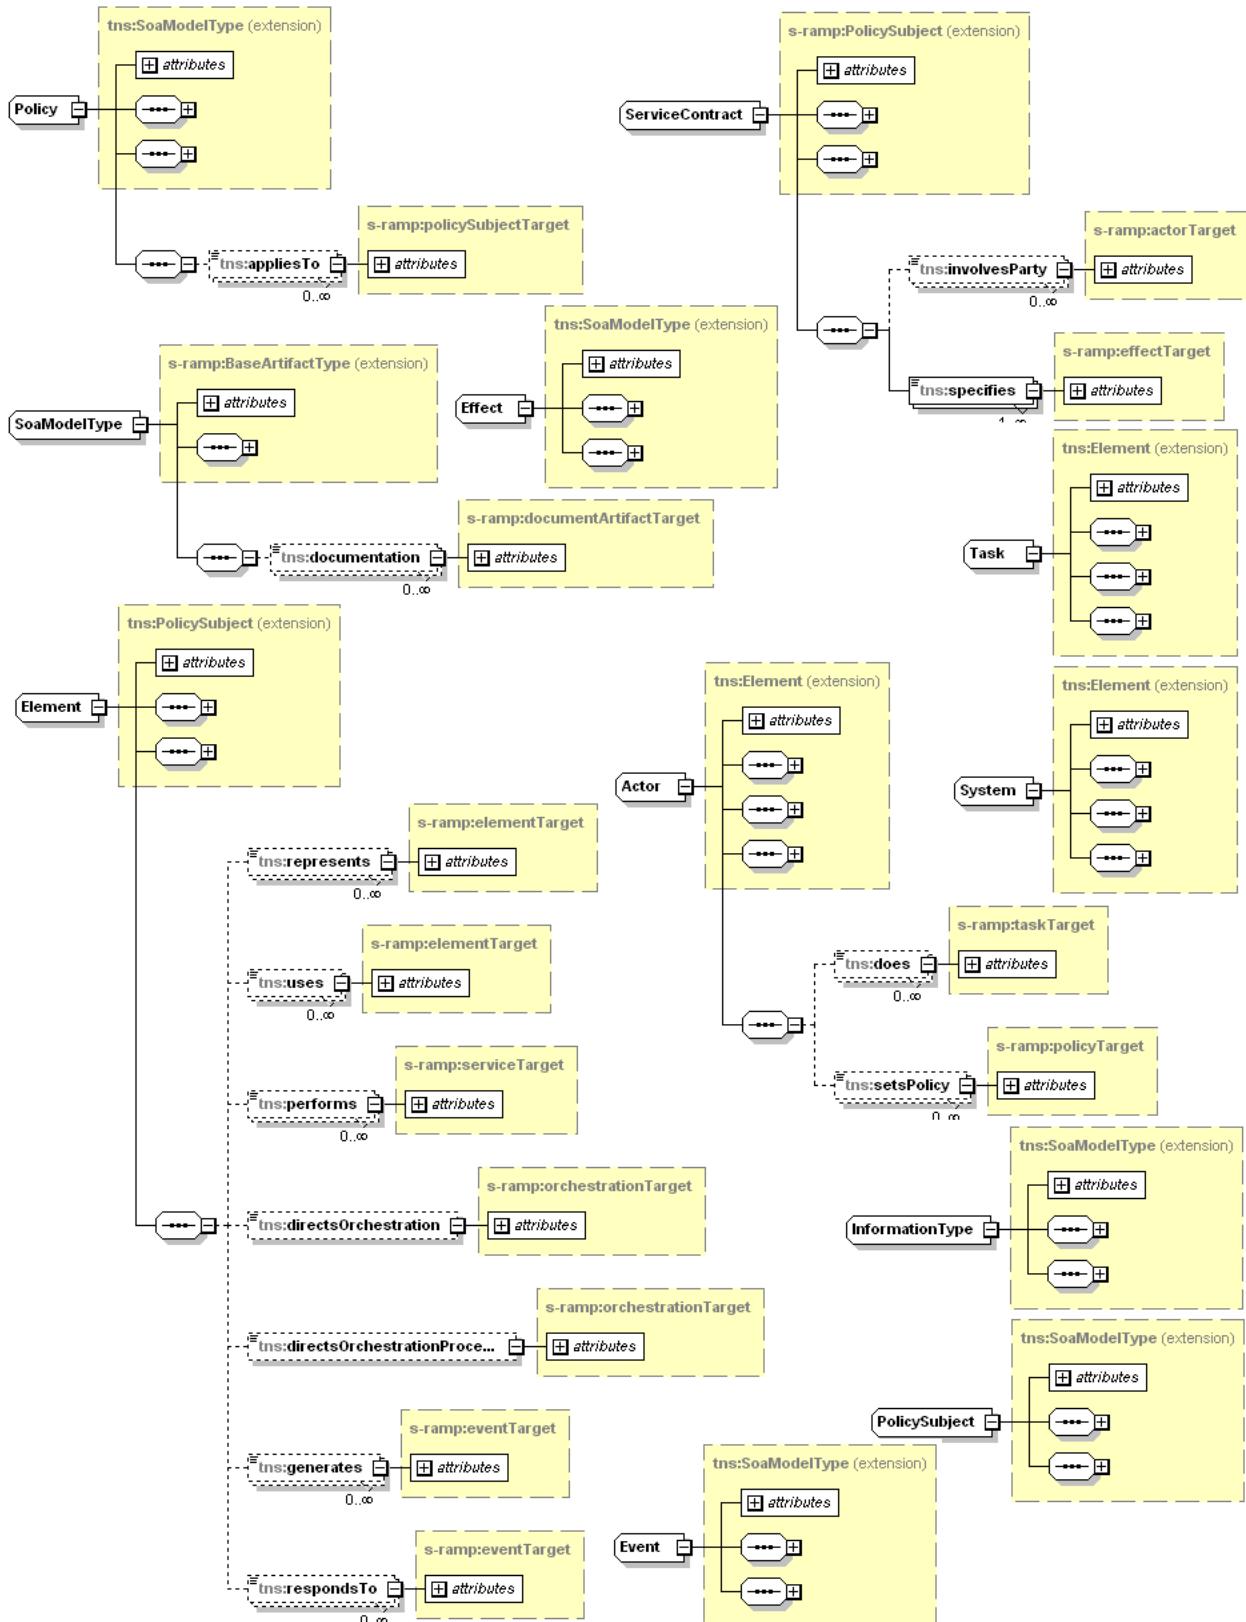

350 **2.3 Modeling SOA Concepts**

351 S-RAMP supports modeling of business level SOA concepts related to service and process
352 representations and interactions. Since it is not the mission of S-RAMP to define a "SOA Ontology" for
353 the industry, this specification has chosen to reference work done by The Open Group in their "SOA
354 Working Group" on the "SOA Ontology" (see <http://www.opengroup.org/projects/soa-ontology/>). That work
355 is compatible with both SCA and BPMN but draws both service and process concepts together at a
356 higher level of abstraction.

357 S-RAMP supports modeling of SOA concepts using a layered approach:
358 1. S-RAMP SOA Model
359 2. S-RAMP Service Implementation Model
360 The sections below describe how the SOA Ontology work is integrated with S-RAMP as well as the
361 implementation layer underneath it.

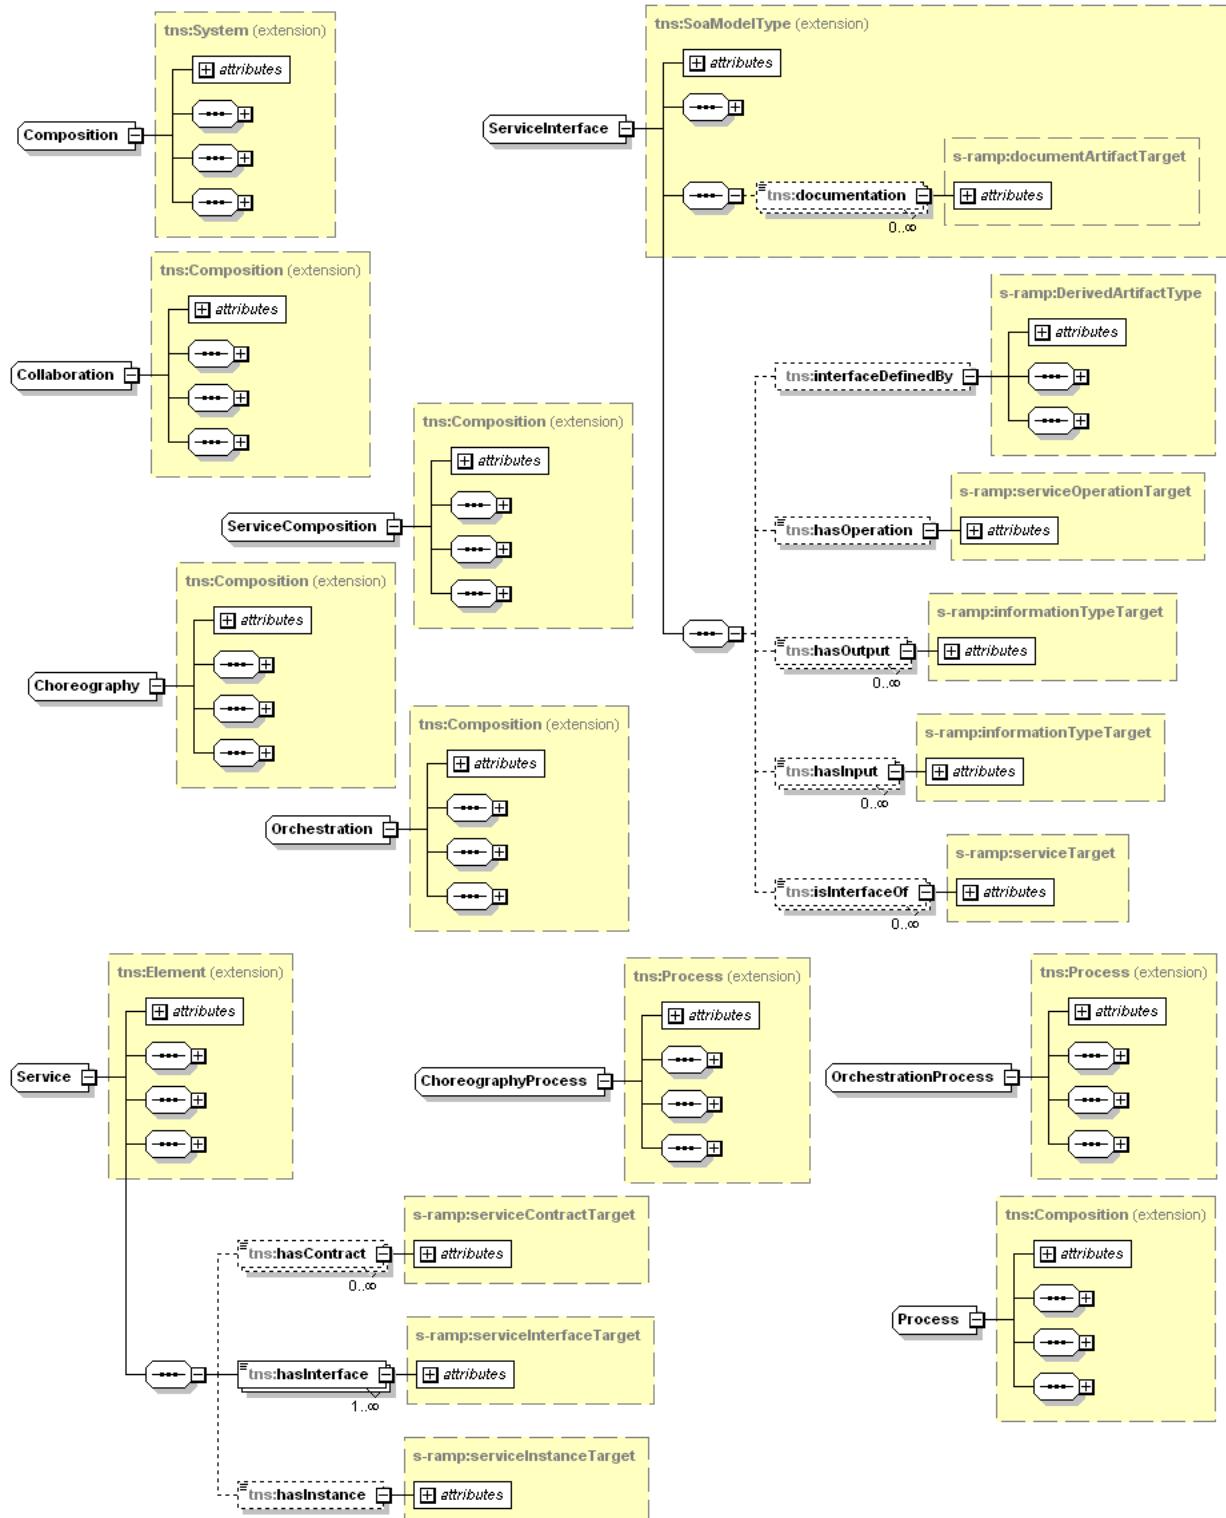

362 **2.3.1 The SOA Model**

363 The S-RAMP SOA Model exists to provide a mechanism to link work done by The Open Group SOA
364 Ontology work group (**[SOAONT]**) with the rest of the S-RAMP internal models. It defines a very minimal
365 set of linkages to artifacts defined in the SOA Ontology.
366
367 Several S-RAMP modeling features have been defined in order to provide linkage between the SOA
368 Ontology and the S-RAMP data model. This is done using the S-RAMP SOA Model. Artifact Types in
369 this model are all user instantiated, and are described in the S-RAMP SOA Model illustrated in *Figure 2*
370 below.
371

372

Figure 2: Conceptualized Model of SOA Model Artifacts (part 1)

374

375 *Figure 3: Conceptualized Model of SOA Model Artifacts (part 2)*

376

377 SOA Model artifacts and the SOA Ontology artifacts referenced by the SOA Model are designed to
378 provide clients the ability to create conceptual SOA representations. SOA Model Artifacts are all logical

379 artifacts and do not represent or correspond directly to a document instance, as do those in the Derived
380 Models.

381 S-RAMP provides an XML Schema representation of the S-RAMP SOA Model, including elements
382 corresponding to the base version of The Open Groups SOA Ontology's defined artifacts, within the
383 context of the S-RAMP data model. It can be found in Appendix **Error! Reference source not found..**

384 **2.3.1.1 SOA Model Artifact Types and Relationships**

385 The abstract *SoaModelType* Artifact Type implicitly acts as a super class for ALL top level SOA Ontology
386 artifacts when they are used within the context of S-RAMP. This imbues all of them with the properties
387 built into all S-RAMP Artifact Types. S-RAMP adds several relationships to SOA Ontology Artifacts used
388 in the SOA Model in order to provide a connection from the SOA Ontology artifacts into the
389 implementation level artifacts described in the Service Implementation Model in Section **Error!**
390 **Reference source not found..**

391 SOA Model Artifacts MAY have relationships to Document Artifacts and/or Derived Artifacts in other
392 models, as well as among themselves. All the relationships defined in the SOA Model are Modeled
393 Relationships. See Section **Error! Reference source not found.** for behavioral details associated with
394 Modeled Relationships. The relationships that have been added to artifacts from the SOA Ontology are
395 summarized in **Error! Reference source not found.** below.

396

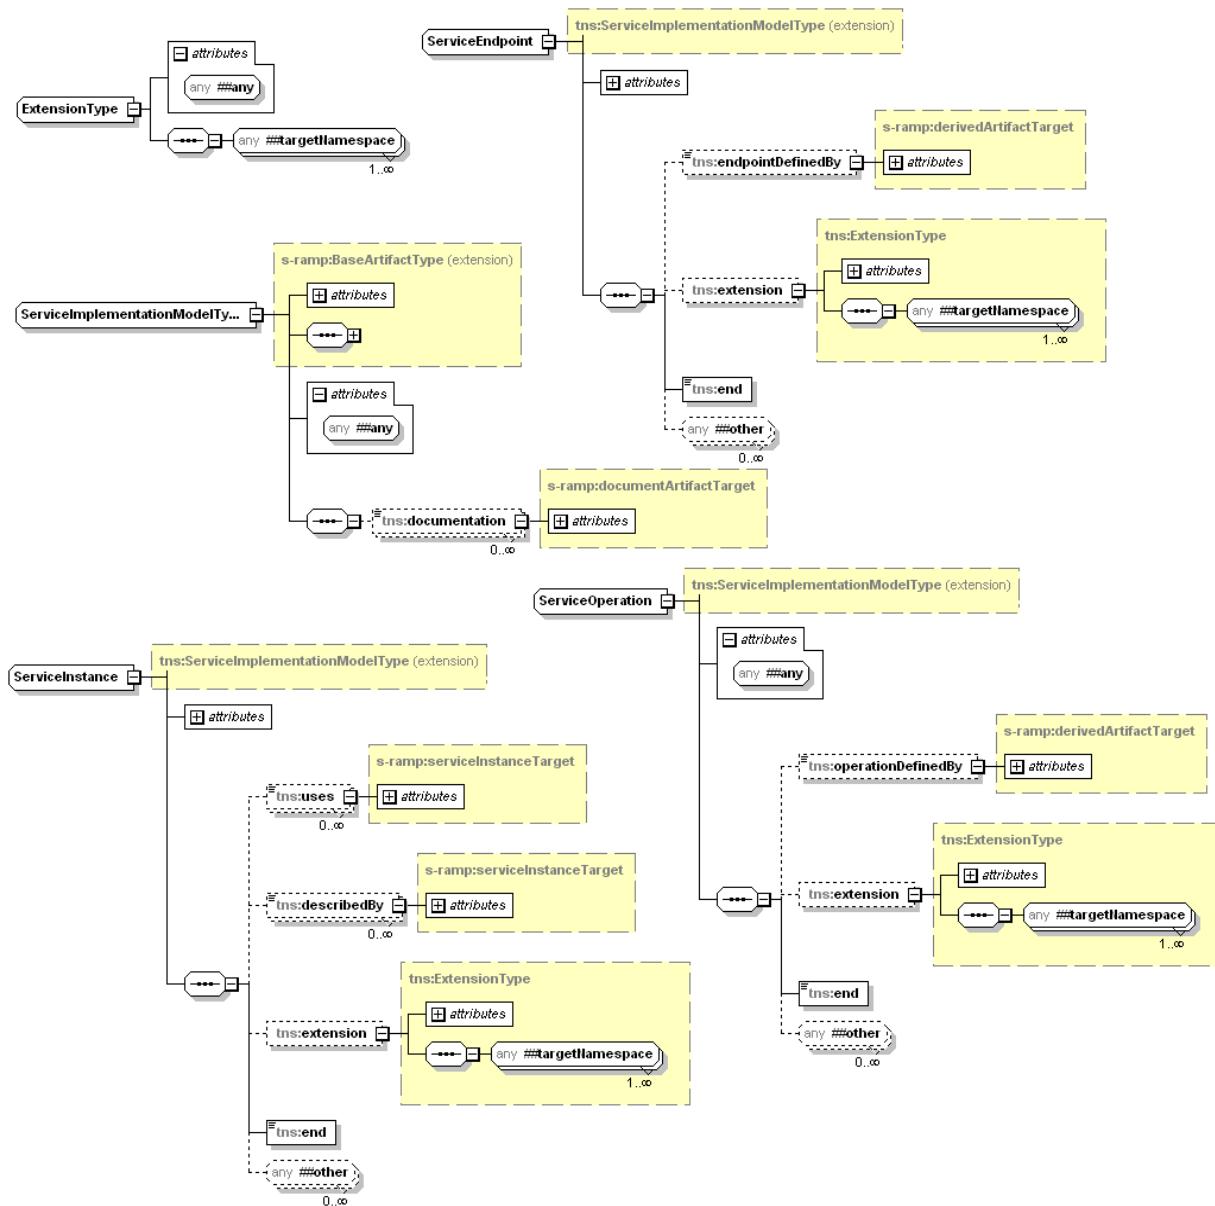

397 *Table 6: SOA Model Relationships*

Relationship Name	Source Artifact Type (from SOA Ontology)	Target Artifact Type (from S-RAMP Business & Core Models)	Notes
hasInstance	Service	ServiceInstance	
hasOperation	ServiceInterface	ServiceOperation	
interfaceDefinedBy	ServiceInterface	<i>DerivedArtifactType</i>	This allows one to indicate the Derived Artifact instance which defines this service interface. For example, this could be <i>PortType</i> artifact instance from the WSDL Model.
policyDefinedBy	Policy	<i>DerivedArtifactType</i>	This allows one to link the SOA Model Policy artifact with a concrete S-RAMP derived artifact type (e.g., PolicyAttachment)
informationTypeDefinedBy	InformationType	<i>DerivedArtifactType</i>	This allows one to link the SOA Model InformationType artifact with a concrete S-RAMP derived artifact type (e.g., PolicyAttachment)

398

399 **2.3.2 The Service Implementation Model**

400 S-RAMP defines a "Service Implementation Model" which describes the service implementation layer
401 underneath the SOA Model. Artifact Types in this model are all user instantiated and most are extensible.
402 Each of these artifacts derives from the *ServiceImplementationModelType* and may be created, changed,
403 updated and deleted by the client. There are a number of pre-defined Modeled Relationships between
404 artifacts of particular types. **Error! Reference source not found.** below illustrates the conceptualized
405 Service Implementation Model artifacts.

408 *Figure 4: Conceptualized Model of Service Implementation Model Artifacts*

410 S-RAMP provides an XML Schema representation of the Service Implementation Model. It can be found
 411 in Appendix **Error! Reference source not found.**. The sub-sections that follow discuss each of the
 412 Service Implementation Artifact types in more detail.

413 **2.3.2.1 Service Implementation Model Artifact Types and Relationships**

414 The primary Artifact Type from which all Service Implementation Model Artifacts extend is the abstract
 415 **ServiceImplementationModelType**. The concrete Service Implementation Model Artifacts that extend it
 416 are designed to provide the implementation layer below the SOA Model which allows clients to build SOA
 417 representations. Service Implementation Model Artifacts are all logical artifacts and do not represent or
 418 correspond directly to a document instance as do those in the Derived Models.

419 Service Implementation Model Artifacts MAY have relationships to Document Artifacts and/or Derived
420 Artifacts in other models, as well as among themselves. All the relationships shown in the Service
421 Implementation Model are Modeled Relationships. See Section **Error! Reference source not found.** for
422 behavioral details associated with Modeled Relationships. Of note for the
423 *ServiceImplementationModelType* is the *documentation* Modeled Relationship which allows any artifact in
424 the Service Implementation Model to reference a document describing it.

425 The concrete Service Implementation Model Artifact Types are then:

426 **Organization**

- 427 • The *Organization* type is used to describe an organizational entity. It is a subclass of the “Human
428 Actor” artifact defined in the SOA Ontology. Clients can define an unlimited number of
429 organizations and can use the *provides* relationship to link an Organization to any Service
430 Implementation Model Artifact

431 **ServiceInstance**

- 432 • The *ServiceInstance* Artifact Type represents deployed instance(s) of a service. For example, a
433 Web service running in WebSphere, or Oracle Fusion, etc. The *describedBy* Modeled
434 Relationship can be used to reference document artifact(s) that describe it.

435 **ServiceEndpoint**

- 436 • The *ServiceEndpoint* Artifact Type represents a physical location at which the Service instance
437 can be invoked, using its *url* Modeled Property. The *endpointDefinedBy* Modeled Relationship
438 allows indicating the Derived Artifact instance that defines this Service endpoint is defined. For
439 example, this could be a *Port* artifact instance from the WSDL Model.

440 **ServiceOperation**

- 441 • The *ServiceOperation* Artifact Type represents the specific operation performed by the Service.
442 The *operationDefinedBy* Modeled Relationship can be used to link a *ServiceOperation* with a
443 Derived Artifact which defines it. For example this could be an *Operation* artifact instance from
444 the WSDL Model.

445 **2.4 Derived Models**

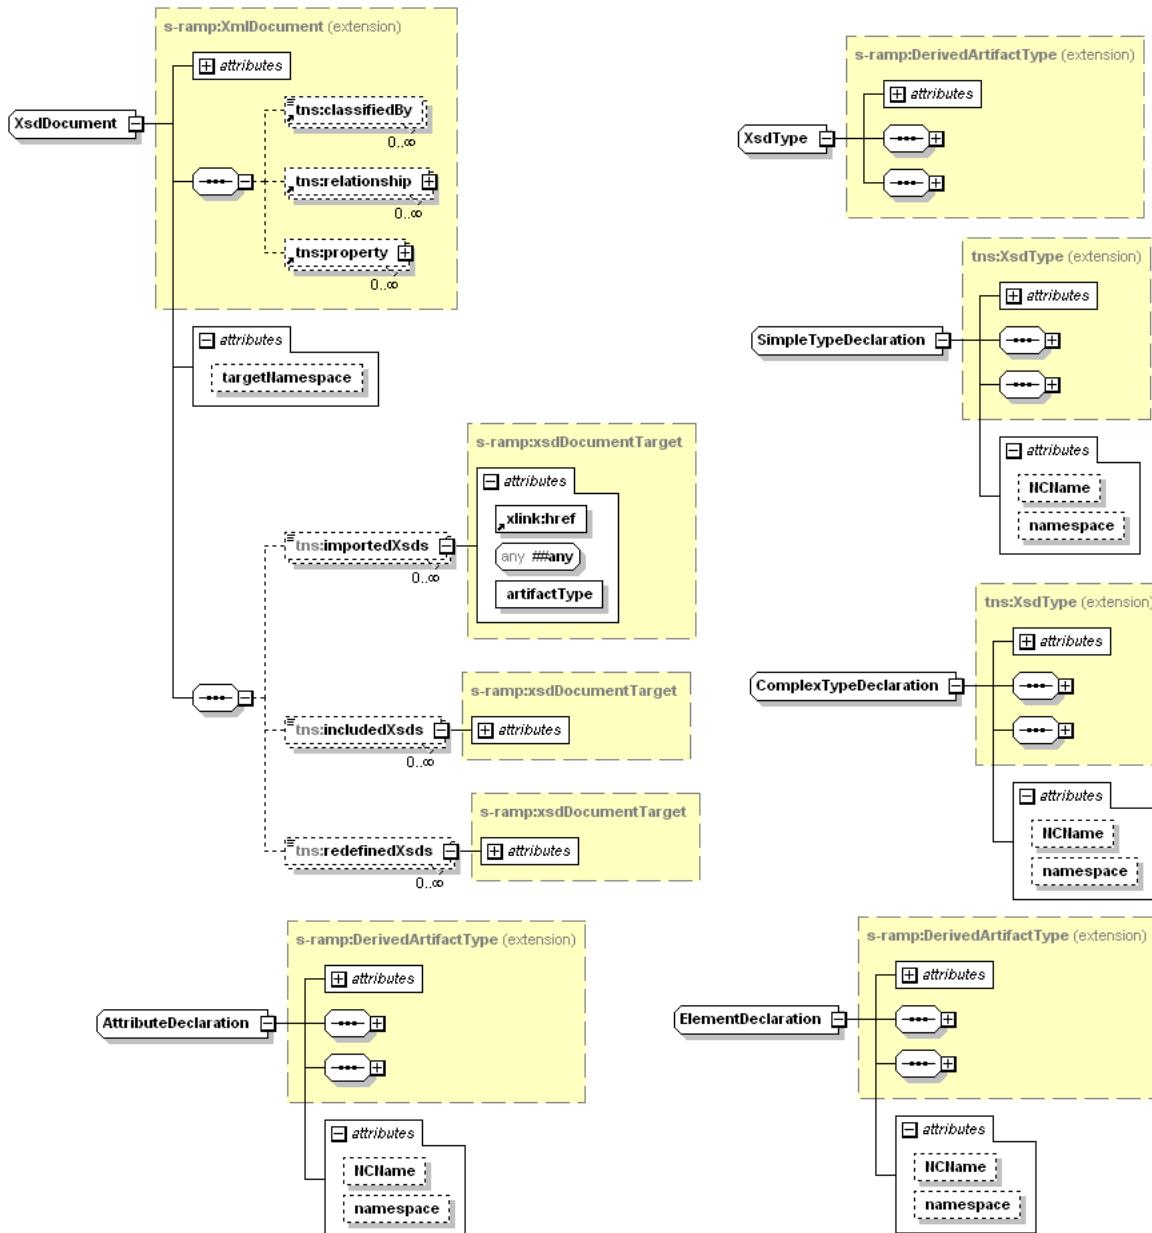

446 The sections that follow describe the logical models that are constructed by the repository in response to
447 publication of a document for which a Derived Model is defined. The server parses these documents
448 upon publication, dynamically constructing Derived Artifacts corresponding to the major data type
449 components of the document. Every Derived Artifact instance has a *relatedDocument* relationship to the
450 document from which it was created. The artifacts and relationships in a Derived Model provide a
451 powerful tool for searching the repository based on specific components of such a document (e.g., a
452 WSDL PortType, etc.). In most cases, the model diagrams illustrated in this section are adequate to
453 define the Artifact Types and the Derived Relationships between them, so these sections are
454 correspondingly brief.

455 Appendix **Error! Reference source not found.** describes all of the Derived Model schemas defined in S-
456 RAMP.

457 **2.4.1 The XSD Model**

458 The XSD Model describes the Artifact Types that correspond to components of an XSD document stored
459 in the repository, and yields structural metadata useful in performing queries. The conceptual model
460 describing the XSD Model is illustrated below in Figure 5: Conceptualized Model of XSD Model Artifacts.

461

462

463 *Figure 5: Conceptualized Model of XSD Model Artifacts*

464 Note that an XSD document MAY include, import, or redefine other XSD documents. These capabilities
 465 are modeled using the *includedXsds*, *importedXsds* and *redefinedXsds* Derived Relationships,
 466 respectively.

467 A *SimpleTypeDeclaration* artifact instance is generated for each global simple type defined in the
 468 associated XML Schema document. Similarly, a *ComplexTypeDefinition* instance is generated for each
 469 global complex type defined in that XML Schema document. Each global attribute declared in the XML
 470 Schema document will generate a corresponding *AttributeDeclaration* artifact instance, and finally, each
 471 global element declared in the XML Schema document will generate a corresponding *ElementDeclaration*
 472 artifact instance.

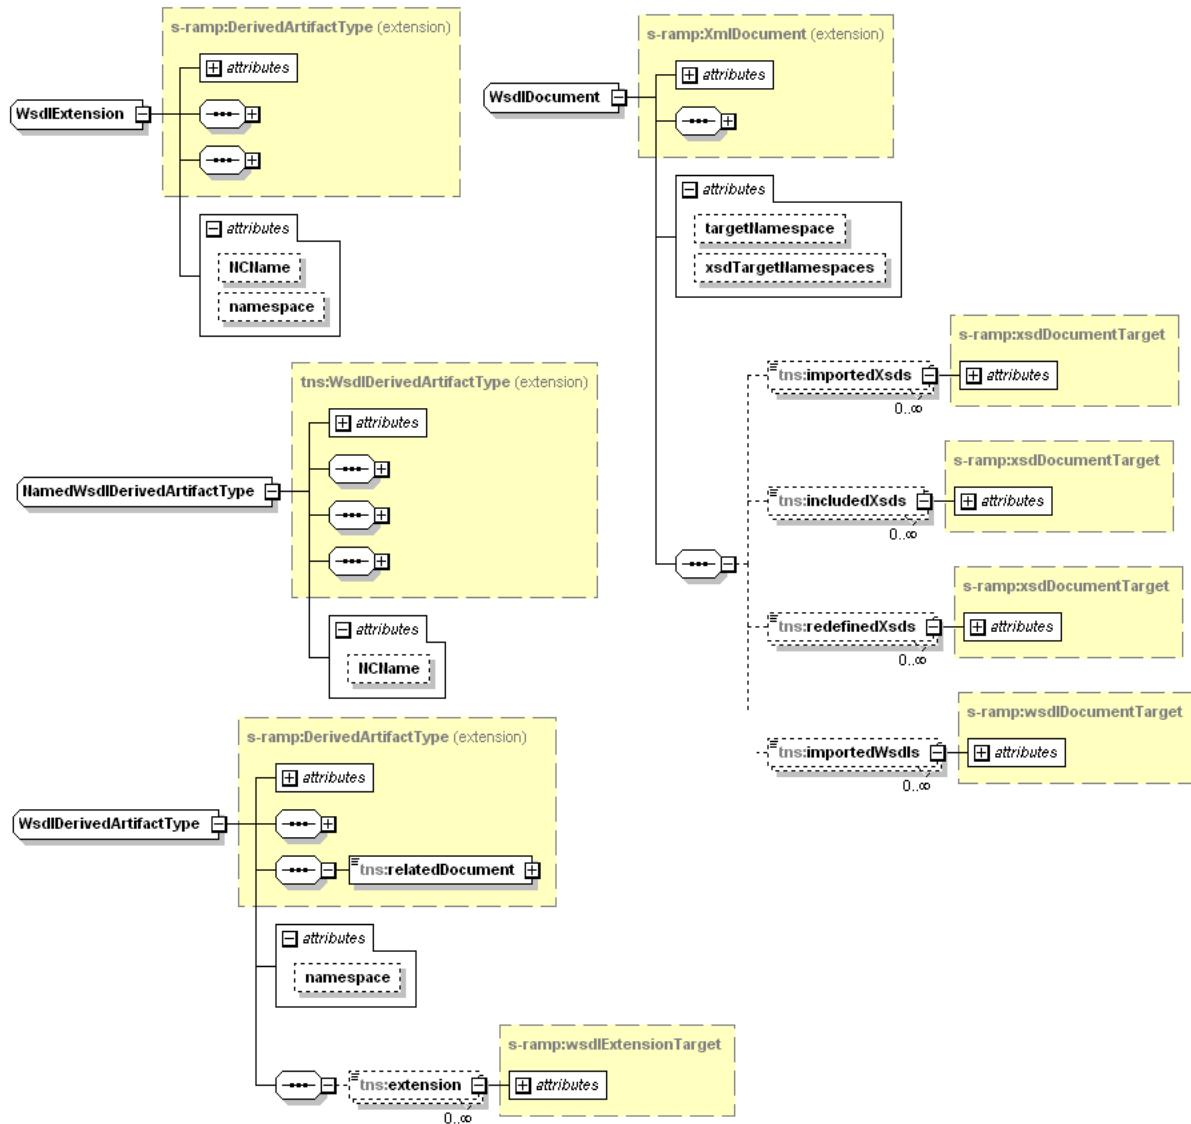

473 While it is possible to construct a more fine-grained model of an XML Schema document, this level of
 474 modeling provides a suitably rich context for discovery queries without creating an overly complex model.

475 **2.4.2 The WSDL Model**

476 The WSDL Model is one of the most complex Derived Models, owing to the complexity of WSDL itself.
477 The WSDL Model contains substantial richness because of the value in being able to perform highly
478 refined queries using logical artifact representations of most of a WSDL document's constituent
479 components.

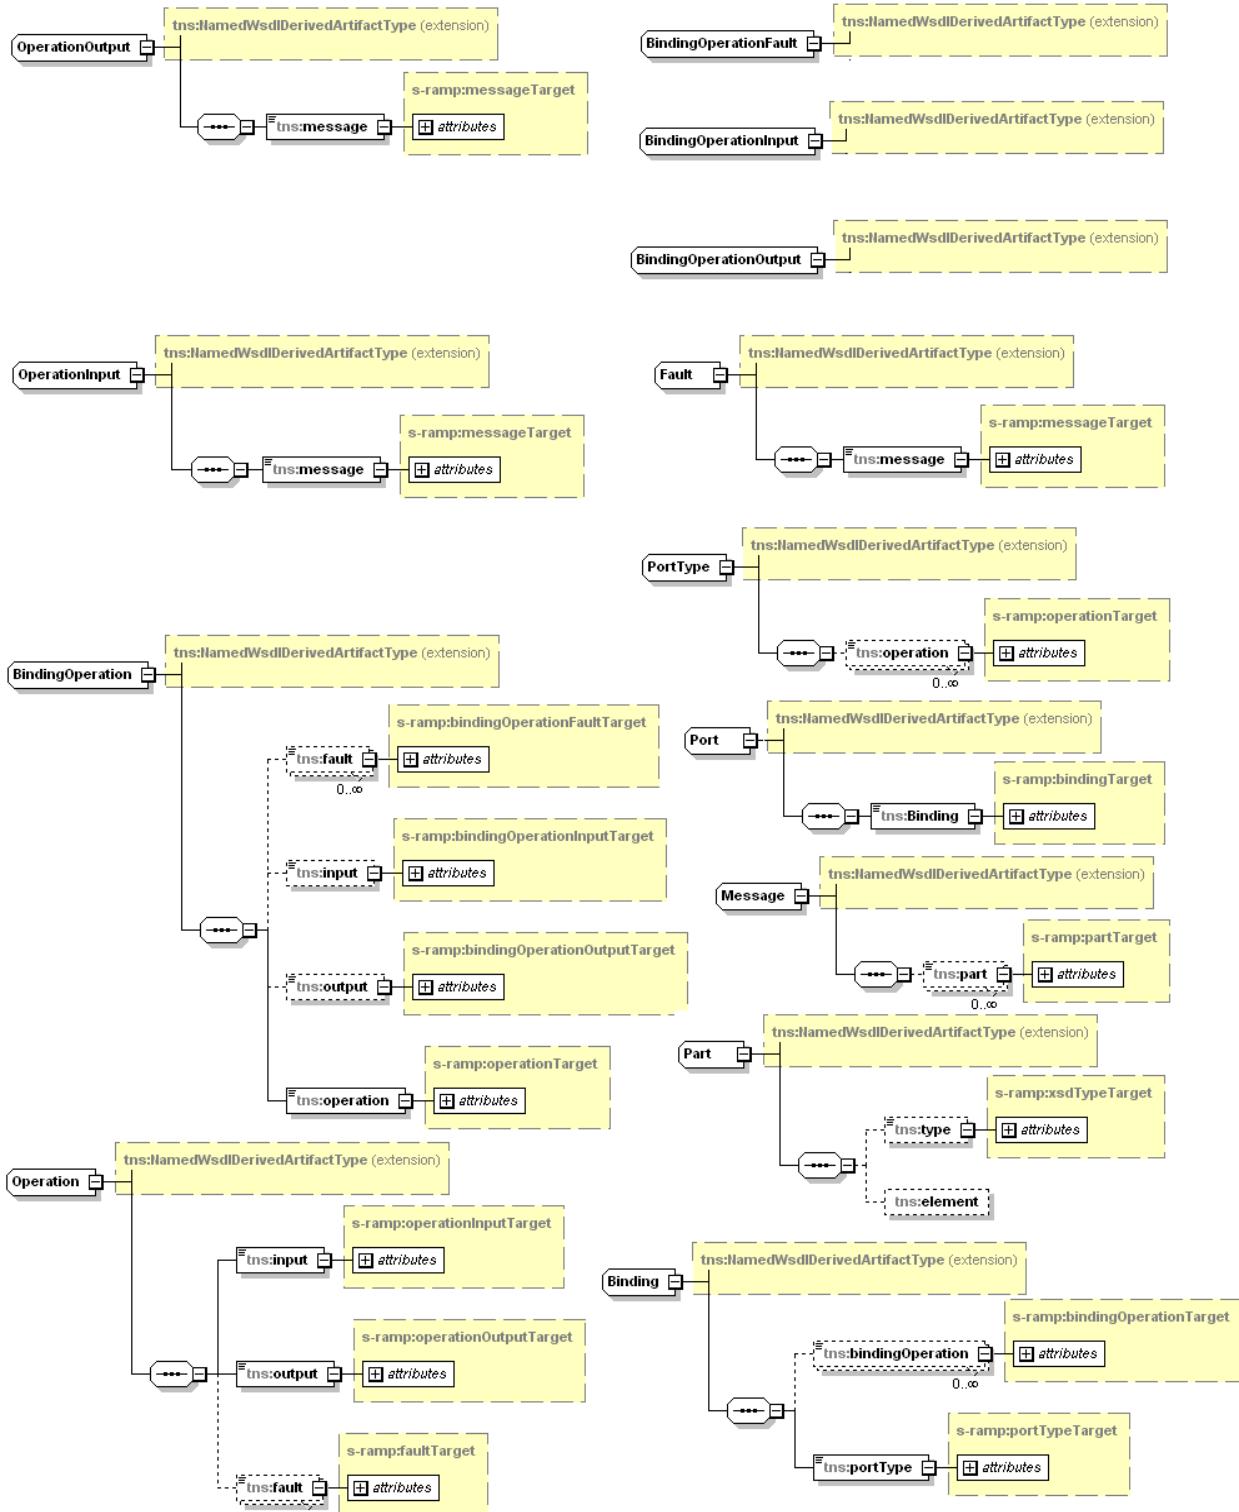

480 Figure 6 and Figure 7 below provide a conceptual model representing the logical artifacts and their
481 Derived Relationships in the WSDL Model. This model is intended to mirror the structure of a WSDL file.
482 In most cases, the artifact names exactly match corresponding data types in WSDL (e.g., *Message*,
483 *PortType*, *Operation*, *Binding*, *Service*, *Port*, and so on).

484

485

486 *Figure 6: Conceptual Diagram of WSDL Model: Part 1*

487

488 *Figure 7: Conceptual Diagram of WSDL Model: Part 2*

489 Note that aggregation relationships in these diagrams are modeled as Derived Relationships in the WSDL
 490 Model schema found in Appendix **Error! Reference source not found.**.

491 Note that the WsdlExtension Artifact Type illustrated in Figure 7 below is used to model extensibility
 492 elements for any given WSDL element. This supports WSDL extensions that the repository does not
 493 recognize.

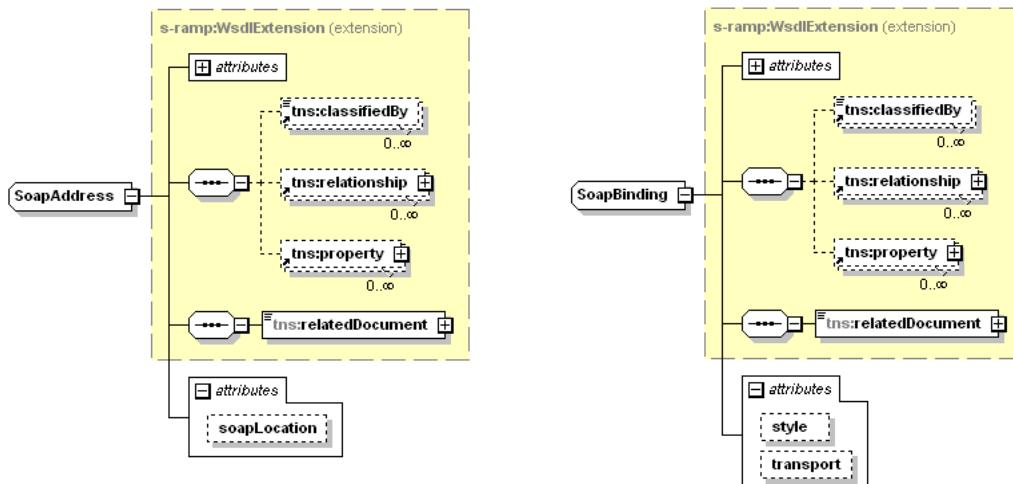

494 The WsdlDerivedArtifactType is a modeling convenience from which all WSDL related metadata artifacts
495 extend. It contains a *namespace* attribute that is the namespace of the WSDL document and it applies to
496 every Derived Artifact instance for that Document. It also has an *extension* Derived Relationship which
497 serves to identify the set of WSDL extensions which apply to the Derived Artifact.

498 A WSDL document can import, include and redefine XSD document(s), as well as import other WSDL
499 documents. These capabilities are modeled using the *importedXsds*, *includedXsds*, *redefinedXsds*, and
500 *importedWsdl*s relationships, respectively. .

501 **2.4.3 The SOAPWSDL Model**

502 The SOAPWSDL Model contains the SOAP 1.1 binding specific WSDL Model artifacts for WSDL 1.1. It is
503 separated into its own Model and schema to simplify its use. Figure 8 below illustrates a conceptual
504 model of the relevant SOAP WSDL Model artifacts.

505

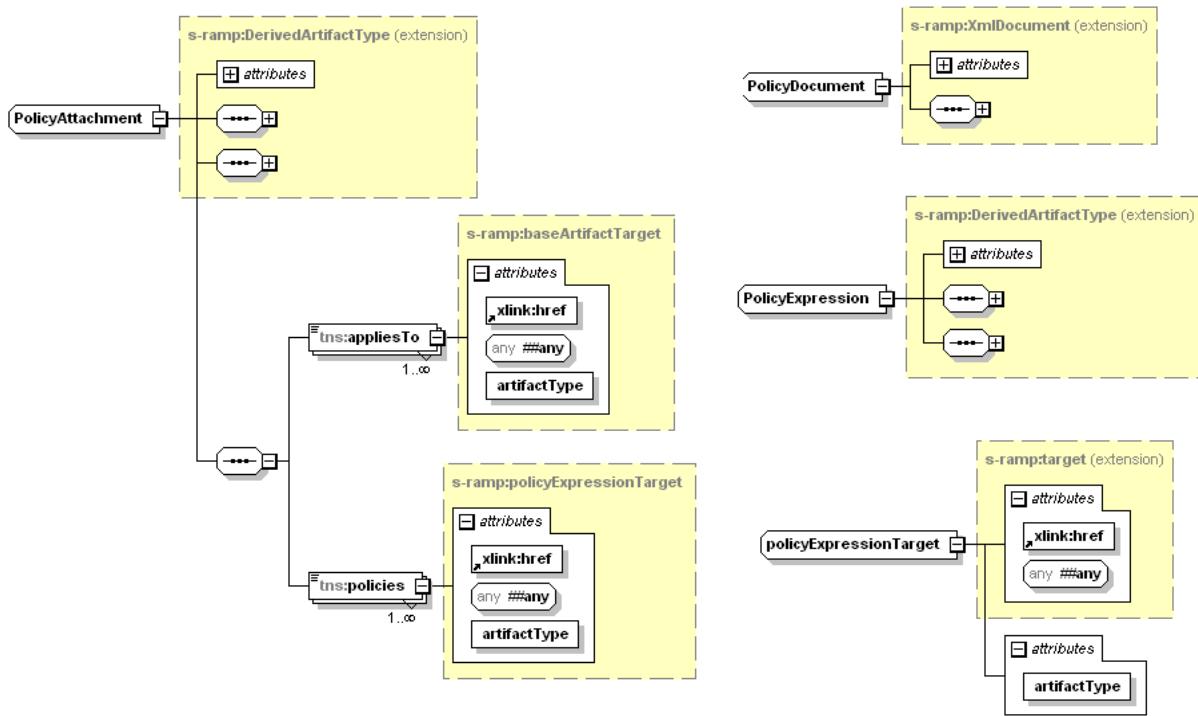

506

507 *Figure 8: Conceptualized Diagram of the SOAP WSDL Model*

508 **2.4.4 The Policy Model**

509 The Policy Model describes the Artifact Types that correspond to the primary components of a WS-Policy
510 document. Policy expressions can be in a standalone policy document, or embedded in another
511 document such as a WSDL. Figure 9 below is a conceptual diagram of the Policy Model:

512

513 *Figure 9: Conceptualized Model of Policy Model Artifacts*

514

515 All *appliesTo* relationships are instantiated in the repository based on the content in the policy attachment
 516 document. There is no restriction on the artifacts it can reference.

517 **2.5 Referencing S-RAMP Artifacts**

518 The syntax for referencing Artifact Type(s) is defined in each of the S-RAMP bindings (e.g., the S-RAMP
 519 Atom Binding). Please refer to the appropriate binding specific document of this specification for details.

520 **2.5.1 Notional Syntax**

521 One possible syntax is as follows and is used in several examples within this specification:

522

```
/s-ramp/{ArtifactModel}/{ArtifactType}
```

524

525 Note that each successive component of this syntax is optional. Specifically

526

- A reference of “/s-ramp” refers to all Artifact Types in all models
- A reference of “/s-ramp/{Artifact Model}” refers to all Artifact Types within the specified Artifact Model.
- References of the form “//{ArtifactModel}” or “//{ArtifactType}” are also permitted.

530

531 Table 7: Artifact Models and Types below provides the pre-defined values for Artifact Model and Artifact
 532 Types. Abstract types are not included since they cannot be instantiated.

533

534 *Table 7: Artifact Models and Types*

536 Below are some examples of S-RAMP model and Artifact Type references using the notional syntax
 537 described above.

538

539 *Example 1: Artifact Model and Type References*

```

540      /s-ramp
541          o References all Artifact Types in the repository
542      /s-ramp/xsd    or      //xsd
543          o References all Artifact Types in the XSD Model (e.g., XsdDocument, XsdType, ...)
544      /s-ramp/xsd/XsdType   or      //XsdType
545          o References the XsdType Artifact Type in the XSD Model
546      /s-ramp/soa/Service
547          o References all Service Artifacts Types in the SOA Model (included by reference to
548              The Open Group's SOA Ontology)
549      /s-ramp/wsdl/Port
550          o References the Port Artifact Type in the WSDL Model
  
```

551

552

3 Classification Systems in S-RAMP

553 A classification system allows classification values to be organized in a hierarchy, allowing artifacts to be
 554 grouped into sets and to identify subsets within those sets. Query and display of all artifacts in a set then
 555 becomes possible and provides a simple yet powerful means of classifying and finding related objects.
 556 Artifact instances in the repository MAY have classification values applied to them.

557 A simple example of a classification system hierarchy is a geographical region hierarchy that could, for
 558 example, be used to indicate which location produced an artifact. Using '/' to delineate levels in the
 559 hierarchy and ',' to separate members at the same level, one part of an example hierarchy could be World
 560 / Asia / Japan, China. The hierarchy could also contain World / Europe / United Kingdom, Germany. In
 561 other words, subsets of World are Asia and Europe, subsets of Asia are Japan and China, and subsets of
 562 Europe are United Kingdom and Germany. To find artifacts produced by teams in Asia, a search can be
 563 issued to return artifacts classified by the Asia classification. To give the behavior desired, a repository
 564 implementation interprets this query as requiring the retrieval of artifacts classified by Asia and its sub-
 565 groups i.e. Asia or Japan or China.

566 Classification systems used in S-RAMP are expressed in the Web Ontology Language (OWL) that builds
 567 upon the Resource Description Framework (RDF). The RDF/XML serialization format is commonly used
 568 for files containing OWL constructs and is a format that SHALL be understood by an S-RAMP repository.
 569 OWL consists of three increasingly expressive sublanguages, OWL Lite, OWL DL and OWL Full. The
 570 W3C "OWL Web Ontology Language Overview" document indicates that "OWL Lite supports those users
 571 primarily needing a classification hierarchy and simple constraints", and accordingly the OWL elements
 572 that S-RAMP uses to define classification systems come from OWL Lite. To enable the classification
 573 capabilities required in S-RAMP, a restricted set of OWL Lite elements is sufficient. Also, it should be
 574 noted that S-RAMP does not support multiple inheritance.

575 The elements that SHALL be supported and a brief description of each follow (refer to the W3C
 576 documents detailing OWL and RDF for further detail on these elements).

577

rdf:ID

- 579 • In an element that requires a resource to be identified, an *rdf:ID* attribute MAY be used. This
 580 attribute has slightly different behavior to *rdf:about*, including the requirement that the value only
 581 appear once in the scope of a document, so it provides a useful check when defining distinct
 582 resources. RDF and OWL use URIs to identify resources. The attribute value is a string indicating
 583 a URI fragment relative to the currently in-scope base value (typically set using the *xml:base*
 584 attribute).

rdf:about

- 586 • As an alternative to using an *rdf:ID* attribute to identify a resource, an *rdf:about* attribute MAY be
 587 used. The attribute value is either a string indicating an absolute URI, or a string indicating a
 588 relative URI resolved against the currently in-scope base value (typically set using the *xml:base*
 589 attribute).

owl:Ontology

- 591 • In OWL, classification systems are represented by an OWL ontology. The ontology groups a
 592 number of related classifications together. In the example the geographical regions classification
 593 system would be defined using an *owl:Ontology* element.

owl:Imports

- 595 • *owl:Imports* elements are permitted under *owl:Ontology*. This means that classes declared in the
 596 ontology MAY subclass classes declared in any imported ontologies, although multiple
 597 inheritance is not permitted. How owl ontologies are imported is vendor specific and therefore the
 598 resolution of *owl:import* references is also vendor specific.

owl:Class

- 600 • OWL represents classifications with OWL classes. In the example, the World, Europe, Asia,
 601 United Kingdom, Germany, Japan and China classifications would be defined using an *owl:Class*
 602 element.

603 ***rdfs:subClassOf***

- 604 • To define the hierarchy, classes are related to each other via the *rdfs:subClassOf* element. If
 605 class B is declared to be a subclass of class A, then the instances of class B represent a subset
 606 of the instances of class A. In the example, Asia would be declared to be a subclass of World,
 607 Japan a subclass of Asia, and so on.

608 ***rdfs:label***

- 609 • Ontologies and classes MAY be given a human readable name using the *rdfs:label* element.
 610 Names in multiple languages are supported by this element, using the *xml:lang* attribute.

611 ***rdfs:comment***

- 612 • Ontologies and classes MAY be given a human readable comment or description using the
 613 *rdfs:comment* element. Comments in multiple languages are also supported by this element using
 614 the *xml:lang* attribute.

615

616 All other OWL elements are not supported (in terms of OWL Lite this means that property-related
 617 elements, and the *owl:equivalentClass*, *owl:imports*, *owl:intersectionOf*, and versioning elements are not
 618 supported).

619 OWL files used in S-RAMP MUST conform to the following rules, which result in ontologies that are self-
 620 contained in a single OWL file:

- 621 • There MUST be exactly one *owl:Ontology* element in any OWL file
- 622 • A class MUST only be defined in one ontology

623 The example ontology can be expressed in OWL as follows:

624

625 *Example 2: An OWL Ontology*

```

626   <?xml version="1.0" encoding="UTF-8"?>
627
628   <!DOCTYPE rdf:RDF [
629     <!ENTITY xsd "http://www.w3.org/2001/XMLSchema#">
630     <!ENTITY rdf "http://www.w3.org/1999/02/22-rdf-syntax-ns#">
631     <!ENTITY rdfs "http://www.w3.org/2000/01/rdf-schema#">
632     <!ENTITY owl "http://www.w3.org/2002/07/owl#">
633     <!ENTITY ns_region "http://www.regions.com/geographicalregion">

642     xmlns:base=&ns_region;""
643   >
644
645   <!-- ontology -->
646
647   <owl:Ontology rdf:ID="">
648     <rdfs:label>Geographical Regions</rdfs:label>
649     <rdfs:comment>An ontology used to provide classifications describing geographical
650     regions.</rdfs:comment>
651   </owl:Ontology>
652
653   <!-- root class -->
654
655   <owl:Class rdf:ID="World">
656     <rdfs:label>World</rdfs:label>
657     <rdfs:label xml:lang="en">World</rdfs:label>
658     <rdfs:label xml:lang="fr">Monde</rdfs:label>
```

```

659      </owl:Class>
660
661      <!-- sub classes -->
662
663      <owl:Class rdf:ID="Asia">
664          <rdfs:subClassOf rdf:resource="#ns_region;#World"/>
665          <rdfs:label>Asia</rdfs:label>
666      </owl:Class>
667
668      <owl:Class rdf:ID="Europe">
669          <rdfs:subClassOf rdf:resource="#ns_region;#World"/>
670          <rdfs:label>Europe</rdfs:label>
671      </owl:Class>
672
673      <!-- sub sub classes -->
674
675      <owl:Class rdf:ID="Japan">
676          <rdfs:subClassOf rdf:resource="#ns_region;#Asia"/>
677          <rdfs:label>Japan</rdfs:label>
678      </owl:Class>
679
680      <owl:Class rdf:ID="China">
681          <rdfs:subClassOf rdf:resource="#ns_region;#Asia"/>
682          <rdfs:label>China</rdfs:label>
683      </owl:Class>
684
685      <owl:Class rdf:ID="UnitedKingdom">
686          <rdfs:subClassOf rdf:resource="#ns_region;#Europe"/>
687          <rdfs:label>United Kingdom</rdfs:label>
688      </owl:Class>
689
690      <owl:Class rdf:ID="Germany">
691          <rdfs:subClassOf rdf:resource="#ns_region;#Europe"/>
692          <rdfs:label>Germany</rdfs:label>
693      </owl:Class>
694
695  </rdf:RDF>
696

```

697 Some points of interest in the foregoing example:

- 698 • An *rdfs:comment* element is shown within the Geographical Regions *owl:ontology* element, but
699 comments may be used in *owl:Class* constructs if desired.
- 700 • *rdfs:label* elements have generally been used with no *xml:lang* attribute specified. However,
701 multiple *rdfs:label* elements MAY be specified within an *owl:Ontology* or *owl:Class* element, and
702 these may contain a variety of *xml:lang* attribute values (and an *rdfs:label* element with no
703 *xml:lang* attribute may be specified in addition to elements with such attributes present). The
704 World class in the ontology listed in Example 2 illustrates this. An *owl:Ontology* or *owl:Class*
705 element SHOULD contain only one *rdfs:label* element with a given *xml:lang* value to ensure well-
706 defined behavior when requesting a label for a specific language.
- 707 • The behavior of *rdfs:comment* elements with respect to *xml:lang* attributes is identical to the
708 behavior for *rdfs:label* elements.
- 709 • Although the example shows a single root class which the other classes subclass either directly
710 or indirectly, multiple root classes are permitted in an ontology. Also permitted are stand-alone
711 classes that neither subclasses some parent class nor are themselves parents to other child
712 classes.
- 713 • Multiple inheritance (a class being a subclass of multiple parent classes) is NOT permitted.

714 4 S-RAMP Query Model

715 The S-RAMP specification supports a robust query interface that compliant implementations MUST
716 support. It provides a way to find repository artifacts using a rich set of constraints. The query expression
717 in S-RAMP uses an XPath 2.0 based dialect. Refer to Section **Error! Reference source not found.** for
718 additional information on the S-RAMP query grammar. The expression predicates act as filters to identify
719 matching artifact instances. Filtering can be done based upon artifact metadata, including properties,
720 relationships and classifications. Complex criteria can be formed. One can for example, search for “all
721 services which are categorized as being in production”, or find “all the XML Schema documents which are
722 referenced by any WSDL document”, and so on. Queries are executed against a set of S-RAMP artifacts
723 using the criteria provided and the result returned is a set of S-RAMP artifacts. Furthermore, all artifact
724 types both concrete and abstract are eligible for use in the query expressions.
725 Specific request and response syntax for executing query requests is, however, binding specific. Details
726 can be found in the relevant binding document(s) of this specification. This document covers the
727 common features of an S-RAMP query, independent of their invocation syntax.

728 4.1 Query Dialect (XPath2) Context

729 Since the S-RAMP query model is based on XPath2 [**XPATH**], this specification defines a static context
730 for the information available during static analysis of a query expression prior to its evaluation, as well as
731 a dynamic context for the information available when the expression is evaluated.

732 Static analysis of query expressions is performed using the following static context:
733

734 *Table 8: Static Context for S-RAMP Query Expressions*

Component	Value
XPath 1.0 Compatibility Mode	False
Statically known namespaces	See Table 4: Prefixes and XML Namespaces Used in this Specification
Default element/type namespaces	http://docs.oasis-open.org/s-ramp/ns/s-ramp-v1.0
Default function namespace	http://docs.oasis-open.org/s-ramp/ns/s-ramp-v1.0
In-scope schema definitions	S-RAMP schemas are defined at https://www.oasis-open.org/committees/tc_home.php?wg_abbrev=s-ramp . A copy is included in the Appendices of this document.
In-scope variables	Only the variables used in a template based query expression (typically applies to Stored Query)
Context item static type	<code>element(http://docs.oasis-open.org/s-ramp/ns/s-ramp-v1.0, record)</code>
Function signatures	Functions defined in XQuery 1.0 and XPath 2.0 Functions and Operators document [QUERYOPS], plus functions defined in Section Query Functions
Statically known collations	<u>none</u>
Default collation	http://www.w3.org/2005/xpath-functions/collation/codepoint
Base URI	<u>none</u>
Statically known documents	<u>none</u>

Statically known collections	none
Statically known default collection type	none

735

736 The following dynamic context defines the default values that are available during evaluation of an S-
 737 RAMP query expression:

738

739 *Table 9: Dynamic Context for S-RAMP Query Expressions*

Component	Value
context item	dynamic; node changes during evaluation of the expression
context position	1
context size	1
Variable values	none
Function implementations	function implementations are on a per-server basis
Current dateTime	date and time on server against which request is made
Implicit time zone	UTC+/-0
Available documents	none
Available collections	none
Default collection	"s-ramp"

740

741 The domain of an S-RAMP query is the structure of the data model defined by its schemas, using the
 742 Artifact Model and Artifact Type reference syntax described in **Error! Reference source not found..**

743 Additional features and limitations of S-RAMP query support:

- 744 • Uses the XPath2 default Axis of ancestor / child
- 745 • The XPath abbreviated paths listed below are not supported:
 - 746 ○ '..'
- 747 • XPath2 Node types are not supported
 - 748 ○ Comments, text and so on are not relevant in an S-RAMP query

749 4.2 Query Expression Predicates

750 The default namespace assumed in an S-RAMP query is <http://docs.oasis-open.org/s-ramp/ns/s-ramp-v1.0>. S-RAMP query expressions allow filtering of the path expression using XPath 2.0 predicates, in the form:

753

754 {path-expression} [{predicate}]

755

756 where:

757

758 {path-expression} = /s-ramp/{ArtifactModel}/{ArtifactType}

759

760 corresponds to the S-RAMP Artifact Model and Type reference syntax (see Table 5: Pre-Defined Artifact
761 Type Models); and:

762

763 {predicate}

764

765 is an XPath2 predicate which conforms to the S-RAMP query grammar (see SectionQuery Grammar).

766

767 When evaluated, the predicate returns true or false, and thus filters the set of artifacts returned from the
768 query. Predicates can use combinations of artifact properties, relationships and classifications. The
769 predicate sets the context for evaluating the query, making it wider or narrower. If a query predicate uses
770 a property which is not defined on an artifact instance whose scope is within the path-expression, then
771 the predicate is false for that artifact and it is not returned from the query. Several examples follow:

772

773 *Example 3: Query Expressions Using Properties*

774 `/s-ramp/xsd/XsdDocument[@someProperty]`

- 775 o Returns *XsdDocument* artifact instances which have a generic property named
776 "someProperty".

777 `/s-ramp/xsd/XsdDocument[@name = 'bob']`

- 778 o Returns *XsdDocument* artifact instances that have an artifact name whose value is
779 "bob".

780 `/s-ramp/serviceImplementation/ServiceInstance[@someProperty = 'high']`

- 781 o Returns *ServiceInstance* artifact instances having a generic property called
782 `someProperty` whose value equals 'high'.

- 783 o If the requested property is not defined on the artifact within the set of
784 artifacts selected for search, then the predicate is false and that artifact is
785 therefore not returned.

786

787 *Example 4: Query Expression Using Relationships*

788 `/s-ramp/wsdl/WsdlDocument[includedXsds]`

- 789 o Returns all the *WsdlDocument* artifact instance(s) representing WSDL documents for
790 which the query predicate evaluates to a non-empty context. The context here
791 consists of the targets of the `includedXsds` relationship; therefore any
792 *WsdlDocument* artifact that has at least one `includedXsds` relationship is returned.
793 o If the relationship in the predicate is not defined on a given artifact within the
794 set of artifacts selected for search, then the predicate expression is false and
795 that artifact is not returned.

796

797 *Example 5: Query Expressions Using Relationships and Properties*

798 `/s-ramp/wsdl/WsdlDocument[includedXsds[@someProperty='true']]`

- 799 o Only *WsdlDocument* artifact instances corresponding to WSDL documents which have at
800 least one `includedXsds` relationship instance, that has a property name of
801 "someProperty", whose value is "true" will be returned.
802 o If the relationship in the predicate is not defined on a given artifact whose
803 scope is within the path expression, then the predicate evaluates to false and
804 that artifact is not returned.

```

805
806 Example 6: Extended Artifacts
807     /s-ramp/ext/BpmnDocument[@name = 'LoanApproval']
808         ○ Returns only BpmnDocument extended artifact instances named 'LoanApproval'.
809
810
811 Example 7: Query Expressions Using Relationships as Sub-Artifact Sets
812     /s-ramp/wsdl/Message[@name='PurchaseRequestMessage']/part
813         ○ Returns all Part artifacts of the Message artifact named 'PurchaseRequestMessage'.

```

814 4.3 Query Functions

815 S-RAMP defines a number of its own query functions in addition to using some already defined in XPath
816 2.0 [**XPATH**]. This includes functions that provide several useful simplifications associated with how an
817 artifact is classified. These query functions use the following syntax:

```

818
819     s-ramp:{function-name}({artifact}, {category-value-1}, {category-value-2}, ...)

```

820 Table 10: Query Functions Used in S-RAMP below lists the functions used in S-RAMP. Each of the
821 examples for the classification-based functions it describes assumes the following conceptual OWL
822 ontology:

- 823 • class color
 - 824 ○ class red
 - 825 ○ class white
- 826 • class taste
 - 827 ○ class sour
 - 828 ○ class sweet
 - 829 ○ class spicy

830 where this ontology is used to classify a set of WsdlService artifact instances:

- ```

832 • name = "Bread" classifiedBy = ["white", "sweet"]
833 • name = "Wine" classifiedBy = ["red", "sweet"]
834 • name = "Chili" classifiedBy = ["red", "spicy"]

```

835  
836 and each of the classifiedBy URI references to these will be abbreviated simply as the class name here  
837 for brevity:

838 Table 10: Query Functions Used in S-RAMP

| Function                 | Descriptions & Examples                                                                                                                                                                                          |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| s-ramp:classifiedByAnyOf | <p>Returns all artifact instances classified by at least one of the specified OWL URIs or their subtypes.</p> <p>Syntax: <code>classifiedByAnyOf({artifact}, {classifiedBy_1}, {classifiedBy_2}, ...)</code></p> |

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                 | <p>Using the classification example setup preceding this table, this example returns all 3 <i>WsdlService</i> artifact instances:</p> <pre>/s-ramp/wsdl/WsdlService[classifiedByAnyOf(., 'taste')]</pre> <p>This example returns the Wine and Chili <i>WsdlService</i> artifact instances:</p> <pre>/s-ramp/wsdl/WsdlService[classifiedByAnyOf(., 'red', 'spicy')]</pre>                                                                                                                                                                                               |
| s-ramp:classifiedByAllOf        | <p>Returns all artifact instances classified by every one of the specified OWL URIs or their subtypes.</p> <p>Syntax: <code>classifiedByAllOf({artifact}, {classifiedBy_1}, {classifiedBy_2},...)</code></p> <p>This example returns all 3 <i>WsdlService</i> artifact instances:</p> <pre>/s-ramp/wsdl/WsdlService[classifiedByAllOf(., 'taste')]</pre> <p>This example returns only the Wine <i>WsdlService</i> artifact instance:</p> <pre>/s-ramp/wsdl/WsdlService[classifiedByAllOf(., 'red', 'sweet')]</pre>                                                     |
| s-ramp:exactlyClassifiedByAnyOf | <p>Returns all artifact instances classified by at least one of the specified OWL URIs. Subtypes are not considered:</p> <p>Syntax: <code>exactlyclassifiedByAnyOf({artifact}, {classifiedBy_1}, {classifiedBy_2},...)</code></p> <p>This example returns none of the <i>WsdlService</i> artifact instances:</p> <pre>/s-ramp/wsdl/WsdlService[exactlyClassifiedByAnyOf(., 'taste')]</pre> <p>This example returns only the Wine and Chili <i>WsdlService</i> artifact instances:</p> <pre>/s-ramp/wsdl/WsdlService[exactlyClassifiedByAnyOf(., 'red', 'taste')]</pre> |
| s-ramp:exactlyClassifiedByAllOf | <p>Returns all artifact instances classified by every one of the specified OWL URIs. Subtypes are not considered:</p> <p>Syntax: <code>exactlyclassifiedByAllOf({artifact}, {classifiedBy_1}, {classifiedBy_2},...)</code></p> <p>This example returns none of the <i>WsdlService</i> artifact instances:</p> <pre>/s-ramp/wsdl/WsdlService[exactlyClassifiedByAllOf(., 'taste')]</pre> <p>This example returns only the Wine <i>WsdlService</i> artifact instance:</p> <pre>/s-ramp/wsdl/WsdlService[exactlyClassifiedByAllOf(., 'red', 'sweet')]</pre>               |

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| xp2:matches | <p>This is the XPath 2.0 matches function, which returns an xsd:boolean indicating whether {value} of its first argument matches the regular {expression} that is its second argument.</p> <p>Syntax: matches( {value}, {expression} )</p> <p>The expression may use wildcards, but only in the form ‘.*’</p> <p>This example returns all artifact instances (of any Artifact Type) from the Service Implementation Model, whose artifact <i>name</i> matches “.*account.*”, and a user-defined <i>version</i> property whose value is ‘1’.</p> <pre>/s-ramp/serviceImplementation[xp2:matches(@name, ‘.*account.*’)     and @version = ‘1’]</pre>                                          |
| xp2:not     | <p>This is the XPath 2.0 “not” (negation) function, which accepts an xsd:boolean as its input and returns the inversion.</p> <p>Syntax: not( {boolean-expression} )</p> <p>Within the context of the S-RAMP query language, this function can only be applied within the predicate, and the ‘boolean-expression’ is restricted to a property or relationship. This effectively addresses the use-case of searching for artifacts that do not have a given property or relationship.</p> <pre>/s-ramp/core/Document[xp2:not(@user-property)] /s-ramp/wsdl/Part[xp2:not(element)]</pre> <p>Note: to invert a property value, simply use the ‘!=’ operator rather than the ‘not’ function.</p> |

## 839    4.4 Query Grammar

840    This section describes the XPath2 based query grammar used in S-RAMP. It is based on a redacted  
 841    subset of the XPath 2.0 grammar [[XPATH](#)].

842

843    **QName ::=**

844                [<http://www.w3.org/TR/REC-xml-names/#NT-QName>]

845

846    **s-ramp query ::=**

847                artifact -set

848                | artifact -set '[' predicate '']'

849                | artifact -set '[' predicate ']' '/' subartifact-set

850

851    **artifact- set::=**

852                location-path

853

```

854 location-path::=
855 /s-ramp
856 |/s-ramp/<artifact-model>
857 | /s-ramp/<artifact-model>/<artifact-type>
858 | //<artifact-model>
859 | //<artifact-type>
860 subartifact-set::=
861 relationship-path
862 | relationship-path '[' predicate ']'
863 | relationship-path '[' predicate ']' '/' subartifact-set
864 | FunctionCall
865
866 relationship-path::=
867 any-outgoing-relationship
868 | <s-ramp-relationship-type>
869
870 any-outgoing-relationship::=
871 outgoing
872
873 Predicate::=
874 Expr
875
876 Expr::=
877 AndExpr
878
879 AndExpr::=
880 OrExpr
881 | AndExpr 'and' OrExpr
882
883 OrExpr::=
884 EqualityExpr
885 | OrExpr 'or' EqualityExpr
886
887 EqualityExpr::=
888 subartifact-set
889 |ForwardPropertyStep
890 | ForwardPropertyStep '=' PrimaryExpr
891 | ForwardPropertyStep '!=' PrimaryExpr
892 | ForwardPropertyStep '<' PrimaryExpr
893 | ForwardPropertyStep '>' PrimaryExpr
894 | ForwardPropertyStep '<=' PrimaryExpr
895 | ForwardPropertyStep '>=' PrimaryExpr
896 | '(' Expr ')'
897

```

```

998 PropertyQName ::=

999 QName

100

101 PrimaryExpr ::=

102 Literal

103 | Number

104 | '$' <PropertyQName>

105

106 ForwardPropertyStep ::=

107 Subartifact-set'/@<PropertyQName>|@<PropertyQName>

108

109 FunctionCall ::=

110 FunctionName '(' (Argument (',' Argument)*)? ')'

111

112 Argument ::=

113 PrimaryExpr

114 | Expr

115

116 Literal ::=

117 "" [^"]* "" | """ [^']* """

118

119 Number ::=

120 Digits ('.' Digits?)? | '.' Digits

121

122 Digits ::=

123 [0-9]+

124

125 FunctionName ::=

126 QName – NodeType

127

128 NodeType ::=

129 'comment'

130 | 'text'

131 | 'processing-instruction'

132 | 'node'

```

## 933 4.5 Stored Queries

934 S-RAMP provides support for storing queries in the repository using the *StoredQuery* Artifact Type. This  
 935 can be convenient because it allows quick execution of a frequently performed query. The syntax  
 936 associated with creation, retrieval, update and deletion of a Stored Query is binding specific. Refer to the  
 937 appropriate binding document of this specification for details.

938

939 The *StoredQuery* Artifact Type does NOT extend *BaseArtifactType* as do most other Artifact Types in S-  
940 RAMP, which means it is simpler and possesses only these built-in attributes:

- 941     • queryName: The name of the Stored Query instance. This must be unique.  
942     • queryExpression: The specification of the query expression.

943

944 A *StoredQuery* MAY also contain a list of propertyName values. These are used to indicate to the server  
945 that the results returned from the execution of the query SHALL include values for those property names  
946 when they are present in the artifact instance(s) returned. This can be valuable in bindings that may not  
947 necessarily return the complete artifact in query results. The actual format of the query response is  
948 binding specific.

---

949

## 5 Conformance

950

### 5.1 Introduction

951 S-RAMP defines a data model and protocol for Service Repository implementations.

952 An implementation is not compliant with this specification if it fails to satisfy one or more of the MUST or  
953 REQUIRED level requirements defined herein.

954 The XML Schemas take precedence over the normative text within this specification that takes  
955 precedence over the S-RAMP XML Schema in the appendix of this document. The authoritative S-RAMP  
956 XML Schema is published at:

957

958 [https://www.oasis-open.org/committees/tc\\_home.php?wg\\_abbrev=s-ramp](https://www.oasis-open.org/committees/tc_home.php?wg_abbrev=s-ramp)

959

960 This specification addresses the following aspects of conformance:

- 961
  - Data Model
  - Classification Systems
  - Query Model

964

### 5.2 Data Model

965 A conformant implementation MUST include support for the following data models defined in Section 2 of  
966 this specification:

967

968 Note: "M" means mandatory-to-implement. "O" means optional.

969

970 *Table 11: Required Data Models*

| Data Model                           | M/O |
|--------------------------------------|-----|
| Core Model: Document                 | M   |
| Core Model: XmlDocument              | M   |
| Extended Model: ExtendedArtifactType | M   |
| Extended Model: ExtendedDocument     | M   |
| XSD Model: XsdDocument               | M   |
| XSD Model: ElementDeclaration        | M   |
| XSD Model: AttributeDeclaration      | M   |
| XSD Model: ComplexTypeDeclaration    | M   |
| XSD Model: SimpleTypeDeclaration     | M   |
| WSDL Model: WsdlDocument             | M   |
| WSDL Model: WsdlService              | M   |
| WSDL Model: Port                     | M   |

|                                    |   |
|------------------------------------|---|
| WSDL Model: Binding                | M |
| WSDL Model: PortType               | M |
| WSDL Model: BindingOperation       | M |
| WSDL Model: BindingOperationInput  | M |
| WSDL Model: BindingOperationFault  | M |
| WSDL Model: BindingOperationOutput | M |
| WSDL Model: Operation              | M |
| WSDL Model: OperationInput         | M |
| WSDL Model: OperationOutput        | M |
| WSDL Model: Fault                  | M |
| WSDL Model: Message                | M |
| WSDL Model: Part                   | M |
| WSDL Model: WsdlExtension          | O |
| SOAP WSDL Model: SoapAddress       | M |
| SOAP WSDL Model: SoapBinding       | M |
| Policy Model: PolicyDocument       | M |
| Policy Model: PolicyAttachment     | M |
| Policy Model: PolicyExpression     | M |
| SOA Model: SoaModelType            | M |
| SOA Model: ServiceInterface        | M |
| SOA Model: Effect                  | M |
| SOA Model: Event                   | M |
| SOA Model: InformationType         | M |
| SOA Model: Policy                  | M |
| SOA Model: PolicySubject           | M |
| SOA Model: ServiceContract         | M |
| SOA Model: Element                 | M |
| SOA Model: Service                 | M |
| SOA Model: Actor                   | M |
| SOA Model: Organization            | M |
| SOA Model: System                  | M |
| SOA Model: Task                    | M |
| SOA Model: Composition             | M |

|                                                              |   |
|--------------------------------------------------------------|---|
| SOA Model: ServiceComposition                                | M |
| SOA Model: Choreography                                      | M |
| SOA Model: Collaboration                                     | M |
| SOA Model: Orchestration                                     | M |
| SOA Model: Process                                           | M |
| SOA Model: ChoreographyProcess                               | M |
| SOA Model: CollaborationProcess                              | M |
| SOA Model: OrchestrationProcess                              | M |
| Service Implementation Model: ServiceImplementationModelType | M |
| Service Implementation Model: ServiceInstance                | M |
| Service Implementation Model: ServiceOperation               | M |
| Service Implementation Model: ServiceEndpoint                | M |
| Service Implementation Model: ServiceOperation               | M |

971

## 972 **5.3 Classification Systems**

973 A conformant implementation MAY support OWL Lite classification systems as defined in Classification  
 974 Systems in S-RAMP of this specification. If an implementation chooses not to support OWL Lite  
 975 classification systems, then it MUST fail if a value is added to the 'classifiedBy' attribute as defined in  
 976 Classifications.

## 977 **5.4 Query Model**

978 S-RAMP defines an XPath 2 based query model. The following table lists the features of the S-RAMP  
 979 Query Model and their conformance requirement:

980

981 Note: "M" means mandatory-to-implement. "O" means optional.

| Query Model Feature           | Example                               | M/O |
|-------------------------------|---------------------------------------|-----|
| All Artifact Query            | /s-ramp                               | M   |
| Filter by Artifact Model      | /s-ramp/wsdl                          | M   |
| Filter by Artifact Type       | //ElementDeclaration                  | M   |
| Filter by Both                | /s-ramp/policy/PolicyAttachment       | M   |
| Filter by Core Attribute      | //ElementDeclaration[@version='1.0']  | M   |
| Filter by Custom Attribute    | //ElementDeclaration[@foo='bar']      | M   |
| Filter by Relationship        | //ElementDeclaration[includedXsds]    | M   |
| Filter by Relationship Target | //Part[includedXsds[@name='xyz.xsd']] | M   |
| Negation by Attribute         | //ElementDeclaration[not(@foo)]       | M   |

|                                           |                                                         |   |
|-------------------------------------------|---------------------------------------------------------|---|
| Negation by Relationship                  | //Part[not(element)]                                    | M |
| Function: matches()                       | //Part[xp2:matches(@name, 'foo.*')]                     | M |
| Function: s-ramp:classifiedByAnyOf        | //Document[s-ramp:classifiedByAnyOf(., 'spicy')]        | O |
| Function: s-ramp:classifiedByAllOf        | //Document[s-ramp:classifiedByAllOf(., 'spicy')]        | O |
| Function: s-ramp:exactlyClassifiedByAnyOf | //Document[s-ramp:exactlyClassifiedByAnyOf(., 'spicy')] | O |
| Function: s-ramp:exactlyClassifiedByAllOf | //Document[s-ramp:exactlyClassifiedByAllOf(., 'spicy')] | O |
| Boolean Filters                           | //Part[@name='invoice' and @prop1='val1']               | M |
| Sub-Artifact Sets                         | //Message[@name='customer']/part                        | O |

1013    **Appendix B. Non-Normative Text**

1014    This specification provides no additional non-normative information at this time. It is expected that best  
1015    practices for S-RAMP Repositories will emerge over time as this specification is adopted by vendors and  
1016    users.

1017

## Appendix D. Glossary

| Term                         | Definition                                                                                                                               |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| Artifact Type                | The data type of an S-RAMP artifact.                                                                                                     |
| Artifact Type Model          | Grouping of similar S-RAMP Artifact Types (e.g. wsdl, policy).                                                                           |
| Service Implementation Model | Set of S-RAMP Artifact Types and relationships that describe the service implementation layer associated with the SOA Model.             |
| Core Model                   | Set of basic Artifact Types.                                                                                                             |
| Policy Model                 | Set of Policy document related derived Artifact Types.                                                                                   |
| Relationship                 | The logical triple of a Relationship Type, Source and Target. Relationships in S-RAMP are all directed from a source, to a target.       |
| Relationship Type            | A name that represents the type of the relationship (e.g., "includedXsds"). Multiple relationships can share the same Relationship Type. |
| SOA Model                    | Set of Artifact Types and relationships used to link The Open Group's SOA Ontology artifact types with those in the S-RAMP data model.   |
| WSDL Model                   | Set of WSDL document related derived data types.                                                                                         |
| XSD Model                    | Set of XSD document related derived data types.                                                                                          |
| Extended Artifact Model      | An S-RAMP model whose content and structure has been defined by the client.                                                              |
