## Additional artifacts:

This prose specification is one component of a Work Product which also includes:

- XML schemas: <http://docs.oasis-open.org/saf/saf/v1.0/csprd02/schemas/>

Declared XML namespace:

- ~~<http://docs.oasis-open.org/saf/ns/symptoms/2011/10>~~

- <http://docs.oasis-open.org/saf/ns/symptoms/2012/07/>

Abstract:

This document normatively defines a reference architecture for the Symptoms Automation Framework, a tool in the automatic detection, optimization, and remediation of operational aspects of complex systems, notably data centers. It also provides a non-normative XML data

model, based on a pseudo schema, and ~~a normative set of schema and WSDL documents~~ an XSD.

**Status:**

This document was last revised or approved by the OASIS Symptoms Automation Framework (SAF) TC on the above date. The level of approval is also listed above. Check the “Latest version” location noted above for possible later revisions of this document.

Technical Committee members should send comments on this specification to the Technical Committee’s email list. Others should send comments to the Technical Committee by using the “Send A Comment” button on the Technical Committee’s web page at <http://www.oasis-open.org/committees/saf/>.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (<http://www.oasis-open.org/committees/saf/ipr.php>).

**Citation format:**

When referencing this specification the following citation format should be used:

# 1 Introduction

The Symptoms Automation Framework is architecture for enabling interoperable diagnosis and treatment of complex systems. The architecture is implementation agnostic yet it supports both stateful or real-time processing and postmortem diagnostics. The key constituent of the architecture is the Symptom, an instance indicating an observed negative or positive condition. Symptoms can be characterized by a Syndrome, which is a published pattern of conditions and other Symptoms. Once identified, a Syndrome can be treated (either to remedy a problem or enhance positive characteristics of the system) by application of one or more Protocols, which describe how to carry out a process to treat, optimize, or further diagnose the Syndrome. The Protocol is rendered to a specific situation and subject in the form of a Prescription. The framework also provides for diagnostics, a type of Protocol, to provide further information to refine the diagnosis of a given Syndrome. These four main elements comprise the Symptoms information model, presented in the next section. This document also defines the key actors that participate in the Symptoms cycle of identify, diagnose, and treat, namely the Syndrome Catalog, Case Manager, Symptom Source, Diagnostician, and Practitioner. Lastly, a collection of interfaces, which may be supported by these actors, is described.

## 1.1 Terminology

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in [RFC2119].

### 1.1.1 Notational Conventions

This specification uses a notational convention, referred to as “Pseudo-schemas” in a fashion similar to the WSDL 2.0 Part 1 specification. A Pseudo-schema uses a BNF-style convention to describe attributes and elements:

- '?' denotes optionality (i.e. zero or one occurrences),
- '\*' denotes zero or more occurrences,
- '+' one or more occurrences,
- '[' and ']' are used to form groups,
- '|' represents choice.
- Attributes are conventionally assigned a value corresponding to their type.

```
<!-- sample pseudo-schema -->
<element
  required_attribute_of_type_QName="xs:QName"
  optional_attribute_of_type_string="xs:string"? >
<required_element />
<optional_element />?
<one_or_more_of_these_elements />+
<zero_or_more_of_these_elements />*
  [ <choice_1 /> | <choice_2 /> ]
</element>
```

## 1.2 XML Namespaces

The following namespaces are used in this document:

Prefix	Namespace
xsd	http://www.w3.org/2001/XMLSchema
saf	http://docs.oasis-open.org/saf/ns/symptoms/ <del>2011/10</del> 2012/07

42

43 **1.3 Normative References**

44 **[RFC2119]** S. Bradner, *Key words for use in RFCs to Indicate Requirement Levels*,  
45 <http://www.ietf.org/rfc/rfc2119.txt>, IETF RFC 2119, March 1997.  
46  
47 **[XPath20]** A. Berglund et al, XML Path Language, version 2.0,  
48 <http://www.w3.org/TR/xpath20/>, January 2007.  
49  
50 **[XQUERY]** S. Boag et al, XQuery 1.0: An XML Query Language,  
51 <http://www.w3.org/TR/xquery/>, January 2007.  
52  
53 **[XML10]** T. Bray et al, Extensible Markup Language (XML) 1.0, November 2008.  
54  
55

**NOTE: The proper format for a citation to an OASIS Technical Committee's work (whether Normative or Non-Normative) is:**

~~OASIS~~

~~Stage (Committee Draft 01, Committee Draft 02, Committee Specification 01, etc. or Standard)~~

~~Title (italicized or in quotation marks)~~

~~Approval Date (Month YYYY)~~

~~URI of the actual Authoritative Specification (namespace is not acceptable as the content changes over time)~~

~~For example:~~

~~**EDXL-HAVE** — OASIS Standard, "Emergency Data Exchange Language (EDXL) Hospital  
AVailability Exchange (HAVE) Version 1.0", November 2008.  
— [http://docs.oasis-open.org/emergency/edxl-have/os/emergency\\_edxl\\_have-1.0-spec-os.doc](http://docs.oasis-open.org/emergency/edxl-have/os/emergency_edxl_have-1.0-spec-os.doc)~~

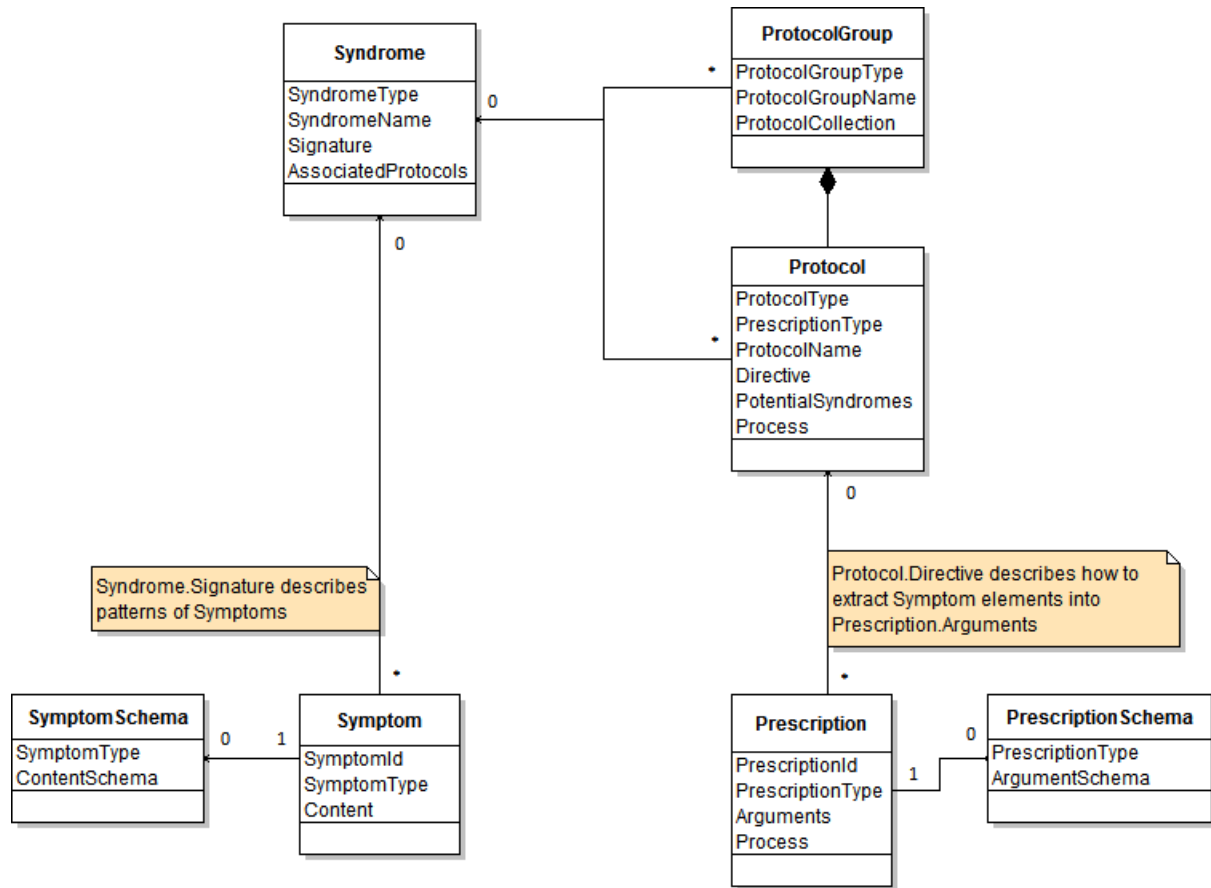

56

57

58

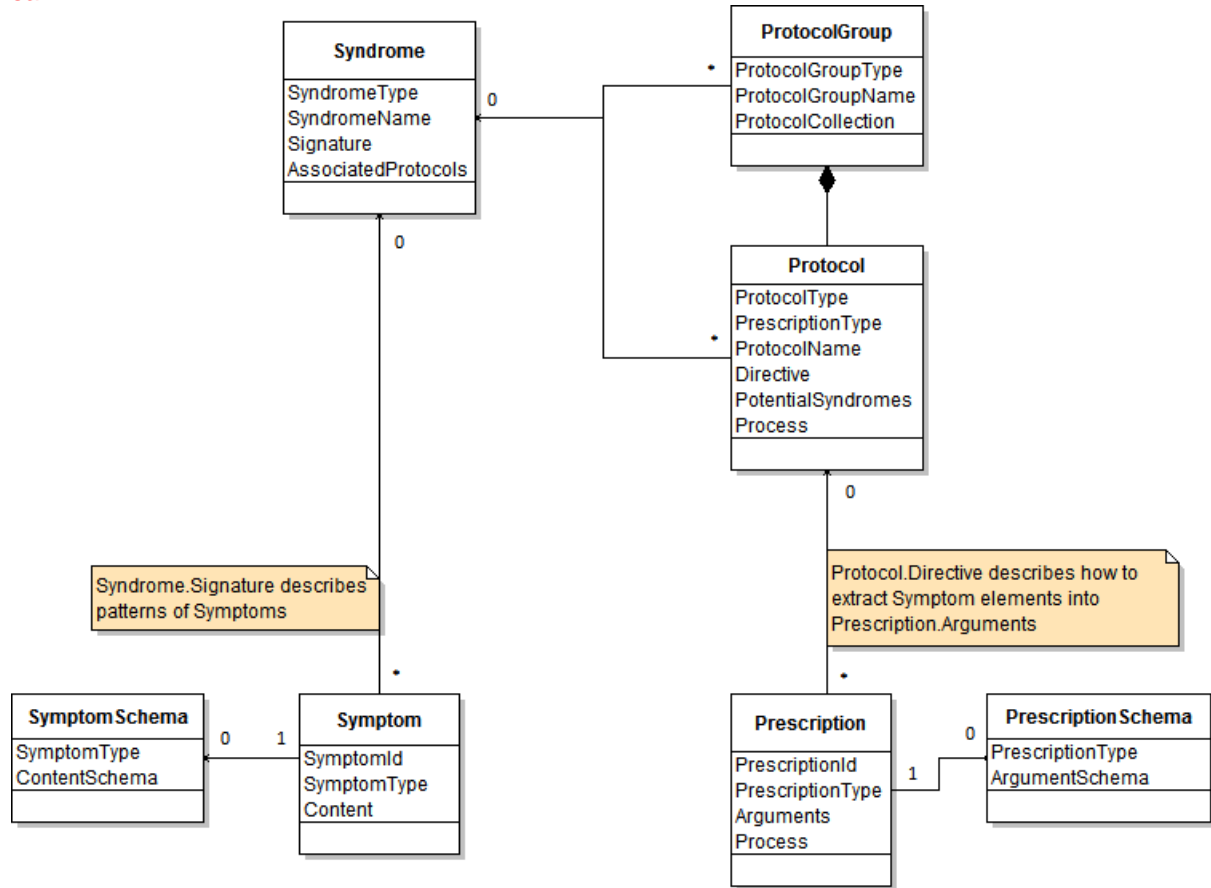

59

## 2 Information Model

63 saf:

64

## 65 2.1 SAFType

66 The SAFType is a definition used throughout the specification to represent a unique semantics for an  
67 element.

Field	Type	Properties	Description
Uri	anyURI	Required, Immutable	The Uri, uniquely defines the semantics of the SAFType.
Version	string	Optional, Immutable	The Version, in combination with Uri to establish supplemental uniqueness of a SAFType.

68

### 69 2.1.1 Non Normative Pseudo Schema

70 The following is one possible non-normative pseudo schema for the SAFType.

```

71 | <saf:SAFType>
72 |   <Uri>xsd:anyURI</Uri>
73 |   <Version>xsd:string</Version>?
74 | </saf:SAFType>

```

75

76 Example of a SAFType for a Fever Syndrome:

```

77 | <saf:SAFType>
78 |   <Uri>http://safexample.com/saf/types/syndromes/fever/</Uri>
79 |   <Version>1</Version>
80 | </saf:SAFType>

```

81

## 82 2.2 Syndrome

83 A Syndrome is an identifiable collection of zero or more related Symptoms (as identified by a signature).  
84 Since a Syndrome describes a Symptom (see below) a Syndrome can be thought of as describing a class  
85 of Symptom Instances.

Field	Type	Properties	Description
Syndrome Type	saf:SAFType	Required, Immutable	The SyndromeType uniquely defines the semantics of the Syndrome.
Syndrome Name	string	Required, Mutable	A descriptive name for the Syndrome.
Description	string	Required, Mutable	A verbose explanation of the Syndrome for human consumption.
Likelihood	{VeryFrequent, Frequent, Balanced, Infrequent, Rare, NotAvailable}	Required, Mutable	An indication as to the typicality of this Syndrome.
Impact	{VeryHigh, High, Moderate, Low, Minimal, Unknown}	Required, Mutable	The effect of this Syndrome with respect to the consequences of not detecting, diagnosing, or treating it.
Urgency	{VeryHigh, High, Moderate, Low, VeryLow, Unknown}	Required, Mutable	The speed and tenacity with which this Syndrome should receive attention.
Signature	string	Required, Mutable	An XQuery expression [XQUERY] that detects an interesting pattern of Symptoms and defines how to recognize a Syndrome. If the result is empty the Syndrome is not present in the system. A non-empty result contains a valid XML document [XML10]. This document MAY contain matched Symptom instances or other information pertaining to the Syndrome. This document MUST be available for Processing Protocols.
Associated Protocols	ProtocolReference [0..n] ProtocolGroup Reference[0..n]	Optional, Mutable	A collection of diagnostic tests and actions, of which NONE or ONE may be prescribed by the Diagnostician. The list may contain zero or more Protocols and/or zero or more groups of Protocols. Protocols within a group are executed together.

## 86 2.2.1 Non Normative Pseudo Schema

87 The following is one possible non-normative pseudo schema for the Syndrome.

```
88 <Syndrome>
89   <SyndromeType>saf:SAFType</SyndromeType>
90   <SyndromeName>xsd:string</SyndromeName>
91   <Description>xsd:string</Description>
92   <Likelihood>
93     [Common|Uncommon|Rare|NotAvailable]
94   </Likelihood>
95   <Impact>
96     [HighImpact|ModerateImpact|LowImpact|UnknownImpact]
97   </Impact>
98   <Urgency>
99     [HighUrgency|ModerateUrgency|LowUrgency|UnknownUrgency]
100  </Urgency>
101  <Signature>xsd:string</Signature>
102  <AssociatedProtocols>
103    <ProtocolReference>saf:SAFType</ProtocolReference>*
104    <ProtocolGroupReference>saf:SAFType</ProtocolGroupReference>*
105  </AssociatedProtocols>?
106 </Syndrome>
```

107

108 Example of a Syndrome to identify Fever based on a temperature values (Symptoms) coming from  
109 sensors. The associated protocols will attempt a remediation, perhaps without fully understanding the  
110 symptoms, by giving aspirin, and also perform more diagnostic tests via the protocol group to determine  
111 the cause of the fever.

```
112 <Syndrome>
113   <SyndromeType>
114     <Uri>http://saf.com/types/syndromes/fever/</Uri>
115     <Uri>http://example.com/saf/types/syndromes/fever/</Uri>
116     <Version>2</Version>
117   </SyndromeType>
118   <SyndromeName>FeverSyndrome</SyndromeName>
119   <Description>Syndrome identifying fever</Description>
120   <Likelihood>Common</Likelihood>
121   <Impact>Low</Impact>
122   <Urgency>Moderate</Urgency>
123   <Signature>
124     for $x in /Symptoms/Symptom
125     where
126
127     $x[SymptomType="http://safexample.com/saf/types/symptoms/temperature/"
128       and $x/Content/Temperature[Value >= 38]
129     return $x
130   </Signature>
131   <AssociatedProtocols>
132     <ProtocolReference>
133       <Uri>http://saf.com/types/protocols/aspirin/</Uri>
134       <Uri>http://example.com/saf/types/protocols/aspirin/</Uri>
135     </ProtocolReference>
136     <ProtocolGroupReference>
137       <Uri>http://saf.com/types/protocol-groups/diagnosefever/</Uri>
138       <Uri>
139         http://example.com/saf/types/protocol-groups/diagnosefever/
140       </Uri>
141     </ProtocolGroupReference>
```

142 </AssociatedProtocols>  
143 </Syndrome>  
144

145 **2.3 Protocol**

146 A Protocol is a process for confirming a potential Syndrome diagnosis via the creation of validating  
 147 Symptoms, for remediating a Syndrome, optimizing the system, and/or preventing a Syndrome from  
 148 occurring. It provides the template necessary to create a Prescription.

Field	Type	Properties	Description
Protocol Type	saf:SAFType	Required, Immutable	ProtocolType uniquely defines the semantics of the Protocol.
Prescription Type	saf:SAFType	Required, Immutable	PrescriptionType uniquely defines the semantics of all Prescription instances, baring this type, created as a result of applying this Protocol and MUST be included in any generated Prescriptions.
Protocol Name	string	Required, Mutable	A descriptive name for the Protocol.
Description	string	Required, Mutable	A verbose explanation of the Protocol for human consumption.
Effectiveness	{Effective, PartiallyEffective, BestEffort, Ineffective, Inconclusive, Unknown}	Required, Mutable	The expected success of the Protocol.
Risk	{VeryHigh, High, Moderate, Low, VeryLow, Unknown}	Required, Mutable	The expected side effects or undesired consequences of running the Protocol.
Duration	{VeryLong, Long, Moderate, Short, VeryShort, Unknown}	Required, Mutable	The expected amount of time necessary to complete the Protocol.
Function	{Diagnostic, Preventative, Remedial, Diagnostic_Preventative, Diagnostic_Remedial, Preventative_Remedial, Diagnostic_Preventative_Remedial, Other}	Required, Mutable	The type of Protocol, either a remedial treatment, a preventative treatment, a confirming diagnostic, or a combination.
Directive	string	Required, Mutable	An XQUERY expression that generates an XML document containing information needed to create the Arguments of a Prescription instance. This document MAY contain Symptom elements or other information

			pertaining to the Syndrome or the system environment.
Potential Syndromes	Syndrome Reference[0..n]	Optional, Mutable	A list of Syndromes that can be indirectly matched as a result of the Protocol process.
Process	string	Optional, Mutable	Implementation specific diagnostic and treatment workflow instructions.

## 149 2.3.1 Non Normative Pseudo Schema

150 The following is one possible non-normative pseudo schema for the Protocol class.

```
151 <Protocol>
152   <ProtocolType>saf:Type</ProtocolType>
153   <PrescriptionType>saf:Type</PrescriptionType>
154   <ProtocolName>xsd:string</ProtocolName>
155   <Description>xsd:string</Description>
156   <Effectiveness>
157     [Effective|PartiallyEffective|
158      BestEffort|Ineffective|Inconclusive]
159   </Effectiveness>
160   <Risk>
161     [HighRisk|ModerateRisk|LowRisk|UnknownRisk]
162   </Risk>
163   <Duration>
164     [LongDuration|ModerateDuration|ShortDuration|UnknownDuration]
165   </Duration>
166   <Function>
167     [Diagnostic|Preventative|Remedial|
168      Diagnostic_Preventative|Diagnostic_Remedial|
169      Preventative_Remedial|Diagnostic_Preventative_Remedial|Other]
170   </Function>
171   <Directive>xsd:string</Directive>
172   <PotentialSyndromes>
173     <SyndromeReference>saf:SAFType</SyndromeReference>*
174   </PotentialSyndromes?>
175   <Process>xsd:string</Process?>
176 </Protocol>
```

177

178 Example of a Protocol designed to provide temporary remediation of the Fever Syndrome.

```
179 <Protocol>
180   <ProtocolType>
181     <Uri>http://saf.com/types/protocols/aspirin/</Uri>
182     <Uri>http://example.com/saf/types/protocols/aspirin/</Uri>
183   </ProtocolType>
184   <PrescriptionType>
185     <Uri>
186       http://saf.com/types/prescriptions/aspirin/
187       http://example.com/saf/types/prescriptions/aspirin/
188     </Uri>
189   </PrescriptionType>
190   <ProtocolName>AspirinProtocol</ProtocolName>
191   <Description>Medication for Fever</Description>
192   <Effectiveness>BestEffort</Effectiveness>
193   <Risk>Low</Risk>
194   <Duration>Short</Duration>
195   <Function>Remedial</Function>
196   <Directive>
197     for $x in /Symptoms/Symptom
198       let $subject := $x/Subject
199       let $value := fn:number($x/Content/Temperature/Value)
200       return
201     <Details>
202       <Subject>$subject</Subject>
203       (: Give 1 aspirins for every 2 degrees above 38 :)
204     <AspirinCount>
```

```
205         {if ($value > 38) then (  
206             fn:floor($value - 38) div 2)  
207             ) else (0)}  
208         </AspirinCount>  
209     </Details>  
210 </Directive>  
211 <PotentialSyndromes>  
212     <SyndromeReference>  
213         <Uri>  
214             http://saf.com/types/syndromes/fever/  
215             http://example.com/saf/types/syndromes/fever/  
216         </Uri>  
217     </SyndromeReference>  
218 </PotentialSyndromes>  
219 <Process>  
220     ProvisionAspirin (Subject, AspirinCount);  
221 </Process>  
222 </Protocol>
```

## 223 2.4 ProtocolGroup

224 A ProtocolGroup is a collection of Protocols which will be enacted together as a group. The Syndrome  
225 AssociatedProtocols field references Protocol and/or ProtocolGroup allowing for flexibility in how  
226 validation, remediation, optimization, and prevention processes are invoked.

Field	Type	Properties	Description
Protocol Group Type	saf:SAFType	Required, Immutable	ProtocolGroupType uniquely defines the semantics of the ProtocolGroup.
Protocol Group Name	string	Required, Mutable	A descriptive name for the ProtocolGroup.
Description	string	Required, Mutable	A verbose explanation of the ProtocolGroup for human consumption.
Protocol Collection	ProtocolReference [1..n]	Required, Mutable	A collection of one or more Protocols which must be enacted together as a group.

### 227 2.4.1 Non Normative Pseudo Schema

228 The following is one possible non-normative pseudo schema for the ProtocolGroup class.

```
229 <ProtocolGroup>  
230   <ProtocolGroupType>saf:SAFType</ProtocolGroupType>  
231   <ProtocolGroupName>xsd:string</ProtocolGroupName>  
232   <Description>xsd:string</Description>  
233   <ProtocolCollection>  
234     <ProtocolReference>saf:SAFType</ProtocolReference>+  
235   </ProtocolCollection>  
236 </ProtocolGroup>
```

237

238 Example of a Protocol designed to gather more information in the fever diagnosis.

```
239 <ProtocolGroup>  
240   <ProtocolGroupType>  
241     <Uri>http://saf.com/types/protocol-groups/diagnosefever/</Uri>  
242     <Uri>http://example.com/saf/types/protocol-groups/diagnosefever/</Uri>  
243   </ProtocolGroupType>  
244   <ProtocolGroupName>FeverDiagnosis</ProtocolGroupName>  
245   <Description>  
246     Actions necessary to diagnose the type of fever.  
247   </Description>  
248   <ProtocolCollection>  
249     <ProtocolReference>  
250       <Uri>http://saf.com/types/protocols/blood_culture/</Uri>  
251       <Uri>http://example.com/saf/types/protocols/blood_culture/</Uri>  
252     </ProtocolReference>  
253     <ProtocolReference>  
254       <Uri>http://saf.com/types/protocols/skin_temperature/</Uri>  
255       <Uri>http://example.com/saf/types/protocols/skin_temperature/</Uri>  
256     </ProtocolReference>  
257   </ProtocolCollection>  
258 </ProtocolGroup>
```

259

260 **2.5 Prescription**

261 A Prescription is an instance of a process, which MAY correspond to a Protocol. It is used to provide  
 262 remediation, diagnostics, preventative measures, or optimization to be performed. Prescriptions MAY  
 263 represent automated or Manual steps. A Prescription includes arguments specific to the subject or  
 264 component that is the target of the prescription.

Field	Type	Properties	Description
PrescriptionId	anyURI	Required, Unique, Immutable	The identifier for the Prescription. This element MUST be globally unique and MAY be used as the primary key for the Prescription.
Prescription Type	saf:SAFType	Required, Immutable	The PrescriptionType defines the semantics of this Prescription. All Prescriptions baring the same PrescriptionType MUST have the same semantics.
Expiration Date	dateTime	Optional, Mutable	An optional date recommendation beyond which the Prescription MAY no longer be useful.
Arguments	any	Optional, Mutable	The XML rendered arguments needed by the recipient of the Prescription to apply this Prescription to a specific target.
Process	string	Optional, Mutable	Optional process, such as a script to be executed by the recipient of the Prescription.

## 265 2.5.1 Non Normative Pseudo Schema

266 The following is one possible non-normative pseudo schema for the Prescription class.

```
267 <Prescription>
268   <PrescriptionId>xsd:anyURI</PrescriptionId>
269   <PrescriptionType>saf:SAFType</PrescriptionType>
270   <ExpirationDate>
271     xsd:dateTime
272   </ExpirationDate>?
273   <Arguments>xsd:any</Arguments>?
274   <Process>xsd:string</Process>?
275 </Prescription>
```

276

277 Example of a generated prescription that would check the arguments supplied and take the necessary  
278 (simplistic in this case) decisions.

```
279 <Prescription>
280   <PrescriptionId>
281     http://saf.com/prescriptions/aspirin/12345
282     http://example.com/saf/prescriptions/aspirin/12345
283   </PrescriptionId>
284   <PrescriptionType>
285     <Uri>http://saf.com/types/prescriptions/aspirin/</Uri>
286     <Uri>http://example.com/saf/types/prescriptions/aspirin/</Uri>
287     <Version>2</Version>
288   </PrescriptionType>
289   <ExpirationDate>2011-10-23</ExpirationDate>
290   <Arguments>
291     <Details>
292       <Subject>http://safexample.com/saf/subjects/patient-234</Subject>
293       <AspirinCount>2</AspirinCount>
294     </Details>
295   </Arguments>
296   <Process>
297     ProvisionAspirin(Subject, AspirinCount);
298   </Process>
299 </Prescription>
300
```

301 **2.6 Symptom**

302 A Symptom is the instance, possibly corresponding to a Syndrome and described by a Signature,  
 303 indicating that the condition or situation is present in the system. There SHOULD be a Syndrome  
 304 corresponding to each type of Symptom or a combination of Symptoms as identified by the Syndrome  
 305 signature. Unlike Syndromes and Protocols, which may be relatively static and represent the knowledge  
 306 within the framework, Symptoms represent the dynamic state of the system and are therefore expected to  
 307 be emitted frequently. Once emitted, Symptoms are immutable, and they can be safely used for audit  
 308 trails and historical record keeping.

309 Symptoms may be linked to other previously emitted symptoms by specifying the unique ID of those  
 310 symptoms and the type of relationship to them (e.g. causal, supersedes, custom, etc). Symptoms may  
 311 also be associated with other symptoms in a less direct manner through one or more incident IDs.

Field	Type	Properties	Description
SymptomId	anyURI	Required, Unique, Immutable	The identifier for the Symptom. This element MUST be globally unique and MAY be used as the primary key for the Symptom.
Symptom Type	saf:SAFType	Required, Immutable	This SymptomType defines the semantics of this Symptom. All Symptoms baring the same SymptomType MUST have the same semantics.
CreationDate	dateTime	Required, Immutable	The date-time (in UTC) when the Symptom was created. The value of this element SHOULD provide as much granularity as possible.
Confidence	{HighConfidence, ModerateConfidence, LowConfidence, UnknownConfidence}	Require, Immutable	The level of confidence in the accuracy and quality of this symptom, as determined by the Symptom Source.
Reporter	anyURI	Required, Immutable	Identification of the entity that emitted the Symptom.
Subject	anyURI	Required, Immutable	Identification of the entity exhibiting the Symptom.
Expiration Date	dateTime	Optional, Immutable	An optional date-time (in UTC) recommendation beyond which the Symptom may no longer be useful.
Related Symptoms	RelatedSymptom [0..n]	Optional, Immutable	A collection of previously emitted symptoms that are related to this symptom in one of a number of possible relationship types. The Symptom Emitter supplies this information.
Incident	anyURI [0..n]	Optional, Immutable	A Symptom Emitter can fill in this information denoting this Symptom to be part of a group of Symptoms all of which relate to the same incident.
Content	any	Optional, Immutable	An implementation dependent element that could contain such data as the raw events/messages that triggered the creation of the Symptom.

## 312 2.6.1 Non Normative Pseudo Schema

313 The following is one possible non-normative pseudo schema for the Symptom class.

```
314 <Symptom>
315   <SymptomId>xsd:anyURI</SymptomId>
316   <SymptomType>saf:SAFType</SymptomType>
317   <CreationDate>xsd:dateTime</CreationDate>
318   <Confidence>
319     [HighConfidence|ModerateConfidence|
320      LowConfidence|UnknownConfidence]
321   </Confidence>
322   <Reporter>xsd:anyURI</Reporter>
323   <Subject>xsd:anyURI</Subject>
324   <ExpirationDate>
325     xsd:DateTime
326   </ExpirationDate>?
327   <RelatedSymptoms>
328     <RelatedSymptom type="[Causal|Supersedes|Repetition|Other]">
329       xsd:anyURI
330     </RelatedSymptom>+
331   </RelatedSymptoms>?
332   <Incident>xsd:anyURI</Incident>?
333   <Content>xsd:any</Content>?
334 </Symptom>
```

335

336 Example of a symptom instance conveying temperature information from a sensor.

```
337 <Symptom>
338   <SymptomId>
339     http://saf.com/symptoms/temperature/2
340     http://example.com/saf/symptoms/temperature/2
341   </SymptomId>
342   <SymptomType>
343     <Uri>http://saf.com/types/symptom/temperature/</Uri>
344     <Uri>http://example.com/saf/types/symptom/temperature/</Uri>
345   </SymptomType>
346   <CreationDate>2011-10-24 13:10:05</CreationDate>
347   <Confidence>High</Confidence>
348   <Reporter>http://safexample.com/saf/reporters/tempsensor-123/</Reporter>
349   <Subject>http://safexample.com/saf/subjects/patient-234/</Subject>
350   <ExpirationDate>2011-10-24 14:10:05</ExpirationDate>
351   <RelatedSymptoms>
352     <RelatedSymptom type="Supersedes">
353       http://safexample.com/saf/symptoms/temperature/1
354     </RelatedSymptom>
355   </RelatedSymptoms>
356   <Incident>http://safexample.com/saf/incidents/12345/</Incident>
357   <Content>
358     <Temperature>
359       <Value>38</Value>
360       <Scale>C</Scale>
361     </Temperature>
362   </Content>
363 </Symptom>
```

364

365

366

367

## 368 2.7 SymptomSchema

369 A SymptomSchema describes the non-normative xml in the Content field of Symptoms. With this  
370 information, a catalog author has the complete picture of a Symptom definition for a given type, and is  
371 able to create Syndrome signatures describing patterns of interest within a collection of Symptoms.

372 The SymptomSchema entity is entirely optional within a SAF system, as the information needed to create  
373 Syndrome signatures could be gleaned from existing Symptoms in the SymptomStore. The  
374 SymptomSchema offers a more straightforward way of defining that information. One that doesn't require  
375 the pre-existence of Symptoms.

376 SymptomSchema is most closely aligned with the role of Symptom Source. These sources can optionally  
377 register SymptomSchema entries into the Catalog for each type of Symptom.

Field	Type	Properties	Description
Symptom Type	saf:SAFType	Required, Unique, Immutable	This SymptomType defines the semantics of this SymptomSchema. All SymptomSchemas baring the same SymptomType MUST have the same semantics.
Content Schema	any	Required	Describes the Symptom Content xml for this type via XML Schema Document notation.

### 378 2.7.1 Non Normative Pseudo Schema

379 The following is one possible non-normative pseudo schema for the SymptomSchema class.

```
380 <SymptomSchema>  
381   <SymptomType>saf:SAFType</SymptomType>  
382   <ContentSchema>xsd:any</ContentSchema>  
383 </SymptomSchema>
```

384

385 Example of a schema for temperature information.

```
386 <SymptomSchema>  
387   <SymptomType>  
388     <Uri>http://saf.com/types/symptom/temperature/</Uri>  
389     <Uri>http://example.com/saf/types/symptom/temperature/</Uri>  
390   </SymptomType>  
391   <ContentSchema>  
392     <Temperature>  
393       <Value>xsd:float</Value>  
394       <Scale>[C|F]</Scale>  
395     </Temperature>  
396   </ContentSchema>  
397 </SymptomSchema>
```

398

## 399 2.8 PrescriptionSchema

400 A PrescriptionSchema describes the non-normative xml in the Arguments field of Prescriptions. With this  
401 information, a catalog author has the complete picture of a Prescription definition for a given type, and is  
402 able to create the Protocol directives used to translate pattern results into Prescription arguments.

403 The PrescriptionSchema entity is entirely optional within a SAF system, as the information needed to  
404 create Protocol directives could be manually gleaned from external Practitioner documents and so forth.  
405 The PrescriptionType offers a more straightforward way of defining that information.

406 PrescriptionSchema is most closely aligned with the role of Practitioner. The Practitioner can optionally  
407 register PrescriptionSchema entries into the Catalog for each type of Prescription.

Field	Type	Properties	Description
Prescription Type	saf:SAFType	Required, Unique, Immutable	The PrescriptionType defines the semantics of this PrescriptionSchema. All PrescriptionSchemas bearing the same PrescriptionType MUST have the same semantics.
Argument Schema	any	Required	Describes the Prescription Argument xml for this type via XML Schema Document notation.

### 408 2.8.1 Non Normative Pseudo Schema

409 The following is one possible non-normative pseudo schema for the Prescription class.

```
410 <PrescriptionSchema>  
411   <PrescriptionType>saf:SAFType</PrescriptionType>  
412   <ArgumentSchema>xsd:any</ArgumentSchema>  
413 </PrescriptionSchema>
```

414

415 Example of a schema for the aspirin disposing Prescription.

```
416 <PrescriptionSchema>  
417   <PrescriptionType>  
418     <Uri>http://saf.com/types/prescriptions/aspirin/</Uri>  
419     <Uri>http://example.com/saf/types/prescriptions/aspirin/</Uri>  
420     <Version>2</Version>  
421   </PrescriptionType>  
422   <ArgumentSchema>  
423     <Details>  
424       <Subject>xsd:anyURI</Subject>  
425       <AspirinCount>xsd:integer</AspirinCount>  
426     </Details>  
427   </ArgumentSchema>  
428 </PrescriptionSchema>
```

429

---

## **3 Architectural Roles**

430 An implementation of the Symptoms Automation Framework MAY implement any of the roles detailed  
431 below. If an implementation provides a capability described by any of the roles, it MUST implement that  
432 capability as specified below. An implementation MAY incorporate all the roles into a single entity or MAY  
433 define separate entities for collections of roles. More than one instance of any role MAY be present in an  
434 implementation of the Symptoms Automation Framework.

### **2.9.13.1 Information Sources**

436 This specification defines two information sources, the Syndrome and Protocol Catalogue (Catalogue for  
437 short), and the Symptom Store. This specification does not prescribe the method for persisting the  
438 information sources (e.g. data base, files store, memory image, etc.). This specification prescribes the  
439 contents of the data exchange and recommends a set of schemas by which this data is communicated to  
440 and from other roles and components of the Symptoms Automation Framework.

#### **2.9.13.1.1 Syndrome and Protocol Catalog**

442 The Catalog contains Syndromes and Protocols associated with the system for which that Catalog was  
443 designed, as well as SymptomSchema and PrescriptionSchema which define the schemata for the  
444 Symptom content and the Prescription arguments respectively. In any Symptoms Automation Framework  
445 there MAY be several Catalogs, each possibly associated with a specialized aspect of the system. While  
446 the Catalog is generally static during operation of the Symptoms Automation Framework, it MAY evolve  
447 over time as new Syndromes and Protocols are identified. The data exchange to and from the Catalog  
448 MUST comply with the Syndromes and Protocols as defined in this specification.

#### **2.9.23.1.2 Symptom Store**

449 The Symptoms Store is an optional repository when Symptom persistence is desired and contains  
450 Symptoms that have been created by Symptom sources. In any Symptoms Automation Framework there  
451 MAY be several Symptom Stores. The Symptom Store is dynamic and its contents are expected to  
452 change continuously during the operation of the Symptoms Framework. The currency of the Symptom  
453 Store is dependent on many factors such as Symptom Source emission rate, network latency, store  
454 frequency, etc. The data flows to and from the Symptoms Store MUST carry Symptoms as defined in this  
455 specification.  
456

### **2.10.3.2 Active Roles**

458 The Active Roles in the Symptoms Automation Framework include Catalog Sources, Symptoms Sources,  
459 a Case Manager, a Diagnostician, and a Practitioner described in the following sections. Each role MAY  
460 be instantiated in the Symptoms Automation Framework as a distinct component. The roles MAY also be  
461 combined in arbitrary ways to create more complex components performing the functions of several or all  
462 roles. There MAY be any number (including zero) of components in Symptoms Automation Framework  
463 exhibiting each role.

#### **2.10.13.2.1 Catalog Source**

465 The Catalog Source role represents a source of Syndromes and Protocols. A Catalog MAY have initial  
466 content or be empty when Symptoms Automation Framework is setup. A Catalog Source MAY provide  
467 additional contents to or updates the Catalogs as the Symptoms Automation Framework evolves during  
468 operation.

469 | **2.10-23.2.2 Symptom Source**

470 | The Symptoms Source role represents an emitter of Symptoms. A Symptom Source MAY provide  
471 | Symptoms at any time. The symptom source MAY be a component that experiences the symptom (the  
472 | *subject* or affected component) or the *reporter* of a symptom that receives, filter, enrich, and forwards,  
473 | symptoms from other Symptom Sources.

474 | **2.10-33.2.3 Case Manager**

475 | The Case Manager acts as the orchestrator within the Symptoms Automation Framework. The Case  
476 | Manager gathers Symptoms, keeps track of what Symptoms are currently of importance within the  
477 | system, and directs the actions of the other roles. The Case Manager maintains the state of the  
478 | Symptoms Automation Framework and keeps track of the diagnose-prescribe cycle. A Case Manager  
479 | may have broader knowledge about the entire system disposition and consult with one or more  
480 | Diagnosticians to leverage specialties prior to prescribing a Prescription. The Case Manager role selects  
481 | which Prescriptions to administer based on Diagnoses provided by the Diagnosticians. These  
482 | Prescriptions MAY provide additional diagnostic information (that is a new Symptom) to narrow the scope  
483 | of possible Syndromes or perform treatments on the system.

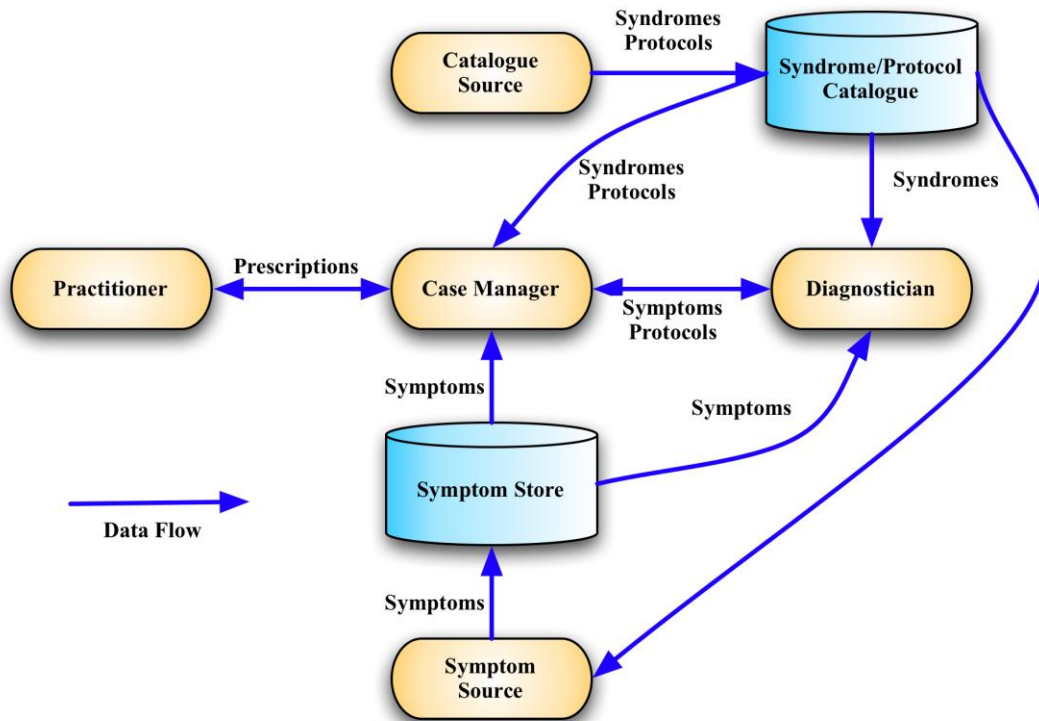

484 | **2.10-43.2.4 Diagnostician**

485 | The Diagnostician compares Symptoms with the signatures of various Syndromes to determine if any  
486 | Syndromes, matching those Symptoms, exist within the system. While the rules governing the processes  
487 | are expressed in XQuery, the processes used to analyze and/or match against the Syndromes are  
488 | implementation specific.

489

490 | **2.10.53.2.5 Practitioner**

491 The Practitioner administers Prescriptions as requested by the Case Manager. There may be one or more  
492 Practitioners in a SAF system, each one potentially able to understand and administer a different set of  
493 PrescriptionTypes.

494

Figure 1: Roles and Information Stores in the Symptoms Automation Framework.

495

## 34 Interfaces

496 Problem determination includes problem detection, isolation, and resolution. Effective problem diagnosis  
497 is dependent upon basic reliability, availability, and serviceability (RAS) capabilities present in any  
498 system. Problems include situations that degrade the overall performance of installed components,  
499 situations that make some of the components unavailable, and situations that make all components  
500 unavailable. Often components implement special behavior that is available when they are in a failure  
501 mode. This behavior captures the internal and or external state of the component to aid in later problem  
502 determination.

503 The components can either play a role as the component that experiences the situation (the *subject* or  
504 affected component) or the *reporter* of a situation. In some cases, the reporter and the subject  
505 components can be the same. The subject and reporter roles are outside the Symptoms Automation  
506 Framework architecture, but are discussed here for clarity.

507 The Subject is the component that was affected by or was impacted by the event or the situation. The  
508 reporters are those components that submit symptoms on behalf of the Subjects. The reporter produces  
509 symptoms according to the symptoms model and uses an emission mechanism to submit the symptoms.

510 In this specification we have introduced concepts of the Symptom, Syndrome, Protocol, and Prescription  
511 each describing parts of the Symptoms Automation Framework information model. These elements of  
512 the information model are exchanged using the following interfaces.

513

Interface	Description	Candidate Role
Symptom Emitter	This is for the symptom sources or reporters emitting symptoms	Symptom Source
	Operations <ul style="list-style-type: none"> <li>List supported types (Optional)</li> </ul>	

514

Symptom Handler	This is for the entity that receives symptoms for further processing	Diagnostician Symptom Source Case Manager Others
	<ul style="list-style-type: none"> <li>Get a Symptom</li> <li>Add a Symptom</li> <li>Query Symptoms</li> </ul>	

515

Prescription Emitter	The source for emitting a prescription	Case Manager
	N/A	

516

Prescription Handler	This is for component that receives and acts on the prescription	Practitioner Case Manager Others
	<ul style="list-style-type: none"> <li>Receive Prescription</li> </ul>	

	<ul style="list-style-type: none"> <li>List supported types</li> </ul>
--	--

517

Catalog Emitter	The source (files, tools, etc) for syndromes and protocols.	Catalog Source Authoring Tools
	N/A	

518

Catalog Handler	This for the component that is capable of handling specific syndromes and protocols.	Catalog Source Case Manager Others
	<ul style="list-style-type: none"> <li>Get a Syndrome</li> <li>Add a Syndrome</li> <li>Update a Syndrome</li> <li>Delete a Syndrome</li> <li>Query Syndromes</li> <li>Get a Protocol</li> <li>Add a Protocol</li> <li>Update a Protocol</li> <li>Delete a Protocol</li> <li>Query Protocols</li> <li>Associate a Protocol to a Syndrome (Optional)</li> <li>Get a SymptomType</li> <li>Add a SymptomType</li> <li>Update a SymptomType</li> <li>Delete a SymptomType</li> <li>Get a PrescriptionType</li> <li>Add a PrescriptionType</li> <li>Update a PrescriptionType</li> <li>Delete a PrescriptionType</li> </ul>

## 45 Notes on Future Specification Development

This section highlights a number of issues that the authors believe should be addressed by the Technical Committee once it is formed. The reasons for not addressing these issues in this version of the specification vary from, a feeling that a wider community is needed to address them, to a need to complete this version in a timely manner.

While the Signature in a Syndrome is specified as a single XQuery expression, it is acknowledged by the authors that processing of this expression may be performed incrementally to reflect the dynamic nature of Symptom creation. It may be necessary to decompose, explicitly in the specification, this XQuery expression into a conjunction of multiple, simpler expressions.

The Associated Protocols in a Syndrome may have dependencies between them, such as "all must be applied", "any one may be applied", "must be applied in order", or possibly organized into sub-groups.

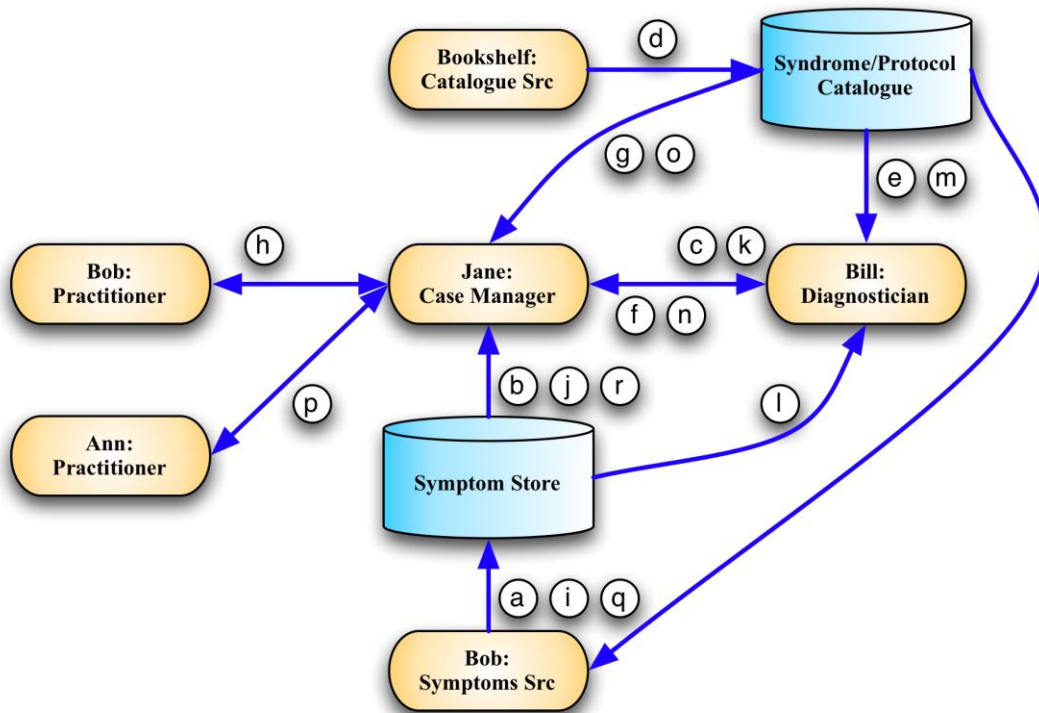

The current ProtocolGroup concept will handle the majority of cases where this is needed, but any more sophisticated requirements will have to be defined more explicitly perhaps in a combination Protocol.

Extensibility in the specification is handled with the concepts of SymptomSchema and PrescriptionSchema, which enable the modification of open content schemata to support custom application requirements. In addition, the related symptoms type, which defines relationships between symptoms, is also extensible in that it recommends a number of standard relations ("causal", "supersedes", "repetition", etc) but allows any arbitrary values to be used. However, the above notwithstanding, this specification could benefit even more from extensibility. Extensibility can help with the development of future versions of the specification and possible extensions.

## 540 56 Examples

### 541 5.16.1 Medical Sequence Diagram

542 The diagram below provides non-normative example of how the Symptoms Automation Framework might  
543 apply in the motivational use case used to design the Symptoms concept. This example is drawn from the  
544 simple case of someone not feeling well and a health care provider provides diagnosis and treatment.

545

Figure 2: Medical Diagnosis Sequence

546 Symptoms Process:

- 547 a) Bob (Symptoms Source) says, "I don't feel so good." (Symptom).
- 548 b) Jane (Case Manager) hears of Bob's Symptom, and
- 549 c) asks Bill (Diagnostician), "What do you think it is? "
- 550 d) Bill collects a first aid book (Catalog) from the bookshelf (Catalog Source).
- 551 e) Bill consults the Catalog and learns that the top entry listing the "I don't feel so good"
- 552 Symptom is a "Fever" (Syndrome), and
- 553 f) he passes this to Jane.
- 554 g) Jane looks up "Fever" in the Catalog where it recommends, "take temperature" (Protocol) to
- 555 verify the Syndrome, using a mercury thermometer (Prescription).
- 556 h) She then instructs Bob (this time a Practitioner) to take his own temperature.
- 557 i) Bob reports his temperature (a new Symptom).
- 558 j) Jane reads it and
- 559 k) again consults Bill.
- 560 l) Bill reads the value of the temperature and

- 561 m) again finds that "Fever" is the most likely Syndrome based on the high value of the newly
- 562 reported Symptom.
- 563 n) Bill tells Jane it's a "Fever."
- 564 o) Jane, again consulting the Catalog, decides that a medication (Protocol) is needed and
- 565 selects two Aspirin (Prescription) and
- 566 p) asks Ann to give Bob two Aspirin.
- 567 q) Bob later reports, "I feel much better" (another new Symptom) and Jane stops worrying.

### 5-26.2 Catalogue Authoring Diagram

The diagram below provides non-normative example of how Catalogue Authors may go about retrieving available Symptom and Prescription types in order to define Syndromes and Protocols.

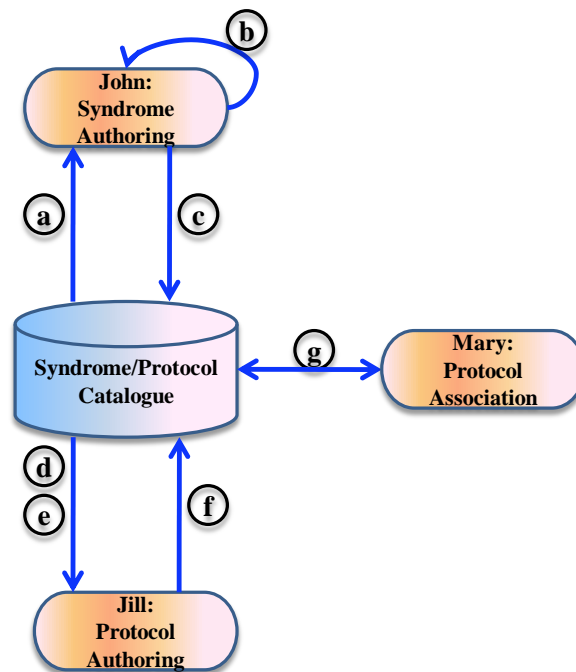

Figure 3: Catalog Authoring

#### Authoring Process:

- 577 a) John (Catalogue Source) wants to define a syndrome for Fever. He consults the Catalogue
- 578 and finds the SymptomSchema used by Symptoms conveying temperature information
- 579 (added by Symptom Emitters able to emit temperature data)
- 580 b) He uses the schema to construct a signature for the Fever Syndrome
- 581 c) John publishes the Syndrome in the Catalogue
- 582 d) Jill (Catalogue Source) is responsible for defining appropriate Protocols and wants to define
- 583 one to tackle Fever. She searches for what type and format of arguments are expected in

584 order to generate a Prescription to remediate Fever. She finds a relevant PrescriptionSchema  
585 in the Catalogue (as generated and added to the Catalogue by Practitioners that can handle  
586 such Prescriptions).

587 e) Jill also needs to know how to extract these arguments, so she looks into the Fever  
588 Syndrome's Signature to find out what it will return as a result.

589 f) Jill then creates a Protocol with a Directive able to generate the above PrescriptionSchema  
590 by extracting Subject and AspirinCount information from the Symptoms returned by the  
591 Syndrome signature. She adds this Protocol to the Catalogue.

592 g) Jill then goes on to associate this Protocol to the Fever Syndrome.

593

---

## 67 Conformance

594

An implementation is not conformant with this specification if it fails to satisfy one or more of the MUST or REQUIRED level requirements defined herein for the roles and modes it implements.

595

596

Normative text within this specification takes precedence over normative outlines, which in turn take precedence over the XML Schema [[XML Schema Part 1](#), [Part 2](#)] and WSDL [[WSDL 1.1](#)] descriptions, which in turn take precedence over examples.

## 600 Appendix A. Acknowledgements

601 The following individuals have participated in the creation of this specification and are gratefully  
602 acknowledged:

### 603 **Participants:**

604 Mike Baskey, IBM  
605 Alvin Black, CA  
606 Stavros Isaiadis, Bank of America Merrill Lynch (previously Fujitsu Limited)  
607 Vivian Lee, Fujitsu Limited  
608 Paul Lipton, CA  
609 Yasuhide Matsumoto, Fujitsu Limited  
610 Marcelo Perazolo, IBM  
611 David Snelling, Fujitsu Limited  
612 Jeffrey Vaught, CA

### 613 **Co-Developers of the initial contributions:**

614 This document is based on initial contributions to the OASIS SAF Technical Committee by the following  
615 co-developers.

616 Mike Baskey, IBM  
617 Alvin Black, CA  
618 Vivian Lee, Fujitsu Limited  
619 Paul Lipton, CA  
620 Yasuhide Matsumoto, Fujitsu Limited  
621 Marcelo Perazolo, IBM  
622 Abdi Salahshour, IBM  
623 David Snelling, Fujitsu Limited  
624 Jeffrey Vaught, CA

### 625 **Acknowledgements of the initial contributions:**

626 The following individuals have provided invaluable input to the original contributions and were  
627 acknowledged in the initial contributions.

628 Mike Baskey, IBM  
629 Alvin Black, CA  
630 Michel Drescher, Fujitsu Limited  
631 Vivian Lee, Fujitsu Limited  
632 Paul Lipton, CA  
633 Yasuhide Matsumoto, Fujitsu Limited  
634 Marcelo Perazolo, IBM  
635 Abdi Salahshour, IBM  
636 David Snelling, Fujitsu Limited  
637 Jeffrey Vaught, CA

## Appendix B. Revision History

Revision	Date	Editor	Changes Made
Wd-01	2009/11/12	Vivian Lee	Created the initial working draft by converting the input specification to OASIS template.
Wd-02	2010/05/08	Stavros Isaiadis	Added Types Store text. Added Appendix B for resource model and possible REST implementation Modified Interface section Replaced XPath with XQuery where necessary Removed the specification URIs and version info as this is only a working draft at the moment Replaced "Autonomic" with "Automation"
Wd-03	2010/09/22	Stavros Isaiadis	Preparing for CD approval, so kept only interface changes and removed Types Store and REST appendix as immature for CD at this point.
Wd-04	2010/09/27	Stavros Isaiadis	Polished for CD preparation (accepted/rejected changes as per discussions, etc.)
CD-01	2010/10/05	Stavros Isaiadis	Modified headers to denote CD status
CD-01 Rev 01	2011/03/21	Stavros Isaiadis	Added related symptoms and incident to the symptom element. Minor other changes.
CD-01 Rev 03	2011/05/06	Stavros Isaiadis	Changes in associated protocols and protocol groups
CD-01 Rev 04	2011/05/09	Jeff Vaught	Added ProtocolGroup and Incident ID. Some cleaning up of the schemas.
CD-01 Rev 05	2011/06/13	Stavros Isaiadis	Cleaning up. Made PotentialSyndromes a structured collection
CD-01 Rev 06	2011/06/27	Jeff Vaught	Changed <xsd:any> to xsd:any, as it is not an element. Cleaned up ProtocolGroup definition.
CD-01 Rev 07	2011/08/29	Jeff Vaught	Added SymptomType and ProtocolType sections along with their pseudoschemata.
CD-01 Rev 08	2011/08/30	Stavros Isaiadis	Added interfaces and some text for the SymptomType and PrescriptionType. Minor fixes.
CD-01 Rev 09	2011/09/19	Jeff Vaught	Added comments/changes per 9/19 review meeting.
CD-01 Rev 13	2011/10/21	Stavros Isaiadis	Added extensibility text; added example of

			Catalogue authoring; other minor changes throughout
CD-01 Rev 14	2011/10/21	Stavros Isaiadis	Added examples for each information model element
CD-01 Rev 15	2011/10/21	Stavros Isaiadis	Harmonized enumeration types, modifications in the examples and Appendix B
CD-01 Rev 16	2011/11/06	Jeff Vaught	Minor organization changes, modifications to pseudo xml examples, and section 5.2 diagram.
CD-01 Rev 17	2011/11/21	Jeff Vaught	Tidying of table widths, include missing label in 5.2.
CD-02 Rev 01	2011/11/22	Jeff Vaught	Initial CD-02
<a href="#">CD-02 Rev 02</a>	<a href="#">2012/07/30</a>	<a href="#">Stavros Isaiadis</a>	<a href="#">Changes as per admin comments on CD-01; minor other modifications</a>
<a href="#">CD-02 Rev 03</a>	<a href="#">2012/10/09</a>	<a href="#">Stavros Isaiadis</a>	<a href="#">Minor changes to prepare for voting</a>
