**Technical Committee:**

OASIS Security Services (SAML) TC

**Chair(s):**

Thomas Hardjono, M.I.T.

Nathan Klingenstein, Internet2

**Editor(s):**

Hal Lockhart, Oracle

**Related Work:**

This specification is related to:

XML schemas: [saml-session-token/v1.0/csprd02/xsd/](#)

**Declared XML namespace:**

XML Schema(s): [saml-session-token/v1.0/csprd01/xsd/](#)

**Declared XML Namespace(s):**

urn:oasis:names:tc:SAML:2.0:profiles:session:metadata

**Abstract:**

Web Servers and Application Servers generally maintain security state information for currently active users, particularly once some type of authentication has occurred. This specification defines a format for communicating such security session state based on the OASIS SAML Assertion. It also specifies two different mechanisms for communicating this information between servers via a standard Web browser.

**Status:**

This document was last revised or approved by the OASIS Security Services (SAML) TC on the above date. The level of approval is also listed above. Check the "~~Latest Version~~" location noted above for possible later revisions of this document.

Technical Committee members should send comments on this specification to the Technical Committee's email list. Others should send comments to the Technical Committee by using the "Send A Comment" button on the Technical Committee's web page at <http://www.oasis-open.org/committees/security/>.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (<http://www.oasis-open.org/committees/security/ipr.php>).

# 1 Introduction (non-normative)

1 Although the HTTP protocol [RFC2616] is deliberately stateless, efficient implementation of security requirements  
2 such as attribute-based authorization and inactivity timeout require maintaining state associated with each active  
3 connection. This state may consist of historical information (authentication occurred), relatively static information  
4 (user's attributes) and dynamic information (time of last interaction).

5 Web applications are commonly implemented by passing requests from browsers to any of a number of servers.  
6 These servers may be heterogeneous or homogeneous in function, geographically centralized or distributed. Typic-  
7 ally users are unaware that multiple servers are involved. It is therefore desirable to simulate a single system with  
8 uniform knowledge and behavior.

9 This means that a server receiving a request from a browser that last interacted with a different server must have a  
10 means to obtain the most recent session state. The only practical method of doing this is to pass the information via  
11 the browser using an HTTP cookie [RFC2965]. (An HTTP cookie is a HTTP header which is provided by a server  
12 in a response message and will be added by the browser to any subsequent request messages to a server in the same  
13 domain.)}. The cookie may be used either to pass the encoded session token itself, or if it is too large, to pass a refer-  
14 ence to the token.

## 1.1 Terminology

15 The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD  
16 NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this specification are to be interpreted as described in  
17 IETF RFC 2119 [RFC2119].

18 Conventional XML namespace prefixes are used throughout the listings in this specification to stand for their re-  
19 spective namespaces as follows, whether or not a namespace declaration is present in the example:

Prefix	XML Namespace	Comments
saml:	<a href="urn:oasis:names:tc:SAML:2.0:assertion">urn:oasis:names:tc:SAML:2.0:assertion</a>	<a href="#">This is the SAML V2.0 assertion namespace</a>
ds:	<a href="http://www.w3.org/2000/09/xmldsig#">http://www.w3.org/2000/09/xmldsig#</a>	<a href="#">This namespace is defined in the W3C XML Schema specification</a>
md:	<a href="urn:oasis:names:tc:SAML:2.0:metadata">urn:oasis:names:tc:SAML:2.0:metadata</a>	<a href="#">This is the SAML V2.0 metadata namespace [SAML2Meta]</a>
mdsess:	<a href="urn:oasis:names:tc:SAML:2.0:profiles:session:metadata">urn:oasis:names:tc:SAML:2.0:profiles:session:metadata</a>	<a href="#">This is the SAML V2.0 metadata extension namespace defined by this document and its accompanying schema</a>
Prefix	XML Namespace	Comments
saml:	<a href="urn:oasis:names:tc:SAML:2.0:assertion">urn:oasis:names:tc:SAML:2.0:assertion</a>	<a href="#">This is the SAML V2.0 assertion namespace</a>
ds:	<a href="http://www.w3.org/2000/09/xmldsig#">http://www.w3.org/2000/09/xmldsig#</a>	<a href="#">This namespace is defined in the W3C XML Schema specification</a>
md:	<a href="urn:oasis:names:tc:SAML:2.0:metadata">urn:oasis:names:tc:SAML:2.0:metadata</a>	<a href="#">This is the SAML V2.0 metadata namespace [SAML2Meta]</a>
mdsess:	<a href="urn:oasis:names:tc:SAML:2.0:profiles:session:metadata">urn:oasis:names:tc:SAML:2.0:profiles:session:metadata</a>	<a href="#">This is the SAML V2.0 metadata extension namespace defined by this document and its accompanying schema [MDESS-XSD]</a>

## 2 Session Management Architectures (non-normative)

74 In this document the server providing session information is called the Session Authority (SA) and the server using  
75 the information is called the Session Consumer (SC). These roles operate only in the context of a single interaction.  
76 Usually servers will take on each role in turn. The token is created by the SA and read by the SC.

77 Session management can be implemented using a variety of architectures. For example, each Web or Application  
78 server can implement a session management capability internally as shown in Figure 1. In this case each server acts  
79 as both SA and SC.

80

81

82

*Figure 1 – Every Server a Session Manager*

83

84 Session management can also be implemented by one or more dedicated session management servers as shown in  
85 Figure 2. These are accessed as needed by web and application servers. Depending on the specific design the session  
86 manager may act as SA and SC or the roles may be divided between the session manager and web servers.

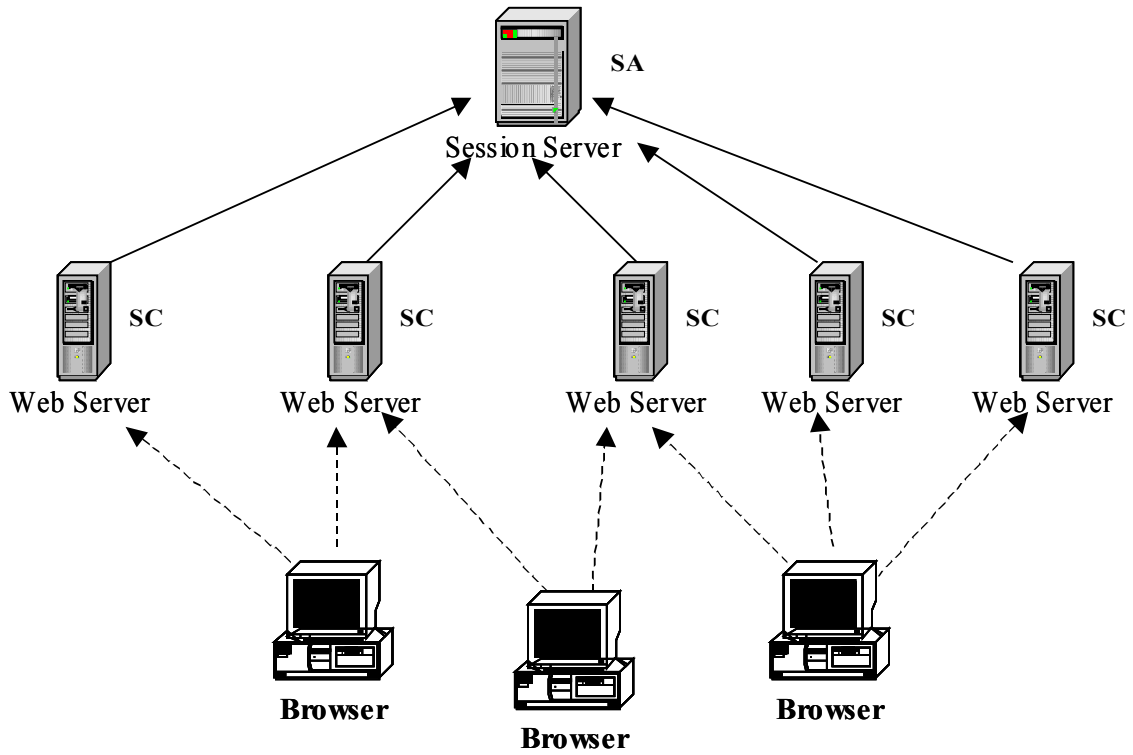

Figure 2 – Dedicated Session Management Servers

87  
88  
89  
90

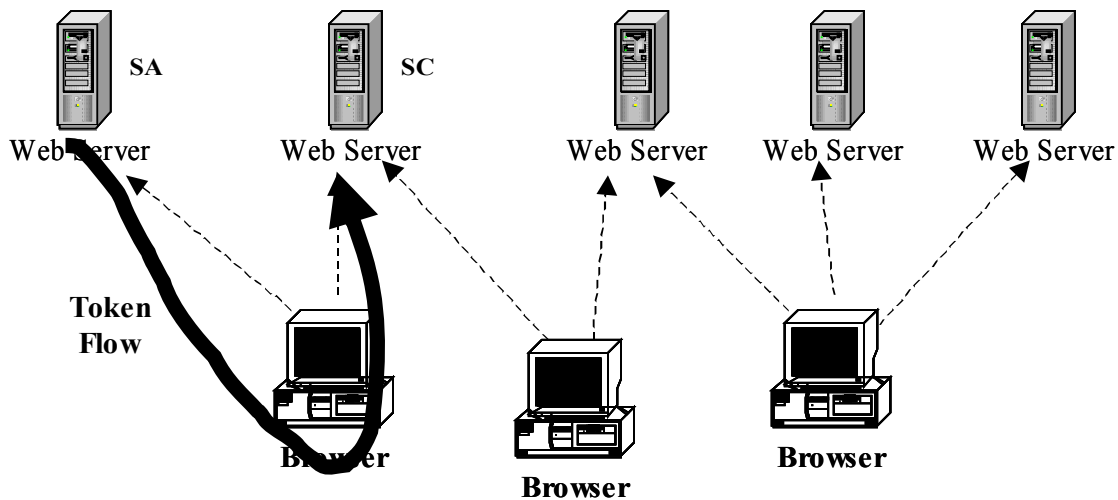

## 3 Session Management Algorithm (normative)

91 This section describes the processing used to by a server which is acting as both an SA and SC. There are two vari-  
92 ants, depending on whether the cookie contains the Token or is a reference to the Token.

### 3.1 Stateful Token Algorithm

93 When the session state is encoded into the cookie, the browser receives the cookie from the SA and returns it in the  
94 next request sent to any SC. The browser does not perform any processing on the cookie. The cookie is created by  
95 the SA and processed by the SC, but there is no direct communications transfer interactions are entirely between web-  
96 browsers and session managers. There is no direct communications between the SA and SC as shown in Figure 3.

97

98

100

Figure 3 – Stateful Cookie

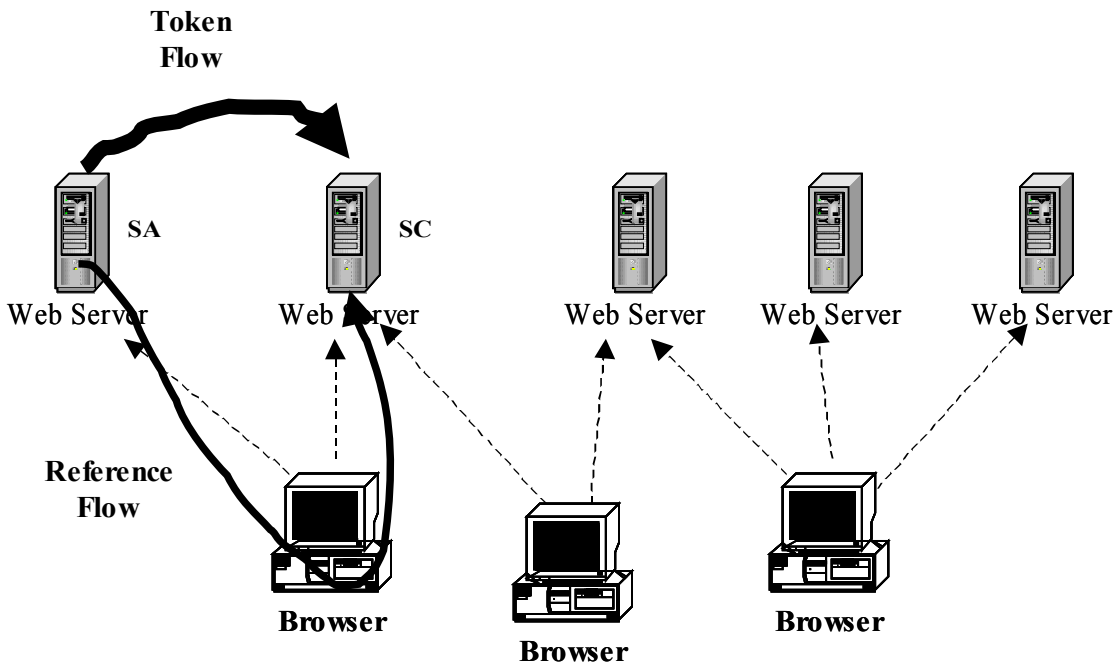

101

- 102 1. When an application request is received, the SC first checks to see if a session cookie of the type  
103 supported (stateful or reference) is present. The name of the supported cookie type MAY be ob-  
104 tained from metadata. If the cookie is not present, the SC MUST proceed as it would with any re-  
105 quest from a user who has not authenticated. Depending on the request this may mean permitting  
106 it, causing authentication to be performed or taking some other action.
- 107 2. If the cookie contains a session reference, the SC MUST use the reference to obtain the cookie  
108 as described in Section 3.2. If the cookie is stateful, it contains the Token. In either case pro-  
109 cessing continues with the next step.
- 110 3. The SC must verify the signature of the Token. The ability to determine the correct key to use for  
111 this purpose implies some type of key management function. If the signature is not valid, the SC  
112 MUST discard the request with no action, so as to reduce the effect of denial of service attacks by  
113 unauthorized users. (Administrative reporting of potential attacks may occur.) If the signature is  
114 not present and the Token was not received over a secure channel, the SC SHOULD discard the  
115 request.
- 116 4. The `<saml:Conditions>` element MUST be checked for validity as described in Section 2.5 of  
117 [SAML2Core]. If the Token is not valid, the SC MUST treat the request as unauthenticated. Other  
118 checks MAY be performed to ensure the Token contains the required information.
- 119 5. The Address XML Attribute of the `<saml:SubjectConfirmationData>` element in the Token  
120 MAY be compared to the IP address from which the request originated and if they are different,  
121 the request discarded.

- 122 6. Idle time out MAY be implemented by configuring each SC with a maximum idle time value. Typ-  
123 ically, the value will be the same for all SCs hosting the same application type, but this algorithm  
124 does not depend on this being the case. It is simply assumed that each SC is configured with a  
125 maximum idle time value by some means unspecified in this document. In practice, maximum idle  
126 time values might range from 5 minutes to 30 minutes.  
127 If idle timeout is enabled, the SC subtracts the value of the  
128 `urn:oasis:names:tc:SAML:2.0:profiles:session:timeLastActive` SAML Attribute  
129 from the current time and compares the result to the maximum idle time value. If the difference  
130 exceeds the maximum value, the Token is discarded, any existing session information for that  
131 user is cleared and the user is informed that the session has timed out because of inactivity. The  
132 request MUST be treated as unauthenticated.
- 133 7. Maximum login time (sometimes called session time limit) MAY be implemented by configuring  
134 each server with a maximum login time value. This may be a single value or depend on the type  
135 of login performed most recently. Maximum login time limits typically range from 1 hour to 24  
136 hours.  
137 If maximum login time is enabled, the SC subtracts the value of the `AuthnInstant` XML Attrib-  
138 ute of the `<saml:AuthnStatement>` from the current time and compares the result to the max-  
139 imum login time. If the time since the last authentication exceeds the maximum value, the request  
140 MUST be treated as unauthenticated.
- 141 8. After these checks, the SC MAY make use of the information in the Token, for authorization, per-  
142 sonalization or other purposes.
- 143 9. When the HTTP response is sent, the server acts as a Session Authority (SA). If a stateful cookie  
144 is being employed, the SC MUST construct a Token containing the current values as described in  
145 Section 4. The Token is then signed and inserted in the cookie of the response.  
146 If a session reference cookie is being employed, the SA MUST generate the session reference  
147 value and insert the URL and reference in the cookie as described in Section 6. The SA MUST  
148 implement a responder at the given URL which returns a Token with the same contents as would  
149 have been put in a stateful cookie. The SA MAY generate the Token in advance or at the time it is  
150 requested.
- 151 10. As an optimization, the server MAY maintain a Token Freshness value, which allows Tokens to  
152 be reused if they were created recently. For example, the value might be something like 30  
153 seconds. If the value of the `IssueInstant` XML Attribute of the `<saml:AuthnStatement>`  
154 subtracted from the current time is less the Token Freshness value, the received Token (or ses-  
155 sion reference) is put in the cookie instead of creating and signing a new Token. This reduces the  
156 overhead of a series of closely spaced requests at the cost of reducing the precision of the idle  
157 timeout and maximum login time algorithms.

## 3.2 Session Reference Algorithm

158 Instead of the cookie containing the Token, it MAY instead merely contain a reference to the session. The actual  
159 session Token is obtained by making a query to the SA which generated the reference. In this case the cookie con-  
160 tains two parts: a server endpoint in the form of a URI and a large random number. In this case, the SA and SC com-  
161 municate directly as shown in Figure 4

162

164

*Figure 4 – Session Reference Cookie*

165 The SC MUST call the indicated endpoint, providing the reference as an input value, as described in Section 6. The  
 166 SA checks to see if the reference corresponds to a valid session. If not, it MUST return an error. If it does corres-  
 167 pond to a valid session, the SA must return a session Token, constructed as described above. If this back channel  
 168 connection is integrity protected, e.g. using TLS, then the SA MAY choose not to sign the Token. The SC MUST  
 169 process the Token as described in section 3.1 beginning with step 3.

---

## 4 Token Format (normative)

170 The format of the Session Token is based on the `<saml:Assertion>` element defined by [SAML2Core]. The  
171 Assertion MUST contain exactly one `<saml:AuthnStatement>` element and at exactly one `<saml:AttributeStatement>`  
172 `<element>`. The contents of the Assertion and the Statements are specified in the following sections.  
173

### 4.1 Required Information

174 **Identification:** urn:oasis:names:tc:SAML:2.0:profiles:session

175 **Contact information:** security-services-comment@lists.oasis-open.org

176 **Description:** Given below.

177 **Updates:** None.

### 4.2 Assertion Header

178 The assertion header MUST contain the following items.

179 `Version` [Required]

180 The SA MUST set the value of the `saml:Version` attribute to “2.0” as required by [SAML2Core]. The  
181 SC SHOULD verify this value.

182 `ID` [Required]

183 The SA MUST set the value of the `saml:ID` or `xs:ID` to a unique identifier as required by [SAML2-  
184 Core].

185 `IssueInstant` [Required]

186 The SA MUST set the value of the `saml:IssueInstant` to the time the Token was created as required  
187 by [SAML2Core]. When the cookie contains a session reference, it MAY differ from the user’s  
188 `TimeLastActive`.

189

190 `<saml:Issuer>` [Required]

191 The Session Authority MUST set this value to its own name.

192

193 `<ds:Signature>` [Optional]

194 When the Assertion is carried in a cookie, the SA MUST sign it. See Section 5. If the Assertion is signed,  
195 the SC MUST verify the signature before processing it.

196

197 `<saml:Subject>` [Required]

198 The SA MUST create a `<saml:Subject>` element containing the following Elements and Attributes except as  
199 noted below.

200

201 `<saml:NameID>` [Optional]

202 Any deployment of this specification MUST profile the use of the `NameID` element and its associated At-  
203 tributes: `NameQualifier`, `SPNameQualifier`, `Format` and `SPProviderID`. This includes mak-  
204 ing their use required, prohibited or optional.

205 `<saml:SubjectConfirmation>` [Required]

206 The SA MUST include a `<saml:SubjectConfirmation>` which contains a **Subject Conformation**  
207 `saml:Method` attribute.

208 Method [Required]

209 The Subject Confirmation `saml:Method` MUST have a value of

210 `urn:oasis:names:tc:SAML:2.0:cm:bearer`

211

212 `<saml:SubjectConfirmationData>` [Required]

213 The SA MUST set the `<saml:SubjectConfirmationData>` element to have the following at-  
214 tribute.

215

216 Address [Required]

217 The SA MUST set the value of the `saml:Address` attribute to contain the address of the  
218 browser in IPv4 dotted decimal format, e.g. "198.51.100.1" or in IPv6 address format as de-  
219 scribed in Section 2.2 of [RFC3513], e.g., "2001:db8::1". The SC MAY compare the value to the  
220 known address of the browser.

221

222 `<saml:Conditions>` [Required]

223 The SC MUST set the `<saml:Conditions>` element to contain the following attributes.

224 `NotBefore` [Required]

225 `NotOnOrAfter` [Required]

226 The SA MUST set these so as to delimit the validity interval of the Token. The SC MUST check the condi-  
227 tions element, including the validity interval as specified in section 2.5 of [SAML2Core].

228

229 `<saml:Advice>` [Prohibited]

230 The SA MUST NOT include an `<saml:Advice>` element in the Token.

231

232 The SA MAY include any other elements or attributes specified in [SAML2Core] which are not explicitly required  
233 or prohibited by this document.

### 4.3 Authentication Statements

234 The Assertion MUST contain exactly one `<saml:AuthnStatement>` element. It MUST contain the following  
235 XML attribute.

236

237 `AuthnInstant` [Required]

238 The SA MUST set the `AuthnInstant` to the time authentication occurred, as defined in [SAML2Core].  
239 The SC MAY use this value to implement a maximum login time.

240

241 `<saml:AuthnContext>` [Required]

242 The contents of the Authentication Context MUST conform to [SAML2AuthnCtx].

243 The SA MUST set the Authentication Strength attribute in the Attribute Statement, (see section 4.3), to correspond  
244 to the value assigned to the authentication method present in the Authentication Statement.

245 The level of assurance (LOA) associated with this Authentication MAY be expressed as specified in [SAML2I-  
246 dAssure].

## 4.4 Attribute Statement

247 The Assertion **MUST** contain exactly one `<saml:AttributeStatement>` element.

248 The following SAML Attributes **MUST** be present.

### 4.4.1 Session Id

249 This attribute has a name format type of `urn:oasis:names:tc:SAML:2.0:attrname-format:uri`. The  
250 name of the attribute is `urn:oasis:names:tc:SAML:2.0:profiles:session:sessionId`.

251 The value of this attribute is of type string and the SA **MUST** set it to contain the unique identifier of the session.  
252 (This is not the same as the session reference described in section 6.) The SC **MAY** use this value as an index to the  
253 stored session information.

### 4.4.2 Authentication Strength

254 This attribute has a name format type of `urn:oasis:names:tc:SAML:2.0:attrname-format:uri`. The  
255 name of the attribute is `urn:oasis:names:tc:SAML:2.0:profiles:session:authentication-`  
256 `Strength`.

257 The value of this attribute is of type integer in the range of 0-99. It is a deployment-specific value associated with  
258 every type of Authentication supported by the deployment, where a higher number represents a more secure method.  
259 The SA **MUST** set the value of the attribute to correspond to the value assigned to the authentication method repres-  
260 ented in the Authentication Statement present in the Assertion. Authentication method is defined as a specific Au-  
261 thentication Context Class with specific instance values or ranges of values.

262 The means by which the mapping of Authentication methods to AuthenticationStrength is communicated to SAs and  
263 SCs is outside the scope of this Profile.

### 4.4.3 Time Last Active

264 This attribute has a name format type of `urn:oasis:names:tc:SAML:2.0:attrname-format:uri`. The  
265 name of the attribute is `urn:oasis:names:tc:SAML:2.0:profiles:session:timeLastActive`.

266 The SA **MUST** set the value to contain the datetime of the completion of the last request. The SC **MAY** use this  
267 value implement an idle timeout algorithm.

### 4.4.4 Token Format Version

268 This attribute has a name format type of `urn:oasis:names:tc:SAML:2.0:attrname-format:uri`. The  
269 name of the attribute is `urn:oasis:names:tc:SAML:2.0:profiles:session:tokenFormatVer-`  
270 `sion`.

271 The SA **MUST** set the value to contain a string value contain the major and minor version numbers of the Token  
272 format being used, e.g. "2.3". The Token format version is the same as the version of this Profile, that is: "1.0".

273 The Attribute Statement **MAY** contain other Attributes as specified in [SAML2Core].

---

## 5 Token Carried in Cookie (normative)

274 If size allows, the session token MAY be carried in the cookie. The cookie name can be determined by out of band  
275 agreement or via metadata.

276 When the token is carried in the cookie, it MUST be signed as specified in [SAML2Core]. The Token MAY also be  
277 encrypted as specified in [SAML2Core].

### 5.1 Compression

278 The Token MAY be compressed to reduce its size. Compression MUST be done after signing and encryption. The  
279 only compression method specified by this document is the DEFLATE algorithm. [RFC1951] After compression the  
280 resulting binary string MUST be encoded using Base64[RFC4648].~~[RFC4648]~~

281 The use of compression MAY be indicated via metadata. Implementations MAY define alternative compression  
282 methods and corresponding metadata values.

---

## 6 Session Reference Carried in Cookie (normative)

283 Instead of transmitting the Assertion in the cookie, the SA MAY instead put a reference to the Assertion in the  
284 cookie. The reference then MAY be used to retrieve the Assertion.

285 When this approach is used, the cookie value MUST consist of an HTTP scheme URL followed by the “?” charac-  
286 ter, followed by “ID=” followed by an unguessable number of at least 256 bits represented as a positive decimal in-  
287 teger. The entire value MUST be percent encoded as described in Section 2 of [RFC3986].

288 The URL represents a server endpoint which supports the SAML URI Binding as specified in [SAML2Bind].

289 The SA using this scheme MUST respond to protocol requests by returning the indicated Assertion with the session  
290 information.

291 The Token MUST be carried over secure transport and/or signed as specified in [SAML2Core]. The Token MAY  
292 also be encrypted as specified in [SAML2Core].

## 7 Metadata (normative)

293 This section defines metadata which MAY be used to communicate cookie names and other properties associated  
294 with a Session Authority.

295 The SAML V2.0 metadata specification [SAML2Meta] defines the following namespace:

```
urn:oasis:names:tc:SAML:2.0:metadata
```

296 By convention, the namespace prefix `md:` is used to refer to the above namespace.

297 This specification defines a new namespace:

```
urn:oasis:names:tc:SAML:2.0:profiles:session:metadata
```

298 The prefix `mdsess:` is used here and in the accompanying schema to refer to this new namespace. In  
299 what follows, any unqualified element or type is assumed to belong to this new namespace.

### 7.1 Element `<md:RoleDescriptor>`

300 The `<md:RoleDescriptor>` element defined in [SAML2Meta] is an abstract extension point that con-  
301 tains descriptive information common across various entity roles. New roles can be defined by extending its ab-  
302 stract `md:RoleDescriptorType` complex type, which is the approach taken here.

### 7.2 CookieName and CookieNameType

303 Complex type `mdsess:CookieNameType` holds information intended to describe cookies used by this profile.  
304 The `<mdsess:CookieName>` element is defined to be of type `mdsess:CookieNameType`. The value of  
305 the `<mdsess:CookieName>` element is a string which is the cookie name. It contains the following XML attrib-  
306 utes.

307 `CookieContent` [Required]

Required attribute that indicates the format of the content of the cookie. The values defined by  
this specification are:

308 `urn:oasis:names:tc:SAML:2.0:profiles:session:metadata:token`

309 This indicates that the SAML Assertion is carried in the cookie as described in Section 5 of this  
310 document.

311 `urn:oasis:names:tc:SAML:2.0:profiles:session:metadata:reference`

312 This indicates that the cookie contains a reference to the Token as described in Section 6 of this  
313 document.

314 `CookieCompression` [Optional]

Optional attribute that indicates what kind of compression, if any has been performed on the  
contents of the cookie. If the attribute is not present it indicates no compression has been done.  
The values defined by this specification are:

315 `urn:oasis:names:tc:SAML:2.0:profiles:session:metadata:nocompression`

316 This indicates that no compression has been done.

317 `urn:oasis:names:tc:SAML:2.0:profiles:session:metadata:rfc1951`

318 This indicates that the contents of the cookie have been compressed using the DEFLATE al-  
319 gorithm as described in Section 5.1 of this document.

320 The following schema fragment defines the `<mdsess:CookieName>` element and `mdsess:CookieName-`  
321 `Type` complex type:

```
<element name="CookieName" type="mdsess:CookieNameType"/>

<complexType name="CookieNameType" >
  <simpleContent>
    <extension base="string">
      <attribute name="CookieContent" type="anyURI" use="required"/>
      <attribute name="CookieCompression" type="anyURI" use="optional"/>
    </extension>
  </simpleContent>
```

```
</complexType>
```

### 7.3 Complex Type **SessionAuthorityDescriptorType**

322 Complex type **SessionAuthorityDescriptorType** extends complex type `<md:RoleDescriptor>` to represent  
323 information about SessionAuthorities.. It adds the `<mdsess:CookieName>` element to the items defined by  
324 the `<md:RoleDescriptor>`.

325 The following schema fragment defines the **SessionAuthorityDescriptorType** complex type:

```
<complexType name="SessionAuthorityDescriptorType" >
  <complexContent>
    <extension base="md:RoleDescriptorType">
      <sequence>
        <element ref="mdsess:CookieName" minOccurs="0" maxOccurs="unbounded"/>
      </sequence>
    </extension>
  </complexContent>
</complexType>
</schema>
```

## 8 Example (non-normative)

326 The following is an example of a session token.

```
<saml:Assertion ID="_a75e1c55-01d7-40cc-929f-d627c72ebdfc"
  IssueInstant="2010-11-25T13:16:02Z" Version="2.0"

  <saml:AuthnStatement AuthnInstant="2010-11-25T13:15:13Z">
    <saml:AuthnContext>
      <saml:AuthnContextClassRef>
        urn:oasis:names:tc:SAML:2.0:ac:classes:Password
      </saml:AuthnContextClassRef>
    </saml:AuthnContext>
  </saml:AuthnStatement>
  <saml:AttributeStatement>
    <saml:Attribute NameFormat=
      "urn:oasis:names:tc:SAML:2.0:attrname-format:uri"
      Name="urn:oasis:names:tc:SAML:2.0:profiles:session:sessionId"
      xsi:type="xs:string" >
      258673
    </saml:Attribute>
    <saml:Attribute NameFormat=
      "urn:oasis:names:tc:SAML:2.0:attrname-format:uri"
      Name="urn:oasis:names:tc:SAML:2.0:profiles:session:AuthenticationSt
      rength"
      xsi:type="xs:integer" >
    </saml:Attribute>
  </saml:AttributeStatement>
</saml:Assertion>
```

```
    20
  </saml:Attribute>
  <saml:Attribute NameFormat=
    "urn:oasis:names:tc:SAML:2.0:attrname-format:uri"
    Name="urn:oasis:names:tc:SAML:2.0:profiles:session:TimeLastActive"
    xsi:type="xs:dateTime" >
    2010-11-25T13:16:02Z
  </saml:Attribute>
  <saml:Attribute NameFormat=
    "urn:oasis:names:tc:SAML:2.0:attrname-format:uri"
    Name="urn:oasis:names:tc:SAML:2.0:profiles:session:TokenFormatVersion"
    xsi:type="xs:string" >
    1.0
  </saml:Attribute>
</saml:AttributeStatement>
</saml:Assertion>
```

327 For the purpose of this example, it is assumed that the deployment as assigned and **AuthenticationStrength** value  
328 of 20 to the password authentication method.

## 9 Security Considerations (non-normative)

329 The short summary is that this proposal has essentially the same security properties as existing deployed products.

330 The primary threats are: 1) Token forgery, 2) Token capture and unauthorized use and 3) unauthorized disclosure of  
331 Token contents.

332 When the Assertion is carried in the cookie, the signature will prevent forgery.

333 Capture of the Token as it traverses the network can easily be prevented by protecting the browser session with TLS.  
334 This has been rarely done in the past because of performance concerns. However, recently Google has published  
335 work[Overclock-SSL] showing that use can easily be prevented by protecting the browser session with TLS. This  
336 has been rare in past because of performance concerns. However, recently Google has publicized work showing that  
337 Running TLS has a minimal effect on capacity and throughput. They are also working on reducing latency, particu-  
338 larly in the initial handshake.

339 Depending on the application, it may be possible to capture a cookie via a cross-site scripting exploit. This can be  
340 mitigated by setting the HttpOnly attribute to the cookie. While this has not yet been standardized by the IETF yet,  
341 most browsers implement it by not allowing a cookie so marked to be accessed from a script.

342 Cookies can also be subject to interception if presented to some web sites without using TLS. Setting the “Secure”  
343 property on the cookie as specified in [RFC2965] will prevent this. Cookies may also be captured if any server in the  
344 domain is controlled by an attacker, whether or not TLS is used.

345 Another approach to preventing unauthorized use of a token is to compare the IP address in the token with the ad-  
346 dress it was received from. However this may suffer in practice from false positives or false negatives. If the mes-  
347 sages transit a firewall or gateway which performs Network Address Translation (NAT) different servers may see  
348 different IP addresses for the same browser. In this case, IP Address comparison will fail even though the user is le-  
349 gitimate.

350 On the other hand, the premise of IP Address checking is that an attacker cannot put the legitimate user's IP Address  
351 in the message because then the responses will not be routed back to the attacker. However, It would seem that an  
352 attacker who could intercept messages from a point along the network path from browser to server and could also  
353 transmit from that point, could spoof the IP address.

354 Another threat is that one server could take the token from a user and use it to impersonate that user to another  
355 server. This scheme assumes that servers can be trusted not to do this, just as they are trusted not to misuse the pass-  
356 words users type in.

357 IP-address-checking will generally be effective in preventing this type of impersonation, but the widespread use of  
358 Network Address Translation (NAT) makes this questionable. It would seem that an attacker who could intercept  
359 messages from a point along the network path from browser to server and could also transmit from that point, could  
360 spoof the IP address. Encrypting the Assertion would hide the IP Address there, but it would still appear in the IP-  
361 header.

362 Another threat is that one sever could take the token from a user and use it to impersonate that user to another server.  
363 This scheme assumes that servers can be trusted not to do this, just as they are trusted not to misuse the passwords-  
364 users type in.

365 If unauthorized disclosure is a concern, the Assertion can be encrypted as specified in [SAML2Core]. However, if  
366 an unauthorized party can obtain a copy of the token, whether encrypted or not, it can be presented to impersonate  
367 the user. Therefore the utility of encrypting the Assertion is unclear. Generally, exposure of a user’s session state in-  
368 formation to that user will not be considered a threat.

369 When the cookie carries only a reference, no integrity check is required. If the value is invalid, the SAML request  
370 will fail. (Technically SAML will return an empty response.) Again, interception of the cookie will permit imper-  
371 sonation, but this seems to be a threat to any cookie-based scheme.

---

## 10 Conformance

- 372 A Session Authority conforms to this specification if it  
373     • generates Assertions conforming to Section 3 and 4,  
374     • uses the cookie naming scheme specified in Section 7, and  
375     • transmits the Assertion using the method defined in Section 5 or Section 6.  
376
- 377 A Session Consumer conforms to this specification if it  
378     • can process an Assertion as specified in Section 3 and 4,  
379     • can process a cookie named as specified in Section 7, and  
380     • access an Assertion using the method defined in Section 5 or Section 6.  
381

## Appendix B. -Revision History

- 406 • WD01 Initial version
- 407 • WD02 – Removed Cookie Naming, Added Required Information, Changed protocol to URI Binding
- 408 • WD03 – Added example session token.
- 409 • WD04 – Make processing algorithm stateless, allow NameID to be omitted from Subject, remove session
- 410 start time, allow optional compression, define metadata, various corrections and improvements
- 411 • WD05 – Remove `saml:` prefix from XML Attributes, Change validation to refer to SAML Core, Fix
- 412 metadata schema, various editorial and format fixes.
- 413 • WD06 – Correct introductory sentence of section 4 to indicate not all elements are required and mark indi-
- 414 vidual elements and attributes as required, optional or prohibited.
- 415 • [WD07 – Correct errors reported on comment list by Paul Knight. Add missing “/” in schema. Add list of](#)
- 416 [TC members to Acknowledgments.](#)
