

# SAML 2.0 Protocol Extension for Requested Authentication Context

## Committee Draft 03, 11 September 2006

### Document identifier:

draft-sstc-saml-protocol-ext-rac-cd-03

### Location:

[http://www.oasis-open.org/committees/documents.php?wg\\_abbrev=security](http://www.oasis-open.org/committees/documents.php?wg_abbrev=security)

### Technical Committee:

OASIS Security Services TC

### Chair(s):

Hal Lockhart, BEA Systems, Inc

Prateek Mishra, Oracle

### Editors:

Paul Madsen ([paul.madsen@ntt-at.com](mailto:paul.madsen@ntt-at.com)), NTT

Ashish Patel ([ashish.patel@rd.francetelecom.com](mailto:ashish.patel@rd.francetelecom.com)), France Telecom

### Abstract:

This specification defines a protocol extension to SAML 2.0 specification that facilitates a more flexible model for expressing Authentication Context than that currently supported. The extension allows service providers to express combinations of Authentication Context classes in their requests for authentication assertions. The expectation is that the extension, when its additional functionality was necessary, would be used in replacement of the existing Authentication Context mechanisms in the authentication request message. Readers should be familiar with before reading this document.

### Status

This is a **Committee Draft** approved by the Security Services Technical Committee on 11 September 2006.

Committee members should submit comments and potential errata to the [security-services@lists.oasis-open.org](mailto:security-services@lists.oasis-open.org) list. Others should submit them by filling out the web form located at [http://www.oasis-open.org/committees/comments/form.php?wg\\_abbrev=security](http://www.oasis-open.org/committees/comments/form.php?wg_abbrev=security).

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights web page for the Security Services TC (<http://www.oasis-open.org/committees/security/ipr.php>).

# 51 1 Introduction

52 SAML protocol extensions consist of elements defined for inclusion in the `<samlp:Extensions>`  
53 element that modify the behavior of SAML requesters and responders when processing such extended  
54 messages.

55 This specification defines an extension to the SAML 2.0 protocol specification that can be optionally  
56 used to replace the existing mechanisms for Authentication Context `#saml_ac` in authentication requests.  
57 The extension provides a more flexible structure for expressing combinations of Authentication Context  
58 classes than do existing mechanisms.

## 59 1.1 Notation

60 This specification uses normative text.

61 The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD  
62 NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this specification are to be interpreted as  
63 described in :

64 ...they MUST only be used where it is actually required for interoperation or to limit behavior  
65 which has potential for causing harm (e.g., limiting retransmissions)...

66 These keywords are thus capitalized when used to unambiguously specify requirements over protocol  
67 and application features and behavior that affect the interoperability and security of implementations.  
68 When these words are not capitalized, they are meant in their natural-language sense.

69 Listings of XML schemas appear like this.

70 Example code listings appear like this.

72 Conventional XML namespace prefixes are used throughout the listings in this specification to stand for  
73 their respective namespaces as follows, whether or not a namespace declaration is present in the  
74 example:

Prefix	XML Namespace	Comments
saml:	urn:oasis:names:tc:SAML:2.0:assertion	This is the SAML V2.0 assertion namespace <a href="#">SAMLCore</a> .
samlp:	urn:oasis:names:tc:SAML:2.0:protocol	This is the SAML V2.0 protocol namespace <a href="#">SAMLCore</a>
md:	urn:oasis:names:tc:SAML:2.0:metadata	This is the SAML V2.0 metadata namespace . <a href="#">SAMLMeta</a>
rac:	urn:oasis:names:tc:SAML:protocol:ext:rac	This is the SAML V2.0 protocol extension namespace, defined by this document and its accompanying schema <a href="#">RAC-XSD</a>
xsd:	http://www.w3.org/2001/XMLSchema	This namespace is defined in the W3C XML Schema specification <a href="#">Schema1</a> . In schema listings, this is the default namespace and no prefix is shown.

75 This specification uses the following typographical conventions in text: `<SAMLElement>`,  
76 `<ns:ForeignElement>`, Attribute, **Datatype**, OtherCode.

## 2 SAML Protocol Extension for Requested Authentication Context

This specification defines an extension to the SAML 2.0 protocol specification that can be optionally used to replace the existing mechanisms within requests for Authentication Context [SAMLAC](#) with a more flexible structure for expressing combinations of Authentication Context classes.

Existing structures for indicating authentication context in authentication request messages are limited in their ability to express combinations of authentication contexts – the assumption is that the full context can be expressed through a single declaration, declaration reference, or a class reference.

Consequently, were an SP or IDP to wish to express such a logical combination (or the SSTC to define classes to enable this), it would necessarily imply the creation of a new class URI to represent such a combination.

As a concrete example, certain telco use cases demand the ability for IDPs and SPs to distinguish between whether a principal is authenticated with a credential that is known to be shared amongst a group (e.g. a home phone or an internet kiosk) or unique to that principal. Because no existing SAML AC classes support this distinction (nor the schema as it stands), to allow an SP to make this distinction in its `<AuthnRequest>` implies that new AC classes would need to be defined to add the shared/unique distinction to each (relevant) existing AC class. For just this single initially unforeseen aspect of authentication context, we face the possibility of a combinatorial explosion of AC class URIs. Should other such aspects emerge in the future, the problem would be exacerbated.

More scalable would be to allow the SP to compose its Authentication Context requirements through the listing of multiple AC classes, and to allow the SP to control how those multiple classes are to be logically combined. Unfortunately, the existing `<saml:RequestedAuthnContext>` mechanism does not provide this flexibility.

This extension is intended to override existing mechanisms for requesting authentication contexts with a more flexible model – thereby meeting the immediate requirements of the above telco use cases, as well as providing a scalable solution for dealing with similar currently unforeseen AC aspects should they arise.

Unless specifically noted, nothing in this document should be taken to conflict with the SAML 2.0 protocol specification [SAMLCore](#). Readers are advised to familiarize themselves with that specification first.

### 2.1 Element `<rac:RequestedACCombination>`

The `<rac:RequestedACCombination>` element is used to carry the individual requested Authentication Contexts and to specify the logical operator defining how they should be combined.

The following schema fragment defines the `<rac:RequestedACCombination>` element:

```
<element name="RequestedACCombination" type="RequestedACCombinationType"/>
<complexType name="RequestedAuthnContextType">
  <choice>
    <element ref="RequestedACCombination" maxOccurs="unbounded"/>
    <element ref="saml:AuthnContextClassRef" maxOccurs="unbounded"/>
  </choice>
  <attribute name="RACComparison" type="anyURI" use="optional"/>
</complexType>
```

123 The <rac:RequestedACCombination> element can be nested to allow the SP to define combinations  
124 of Authentication Contexts. There SHOULD NOT be more than one level of such nesting.

## 125 2.1.1 RACComparison attribute

126 An SP uses the RACComparison attribute of the <rac:RequestedACCombination> element to  
127 specify the logical comparison or combination to be performed on the listed Authentication Context  
128 classes by the IDP in order to determine the appropriate combined context for any issued statement.

129 This specification defines the following value(s) for the RACComparison attribute. Other additional  
130 values MAY be defined.

131 **URI:** urn:oasis:names:tc:SAML:protocol:ext:rac:all

132 Indicates that the authentication context of any resultant statement MUST  
133 satisfy the requirements of all the listed  
134 <samlp:RequestedAuthenticationContext> elements. This is the default value.

135 **URI:** urn:oasis:names:tc:SAML:protocol:ext:rac:exact

136 Indicates that the authentication context of any resultant statement MUST  
137 be the exact match of one of the listed AC classes.

138 **URI:** urn:oasis:names:tc:SAML:protocol:ext:rac:minimum

139 Indicates that the authentication context of any resultant statement MUST  
140 be at least as strong (as deemed by the responder) as one of the  
141 authentication contexts specified

142 **URI:** urn:oasis:names:tc:SAML:protocol:ext:rac:maximum

143 Indicates that the authentication context of any resultant statement MUST  
144 be as strong as possible (as deemed by the responder) without exceeding the strength of at least one of the  
145 authentication contexts specified.

146 **URI:** urn:oasis:names:tc:SAML:protocol:ext:rac:better

147 Indicates that the authentication context of any resultant statement MUST  
148 be stronger (as deemed by the responder) than any one of the  
149 authentication contexts specified.

## 150 2.2 Example

151 The following is an example of a <rac:RequestedACCombination> element in which the SP is  
152 expressing that it desires the resultant <AuthnStatement> to have an Authentication Context that:

- 153 1. represents an authentication event characterized by a mechanism at least as strong as  
154 'password' AND
- 155 2. represents an authentication event characterized by an authentication credential that is not  
156 shared by multiple users.
- 157 3.

```
158 <rac:RequestedACCombination RACComparison="all">  
159   <rac:RequestedACCombination RACComparison="minimum">  
160     <saml:AuthnContextClassRef>  
161       urn:oasis:names:tc:SAML:2.0:ac:classes:password
```

```
162     </saml:AuthnContextClassRef>
163   </rac:RequestedACCombination>
164   <rac:RequestedACCombination RACComparison="exact">
165     <saml:AuthnContextClassRef>
166       urn:oasis:names:tc:SAML:2.0:ac:ext:classes:sc:unique
167     </saml:AuthnContextClassRef>
168   </rac:RequestedACCombination>
169 </RequestedACCombination>
```

170

## 171 2.3 Processing Rules

172 This extension is included in a protocol request message by placing it in the optional  
173 `<samlp:Extensions>` element. Due to existing processing requirements, all extensions are explicitly  
174 deemed optional. Therefore, senders SHOULD only include this extension when they can be reasonably  
175 confident that the extension will be understood by the recipient.

176 This extension element MUST NOT be used in conjunction with any protocol message element whose  
177 complex type is not derived from the **samlp:RequestAbstractType** complex types.

178 A sender MUST NOT include more than one `<rac:RequestedACCombination>` element in a given  
179 request message unless additional elements occur as nested children of the top-most extension,

180 The `<rac:RequestedACCombination>` extension element MUST NOT be used in a message in which  
181 there exists a `<samlp:RequestedAuthnContext>` element.

182 A sender MAY specify the logical combination it desires by providing the appropriate URI in the  
183 `RACComparison` attribute. If not specified, it is logically equivalent to the `RACComparison` attribute  
184 being present with a value of `urn:oasis:names:tc:SAML:protocol:ext:rac:all`.

185 If a `<AuthnRequest>` message's `<samlp:Extensions>` element contains a  
186 `<rac:RequestedACCombination>` element, then a responder that understands the extension MUST fulfill  
187 the request (if it does so at all) by issuing a `<Response>` containing an assertion with at least one  
188 `<AuthnStatement>` element containing an `<AuthnContext>` element that satisfies the specified  
189 Authentication Context in the `<rac:RequestedACCombination>` extension.

190 If the responder is unable to satisfy the specified Authentication Context then the responder MUST return  
191 a `<Response>` message with a second-level `<StatusCode>` of  
192 `urn:oasis:names:tc:SAML:2.0:protocol:NoAuthnContext`.

## 193 2.4 Metadata Considerations

194 SAML metadata MAY be used to indicate support for this protocol extension at particular protocol  
195 endpoints, using the extension capabilities of the metadata schema.

196 Support for this extension is expressed in SAML 2.0 metadata by adding a boolean-typed XML attribute  
197 to an element of or derived from the **md:EndpointType** complex type, indicating that SAML request  
198 messages sent to that endpoint MAY include this extension.

199 The following schema fragment defines the `rac:supportsRequestedACComb` attribute:

200

```
201 <attribute name="supportsRequestedACComb" type="boolean"/>
```

## 202 2.4.1 Metadata Example

203 The example below shows a fragmentary `<md:SingleSignOnService>` element that advertises  
204 support for the `<rac:RequestedACCombination>` extension. The namespace declaration must be in  
205 scope, but the prefix is of course arbitrary.

206

```
207 <md:SingleSignOnService  
208   xmlns:rac="urn:oasis:names:tc:SAML:protocol:ext:rac"  
209   rac:supportsRequestedACComb="1" .../>
```
