Abstract:

This document lists approved errata to the SAML V2.0 OASIS Standard.

Status:

This document was last revised or approved by the OASIS Security Services (SAML) TC on the above date. The level of approval is also listed above. Check the "Latest version" location noted above for possible later revisions of this document.

Technical Committee members should send comments on this Work Product to the Technical Committee's email list. Others should send comments to the Technical Committee by using the "Send A Comment" button on the Technical Committee's web page at <http://www.oasis-open.org/committees/security/>.

For information on whether any patents have been disclosed that may be essential to implementing this Work Product, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (<http://www.oasis-open.org/committees/security/ipr.php>).

Citation format:

When referencing this Work Product the following citation format should be used:

All capitalized terms in the following text have the meanings assigned to them in the OASIS Intellectual Property Rights Policy (the "OASIS IPR Policy"). The full [Policy](#) may be found at the OASIS website.

This document and translations of it may be copied and furnished to others, and derivative works that comment on or otherwise explain it or assist in its implementation may be prepared, copied, published, and distributed, in whole or in part, without restriction of any kind, provided that the above copyright notice and this section are included on all such copies and derivative works. However, this document itself may not be modified in any way, including by removing the copyright notice or references to OASIS, except as needed for the purpose of developing any document or deliverable produced by an OASIS Technical Committee (in which case the rules applicable to copyrights, as set forth in the OASIS IPR Policy, must be followed) or as required to translate it into languages other than English.

The limited permissions granted above are perpetual and will not be revoked by OASIS or its successors or assigns.

This document and the information contained herein is provided on an "AS IS" basis and OASIS DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY OWNERSHIP RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

OASIS requests that any OASIS Party or any other party that believes it has patent claims that would necessarily be infringed by implementations of this OASIS Committee Specification or OASIS Standard, to notify OASIS TC Administrator and provide an indication of its willingness to grant patent licenses to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification.

OASIS invites any party to contact the OASIS TC Administrator if it is aware of a claim of ownership of any patent claims that would necessarily be infringed by implementations of this specification by a patent holder that is not willing to provide a license to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification. OASIS may include such claims on its website, but disclaims any obligation to do so.

OASIS takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on OASIS' procedures with respect to rights in any document or deliverable produced by an OASIS Technical Committee can be found on the OASIS website. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this OASIS Committee Specification or OASIS Standard, can be obtained from the OASIS TC Administrator. OASIS makes no representation that any information or list of intellectual property rights will at any time be complete, or that any claims in such list are, in fact, Essential Claims.

The name "OASIS" is a trademark of [OASIS](#), the owner and developer of this specification, and should be used only to refer to the organization and its official outputs. OASIS welcomes reference to, and implementation and use of, specifications, while reserving the right to enforce its marks against misleading uses. Please see <http://www.oasis-open.org/who/trademark.php> for above guidance.

E83: Weaken claim made about Exclusive C14N.....	37
E84: Incorrect NameID Format constant.....	37
E85: Conflicting language on profile error responses.....	38
E86: Pseudorandom requirement for persistent NameID format.....	38
E87: Clarify default rules for <md:AttributeConsumingService>.....	38
E88: Human readability of <md:ServiceName>.....	38
E89: NameFormat defaulting for <md:RequestedAttribute>.....	38
E90: RelayState sanitization.....	39
E91: Disallow <ds:Object> element in signatures.....	40
E92: Add guidance for implementers on clock skew.....	40
E93: Mitigation for XML Encryption CBC deficiencies.....	40
E94: Discussion of metadata caching mixes in validity.....	42
3 Acknowledgments.....	44

1 Introduction

This document lists the approved errata to the SAML V2.0 OASIS Standard. Each one has been given an *Erratum* designation. Numbers in the sequence are missing wherever a reported problem (a “proposed erratum”, or PE) resulted in a TC decision not to issue an erratum to any V2.0 specification text, or where an issue has not yet been disposed.

As required by the OASIS Technical Committee Process, the approved errata represent changes that are not “substantive”. The changes focus on clarifications to ambiguous or conflicting specification text, where different compliant implementations might have reasonably chosen different interpretations. The intent of the Security Services TC has been to resolve such issues in service of improved interoperability based on implementation and deployment experience.

In this document, errata change instructions are presented with surrounding context as necessary to make the intent clear. Original specification text is often presented as follows, with problem text highlighted in bold:

This is an original specification sentence. **The second sentence needs to be changed, removed, or replaced.**

New specification text is typically presented as follows, with new or changed text highlighted in bold:

This is a **highly** original specification sentence. **This is the wholly new content to replace the old second sentence. It runs on and on and on.**

In a few cases, text needs only to be struck, in which case the change is shown as follows, with text to be removed both highlighted in bold and struck through:

This is yet another original specification sentence which contains ~~**an inappropriately**~~ long description.

In addition to this normative document, non-normative “errata composite” documents may be provided that combine the prescribed corrections with the original specification text, illustrating the changes with margin change bars, struck-through original text, and highlighted new text. These documents, if available, will be found at the same location as this approved form.

All cited line numbers refer to the PDF forms of the original OASIS Standard specifications in question, not to line numbers in this document or in the errata composite documents.

2 Approved Errata

63
64 Following are the approved errata to the SAML V2.0 OASIS Standard.

E0: Incorrect Section Reference

65
66 Change [SAMLCore] at line 2660 to refer to section 3.7.3 rather than 3.6.3 for Reason codes. This was a
67 typographical error.

E1: Relay State for HTTP Redirect

68
69 Change [SAMLBind] Section 3.4.3 at lines 551-553 to reflect the fact that, indeed, the RelayState para-
70 meter is covered by the query string signature described in Section 3.4.4.1 (DEFLATE encoding). Note
71 that Section 3.5.3, which has similar original wording, remains correct for its case.

72 Original:

73 RelayState data MAY be included with a SAML protocol message transmitted with this binding. The value
74 MUST NOT exceed 80 bytes in length and SHOULD be integrity protected by the entity creating the
75 message. **Signing is not realistic given the space limitation, but because the value is exposed to**
76 **third-party tampering, the entity SHOULD insure that the value has not been tampered with by using**
77 **a checksum, a pseudo-random value, or similar means.**

78 New:

79 RelayState data MAY be included with a SAML protocol message transmitted with this binding. The value
80 MUST NOT exceed 80 bytes in length and SHOULD be integrity protected by the entity creating the
81 message, **either via a digital signature (see Section 3.4.4.1) or by some independent means.**

E2: Metadata Clarifications for HTTP Artifact Binding

82
83 Change [SAMLBind] Section 3.6.7 at lines 1188-1191 to clarify metadata requirements on profiles using
84 the HTTP Artifact binding.

85 Original:

86 Support for the HTTP Artifact binding SHOULD be reflected by indicating URL endpoints at which requests
87 and responses for a particular protocol or profile should be sent. Either a single endpoint or distinct request
88 and response endpoints MAY be supplied. **One or more indexed endpoints for processing**
89 **<samlp:ArtifactResolve> messages SHOULD also be described.**

90 New:

91 Support for **receiving messages using** the HTTP Artifact binding SHOULD be reflected by indicating URL
92 endpoints at which requests and responses for a particular protocol or profile should be sent. **Support for**
93 **sending messages using this binding SHOULD be accompanied by one or more indexed**
94 **<md:ArtifactResolutionService> endpoints for processing <samlp:ArtifactResolve> messages.**

E4: No Role for SAML V1.1 Artifacts in SAML V2.0

95
96 Change [SAMLBind] Section 3.6.4 at line 1067 to clarify that SAML V1.1 artifacts have no role in SAML
97 V2.0.

98 New:

99 The following describes the single artifact type defined by SAML V2.0. **Although the general artifact**
100 **structure resembles that used in prior versions of SAML and the type code of the single format**
101 **described below does not conflict with previously defined formats, there is explicitly no**
102 **correspondence between SAML V2.0 artifacts and those found in any previous specifications, and**
103 **artifact formats not defined specifically for use with SAML V2.0 MUST NOT be used with this**
104 **binding.**

E6: Clarify Constraints on Encrypted NameID

105
106 Change [SAMLCore] Section 3.4.1.1 at line 2139 to clarify that, if encrypted name identifiers are chosen,
107 no further description of the type of name identifier will be available in SAML messages..
108 New:

109 The special Format value `urn:oasis:names:tc:SAML:2.0:nameid-format:encrypted` indicates
110 that the resulting assertion(s) MUST contain `<EncryptedID>` elements instead of plaintext. The underlying
111 name identifier's unencrypted form can be of any type supported by the identity provider for the requested
112 subject. **It is not possible for the service provider to specifically request that a particular kind of**
113 **identifier be returned if it asks for encryption. The `<md:NameIDFormat>` metadata element (see**
114 **[SAMLMeta]) or other out-of-band means MAY be used to determine what kind of identifier to**
115 **encrypt and return.**

E7: Metadata for Agreeing to Sign Authentication Requests

116
117 Change [SAMLMeta] Section 2.4.3 at line 710, 741-742, and 744-747 to remove ambiguity about how to
118 accomplish signing when the IdP SSO descriptor includes the setting `WantAuthnRequestsSigned` and the
119 SP SSO descriptor includes the setting `AuthnRequestsSigned`.
120 New at line 710:

121 The `WantAuthnRequestsSigned` attribute is intended to indicate to service providers whether or not
122 they can expect an unsigned `<AuthnRequest>` message to be accepted by the identity provider. The
123 identity provider is not obligated to reject unsigned requests nor is a service provider obligated to
124 sign its requests, although it might reasonably expect an unsigned request will be rejected. In some
125 cases, a service provider may not even know which identity provider will ultimately receive and
126 respond to its requests, so the use of this attribute in such a case cannot be strictly defined.

127
128 Furthermore, note that the specific method of signing that would be expected is binding dependent.
129 The HTTP Redirect binding (see [SAMLBind]) requires that the signature be applied to the URL-
130 encoded value rather than placed within the XML message, while other bindings generally permit the
131 signature to be within the message in the usual fashion.

132
133 The following schema fragment defines the `<IDPSSODescriptor>` element and its
134 `IDPSSODescriptorType` complex type:

135 New at lines 741-742:

136 Optional attribute that indicates whether the `<samlp:AuthnRequest>` messages sent by this service
137 provider will be signed. If omitted, the value is assumed to be false. **A value of false (or omission of this**
138 **attribute) does not imply that the service provider will never sign its requests or that a signed**
139 **request should be considered an error. However, an identity provider that receives an unsigned**
140 **`<samlp:AuthnRequest>` message from a service provider whose metadata contains this attribute**
141 **with a value of true MUST return a SAML error response and MUST NOT fulfill the request.**

142 New at lines 744-747:

143 Optional attribute that indicates a requirement for the `<saml:Assertion>` elements received by this
144 service provider to be signed. If omitted, the value is assumed to be false. This requirement is in addition to
145 any requirement for signing derived from the use of a particular profile/binding combination. **Note that an**
146 **enclosing signature at the SAML binding or protocol layer does not suffice to meet this requirement,**
147 **for example signing a `<samlp:Response>` containing the assertion(s) or a TLS connection.**

E8: SLO and NameID Termination

148
149 Change [SAMLCore] Section 3.6.3 at lines 2479-2480 to clarify the rules around SP single logout beha-
150 vior when a name identifier has been terminated.

151 Original:

152 The receiving provider can perform any maintenance with the knowledge that the relationship represented
153 by the name identifier has been terminated. **It can choose to invalidate the active session(s) of a**
154 **principal for whom a relationship has been terminated.**

155 New:

156 The receiving provider can perform any maintenance with the knowledge that the relationship represented
157 by the name identifier has been terminated. **In general it SHOULD NOT invalidate any active session(s)**
158 **of the principal for whom the relationship has been terminated. If the receiving provider is an identity**
159 **provider, it SHOULD NOT invalidate any active session(s) of the principal established with other**
160 **service providers. A requesting provider MAY send a <LogoutRequest> message prior to initiating**
161 **a name identifier termination by sending a <ManageNameIDRequest> message if that is the**
162 **requesting provider's intent (e.g., the name identifier termination is initiated via an administrator**
163 **who wished to terminate all user activity). The requesting provider MUST NOT send a**
164 **<LogoutRequest> message after the <ManageNameIDRequest> message is sent.**

165 **E10: Logout Request Reason Mismatch with Schema**

166 Change [SAMLCore] Section 3.7.1 at line 2540 to resolve an apparent conflict between the specification
167 text and the schema. (Note that although in this case the schema could have been more specific, text in
168 SAML specifications is allowed to impose further restrictions on syntactic constraints imposed by a
169 schema, and this technique has been used here to resolve the issue without a substantive change.)
170 New:

171 An indication of the reason for the logout, in the form of a URI reference. **The Reason attribute is specified**
172 **as a string in the schema. This specification further restricts the schema by requiring that the**
173 **Reason attribute MUST be in the form of a URI reference.**

174 **E11: Improperly Labeled Feature**

175 Change [SAMLConf] in Section 3.2 (Table 2) to make the labels in feature rows 6 through 9 consistent.
176 Original labels:

177 Name Identifier Management, HTTP Redirect (IdP-initiated)
178 Name Identifier Management, SOAP (IdP-initiated)
179 Name Identifier Management, HTTP Redirect
180 Name Identifier Management, SOAP

181 New labels:

182 **Name Identifier Management (IdP-Initiated), HTTP Redirect**
183 **Name Identifier Management (IdP-Initiated), SOAP**
184 **Name Identifier Management (SP-Initiated), HTTP Redirect**
185 **Name Identifier Management (SP-Initiated), SOAP**

186 **E12: Clarification on ManageNameIDRequest**

187 Change [SAMLCore] Section 3.6 at lines 2412-2413 and 2438, and change [SAMLProf] Section 4.5 at
188 lines 1320-1321, to remove incorrect implications that the name identifier format can be changed in the
189 course of the protocol.

190 New [SAMLCore] at lines 2412-2413:

191 After establishing a name identifier for a principal, an identity provider wishing to change the value **and/or**
192 **format** of the identifier that it will use when referring to the principal, or to indicate that a name identifier will
193 no longer be used to refer to the principal, informs service providers of the change by sending them a
194 **<ManageNameIDRequest> message.**

195 New [SAMLCore] at line 2438:

196 If the requester is the identity provider, the new value will appear in subsequent **<NameID>** elements as the
197 element's content. **In either case, if the <NewEncryptedID> is used, its encrypted content is just a**
198 **<NewID> element containing only the new value for the identifier (format and qualifiers cannot be**
199 **changed once established).**

200 New [SAMLProf] at lines 1320-23121:

201 Subsequently, the identity provider may wish to notify the service provider of a change in the **format and/or**
202 **value** that it will use to identify the same principal in the future.

E13: Inaccurate Description of Authorization Decision

203
204 Change [SAMLCore] Section 2 at lines 357-358 to complete the list of potential results from an authoriza-
205 tion decision.
206 New:

207 **Authorization Decision:** A request to allow the assertion subject to access the specified resource has been
208 granted or denied **or is indeterminate**.

E14: AllowCreate

209
210 Change [SAMLCore] at lines 2123-2129, 2130, 2143-2147, 2419-2420, and 2480, and change [SAML-
211 Prof] at lines 521-524, to clarify the semantics of `AllowCreate`.
212 Original at [SAMLCore] Section 3.4.1.1, lines 2123-2129:

213 A Boolean value used to indicate whether the identity provider **is allowed**, in the course of fulfilling the
214 request, to create a new identifier **to represent the principal**. Defaults to "false". **When "false", the**
215 **requester constrains the identity provider to only issue an assertion to it if an acceptable identifier**
216 **for the principal has already been established. Note that this does not prevent the identity provider**
217 **from creating such identifiers outside the context of this specific request (for example, in advance**
218 **for a large number of principals).**

219 New at [SAMLCore] Section 3.4.1.1, lines 2123-2129:

220 A Boolean value used to indicate whether the **requester grants to** the identity provider, in the course of
221 fulfilling the request, **permission to create a new identifier or to associate an existing identifier**
222 **representing the principal with the relying party**. Defaults to "false" if not present or the entire element
223 **is omitted**.

224 New at [SAMLCore] Section 3.4.1.1, line 2130 (just after the above changes):

225 **The `AllowCreate` attribute may be used by some deployments to influence the creation of state**
226 **maintained by the identity provider pertaining to the use of a name identifier (or any other persistent,**
227 **uniquely identifying attributes) by a particular relying party, for purposes such as dynamic identifier**
228 **or attribute creation, tracking of consent, subsequent use of the Name Identifier Management**
229 **protocol (see Section 3.6), or other related purposes.**

230
231 **When "false", the requester tries to constrain the identity provider to issue an assertion only if such**
232 **state has already been established or is not deemed applicable by the identity provider to the use of**
233 **an identifier. Thus, this does not prevent the identity provider from assuming such information**
234 **exists outside the context of this specific request (for example, establishing it in advance for a large**
235 **number of principals).**

236
237 **A value of "true" permits the identity provider to take any related actions it wishes to fulfill the**
238 **request, subject to any other constraints imposed by the request and policy (the `IsPassive`**
239 **attribute, for example).**

240
241 **Generally, requesters cannot assume specific behavior from identity providers regarding the initial**
242 **creation or association of identifiers on their behalf, as these are details left to implementations or**
243 **deployments. Absent specific profiles governing the use of this attribute, it might be used as a hint**
244 **to identity providers about the requester's intention to store the identifier or link it to a local value.**

245
246 **A value of "false" might be used to indicate that the requester is not prepared or able to do so and**
247 **save the identity provider wasted effort.**

248
249 **Requesters that do not make specific use of this attribute SHOULD generally set it to "true" to**
250 **maximize interoperability.**

251
252 **The use of the `AllowCreate` attribute MUST NOT be used and SHOULD be ignored in conjunction**
253 **with requests for or assertions issued with name identifiers with a `Format` of**
254 **`urn:oasis:names:tc:SAML:2.0:nameid-format:transient` (they preclude any such state in**
255 **and of themselves).**

256 Original at [SAMLCore] Section 3.6, lines 2419-2420:

257 A service provider also uses this message to register or change the `SPProvidedID` value to be included
258 when the underlying name identifier is used to communicate with it, or to terminate the use of a name
259 identifier between itself and the identity provider.

260 **Note that this protocol is typically not used with “transient” name identifiers, since their value is not**
261 **intended to be managed on a long-term basis.**

262
263 New at [SAMLCore] Section 3.6, lines 2419-2420:

264 A service provider also uses this message to register or change the `SPProvidedID` value to be included
265 when the underlying name identifier is used to communicate with it, or to terminate the use of a name
266 identifier between itself and the identity provider.

267 **This protocol MUST NOT be used in conjunction with the**
268 **`urn:oasis:names:tc:SAML:2.0:nameidformat:transient` <NameID> Format.**
269

270 New at [SAMLCore] Section 3.6.3, line 2480 (note that E8 and E55 specify additional changes to the ori-
271 ginal text shown here):

272 If the <Terminate> element is included in the request, the requesting provider is indicating that (in the case
273 of a service provider) it will no longer accept assertions from the identity provider or (in the case of an
274 identity provider) it will no longer issue assertions to the service provider about the principal. The receiving
275 provider can perform any maintenance with the knowledge that the relationship represented by the name
276 identifier has been terminated. It can choose to invalidate the active session(s) of a principal for whom a
277 relationship has been terminated.

278 **If the receiving provider is maintaining state associated with the name identifier, such as the value of**
279 **the identifier itself (in the case of a pair-wise identifier), an `SPProvidedID` value, the sender’s**
280 **consent to the identifier’s creation/use, etc., then the receiver can perform any maintenance with the**
281 **knowledge that the relationship represented by the name identifier has been terminated.**

282 **Any subsequent operations performed by the receiver on behalf of the sender regarding the**
283 **principal (for example, a subsequent <AuthnRequest>) SHOULD be carried out in a manner**
284 **consistent with the absence of any previous state.**

285 **Termination is potentially the cleanup step for any state management behavior triggered by the use**
286 **of the `AllowCreate` attribute in the Authentication Request protocol (see Section 3.4). Deployments**
287 **that do not make use of that attribute are likely to avoid the use of the <Terminate> element or**
288 **would treat it as a purely advisory matter.**

289 **Note that in most cases (a notable exception being the rules surrounding the `SPProvidedID`**
290 **attribute), there are no requirements on either identity providers or service providers regarding the**
291 **creation or use of persistent state. Therefore, no explicit behavior is mandated when the**
292 **<Terminate> element is received. However, if persistent state is present pertaining to the use of an**
293 **identifier (such as if an `SPProvidedID` attribute was attached), the <Terminate> element provides a**
294 **clear indication that this state SHOULD be deleted (or marked as obsolete in some fashion).**
295
296
297
298

299 Original at [SAMLProf] Section 4.1.4.1, lines 521-524:

300 If the identity provider cannot or will not satisfy the request, it MUST respond with a <Response> message
301 containing an appropriate error status code or codes.

302 **If the service provider wishes to permit the identity provider to establish a new identifier for the**
303 **principal if none exists, it MUST include a <NameIDPolicy> element with the `AllowCreate` attribute**
304 **set to “true”. Otherwise, only a principal for whom the identity provider has previously established**
305 **an identifier usable by the service provider can be authenticated successfully.**
306

307 New at [SAMLProf] Section 4.1.4.1, lines 521-524:

308 If the identity provider cannot or will not satisfy the request, it MUST respond with a <Response> message
309 containing an appropriate error status code or codes.

310 **This profile does not provide any guidelines for the use of `AllowCreate`; see [SAMLCore] for**
311 **normative rules on using `AllowCreate`.**
312

313 **E15: NameID Policy Adherence**

314 Change [SAMLCore] Section 3.4.1.1 at line 2139 to clarify that the expressed name identifier policy must
315 be adhered to.

316 New (note that E6 specifies additional changes to the original text shown here):

317 The special `Format` value `urn:oasis:names:tc:SAML:2.0:nameid-format:encrypted` indicates
318 that the resulting assertion(s) MUST contain `<EncryptedID>` elements instead of plaintext. The underlying
319 name identifier's unencrypted form can be of any type supported by the identity provider for the requested
320 subject.

321
322 **When a `Format` defined in Section Error: Reference source not found 8.3 other than**
323 **`urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified` or**
324 **`urn:oasis:names:tc:SAML:2.0:nameid-format:encrypted` is used, then if the identity provider**
325 **returns any assertions:**

326
327 ● **the `Format` value of the `<NameID>` within the `<Subject>` of any `<Assertion>` MUST be identical**
328 **to the `Format` value supplied in the `<NameIDPolicy>`, and**

329
330 ● **if `SPNameQualifier` is not omitted in `<NameIDPolicy>`, the `SPNameQualifier` value of the**
331 **`<NameID>` within the `<Subject>` of any `<Assertion>` MUST be identical to the `SPNameQualifier`**
332 **value supplied in the `<NameIDPolicy>`.**

333 **E17: Authentication Response IssuerName vs. Assertion** 334 **IssuerName**

335 Change [SAMLProf] Section 4.1.4.2 at lines 541-543 to accurately reflect the conditions under which is-
336 suer information is required and how issuer information at the different levels must correlate.

337 Original:

338 **The `<Issuer>` element MAY be omitted, but if present it MUST contain the unique identifier of the**
339 **issuing identity provider; the `Format` attribute MUST be omitted or have a value of**
340 **`urn:oasis:names:tc:SAML:2.0:nameid-format:entity`.**

341 New:

342 **If the `<Response>` message is signed or if an enclosed assertion is encrypted, then the `<Issuer>`**
343 **element MUST be present. Otherwise it MAY be omitted. If present it MUST contain the unique identifier**
344 **of the issuing identity provider; the `Format` attribute MUST be omitted or have a value of**
345 **`urn:oasis:names:tc:SAML:2.0:nameid-format:entity`.**

346 **E18: Reference to Identity Provider Discovery Service in ECP** 347 **Profile**

348 Change [SAMLProf] Section 4.2.2 at lines 725-726 to remove the incorrect implication that an ECP is a
349 direct participant in the identity provider discovery profile.

350 New:

351 In step 3, the ECP obtains the location of an endpoint at an identity provider for the authentication request
352 protocol that supports its preferred binding. The means by which this is accomplished is implementation-
353 dependent. **~~The ECP MAY use the SAML identity provider discovery profile described in Section 4.3.~~**

354 **E19: Clarification on Error Processing**

355 Change [SAMLBind] Section 3.2.2.1 at lines 310-317 and Section 3.2.3.3 at line 378 to clarify SAML error
356 processing and its relationship to SOAP error processing.

357 Original at Section 3.2.2.1, lines 310-317:

358 The SAML responder **MUST return either a SAML response element within the body of another SOAP**
359 **message or generate a SOAP fault.** The SAML responder MUST NOT include more than one SAML
360 response per SOAP message or include any additional XML elements in the SOAP body. **If a SAML**
361 **responder cannot, for some reason, process a SAML request, it MUST generate a SOAP fault.** SOAP

362 fault codes **MUST NOT** be sent for errors within the SAML problem domain, for example, inability to find an
363 extension schema or as a signal that the subject is not authorized to access a resource in an authorization
364 query. (SOAP 1.1 faults and fault codes are discussed in [SOAP11] Section 4.1.)

365 New at Section 3.2.2.1, lines 310-317:

366 The SAML responder **SHOULD** return a **SOAP message containing either a SAML response element in**
367 **the body or a SOAP fault**. The SAML responder **MUST NOT** include more than one SAML response per
368 SOAP message or include any additional XML elements in the SOAP body. SOAP fault codes **SHOULD**
369 **NOT** be sent for errors within the SAML problem domain, for example, inability to find an extension schema
370 or as a signal that the subject is not authorized to access a resource in an authorization query. **See Section**
371 **3.2.3.3 for more information about error handling**. (SOAP 1.1 faults and fault codes are discussed in
372 [SOAP11] Section 4.1.)

373 Original at Section 3.2.3.3, line 378:

374 In the case of a SAML processing error, the SOAP HTTP server **MUST** respond with "200 OK" and
375 include a SAML-specified `<samlp:Status>` element in the SAML response within the SOAP body.

376 New at Section 3.2.3.3, line 378:

377 In the case of a SAML processing error, the SOAP HTTP server **SHOULD** respond with "200 OK" and
378 include a SAML-specified `<samlp:Status>` element in the SAML response within the SOAP body.

379 **E20: ECP SSO Profile and Metadata**

380 Change [SAMLProf] at line 1081 to add a new subsection, Section 4.2.6, in order to add metadata consid-
381 erations to the ECP profile.

382 New (small portion of previous subsection shown):

383 The ECP **SHOULD** be authenticated to the identity provider, such as by maintaining an authenticated
384 session. Any HTTP exchanges subsequent to the delivery of the `<AuthnRequest>` message and before
385 the identity provider returns a `<Response>` **MUST** be securely associated with the original request.

386 **4.2.6 Use of Metadata**

387
388
389 The rules specified in the browser SSO profile in Section 4.1.6 apply here as well. Specifically, the
390 indexed endpoint element `<md:AssertionConsumerService>` with a binding of
391 `urn:oasis:names:tc:SAML:2.0:bindings:PAOS` **MAY** be used to describe the supported
392 binding and location(s) to which an identity provider may send responses to a service provider
393 using this profile. **IN** addition, the endpoint `<md:SingleSignOnService>` with a binding of
394 `urn:oasis:names:tc:SAML:2.0:bindings:SOAP` **MAY** be used to describe the supported
395 binding and location(s) to which an service provider may send requests to an identity provider using
396 this profile.

397 **E21: PAOS Version**

398 Change [SAMLBind] Section 3.3.3 at line 474 to clarify the PAOS version required. New:

399 ● The HTTP PAOS Header field **MUST** be present and specify the PAOS version with
400 `"urn:liberty:paos:2003-08"` **at a minimum**.

401 **E22: Error in Profile/ECP**

402 Change [SAMLProf] Section 4.2.4.1 at line 907 to refer to the `AssertionConsumerServiceURL` attribute
403 rather than the `AssertionServiceConsumerURL` attribute. This was a typographical error.

404 **E24: HTTPS in URI Binding**

405 Change [SAMLBind] Section 3.7 at lines 1349-1351 to make the HTTP support requirements more appro-
406 priate in the context of the URI binding.

407 Original:

408 Like SOAP, URI resolution can occur over multiple underlying transports. This binding has **transport-**
409 **independent aspects**, but also calls out the **use of HTTP with SSL 3.0 [SSL3] or TLS 1.0 [RFC2246] as**
410 **REQUIRED (mandatory to implement)**.

411 New:

412 Like SOAP, URI resolution can occur over multiple underlying transports. This binding has **protocol-**
413 **independent aspects**, but also calls out **as mandatory the implementation of HTTP URIs**.

414 **E25: Metadata Feature in Conformance**

415 Change [SAMLConf] in Section 3.2 (Tables 2 and 4) to add feature rows, and at line 231 to add two sub-
416 sections, Sections 3.6 and 3.7, in order to reflect conformance aspects of the SAML metadata feature.
417 New in Table 2:

418 Feature	IdP	IdP Lite	SP	SP Lite	ECP
419 Metadata Structures	OPT	OPT	OPT	OPT	N/A
420 Metadata Interoperation	OPT	OPT	OPT	OPT	N/A

421 New in Table 4:

422 Feature	Authn	Attrib	Authz	Requester
423 Metadata Structures	OPT	OPT	OPT	OPT
424 Metadata Interoperation	OPT	OPT	OPT	OPT

425 New at line 231 (small portion of previous subsection shown):

426 If a SAML authority uses SSL 3.0 or TLS 1.0, it **MUST** use a server-side certificate.
427

428 **3.6 Metadata Structures**

429

430 **Implementations claiming conformance to SAML V2.0 may declare each operational mode's**
431 **conformance to SAML V2.0 Metadata [SAMLMeta] through election of the Metadata Structures**
432 **option.**

433

434 **With respect to each operational mode, such conformance entails the following:**

435

- 436 ● **Implementing SAML metadata according to the extensible SAML V2.0 Metadata format in all cases**
437 **where an interoperating peer has the option, as stated in SAML V2.0 specifications, of depending on**
438 **the existence of SAML V2.0 Metadata. Electing the Metadata Structures option has the effect of**
439 **requiring that such metadata be available to the interoperating peer. The Metadata Interoperation**
440 **feature, described below, provides a means of satisfying this requirement.**
- 441
- 442 ● **Referencing, consuming, and adhering to the SAML metadata, according to [SAMLMeta], of an**
443 **interoperating peer when the known metadata relevant to that peer and the particular operation, and**
444 **the current exchange, has expired or is no longer valid in cache, provided the metadata is available**
445 **and is not prohibited by policy or the particular operation and that specific exchange.**
- 446

447 **3.7 Metadata Interoperation**

448

449 **Election of the Metadata Interoperation option requires the implementation to offer, in addition to**
450 **any other mechanism, the well-known location publication and resolution mechanism described in**
451 **the SAML metadata specification [SAMLMeta].**

452 **E26: Ambiguities Around Multiple Assertions and Statements in** 453 **the SSO Profile**

454 Change [SAMLProf] Section 4.1.4.2 at lines 541-572, Section 4.1.4.3 at lines 576-591, and Section
455 4.1.4.5 at lines 600-601 to resolve ambiguities around the usage of multiple assertions and multiple state-
456 ments within an assertion in the SSO profile.
457 Original at Section 4.1.4.2, lines 541-572:

- 458 • The <Issuer> element MAY be omitted, but if present it MUST contain the unique identifier of the
459 issuing identity provider; the Format attribute MUST be omitted or have a value of
460 urn:oasis:names:tc:SAML:2.0:nameid-format:entity.
- 461 • It MUST contain at least one <Assertion>. Each assertion's <Issuer> element MUST contain the
462 unique identifier of the **issuing** identity provider; the Format attribute MUST be omitted or have a value
463 of urn:oasis:names:tc:SAML:2.0:nameid-format:entity.
- 464 • **The set of one or more assertions MUST contain at least one <AuthnStatement> that reflects**
465 **the authentication of the principal to the identity provider.**
- 466 • **At least one assertion containing an <AuthnStatement> MUST contain a <Subject> element**
467 **with at least one <SubjectConfirmation> element containing a Method of**
468 **urn:oasis:names:tc:SAML:2.0:cm:bearer. If the identity provider supports the Single**
469 **Logout profile, defined in Section 4.4, any such authentication statements MUST include a**
470 **SessionIndex attribute to enable per-session logout requests by the service provider.**
- 471 • **The bearer <SubjectConfirmation> element described above MUST contain a**
472 **<SubjectConfirmationData> element that contains a Recipient attribute containing the**
473 **service provider's assertion consumer service URL and a NotOnOrAfter attribute that limits the**
474 **window during which the assertion can be delivered. It MAY contain an Address attribute limiting**
475 **the client address from which the assertion can be delivered. It MUST NOT contain a NotBefore**
476 **attribute. If the containing message is in response to an <AuthnRequest>, then the**
477 **InResponseTo attribute MUST match the request's ID.**
- 478 • Other statements and confirmation methods MAY be included in the assertion(s) at the discretion of
479 the identity provider. In particular, <AttributeStatement> elements MAY be included. The
480 <AuthnRequest> MAY contain an AttributeConsumingServiceIndex XML attribute referencing
481 information about desired or required attributes in [SAMLMeta]. The identity provider MAY ignore this, or
482 send other attributes at its discretion.
- 483 • **The assertion(s) containing a bearer subject confirmation MUST contain an**
484 **<AudienceRestriction> including the service provider's unique identifier as an <Audience>.**
- 485 • Other conditions (and other <Audience> elements) MAY be included as requested by the service
486 provider or at the discretion of the identity provider. (Of course, all such conditions MUST be understood
487 by and accepted by the service provider in order for the assertion to be considered valid.) The identity
488 provider is NOT obligated to honor the requested set of <Conditions> in the <AuthnRequest>, if
489 any.
- 490 • The identity provider is NOT obligated to honor the requested set of <Conditions> in the
491 <AuthnRequest>, if any.

492 New at Section 4.1.4.2, lines 541-572 (note that E17 specifies additional changes to the first bullet item
493 shown here):

- 494 • The <Issuer> element MAY be omitted, but if present it MUST contain the unique identifier of the
495 issuing identity provider; the Format attribute MUST be omitted or have a value of
496 urn:oasis:names:tc:SAML:2.0:nameid-format:entity.
- 497 • It MUST contain at least one <Assertion>. Each assertion's <Issuer> element MUST contain the
498 unique identifier of the **responding** identity provider; the Format attribute MUST be omitted or have a
499 value of urn:oasis:names:tc:SAML:2.0:nameid-format:entity. **Note that this profile**
500 **assumes a single responding identity provider, and all assertions in a response MUST be issued**
501 **by the same entity.**
- 502 • **If multiple assertions are included, then each assertion's <Subject> element MUST refer to the**
503 **same principal. It is allowable for the content of the <Subject> elements to differ (e.g. using**
504 **different <NameID> or alternative <SubjectConfirmation> elements).**

- 505 • Any assertion issued for consumption using this profile **MUST** contain a `<Subject>` element
506 with at least one `<SubjectConfirmation>` element containing a `Method` of
507 `urn:oasis:names:tc:SAML:2.0:cm:bearer`. Such an assertion is termed a bearer
508 assertion. Bearer assertions **MAY** contain additional `<SubjectConfirmation>` elements.

- 509 • Assertions without a bearer `<SubjectConfirmation>` **MAY** also be included; processing of
510 additional assertions or `<SubjectConfirmation>` elements is outside the scope of this
511 profile.

- 512 • At least one bearer `<SubjectConfirmation>` element **MUST** contain a
513 `<SubjectConfirmationData>` element that itself **MUST** contain a `Recipient` attribute
514 containing the service provider's assertion consumer service URL and a `NotOnOrAfter`
515 attribute that limits the window during which the assertion can be [PE52]confirmed by the relying
516 party. It **MAY** also contain an `Address` attribute limiting the client address from which the
517 assertion can be delivered. It **MUST NOT** contain a `NotBefore` attribute. If the containing
518 message is in response to an `<AuthnRequest>`, then the `InResponseTo` attribute **MUST**
519 match the request's ID.

- 520 • The set of one or more bearer assertions **MUST** contain at least one `<AuthnStatement>` that
521 reflects the authentication of the principal to the identity provider. Multiple `<AuthnStatement>`
522 elements **MAY** be included, but the semantics of multiple statements is not defined by this
523 profile.

- 524 • If the identity provider supports the Single Logout profile, defined in Section Error: Reference
525 source not found, any authentication statements **MUST** include a `SessionIndex` attribute to
526 enable per-session logout requests by the service provider.

- 527 • Other statements **MAY** be included in the **bearer** assertion(s) at the discretion of the identity provider. In
528 particular, `<AttributeStatement>` elements **MAY** be included. The `<AuthnRequest>` **MAY** contain
529 an `AttributeConsumingServiceIndex` XML attribute referencing information about desired or
530 required attributes in [SAMLMeta]. The identity provider **MAY** ignore this, or send other attributes at its
531 discretion.

- 532 • **Each bearer** assertion **MUST** contain an `<AudienceRestriction>` including the service provider's
533 unique identifier as an `<Audience>`.

- 534 • Other conditions (and other `<Audience>` elements) **MAY** be included as requested by the service
535 provider or at the discretion of the identity provider. (Of course, all such conditions **MUST** be understood
536 by and accepted by the service provider in order for the assertion to be considered valid.) The identity
537 provider is **NOT** obligated to honor the requested set of `<Conditions>` in the `<AuthnRequest>`, if
538 any.

- 539 • The identity provider is **NOT** obligated to honor the requested set of `<Conditions>` in the
540 `<AuthnRequest>`, if any.

541 Original at Section 4.1.4.3, lines 576-591:

- 542 • Verify that the `Recipient` attribute in any bearer `<SubjectConfirmationData>` matches the assertion
543 consumer service URL to which the `<Response>` or artifact was delivered
- 544 • Verify that the `NotOnOrAfter` attribute in any bearer `<SubjectConfirmationData>` has not passed,
545 subject to allowable clock skew between the providers
- 546 • Verify that the `InResponseTo` attribute in the bearer `<SubjectConfirmationData>` equals the ID of
547 its original `<AuthnRequest>` message, unless the response is unsolicited (see Section 4.1.5), in which
548 case the attribute **MUST NOT** be present
- 549 • Verify that any assertions relied upon are valid in other respects.
- 550
- 551

552 • If any bearer <SubjectConfirmationData> includes an Address attribute, the service provider MAY
553 check the user agent's client address against it.

554 • Any assertion which is not valid, or whose subject confirmation requirements cannot be met SHOULD be
555 discarded and SHOULD NOT be used to establish a security context for the principal.

556 • If an <AuthnStatement> used to establish a security context for the principal contains a
557 SessionNotOnOrAfter attribute, the security context SHOULD be discarded once this time is reached,
558 unless the service provider reestablishes the principal's identity by repeating the use of this profile.

559 New at Section 4.1.4.3, lines 576-591:

560 • Verify that the Recipient attribute in the bearer <SubjectConfirmationData> matches the assertion
561 consumer service URL to which the <Response> or artifact was delivered

562
563 • Verify that the NotOnOrAfter attribute in the bearer <SubjectConfirmationData> has not passed,
564 subject to allowable clock skew between the providers

565
566 • Verify that the InResponseTo attribute in the bearer <SubjectConfirmationData> equals the ID of
567 its original <AuthnRequest> message, unless the response is unsolicited (see Section 4.1.5), in which
568 case the attribute MUST NOT be present

569 • Verify that any assertions relied upon are valid in other respects. **Note that while multiple bearer**
570 **<SubjectConfirmation> elements may be present, the successful evaluation of a single such**
571 **element in accordance with this profile is sufficient to confirm an assertion. However, each**
572 **assertion, if more than one is present, MUST be evaluated independently.**

573 • If any the bearer <SubjectConfirmationData> includes an Address attribute, the service provider
574 MAY check the user agent's client address against it.

575 • Any assertion which is not valid, or whose subject confirmation requirements cannot be met SHOULD be
576 discarded and SHOULD NOT be used to establish a security context for the principal.

577 • If an <AuthnStatement> used to establish a security context for the principal contains a
578 SessionNotOnOrAfter attribute, the security context SHOULD be discarded once this time is reached,
579 unless the service provider reestablishes the principal's identity by repeating the use of this profile. **Note**
580 **that if multiple <AuthnStatement> elements are present, the SessionNotOnOrAfter value closest**
581 **to the present time SHOULD be honored.**

582 Original at Section 4.1.4.5, lines 600-601:

583 If the HTTP POST binding is used to deliver the <Response>, the enclosed assertion(s) MUST be signed.

584 New at Section 4.1.4.5, lines 600-601:

585 If the HTTP POST binding is used to deliver the <Response>, **each assertion MUST be protected by a**
586 **digital signature. This can be accomplished by signing each individual <Assertion> element or by**
587 **signing the <Response> element.**

588 **E27: Incorrect Step Number in ECP Profile**

589 Change [SAMLProf] Section 4.2.4.3 at line 947 to change the reference to the step number from **5** to **7**.
590 This was a typographical error.

591 **E28: Profile Labeling in Conformance**

592 Change [SAMLConf] Section 2 at Table 1 to make its labeling and categorization of profiles more consist-
593 ent.

594 Combine the profile rows labeled **Artifact Resolution**, **Authentication Query**, **Attribute Query**, and **Au-**
595 **thorization Decision Query** into a single profile row labeled **Assertion Query/Request** in column 1, with
596 the breakdown of these four protocol types moved to column 2 (message flows) for that row.

597 Remove the profile rows labeled **SAML URI binding** and **Metadata**.

598 **E29: Incomplete Listing of Features in Conformance**

599 Change [SAMLConf] Section 3.2 at Table 2 to include missing feature rows. New:

600	Feature	IdP	IdP Lite	SP	SP Lite	ECP
601	Request for Assertion by Identifier	OPT	N/A	N/A	N/A	N/A
602	SAML URI Binding	OPT	N/A	N/A	N/A	N/A

603 **E30: Key Replacement**

604 Change [SAMLCore] Section 6.1 at line 3110 to improve wording around key replacement. Original:

605 Encrypted data and **optionally one** or more encrypted keys **MUST** replace the plaintext information in the
606 same location within the XML instance.

607 New:

608 Encrypted data and **zero** or more encrypted keys **MUST** replace the plaintext information in the same
609 location within the XML instance.

610 **E31: Various Minor Errors in Binding**

611 Change [SAMLBind] Section 3.3.5 at line 511, Section 3.5.3 at line 785, and Section 3.6.5 at lines 1136
612 and 1397 to clean up various minor wording errors.

613 At Section 3.3.5, line 511, capitalize the word **RECOMMENDED**.

614 Original at Section 3.5.3, line 785:

615 If no such **value** is included with a SAML request message, or if the SAML response message is being
616 generated without a corresponding request ...

617 New at Section 3.5.3, line 785:

618 If no such **RelayState data** is included with a SAML request message, or if the SAML response message is
619 being generated without a corresponding request ...

620 Original at Section 3.6.5, line 1136:

621 The SAML requester determines the SAML responder by examining the artifact, and issues a
622 <samlp:ArtifactResolve> request containing the artifact to the SAML responder using a **direct** SAML
623 binding, as in step 3.

624 New at Section 3.6.5, line 1136:

625 The SAML requester determines the SAML responder by examining the artifact, and issues a
626 <samlp:ArtifactResolve> request containing the artifact to the SAML responder using a **synchronous**
627 SAML binding, as in step 3.

628 Original at Section 3.6.5, line 1397:

629 Note that the use of wildcards **is not allowed for on** such queries.

630 New at Section 3.6.5, line 1397:

631 Note that **the URI syntax does not support** the use of wildcards **in** such **ID** queries.

632 **E32: Missing Required Information in Profiles**

633 Change [SAMLProf] at line 1092. New subsection added at line 1092 as Section 4.3.1, incrementing the
634 subsection numbers of the existing Sections 4.3.1 through 4.3.3:

635 **4.3.1 Required Information**

636 **Identification:** urn:oasis:names:tc:SAML:2.0:profiles:SSO:idp-discovery

637 **Contact information:** security-services-comment@lists.oasis-open.org

638 **Description:** Given below.

639

Updates: None.

640 **E33: References to Assertion Request Protocol**

641 Change [SAMLMeta] Section 2.4.3 at line 700, Section 2.4.5 at line 838, Section 2.4.6 at line 871, and
642 Section 2.4.7 at line 904 to change references to the **Assertion Request** protocol to **Assertion**
643 **Query/Request**. This is just a typographical error.

644 **E34: RequestedAttribute Section Heading**

645 Change [SAMLMeta] at line 809 to make the Section **2.4.4.2** heading be a level below, at **2.4.4.1.1**, for
646 consistency in reflecting element nesting in the document outline.

647 **E35: Response Consumer URL Rules and Example**

648 Change [SAMLProf] Section 4.2.4.1 at lines 906-908, and Section 4.2.4.3 at line 964, to make the ex-
649 ample conform to the rules for a response consumer URL and explain these rules more clearly.
650 Original at Section 4.2.4.1, lines 906-908:

651 Specifies where the ECP is to send an error response. Also used to verify the correctness of the identity
652 provider's response, by cross checking this location against the **AssertionServiceConsumerURL** in the
653 ECP response header block. This value **MUST** be the same as the AssertionServiceConsumerURL (or the
654 URL referenced in metadata) conveyed in the <AuthnRequest>.

655 New at lines Section 4.2.4.1, 906-908:

656 Specifies where the ECP is to send an error response. Also used to verify the correctness of the identity
657 provider's response, by cross checking this location against the **AssertionConsumerServiceURL** in the
658 ECP response header block. This value **MUST** be the same as the AssertionServiceConsumerURL (or the
659 URL referenced in metadata) conveyed in the <AuthnRequest> **and SHOULD NOT be a relative URL**.

660 Original at Section 4.2.4.3, line 964:

```
661 <paos:Request xmlns:paos="urn:liberty:paos:2003-08"  
662 responseConsumerURL="http://identity-service.example.com/abc"
```

663 New at Section 4.2.4.3, line 964:

```
664 <paos:Request xmlns:paos="urn:liberty:paos:2003-08"  
665 responseConsumerURL="  
666 https://ServiceProvider.example.com/ecp_assertion_consumer"
```

667 **E36: Clarification on Action Element**

668 Change [SAMLCore] Section 2.7.4.2 at lines 1359-1363 to remove the incorrect specification text that
669 says the action namespace is optional (the schema mandates it, and in cases of disagreement, the
670 schema takes precedence).

671 Original:

672 Namespace [**Optional**]

673 A URI reference representing the namespace in which the name of the specified action is to be interpreted.
674 **If this element is absent, the namespace urn:oasis:names:tc:SAML:1.0:action:rwedc-negation**
675 **specified in Section 8.1.2 is in effect.**

676 New:

677 Namespace [**Required**]

678 A URI reference representing the namespace in which the name of the specified action is to be interpreted.

679 **E37: Clarification in Metadata on Indexed Endpoints**

680 Change [SAMLMeta] Section 2.2.3 at line 272 to clarify what it means for two endpoints to be "like".
681 Original:

682 In any such sequence of **like** endpoints **based on this type**, the default endpoint is the first such endpoint
683 with the `isDefault` attribute set to true.

684 New:

685 In any such sequence of **indexed** endpoints **that share a common element name and namespace (i.e. all**
686 **instances of <md:AssertionConsumerService> within a role)**, the default endpoint is the first such
687 endpoint with the `isDefault` attribute set to true.

E38: Clarification Regarding Index on <LogoutRequest>

688 Change [SAMLCore] Section 3.7.1 at line 2546 and [SAMLProf] Section 4.4.4.1 at lines 1302-1304 to cla-
689 rify requirements around session indexes in logout requests.

690 Original at [SAMLCore] Section 3.7.1, line 2546:

692 <SessionIndex> [Optional]

693 **The identifier that indexes this session at the message recipient.**

694 New at [SAMLCore] Section 3.7.1, line 2546:

695 <SessionIndex> [Optional]

696 **The index of the session between the principal identified by the <saml:BaseID>, <saml:NameID>, or <saml:EncryptedID> element, and the session authority. This must correlate to the**
697 **SessionIndex attribute, if any, in the <saml:AuthnStatement> of the assertion used to establish**
698 **the session that is being terminated.**
699

700 New at [SAMLProf] Section 4.4.4.1, lines 1302-1304:

701 If the requester is a session participant, it **MUST** include at least one <SessionIndex> element in the
702 request. **(Note that the session participant always receives a SessionIndex attribute in the**
703 **<saml:AuthnStatement> elements that it receives to initiate the session, per Section 4.1.4.2 of**
704 **the Web Browser SSO Profile.)** If the requester is a session authority (or acting on its behalf), then it **MAY**
705 omit any such elements to indicate the termination of all of the principal's applicable sessions.

E39: Error in SAML Profile Example

707 **Note:** E39 corrects text in a section that is affected by E53, which deprecates the entire
708 section. Please see E53 for details.

709 Change [SAMLProf] Section 8.5.6 at lines 2095-2098 to move the `ldapprof:Encoding` attribute to the
710 correct location.

711 Original:

```
712 <saml:Attribute
713   xmlns:xacmlprof="urn:oasis:names:tc:SAML:2.0:profiles:attribute:XACML"
714   xmlns:ldapprof="urn:oasis:names:tc:SAML:2.0:profiles:attribute:LDAP"
715  xacmlprof:DataType="http://www.w3.org/2001/XMLSchema#string"
716   ldapprof:Encoding="LDAP"
717   NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:uri"
718   Name="urn:oid:2.5.4.42" FriendlyName="givenName">
719   <saml:AttributeValue xsi:type="xs:string">By-Tor</saml:AttributeValue>
720 </saml:Attribute>
```

721 New:

```
722 <saml:Attribute
723   xmlns:xacmlprof="urn:oasis:names:tc:SAML:2.0:profiles:attribute:XACML"
724   xmlns:ldapprof="urn:oasis:names:tc:SAML:2.0:profiles:attribute:LDAP"
725  xacmlprof:DataType="http://www.w3.org/2001/XMLSchema#string"
726   NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:uri"
727   Name="urn:oid:2.5.4.42" FriendlyName="givenName">
728   <saml:AttributeValue xsi:type="xs:string">
```

729 `ldapprof:Encoding="LDAP">By-Tor</saml:AttributeValue>`
730 `</saml:Attribute>`

731 **E40: Holder of Key**

732 Change [SAMLProf] Section 3.1 at lines 335-337 to align the description of Holder of Key in the profiles
733 specification with the language in the core specification.

734 Original:

735 As described in [XMLSig], each `<ds:KeyInfo>` element holds a key or information that enables an
736 application to obtain a key. The holder of a specified key is considered to be **the subject of** the assertion by
737 the asserting party.

738 New (note that E47 specifies additional changes to the original text shown here):

739 As described in [XMLSig], each `<ds:KeyInfo>` element holds a key or information that enables an
740 application to obtain a key. The holder of a specified key is considered to be **an acceptable attesting entity**
741 **for** the assertion by the asserting party.

742 **E41: EndpointType ResponseLocation Clarification in Metadata**

743 Change [SAMLMeta] Section 2.2.2 at line 242 to clarify correct behavior when the response location is
744 omitted from the metadata.

745 New:

746 The `ResponseLocation` attribute is used to enable different endpoints to be specified for receiving request
747 and response messages associated with a protocol or profile, not as a means of load-balancing or
748 redundancy (multiple elements of this type can be included for this purpose). When a role contains an
749 element of this type pertaining to a protocol or profile for which only a single type of message (request or
750 response) is applicable, then the `ResponseLocation` attribute is unused. **If the `ResponseLocation`**
751 **attribute is omitted, any response messages associated with a protocol or profile may be assumed**
752 **to be handled at the URI indicated by the `Location` attribute.**

753 **E42: Match Authorities to Queries in Conformance**

754 Change [SAMLConf] Section 3.2 at Table 4 to indicate more precisely the relationship between SAML au-
755 thorities and queries for types of assertion statements that those authorities do not specialize in produ-
756 cing.

757 Original:

758 Feature	Authn	Attrib	Authz	Requester
759 Authentication Query, SOAP	MUST	OPT	OPT	OPT
760 Attribute Query, SOAP	OPT	MUST	OPT	OPT
761 Authorization Decision Query, SOAP	OPT	OPT	MUST	OPT

762 New:

763 Feature	Authn	Attrib	Authz	Requester
764 Authentication Query, SOAP	MUST	N/A	N/A	OPT
765 Attribute Query, SOAP	N/A	MUST	N/A	OPT
766 Authorization Decision Query, SOAP	N/A	N/A	MUST	OPT

767 **E43: Key Location in saml:EncryptedData**

768 Change [SAMLCore] at line 3116 by replacing the existing Section 6.2 with new Sections 6.2 and 6.3 to
769 reflect correct application and usage of the XML Encryption standard and to add several examples to fully
770 demonstrate this.

771 Original:

772 **6.2 Combining Signatures and Encryption**

773 Use of XML Encryption and XML Signature MAY be combined. When an assertion is to be signed
774 and encrypted, the following rules apply. A relying party MUST perform signature validation and
775 decryption in the reverse order that signing and encryption were performed.

776 • When a signed <Assertion> element is encrypted, the signature MUST first be calculated and
777 placed within the <Assertion> element before the element is encrypted.

778 • When a <BaseID>, <NameID>, or <Attribute> element is encrypted, the encryption MUST be
779 performed first and then the signature calculated over the assertion or message containing the
780 encrypted element.

781 New:

782 6.2 Key and Data Referencing Guidelines

783 If an encrypted key is NOT included in the XML instance, then the relying party must be able to
784 locally determine the decryption key, per [XMLEnc].

785 Implementations of SAML MAY implicitly associate keys with the corresponding data they are used
786 to encrypt, through the positioning of <xenc:EncryptedKey> elements next to the associated
787 <xenc:EncryptedData> element, within the enclosing SAML parent element. However, the
788 following set of explicit referencing guidelines are suggested to facilitate interoperability.

789 If the encrypted key is included in the XML instance, then it SHOULD be referenced within the
790 associated <xenc:EncryptedData> element, or alternatively embedded within the
791 <xenc:EncryptedData> element. When an <xenc:EncryptedKey> element is used, the
792 <ds:KeyInfo> element within <xenc:EncryptedData> SHOULD reference the
793 <xenc:EncryptedKey> element using a <ds:RetrievalMethod> element of Type
794 <http://www.w3.org/2001/04/xmlenc#EncryptedKey>.

795 In addition, an <xenc:EncryptedKey> element SHOULD contain an <xenc:ReferenceList>
796 element containing a <xenc:DataReference> that references the corresponding
797 <xenc:EncryptedData> element(s) that the key was used to encrypt.

798 In scenarios where the encrypted element is being “multicast” to multiple recipients, and the key
799 used to encrypt the message must be in turn encrypted individually and independently for each of
800 the multiple recipients, the <xenc:CarriedKeyName> element SHOULD be used to assign a
801 common name to each of the <xenc:EncryptedKey> elements so that a <ds:KeyName> can be
802 used from within the <xenc:EncryptedData> element’s <ds:KeyInfo> element.

803 Within the <xenc:EncryptedData> element, the <ds:KeyName> can be thought of as an “alias” that
804 is used for backwards referencing from the <xenc:CarriedKeyName> element in each individual
805 <xenc:EncryptedKey> element. While this accommodates a “multicast” approach, each recipient
806 must be able to understand (at least one) <ds:KeyName>. The Recipient attribute is used to
807 provide a hint as to which key is meant for which recipient.

808 The SAML implementation has the discretion to accept or reject a message where multiple
809 Recipient attributes or <ds:KeyName> elements are understood. It is RECOMMENDED that
810 implementations simply use the first key they understand and ignore any additional keys.

811 6.3 Examples

812 In the following example, the parent element (<EncryptedID>) contains <xenc:EncryptedData>
813 and (referenced) <xenc:EncryptedKey> elements as siblings (note that the key can in fact be
814 anywhere in the same instance, and the key references the <xenc:EncryptedData> element):

```
815 <saml:EncryptedID xmlns:saml="urn:oasis:names:tc:SAML:2.0:assertion">  
816   <xenc:EncryptedData xmlns:xenc="http://www.w3.org/2001/04/xmlenc#">  
817     Id="Encrypted_DATA_ID"  
818     Type="http://www.w3.org/2001/04/xmlenc#Element">  
819     <xenc:EncryptionMethod  
820       Algorithm="http://www.w3.org/2001/04/xmlenc#aes128-cbc"/>
```

```

821 <ds:KeyInfo xmlns:ds="http://www.w3.org/2000/09/xmldsig#">
822   <ds:RetrievalMethod URI="#Encrypted_KEY_ID"
823     Type="http://www.w3.org/2001/04/xmlenc#EncryptedKey"/>
824 </ds:KeyInfo>
825 <xenc:CipherData>
826   <xenc:CipherValue>Nk4W4mx...</xenc:CipherValue>
827 </xenc:CipherData>
828 </xenc:EncryptedData>
829
830 <xenc:EncryptedKey xmlns:xenc="http://www.w3.org/2001/04/xmlenc#"
831   Id="Encrypted_KEY_ID">
832   <xenc:EncryptionMethod
833     Algorithm="http://www.w3.org/2001/04/xmlenc#rsa-1_5"/>
834   <xenc:CipherData>
835     <xenc:CipherValue>PzA5X...</xenc:CipherValue>
836   </xenc:CipherData>
837   <xenc:ReferenceList>
838     <xenc:DataReference URI="#Encrypted_DATA_ID"/>
839   </xenc:ReferenceList>
840 </xenc:EncryptedKey>

```

841 In the following <EncryptedAttribute> example, the <xenc:EncryptedKey> element is contained
842 within the <xenc:EncryptedData> element, so there is no explicit referencing:

```

843 <saml:EncryptedAttribute
844   xmlns:saml="urn:oasis:names:tc:SAML:2.0:assertion">
845   <xenc:EncryptedData xmlns:xenc="http://www.w3.org/2001/04/xmlenc#"
846     Id="Encrypted_DATA_ID"
847     Type="http://www.w3.org/2001/04/xmlenc#Element">
848     <xenc:EncryptionMethod
849       Algorithm="http://www.w3.org/2001/04/xmlenc#aes128-cbc"/>
850     <ds:KeyInfo xmlns:ds="http://www.w3.org/2000/09/xmldsig#">
851       <xenc:EncryptedKey Id="Encrypted_KEY_ID">
852         <xenc:EncryptionMethod
853           Algorithm="http://www.w3.org/2001/04/xmlenc#rsa-1_5"/>
854         <xenc:CipherData>
855           <xenc:CipherValue>SDFSDF... </xenc:CipherValue>
856         </xenc:CipherData>
857       </xenc:EncryptedKey>
858     </ds:KeyInfo>
859     <xenc:CipherData>
860       <xenc:CipherValue>Nk4W4mx...</xenc:CipherValue>
861     </xenc:CipherData>
862   </xenc:EncryptedData>
863 </saml:EncryptedAttribute>

```

864 The final example shows an assertion encrypted for multiple recipients, using the
865 <xenc:CarriedKeyName> approach:

```

866 <saml:EncryptedAssertion
867   xmlns:saml="urn:oasis:names:tc:SAML:2.0:assertion">
868   <xenc:EncryptedData xmlns:xenc="http://www.w3.org/2001/04/xmlenc#"
869     Id="Encrypted_DATA_ID"
870     Type="http://www.w3.org/2001/04/xmlenc#Element">
871     <xenc:EncryptionMethod
872       Algorithm="http://www.w3.org/2001/04/xmlenc#aes128-cbc"/>
873     <ds:KeyInfo xmlns:ds="http://www.w3.org/2000/09/xmldsig#">
874       <ds:KeyName>MULTICAST_KEY_NAME</ds:KeyName>
875     </ds:KeyInfo>
876     <xenc:CipherData>
877       <xenc:CipherValue>Nk4W4mx...</xenc:CipherValue>
878     </xenc:CipherData>
879   </xenc:EncryptedData>
880

```

```

881 <xenc:EncryptedKey xmlns:xenc="http://www.w3.org/2001/04/xmlenc#"
882   Id="Encrypted_KEY_ID_1" Recipient="https://sp1.org">
883   <xenc:EncryptionMethod
884     Algorithm="http://www.w3.org/2001/04/xmlenc#rsa-1_5"/>
885   <ds:KeyInfo xmlns:ds="http://www.w3.org/2000/09/xmldsig#">
886     <ds:KeyName>KEY_NAME_1</ds:KeyName>
887   </ds:KeyInfo>
888   <xenc:CipherData>
889     <xenc:CipherValue>xyzABC...</xenc:CipherValue>
890   </xenc:CipherData>
891   <xenc:ReferenceList>
892     <xenc:DataReference URI="#Encrypted_DATA_ID"/>
893   </xenc:ReferenceList>
894
895   <xenc:CarriedKeyName>MULTICAST_KEY_NAME</xenc:CarriedKeyName>
896 </xenc:EncryptedKey>
897
898 <xenc:EncryptedKey xmlns:xenc="http://www.w3.org/2001/04/xmlenc#"
899   Id="Encrypted_KEY_ID_2" Recipient="https://sp2.org">

914 </saml:EncryptedAssertion>

```

E45: AuthnContext Comparison Order

915
916 Change [SAMLCore] Section 3.3.2.2.1 at lines 1815-1819 and 1826 to clarify the lack of orderedness in
917 the comparison of a set of authentication contexts.

918 Original at Section 3.3.2.2.1, lines 1815-1819:

919 Either a set of class references or a set of declaration references can be used. The set of supplied
920 references MUST be evaluated as an ordered set, where the first element is the most preferred
921 authentication context class or declaration. If none of the specified classes or declarations can be satisfied in
922 accordance with the rules below, then the responder MUST return a <Response> message with a second-
923 level <StatusCode> of urn:oasis:names:tc:SAML:2.0:status:NoAuthnContext.

924 New at Section 3.3.2.2.1, lines 1815-1819:

925 Either a set of class references or a set of declaration references can be used. **If ordering is relevant to**
926 **the evaluation of the request, then** the set of supplied references MUST be evaluated as an ordered set,
927 where the first element is the most preferred authentication context class or declaration. If none of the
928 specified classes or declarations can be satisfied in accordance with the rules below, then the responder
929 MUST return a <Response> message with a second-level <StatusCode> of
930 urn:oasis:names:tc:SAML:2.0:status:NoAuthnContext. **For example, ordering is significant**
931 **when using this element in an <AuthnRequest> message but not in an <AuthnQuery> message.**

932 Original at Section 3.3.2.2.1, line 1826:

933 If Comparison is set to "better", then the resulting authentication context in the authentication statement
934 MUST be stronger (as deemed by the responder) than **any** of the authentication contexts specified.

935 New at Section 3.3.2.2.1, line 1826:

936 If Comparison is set to "better", then the resulting authentication context in the authentication statement
937 MUST be stronger (as deemed by the responder) than **one** of the authentication contexts specified.

E46: AudienceRestriction Clarifications

938
939 Change [SAMLCore] Section 2.5.1.4 at lines 924-925 to clarify the logical sense with respect to individual
940 audience elements within an audience-restriction condition grouping.

941 Original:

942 Note that multiple <AudienceRestriction> elements MAY be included in a single assertion, and each
943 MUST be evaluated independently. The effect of this requirement and the preceding definition is that within
944 a given **condition**, the **audiences** form a disjunction (an "OR") while multiple **conditions** form a conjunction
945 (an "AND").

946 New:

947 Note that multiple <AudienceRestriction> elements MAY be included in a single assertion, and each
948 MUST be evaluated independently. The effect of this requirement and the preceding definition is that within
949 a given <AudienceRestrictions>, the <Audience> **elements** form a disjunction (an "OR") while
950 multiple <AudienceRestrictions> **elements** form a conjunction (an "AND").

E47: Clarification on SubjectConfirmation

951
952 Change [SAMLCore] Section 2.4.1.1 at line 698, and change [SAMLProf] Section 3.1 at lines 336 and 341
953 and Section 3.3 at lines 361-363, in order to clarify behavior around the subject confirmation element and
954 the intent of the embedded secondary identifier.

955 New at [SAMLCore] Section 2.4.1.1, line 698 (add text just before the schema listing introduction):

956 **If the <SubjectConfirmation> element in an assertion subject contains an identifier the issuer**
957 **authorizes the attesting entity to wield the assertion on behalf of that subject. A relying party MAY**
958 **apply additional constraints on the use of such an assertion at its discretion, based upon the**
959 **identities of both the subject and the attesting entity.**

960 **If an assertion is issued for use by an entity other than the subject, then that entity SHOULD be**
961 **identified in the <SubjectConfirmation> element.**

962 The following schema fragment defines the <SubjectConfirmation> element and its
963 SubjectConfirmationType complex type:

964 Original at [SAMLProf] Section 3.1, line 336:

965 As described in [XMLSig], each <ds:KeyInfo> element holds a key or information that enables an
966 application to obtain a key. The holder of a **specified key** is considered to be the subject of the assertion by
967 the asserting party.

968 New at [SAMLProf] Section 3.1, line 336 (note that E40 specified additional changes to the original text
969 shown here):

970 As described in [XMLSig], each <ds:KeyInfo> element holds a key or information that enables an
971 application to obtain a key. The holder of **one or more of the specified keys** is considered to be the subject
972 of the assertion by the asserting party.

973 New at [SAMLProf] Section 3.1, line 341 (add text just before the example):

974 **If the <SubjectConfirmation> element in an assertion subject contains an identifier the issuer**
975 **authorizes the attesting entity to wield the assertion on behalf of that subject. A relying party MAY**
976 **apply additional constraints on the use of such an assertion at its discretion, based upon the**
977 **identities of both the subject and the attesting entity.**

978 **If an assertion is issued for use by an entity other than the subject, then that entity SHOULD be**
979 **identified in the <SubjectConfirmation> element.**

980 Example: The holder of the key named "By-Tor" or the holder of the key named "Snow Dog" can confirm
981 itself as the subject.

982 Original at [SAMLProf] Section 3.3, lines 361-363:

983 The subject of the assertion is **the bearer of the assertion**, subject to optional constraints on confirmation
984 using the attributes that MAY be present in the <SubjectConfirmationData> element, as defined by
985 [SAMLCore].

986 New at [SAMLProf] Section 3.3, lines 361-363:

987 The subject of the assertion is **considered to be an acceptable attesting entity for the assertion by the**
988 **asserting party**, subject to optional constraints on confirmation using the attributes that MAY be present in
989 the <SubjectConfirmationData> element, as defined by [SAMLCore].

990 **If the intended bearer is known by the asserting party to be an entity other than the subject, then the**
991 **asserting party SHOULD identify that entity to the relying party by including a SAML identifier**
992 **representing it in the enclosing <SubjectConfirmation> element.**

993 **If multiple attesting entities are to be permitted to use the assertion based on bearer semantics, then**
994 **multiple <SubjectConfirmation> elements SHOULD be included.**

995 **E48: Clarification on Encoding for Binary Values in LDAP Profile**

996 **Note:** E48 corrects text in a section that is affected by E53, which deprecates the entire
997 section. Please see E53 for details.

998 Change [SAMLProf] at line 1762. Original:

999 For all other LDAP syntaxes, the attribute value is encoded, as the content of the <AttributeValue>
1000 element, by base64-encoding [RFC2045] the **encompassing** ASN.1 OCTET STRING-encoded LDAP
1001 attribute value. The `xsi:type` XML attribute MUST be set to `xs:base64Binary`. The profile-specific
1002 Encoding XML attribute is provided, with a value of "LDAP".

1003 New:

1004 For all other LDAP syntaxes, the attribute value is encoded, as the content of the <AttributeValue>
1005 element, by base64-encoding [RFC2045] the **contents of the** ASN.1 OCTET STRING-encoded LDAP
1006 attribute value (**not including the ASN.1 OCTET STRING wrapper**). The `xsi:type` XML attribute MUST
1007 be set to `xs:base64Binary`. The profile-specific Encoding XML attribute is provided, with a value of
1008 "LDAP".

1009 **E49: Clarification on Attribute Name Format**

1010 Change [SAMLCore] Section 2.7.3.1 at line 1217 to clarify the relationship between an attribute's Name-
1011 Format setting and its syntax.

1012 New (add text to the end of the definition of <AttributeValue>):

1013 <AttributeValue> [Any Number]

1014 Contains a value of the attribute. If an attribute contains more than one discrete value, it is
1015 RECOMMENDED that each value appear in its own <AttributeValue> element. If more than one
1016 <AttributeValue> element is supplied for an attribute, and any of the elements have a datatype
1017 assigned through `xsi:type`, then all of the <AttributeValue> elements must have the identical
1018 datatype assigned.

1019 **Attributes are identified/named by the combination of the NameFormat and Name XML attributes**
1020 **described above. Neither one in isolation can be assumed to be unique, but taken together, they**
1021 **ought to be unambiguous within a given deployment.**

1022 **The SAML profiles specification [SAMLProf] includes a number of attribute profiles designed to**
1023 **improve the interoperability of attribute usage in some identified scenarios. Such profiles typically**
1024 **include constraints on attribute naming and value syntax. There is no explicit indicator when an**
1025 **attribute profile is in use, and it is assumed that deployments can establish this out of band, based**
1026 **on the combination of NameFormat and Name.**

1027 **E50: Clarification on SSL Ciphersuites**

1028 Change [SAMLConf] Section 4 at line 235 and Section 5 at line 257 to clarify that the named ciphersuites
1029 are not the only ones that can be supported.
1030 New at Section 4, line 235:

1031 SAML V2.0 uses XML Signature [XMLSig] to implement XML signing and encryption functionality for
1032 integrity, and source authentication. SAML V2.0 uses XML Encryption [XMLEnc] to implement
1033 confidentiality, including encrypted identifiers, encrypted assertions, and encrypted attributes. **The**
1034 **algorithms listed below as being required for SAML V2.0 conformance are based on the mandated**
1035 **algorithms in the W3C recommendations for XML Signature and for XML Encryption, but modified by**
1036 **the SSTC to ensure interoperability of conformant SAML implementations. While the SAML-defined**
1037 **set of algorithms is a minimal set for conformance, additional algorithms supported by XML**
1038 **Signature and XML Encryption MAY be used. Note, however, that the use of non-mandated**
1039 **algorithms may introduce interoperability issues if those algorithms are not widely implemented. As**
1040 **additional algorithms become mandated for use in XML Signature and XML Encryption, the set**
1041 **required for SAML conformance may be extended.**

1042 New at Section 5, line 257:

1043 In any SAML V2.0 use of SSL 3.0 [SSL3] or TLS 1.0 [RFC 2246], servers MUST authenticate to clients
1044 using a X.509 v3 certificate. The client MUST establish server identity based on contents of the certificate
1045 (typically through examination of the certificate's subject DN field). **The set of algorithms required for**
1046 **SAML V2.0 conformance is equivalent to that defined in SAML V1.0 and SAML V1.1. These mandated**
1047 **algorithms were chosen by the SSTC because of their wide implementation support in the industry.**
1048 **While the algorithms defined below are the minimal set for SAML conformance, additional**
1049 **algorithms supported by SSL 3.0 and TLS 1.0 MAY be used.**

1050 **E51: Schema Type of Contents of <AttributeValue>**

1051 Change [SAMLProf] Section 8.1.4 at line 1670 to change the reference from **Section 3.3** to **Section 3**, in
1052 order to fix a typographical error that would have improperly restricted the valid types for attribute values
1053 to derived types, rather than the larger category of built-in types.

1054 **E52: Clarification on NotOnOrAfter Attribute for Subject Confirmation**

1055
1056 Change [SAMLProf] Section 4.1.4.2 at line 557 to correctly reflect the type of validity period that applies to
1057 subject confirmation.

1058 Original:

1059 The bearer <SubjectConfirmation> element described above MUST contain a
1060 <SubjectConfirmationData> element that contains a `Recipient` attribute containing the service
1061 provider's assertion consumer service URL and a `NotOnOrAfter` attribute that limits the window during
1062 which the assertion can be **delivered**. It MAY contain an `Address` attribute limiting the client address from
1063 which the assertion can be delivered.

1064 New (note that E26 specifies additional changes to the original text shown here):

1065 The bearer <SubjectConfirmation> element described above MUST contain a
1066 <SubjectConfirmationData> element that contains a `Recipient` attribute containing the service
1067 provider's assertion consumer service URL and a `NotOnOrAfter` attribute that limits the window during
1068 which the assertion can be **confirmed by the relying party**. It MAY contain an `Address` attribute limiting
1069 the client address from which the assertion can be delivered.

1070 **E53: Correction to LDAP/X.500 Profile Attribute**

1071 Deprecate [SAMLProf] Section 8.2 at lines 1677-1799 by adding a notice after line 1677.

1072 New:

1073 **8.2 X.500/LDAP Attribute Profile – Deprecated**

1074 **NOTE: This attribute profile is deprecated because of a flaw that makes it schema-invalid. The SSTC**
1075 **has replaced it with a separately published SAML V2.0 X.500/LDAP Attribute Profile specification**
1076 **that removes this flaw.**

1077 Directories based on the ITU-T X.500 specifications [X.500] and the related IETF Lightweight Directory
1078 Access Protocol specifications [LDAP] are widely deployed....

1079 **E54: Corrections to ECP URN**

1080 Change [SAMLProf] Section 4.2.3.1 at lines 757 and 763-764 to correct the usage of quotation marks in
1081 HTTP headers.

1082 New at line 757 (add double quotation marks around the URN):

1083 Furthermore, support for this profile **MUST** be specified in the HTTP PAOS Header field as a service value,
1084 with the value "urn:oasis:names:tc:SAML:2.0:profiles:SSO:ecp".

1085 Original at lines 763-764 (single quotation marks are problematic):

```
1086 GET /index HTTP/1.1  
1087 Host: identity-service.example.com  
1088 Accept: text/html; application/vnd.paos+xml  
1089 PAOS: ver='urn:liberty:paos:2003-08' ;  
1090 'urn:oasis:names:tc:SAML:2.0:profiles:SSO:ecp'
```

1091 New at lines 763-764 (double quotation marks used instead):

```
1092 GET /index HTTP/1.1  
1093 Host: identity-service.example.com  
1094 Accept: text/html; application/vnd.paos+xml  
1095 PAOS: ver="urn:liberty:paos:2003-08" ;  
1096 "urn:oasis:names:tc:SAML:2.0:profiles:SSO:ecp"
```

1097 **E55: Language Cleanup Around Name Identifier Management**

1098 Change [SAMLCore] Section 3.6.3 at lines 2477, 2483, and 2486-2487, and Section 8.3.7 at lines 3337-
1099 3339, and change [SAMLProf] Section 4.5 at lines 1319 and 1323 to clear up ambiguities around name
1100 identifier management and its application to various name identifier formats and differing identities for a
1101 principal.

1102 Original at [SAMLCore] Section 3.6.3, lines 2477, 2483, and 2486-2487:

1103 If the <Terminate> element is included in the request, the requesting provider is indicating that (in the case
1104 of a service provider) it will no longer accept assertions from the identity provider or (in the case of an
1105 identity provider) it will no longer issue assertions to the service provider **about the principal**. The receiving
1106 provider can perform any maintenance with the knowledge that the relationship represented by the name
1107 identifier has been terminated.

1108 If the service provider requests that its identifier for the principal be changed by including a <NewID> (or
1109 <NewEncryptedID>) element, the identity provider **MUST** include the element's content as the
1110 SPProvidedID when subsequently communicating to the service provider **regarding this principal**.

1111 If the identity provider requests that its identifier for the principal be changed by including a <NewID> (or
1112 <NewEncryptedID>) element, the service provider **MUST** use the element's content as the
1113 <saml:NameID> element content when subsequently communicating with the identity provider **regarding**
1114 **this principal**.

1115 New at [SAMLCore] Section 3.6.3, lines 2477, 2483, and 2486-2487 (note that E8 specifies additional
1116 changes to the original text shown here):

1117 If the <Terminate> element is included in the request, the requesting provider is indicating that (in the case
1118 of a service provider) it will no longer accept assertions from the identity provider or (in the case of an
1119 identity provider) it will no longer issue assertions to the service provider **using that identifier**. The receiving
1120 provider can perform any maintenance with the knowledge that the relationship represented by the name
1121 identifier has been terminated.

1122 If the service provider requests that its identifier for the principal be changed by including a <NewID> (or
1123 <NewEncryptedID>) element, the identity provider MUST include the element's content as the
1124 SPProvidedID when subsequently communicating to the service provider **using the primary identifier**.

1125 If the identity provider requests that its identifier for the principal be changed by including a <NewID> (or
1126 <NewEncryptedID>) element, the service provider MUST use the element's content as the
1127 <saml:NameID> element content when subsequently communicating with the identity provider **in any case**
1128 **where the identifier being changed would have been used**.

1129 New at [SAMLCore] Section 8.4.7, lines 3337-3339:

1130 The element's SPNameQualifier attribute, if present, MUST contain the unique identifier of the service
1131 provider or affiliation of providers for whom the identifier was generated (see Section 8.3.6). It MAY be
1132 omitted if the element is contained in a message intended only for consumption directly by the service
1133 provider, and the value would be the unique identifier of that service provider.

1134 ~~The element's SPProvidedID attribute MUST contain the alternative identifier of the principal most~~
1135 ~~recently set by the service provider or affiliation, if any (see Section 3.6). If no such identifier has~~
1136 ~~been established, then the attribute MUST be omitted.~~

1137 Original at [SAMLProf] Section 4.5, lines 1319 and 1323:

1138 In the scenario supported by the Name Identifier Management profile, an identity provider has exchanged
1139 some form of **persistent** identifier for a principal with a service provider, allowing them to share a common
1140 identifier for some length of time. Subsequently, the identity provider may wish to notify the service provider
1141 of a change in the format and/or value that it will use to identify the same principal in the future. Alternatively
1142 the service provider may wish to attach its own "alias" for the principal in order to ensure that the identity
1143 provider will include it when communicating with it in the future **about the principal**. Finally, one of the
1144 providers may wish to inform the other that it will no longer issue or accept messages using a particular
1145 identifier. To implement these scenarios, a profile of the SAML Name Identifier Management protocol is
1146 used.

1147 New at [SAMLProf] Section 4.5, lines 1319 and 1323 (note that E12 specifies additional changes to the
1148 original text shown here):

1149 In the scenario supported by the Name Identifier Management profile, an identity provider has exchanged
1150 some form of **long-term** identifier (**including but not limited to identifiers with a Format of**
1151 **urn:oasis:names:tc:SAML:2.0:nameid-format:persistent**) for a principal with a service
1152 provider, allowing them to share a common identifier for some length of time. Subsequently, the identity
1153 provider may wish to notify the service provider of a change in the format and/or value that it will use to
1154 identify the same principal in the future. Alternatively the service provider may wish to attach its own "alias"
1155 for the principal in order to ensure that the identity provider will include it when communicating with it in the
1156 future **using that identifier**. Finally, one of the providers may wish to inform the other that it will no longer
1157 issue or accept messages using a particular identifier. To implement these scenarios, a profile of the SAML
1158 Name Identifier Management protocol is used.

1159 **E56: Confirmation Method Typo**

1160 Change [SAMLProf] Section 3 at line 326 to change the reference from **<ConfirmationMethod>** (an ele-
1161 ment that no longer exists) to **Method** (an attribute, used instead of the element beginning in V2.0 of
1162 SAML).

1163 **E57: SAMLmime Reference**

1164 Change [SAMLBind] Section 4 at lines 1468-1469 to replace a reference to an expired IETF I-D for the
1165 SAMLmime definition to a persistent reference for the same definition.

1166 Original:

1167 [SAMLmime] **application/saml+xml Media Type Registration, IETF Internet-Draft,**
1168 **<http://www.ietf.org/internet-drafts/draft-hodges-saml-mediatype-01.txt>.**

1169 New:

1170 [SAMLmime] **OASIS Security Services Technical Committee (SSTC),**
1171 **"application/samlassertion+xml MIME Media Type Registration", IANA**

1172
1173
1174

MIME Media Types Registry application/samlassertion+xml, December 2004. See <http://www.iana.org/assignments/media-types/application/samlassertion+xml>.

1175
1176
1177
1178

E58: KeyDescriptor Typos in Profiles

Change [SAMLProf] Section 4.1.6 at lines 626 and 627 to expand the keyword **sign** to **signing** and to expand the keyword **encrypt** to **encryption**. These were typographical errors.

Original:

1179
1180
1181
1182

The providers MAY document the key(s) used to sign requests, responses, and assertions with `<md:KeyDescriptor>` elements with a `use` attribute of **sign**. When encrypting SAML elements, `<md:KeyDescriptor>` elements with a `use` attribute of **encrypt** MAY be used to document supported encryption algorithms and settings, and public keys used to receive bulk encryption keys.

1183

New:

1184
1185
1186
1187

The providers MAY document the key(s) used to sign requests, responses, and assertions with `<md:KeyDescriptor>` elements with a `use` attribute of **signing**. When encrypting SAML elements, `<md:KeyDescriptor>` elements with a `use` attribute of **encryption** MAY be used to document supported encryption algorithms and settings, and public keys used to receive bulk encryption keys.

1191
1192

E59: SSO Response When Using HTTP-Artifact

Change [SAMLBind] Section 3.6.5.2 at line 1173 to observe for clarity's sake that particular message delivery mechanisms are not mandated for the "nested" message exchange that takes place as part of the HTTP-Artifact binding.

New:

1193
1194
1195
1196
1197
1198

Note also that there is no mechanism defined to protect the integrity of the relationship between the artifact and the "RelayState" value, if any. That is, an attacker can potentially recombine a pair of valid HTTP responses by switching the "RelayState" values associated with each artifact. As a result, the producer/consumer of "RelayState" information MUST take care not to associate sensitive state information with the "RelayState" value without taking additional precautions (such as based on the information in the SAML protocol message retrieved via artifact).

1199
1200

Finally, note that the use of the `Destination` attribute in the root SAML element of the protocol message is unspecified by this binding, because of the message indirection involved.

1201
1202
1203
1204

E60: Incorrect URI for Unspecified NameID Format

Change [SAMLCore] Section 2.2.2 at line 460 to change the name identifier format from `urn:oasis:names:tc:SAML:1.0:nameid-format:unspecified` to

`urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified`. This was a typographical error.

1205
1206
1207

E61: Reference to Non-Existent Element

Change [SAMLCore] Section 7.1.2 at lines 3160.

Original:

1208
1209

The following SAML protocol **elements** are intended specifically for use as extension points in an extension schema; **their types** are set to abstract, and are thus usable only as the base of a derived type:

1210

- `<Request>` and RequestAbstractType

1211

- `<SubjectQuery>` and SubjectQueryAbstractType

1212

New:

1213
1214
1215

The following SAML protocol **constructs** are intended specifically for use as extension points in an extension schema; **the types listed** are set to abstract, and are thus usable only as the base of a derived type:

- 1216 • RequestAbstractType
- 1217 • <SubjectQuery> and SubjectQueryAbstractType

1218 E62: TLS Keys in KeyDescriptor

- 1219 Change [SAMLMeta] Section 2.4.1.1 at line 624 to specify more clearly how to interpret the `Key-`
1220 `Descriptor` element's `use` attribute.
1221 New (just after the conclusion of the definition list for `KeyDescriptorType`):

1222 **A use value of "signing" means that the contained key information is applicable to both signing**
1223 **and TLS/SSL operations performed by the entity when acting in the enclosing role.**

- 1224 **A use value of "encryption" means that the contained key information is suitable for use in**
1225 **wrapping encryption keys for use by the entity when acting in the enclosing role.**

- 1226 **If the use attribute is omitted, then the contained key information is applicable to both of the above**
1227 **uses.**

- 1228 The following schema fragment defines the `<KeyDescriptor>` element and its `KeyDescriptorType`
1229 complex type:

1230 E63: IdP Discovery Cookie Interpretation

- 1231 Change [SAMLProf] Section 4.3.1 at line 1105 to clear up confusion over interpretation of the contents of
1232 an IdP Discovery cookie. (Note that E32 specifies changes to Section 4 that result in a new Section 4.3.1
1233 being inserted before the original one; E63 applies to the original Section 4.3.1.)
1234 New:

1235 Cookie syntax should be in accordance with IETF RFC 2965 [RFC2965] or [NSCookie]. The cookie MAY be
1236 either session-only or persistent. This choice may be made within a deployment, but should apply uniformly
1237 to all identity providers in the deployment. **Note that while a session-only cookie can be used, the intent**
1238 **of this profile is not to provide a means of determining whether a user actually has an active session**
1239 **with one or more of the identity providers stored in the cookie. The cookie merely identifies identity**
1240 **providers known to have been used in the past. Service providers MAY instead rely on the**
1241 **IsPassive attribute in their `<samlp:AuthnRequest>` message to probe for active sessions.**

1242 E64: Liberty Moniker Used Inappropriately

- 1243 Change [SAMLSec] Section 7.1.1.9, Impersonation without Reauthentication to replace an accidental use
1244 of the moniker "Liberty" in place of "SAML V2.0".
1245 New:

1246 Cookies posted by identity providers MAY be used to support this validation process, though **LibertySAML**
1247 **V2.0** does not mandate a cookie-based approach.

1248 E65: Second-level StatusCode

- 1249 Change various sections as follows in [SAMLCore] to constrain the optional second-level `<StatusCode>`
1250 element used, and clarify that use of second-level codes is optional.
1251 Change section 3.3.2.2.1, lines 1817-1819.
1252 New:

1253 If none of the specified classes or declarations can be satisfied in accordance with the rules below, then the
1254 responder MUST return a `<Response>` message with a **top-level `<StatusCode>` value of**
1255 **`urn:oasis:names:tc:SAML:2.0:status:Responder` and MAY return a second-level**
1256 **`<StatusCode>` of `urn:oasis:names:tc:SAML:2.0:status:NoAuthnContext`.**

- 1257 Change section 3.4.1.2, lines 2172-2173.
1258 New:

1259 In profiles specifying an active intermediary, the intermediary MAY examine the list and return a
1260 <Response> message with an error <Status> and **optionally** a second-level <StatusCode> of

1261 Change section 3.4.1.5.1, lines 2282-2285.

1262 Original:

1263 An identity provider MUST NOT proxy a request where <ProxyCount> is set to zero. The identity
1264 provider MUST return an error <Status> containing a second-level <StatusCode> value of
1265 urn:oasis:names:tc:SAML:2.0:status:ProxyCountExceeded, unless it can directly
1266 authenticate the presenter.

1267 New:

1268 **Unless the identity provider can directly authenticate the presenter, it MUST return a <Response>**
1269 **message with a top-level <StatusCode> value of**

1270 **urn:oasis:names:tc:SAML:2.0:status:Responder and MAY return a second-level**

1271 **<StatusCode> value of urn:oasis:names:tc:SAML:2.0:status:ProxyCountExceeded.**

1272 Change section 3.8.3, lines 2729-2731.

1273 New:

1274 If the responder does not recognize the principal identified in the request, it MAY respond with an error
1275 <Status>, **optionally** containing a second-level <StatusCode> of
1276 urn:oasis:names:tc:SAML:2.0:status:UnknownPrincipal.

1277 **E66: Metadata and DNSSEC**

1278 Change [SAMLMeta] to update the DNSSEC reference from RFC 2535 to RFC 4035.

1279 Updated line 1253:

1280 It is RECOMMENDED that entities publish their resource records in signed zone files using [~~RFC2535~~]-
1281 [**RFC4035**]

1282 Original at lines 1447-1448:

1283 [RFC2535] D. Eastlake. *Domain Name System Security Extensions*. IETF RFC 2535, March 1999. See
1284 <http://www.ietf.org/rfc/rfc2535.txt>.

1285 New at lines 1447-1448:

1286 [**RFC4035**] R. Arends et al. *Protocol Modifications for the DNS Security Extensions*. IETF RFC 4035,
1287 March 2005. See <http://www.ietf.org/rfc/rfc4035.txt>.

1288 **E68: Use of Multiple <KeyDescriptor> Elements**

1289 Add text to section 2.4.1.1 of [SAMLMeta] to clarify the meaning of identically-purposed

1290 <KeyDescriptor> elements within a role.

1291 New at line 625:

1292 **The inclusion of multiple <KeyDescriptor> elements with the same use attribute (or no such**
1293 **attribute) indicates that any of the included keys may be used by the containing role or affiliation. A**
1294 **relying party SHOULD allow for the use of any of the included keys. When possible the signing or**
1295 **encrypting party SHOULD indicate as specifically as possible which key it used to enable more**
1296 **efficient processing.**

1297 The following schema fragment defines the <KeyDescriptor> element and its KeyDescriptorType
1298 complex type:

1299 **E69: Semantics of <ds:KeyInfo> in <KeyDescriptor>**

1300 Add text to section 2.4.1.1 of [SAMLMeta] to clarify the limitations of the specification regarding the
1301 semantics of various kinds of common key representations.

1302 New at line 625 (this change should appear after E68 above):

1303 The `<ds:KeyInfo>` element is a highly generic and extensible means of communicating key
1304 material. This specification takes no position on the allowable or suggested content of this element,
1305 nor on its meaning to a relying party. As a concrete example, no implications of including an X.509
1306 certificate by value or reference are to be assumed. Its validity period, extensions, revocation status,
1307 and other relevant content may or may not be enforced, at the discretion of the relying party. The
1308 details of such processing, and their security implications, are out of scope; they may, however, be
1309 addressed by other SAML profiles.

1310 The following schema fragment defines the `<KeyDescriptor>` element and its `KeyDescriptorType`
1311 complex type:

1312 **E70: Obsolete reference to UUID URN namespace**

1313 Change [SAMLProf] to update the Internet Draft reference for the UUID URN namespace to RFC 4122.
1314 Updated Section 8.3.3.1, line 1836:

1315 values are equal in the sense of [<http://www.ietf.org/internet-drafts/draft-mealling-uuid-urn-05.txt>][RFC4122].
1316 The

1317 Updated Section 8.4.3.1, line 1885:

1318 values are equal in the sense of [<http://www.ietf.org/internet-drafts/draft-mealling-uuid-urn-05.txt>][RFC4122].
1319 The

1320 Original at lines 2111-2112:

1321 [Mealling] P Leach et al. *A UUID URN Namespace*. IETF Internet-Draft, December 2004. See
1322 <http://www.ietf.org/internet-drafts/draft-mealling-uuid-urn-05.txt>.

1323 New at lines 2111-2112:

1324 [RFC4122] P. Leach et al. *A Universally Unique Identifier (UUID) URN Namespace*. IETF RFC 4122,
1325 July 2005. See <http://www.ietf.org/rfc/rfc4122.txt>.

1326 **E71: Missing namespace definition in Profiles**

1327 Change [SAMLProf] to add the "xs" namespace prefix to the table in Section 1.
1328 New row of table in Section 1, between lines 267-268:

1329 **xs:**

1330 <http://www.w3.org/2001/XMLSchema>

1331 This namespace is defined in the W3C XML Schema specification [Schema1]. In schema listings, this
1332 is the default namespace and no prefix is shown. For clarity, the prefix is generally shown in
1333 specification text when XML Schema-related constructs are mentioned.

1334 **E74: Update XML Signature Reference**

1335 Update the XML Signature specification reference in [SAMLCore], [SAMLBind], [SAMLProf], [SAMLMeta],
1336 [SAMLAuthCtx], [SAMLConf], [SAMLSec] to the "Second Edition". Also remove a stale non-normative
1337 reference in [SAMLCore].
1338 Strike [SAMLCore], lines 3439-3440:

1339 [RFC 3075] D. Eastlake, J. Reagle, D. Solo. *XML Signature Syntax and Processing*. IETF RFC 3075, March
1340 2001. See <http://www.ietf.org/rfc/rfc3075.txt>.

1341 Original at [SAMLCore] lines 3415-3416, [SAMLBind] lines 1489-1491, [SAMLProf] lines 2205-2206, [SAML-
1342 Meta] lines 1490-1491, [SAMLAuthCtx] lines 3926-3928, [SAMLConf] lines 410-412, [SAMLSec] lines 1078-
1343 1079:

1344 If the `Format` value is omitted or set to
1345 `urn:oasis:names:tc:SAML:2.0:nameidformat:unspecified`[XMLSig] D. Eastlake et al. XML-
1346 Signature Syntax and Processing. World Wide Web Consortium, February 2002. See

1347 <http://www.w3.org/TR/xmlsig-core/>. Note that this specification normatively references [XMLSig-XSD],
1348 listed below.

1349 New at [SAMLCore] lines 3415-3416, [SAMLBind] lines 1489-1491, [SAMLProf] lines 2205-2206, [SAML-
1350 Meta] lines 1490-1491, [SAMLAuthCtx] lines 3926-3928, [SAMLConf] lines 410-412, [SAMLSec] lines
1351 1078-1079:

1352 **[XMLSig] D. Eastlake et al. *XML Signature Syntax and Processing, Second Edition*. World
1353 Wide Web Consortium, June 2008. See <http://www.w3.org/TR/xmlsig-core/>.**

1354 **E75: Clarify Handling of SubjectConfirmation in AuthnRequest**

1355 Change [SAMLCore] Section 3.4.1.4 to clarify an identity provider's obligation to return an error if it can't
1356 honor the requirements of a <SubjectConfirmation> element in an <AuthnRequest> message.
1357 New at line 2247:

1358 In such a case, the identifier's physical content MAY be different, but it MUST refer to the same principal. **If
1359 the identity provider cannot or will not produce assertions with a strongly matching subject, then it
1360 MUST return a <Response> with an error <Status>, and MAY return a second-level <StatusCode>
1361 that reflects the reason for the failure.**

1362 **E76: Clarify nested validUntil/cacheDuration**

1363 Add text to [SAMLMeta] to clarify the processing of nested `validUntil` or `cacheDuration` attributes.
1364 New in Sections 2.3.1 and 2.3.2, before lines 336 and 409:

1365 When not used as the root element of a metadata instance, a `validUntil` or `cacheDuration` attribute
1366 MAY be used to impose a shorter expiration or cache duration than that of the parent or root element, but
1367 never a longer one; the smaller value takes precedence.

1368 New in Sections 2.4.1 and 2.5, before lines 589 and 972:

1369 A `validUntil` or `cacheDuration` attribute MAY be used to impose a shorter expiration or cache duration
1370 than that of the parent or root element, but never a longer one; the smaller value takes precedence.

1371 **E77: Generalize scope of Metadata specification**

1372 Change [SAMLMeta] to address inadvertent language appearing to restrict use of SAML metadata to only
1373 SAML profiles.
1374 New in Section 1, before line 137:

1375 A variety of extension points are also included to allow for the use of SAML metadata in non-SAML
1376 specifications, profiles, and deployments, and such use is encouraged.

1377 Updated Section 2, lines 153-154:

1378 SAML metadata is organized around an extensible collection of roles representing common combinations of
1379 SAML (and potentially non-SAML) protocols and profiles supported by system entities.

1380 Remove the word "SAML" from lines 226, 230, 311, 323, 332, 360, 372, 397, 403, 444, 478, 531, and
1381 940.

1382 **E78: Reassignment of persistent identifiers**

1383 Add text to [SAMLCore] Section 8.3.7, at line 3325, to clarify that non-reassignment to different principals
1384 is a required property of "persistent" name identifiers.
1385 New:

1386 Persistent name identifier values MUST NOT exceed a length of 256 characters. **A given value, once
1387 associated with a principal, MUST NOT be assigned to a different principal at any time in the future.**

E79: Clarification of SessionNotOnOrAfter

1388
1389 Change [SAMLCore] Section 2.7.2, lines 1062-1065 to loosen wording around the
1390 `SessionNotOnOrAfter` attribute and defer more explicitly to profiles.
1391 Original:

1392 Specifies a time instant at which the session between the principal identified by the subject and the SAML
1393 authority issuing this statement MUST be considered ended. The time value is encoded in UTC, as
1394 described in Section 1.3.3. There is no required relationship between this attribute and a `NotOnOrAfter`
1395 condition attribute that may be present in the assertion.

1396 New:

1397 **Indicates an upper bound on sessions with the subject derived from the enclosing assertion.** The
1398 time value is encoded in UTC, as described in Section 1.3.3. There is no required relationship between this
1399 attribute and a `NotOnOrAfter` condition attribute that may be present in the assertion. **It's left to profiles**
1400 **to provide specific processing rules for relying parties based on this attribute.**

E81: Algorithm statement in XML Signature profile

1401
1402 Change [SAMLCore] Section 5.4.1, lines 2926-2927, and [SAMLMeta] Section 3.1.1, lines 1182-1183, to
1403 relax the implication that RSA with SHA1 is the only supported algorithm.
1404 Original:

1405 SAML processors SHOULD support the use of RSA signing and verification for public key operations in
1406 accordance with the algorithm identified by <http://www.w3.org/2000/09/xmlsig#rsa-sha1>.

1407 New:

1408 Any algorithm defined for use with the XML Signature specification MAY be used.

E82: Empty <ContactPerson> element

1409 Add text to [SAMLMeta] Section 2.3.2.2, before line 500, to clarify that child elements should be included.
1410 New:

1412 At least one child element SHOULD be present in a `<ContactPerson>` element.

E83: Weaken claim made about Exclusive C14N

1413
1414 Change [SAMLCore] Section 5.4.3, lines 2939-2940, and [SAMLMeta] Section 3.1.3, lines 1196-1197, to
1415 better explain the purpose of using exclusive canonicalization.
1416 Original:

1417 Use of Exclusive Canonicalization ensures that signatures created over SAML messages embedded in an
1418 XML context can be verified independent of that context.

1419 New:

1420 Use of Exclusive Canonicalization facilitates the verification of signatures created over SAML messages
1421 when placed into a different XML context than present during signing.

1422 Note that use of this algorithm alone does not guarantee that a particular signed object can be moved from
1423 one context to another safely, nor is that a requirement of signed SAML objects in general, though it MAY be
1424 required by particular profiles

E84: Incorrect NameID Format constant

1425
1426 Change [SAMLCore] Section 3.4.1.1., lines 2133-2134 to fix reference to incorrect constant.
1427 Original:

1428 If the `Format` value is omitted or set to
1429 `urn:oasis:names:tc:SAML:2.0:nameidformat:unspecified`

1430 New:

1431 If the `Format` value is omitted or set to
1432 `urn:oasis:names:tc:SAML:1.1:nameidformat:unspecified`

1433 **E85: Conflicting language on profile error responses**

1434 Add text to [SAMLProf] Section 4.1.3.5., before line 487, to more strongly encourage support for returning
1435 error responses to Service Providers with appropriate security considerations.

1436 New:

1437 Identity provider implementations SHOULD support the issuance of `<saml2p:Response>` messages (with
1438 appropriate status codes) in the event of an error condition, provided that the user agent remains available
1439 and an acceptable location to which to deliver the response is available. The criteria for "acceptability" of a
1440 response location are not formally specified, but are subject to identity provider policy and reflect its
1441 responsibility to protect users from being sent to untrusted or possibly malicious parties.

1442 **E86: Pseudorandom requirement for persistent NameID format**

1443 Change [SAMLCore] Section 8.3.7., lines 3321-3323 to relax requirement for cryptographic pseudo-ran-
1444 domness in the generation of persistent name identifier values.

1445 Original:

1446 Persistent name identifiers generated by identity providers MUST be constructed using pseudo-random
1447 values that have no discernible correspondence with the subject's actual identifier (for example, username).

1448 New:

1449 Persistent name identifiers generated by identity providers MUST be constructed using values that have no
1450 discernible correspondence with the subject's actual identity (for example, username). They MAY be
1451 pseudo-random values, or generated in any other manner, provided there is no guessable relationship
1452 between the value and the subject's underlying identity, and that they are unique within the range of values
1453 generated by a given identity provider for a given service provider or affiliation of providers.

1454 **E87: Clarify default rules for `<md:AttributeConsumingService>`**

1455 Change [SAMLMeta] Section 2.4.4., lines 755-756 to align defaulting rules to similar elements.

1456 Original:

1457 At most one `<AttributeConsumingService>` element can have the attribute `isDefault` set to true. It
1458 is permissible for none of the included elements to contain an `isDefault` attribute set to true.

1459 New:

1460 At most one `<AttributeConsumingService>` element can have the attribute `isDefault` set to true.
1461 The default element is the first element with the `isDefault` attribute set to true. If no such elements exist,
1462 the default element is the first element without the `isDefault` attribute set to false. If no such elements
1463 exist, the default element is the first element in the sequence.

1464 **E88: Human readability of `<md:ServiceName>`**

1465 Change [SAMLMeta] Section 2.4.4.1., line 788 to clarify requirement for human readability.

1466 Original:

1467 One or more language-qualified names for the service.

1468 New:

1469 One or more language-qualified names for the service that are suitable for human consumption.

1470 **E89: NameFormat defaulting for `<md:RequestedAttribute>`**

1471 Add text to [SAMLMeta] Section 2.4.4.2., before line 816, to clarify default value of `NameFormat` attribute.

1472 New:

1473 If no NameFormat value is provided, the identifier urn:oasis:names:tc:SAML:2.0:attrname-
1474 format:unspecified (see Section 8.2.1 of [SAMLCore]) is in effect.

1475 **E90: RelayState sanitization**

1476 Security analysis of SAML implementations in [Sec2011] suggests that guidance is needed to advise
1477 implementers how to avoid enabling a class of attacks involving misuse of the RelayState feature
1478 supported by SAML bindings. The TC thanks the following for their identification of the problem, and their
1479 assistance in drafting this material:

- 1480 • Alessandro Armando, University of Genova and Fondazione Bruno Kessler
- 1481 • Roberto Carbone, Fondazione Bruno Kessler
- 1482 • Luca Compagna, SAP
- 1483 • Jorge Cuellar, Siemens
- 1484 • Giancarlo Pellegrino, SAP
- 1485 • Alessandro Sorniotti, IBM
- 1486 • The EU Projects AVANTSSAR, SPaCloS, and SIAM

1487 Add text to [SAMLBind] Section 3.1.1., before line 233:

1488 New:

1489 Some bindings that define a "RelayState" mechanism do not provide for end to end origin authentication or
1490 integrity protection of the RelayState value. Most such bindings are defined in conjunction with HTTP, and
1491 RelayState is often involved in the preservation of HTTP resource state that may involve the use of HTTP
1492 redirects, or embedding of RelayState information in HTTP responses, HTML content, etc. In such cases,
1493 implementations need to beware of Cross-Site Scripting (XSS) and other attack vectors (e.g., Cross-Site
1494 Request Forgery, CSRF) that are common to such scenarios.

1495 Implementations MUST carefully sanitize the URL schemes they permit (for example, disallowing anything
1496 but "http" or "https"), and should disallow unencoded characters that may be used in mounting such attacks.
1497 This caution applies to both identity and service provider implementations.
1498

1499 Add text to [SAMLBind] Section 3.4.5.2. before line 678, Section 3.5.5.2. before line 861, and Section
1500 3.6.5.2. before line 1174:

1501 New:

1502 When using RelayState in conjunction with HTTP redirects or response information, implementations MUST
1503 carefully sanitize the URL schemes they permit (for example, disallowing anything but "http" or "https"), and
1504 should disallow unencoded characters that may be used in mounting such attacks.

1505 Add text to [SAMLProf] Section 4.1.5., before line 617:

1506 New:

1507 Note that the use of unsolicited responses can lead to Cross-Site Request Forgery (CSRF) vulnerabilities
1508 due to the inability to ensure that a request from the client originated the SAML profile transaction. Service
1509 providers SHOULD have a means of disabling the acceptance of unsolicited responses if circumstances
1510 warrant. The use of solicited responses may also be vulnerable to such attacks, the use of cookies to
1511 correlate the issuance of SAML requests and responses with the same client being one possible solution.
1512 However, if unsolicited responses cannot be prevented, no improvement to the solicited case will be of use.

1513 Add text to [SAMLProf] before line 617, after previous addition:

1514 New:

1515 4.1.6 Use of Relay State

1516 The RelayState feature of the various HTTP-based bindings defined for use with this profile MAY be used to
1517 preserve information about resources requested by the user agent prior to the use of the profile. As
1518 discussed in [SAMLBind], the lack of integrity protection in many scenarios, including the case of unsolicited
1519 responses, makes it essential for identity and service providers to perform appropriate sanitization of the
1520 RelayState value and any URLs derived from it. The URL scheme eventually derived SHOULD be limited to
1521 "https" or "http", and protection against unencoded executable content must be applied.

1522 Add text to [SAMLProf] Section 4.2.5., before line 1082:

1523 New:

1524 The RelayState header block defined for use with this profile MAY be used to preserve information about
1525 resources requested by the client prior to the use of the profile. As discussed in [SAMLBind], the lack of
1526 integrity protection in many scenarios, including the case of unsolicited responses, makes it essential for
1527 identity and service providers to perform appropriate sanitization of the RelayState value and any URLs
1528 derived from it. The URL scheme eventually derived SHOULD be limited to "https" or "http", and protection
1529 against unencoded executable content must be applied.

E91: Disallow <ds:Object> element in signatures

1530
1531 Add text to [SAMLCore] before line 2951:
1532 New:

1533 5.4.5 Object

1534 The <ds:Object> element is not defined for use with SAML signatures, and SHOULD NOT be present.
1535 Since it can be used in service of an attacker by carrying unsigned data, verifiers SHOULD reject signatures
1536 that contain a <ds:Object> element.

1537 Add text to [SAMLMeta] before line 1208:

1538 3.1.5 Object

1539 The <ds:Object> element is not defined for use with SAML metadata signatures, and SHOULD NOT be
1540 present. Since it can be used in service of an attacker by carrying unsigned data, verifiers SHOULD reject
1541 signatures that contain a <ds:Object> element.

E92: Add guidance for implementers on clock skew

1542
1543 Add text to [SAMLCore] after line 314:
1544 New:

1545 SAML system entities SHOULD allow for reasonable clock skew between systems when interpreting time
1546 instants and enforcing security policies based on them. Tolerances of 3-5 minutes are reasonable defaults,
1547 but allowing for configurability is a suggested practice in implementations.

1548 Add text to [SAMLCore] after line 759:
1549 New:

1550 As noted in section 1.3.3, relying parties SHOULD allow for reasonable clock skew in the interpretation of
1551 both values.

1552 Add text to [SAMLCore] after line 887:
1553 New:

1554 As noted in section 1.3.3, relying parties SHOULD allow for reasonable clock skew in the interpretation of
1555 both values.

1556 Add text to [SAMLCore] after line 2538:
1557 New:

1558 As noted in that same section, relying parties SHOULD allow for reasonable clock skew in the interpretation
1559 of this value.

E93: Mitigation for XML Encryption CBC deficiencies

1560 A published paper [Enc2011] has described vulnerabilities in the use of CBC algorithms for data
1561 encryption when the ciphertext is not integrity-protected. The algorithms that provide built-in protection are
1562 not widely implemented yet, and the most effective mitigation for SAML implementations is to encourage
1563 the use of XML Signature or transport authentication at a layer above the use of XML Encryption. In
1564 particular, the ability to sign Responses (and require their use) is an effective strategy in many SAML
1565 profiles. This is to some extent a reversal of conventional wisdom that it's more efficient and just as secure
1566 to limit signing to the Assertion layer (and then encrypt the result).
1567 Replace Section 6.2 in [SAMLCore] with the following:
1568

1569 6.2 Encryption and Integrity Protection

1570 SAML allows for assertions containing encrypted elements to be integrity protected, and allows for
1571 encrypted assertions to be included inside protocol response elements that are themselves integrity
1572 protected (typically via XML Signature, or in some cases through binding-specific mechanisms such as
1573 TLS).

1574 Recent practical attacks against the most common algorithms (at the time of this writing) used for bulk data
1575 encryption in [XMLEnc], which operate in CBC-mode, necessitate the enforcement of integrity protection by
1576 a relying party prior to processing encrypted data. As a result, when CBC-mode algorithms are used for data
1577 encryption, relying parties SHOULD require the presence of integrity protection before processing encrypted
1578 SAML assertions or assertions containing encrypted data. The most appropriate means of achieving this will
1579 vary by profile, but may involve the use of authenticated TLS requests, or a requirement for an authenticated
1580 digital signature at a layer above that of the encrypted elements.

1581 The ability to protect the encryption layer via a signature or TLS is limited by the fact that one typically does
1582 not have the ability to relate the asserting party's key to the cipher key. Thus, while one can limit exposure to
1583 only trusted asserting parties (via their key), it will often be the case that any trusted party's key will be
1584 accepted for the purposes of exploiting this issue.

1585 Other countermeasures, such as attempting to mitigate timing attacks, or limiting reuse of encryption keys,
1586 tend to be impractical for most implementations and the use of integrity protection, when properly
1587 implemented, is the suggested solution if authenticated encryption modes are unavailable.

1588 Change paragraph in Section 4.1.3.5 of [SAMLProf], lines 497-500 to clarify position of signature and add
1589 guidance when CBC-mode encryption is used.

1590 Original:

1591 It is RECOMMENDED that the HTTP requests in this step be made over either SSL 3.0 [SSL3] or TLS 1.0
1592 [RFC2246] to maintain confidentiality and message integrity. The <Assertion> element(s) in the
1593 <Response> MUST be signed, if the HTTP POST binding is used, and MAY be signed if the HTTP-Artifact
1594 binding is used.

1595 New:

1596 It is RECOMMENDED that the HTTP requests in this step be made over either SSL 3.0 [SSL3] or TLS 1.0
1597 [RFC2246] to maintain confidentiality and message integrity. For the purposes of the profile, either the
1598 <Response> or the <Assertion> element(s) in the <Response> MUST be signed, if the HTTP POST
1599 binding is used, and MAY be signed if the HTTP-Artifact binding is used. If an <EncryptedAssertion>
1600 element is present and a CBC-mode algorithm is used, then the <Response> SHOULD be signed to ensure
1601 the ciphertext is integrity protected (see section 6.2 of [SAMLCore]).

1602 Add text to Section 4.1.4.3 of [SAMLProf], after line 591:

1603 Note that if <EncryptedAssertion> elements are present and a CBC-mode algorithm is used, then the
1604 <Response> SHOULD be signed to ensure the ciphertext is integrity protected (see section 6.2 of
1605 [SAMLCore]). Some deployments may require both the <Response> and any <Assertion> elements be
1606 signed to address both the encryption issue and non-repudiation of the assertion (the latter being outside the
1607 scope of SAML).

1608 Change paragraph in Section 4.2.5 of [SAMLProf], lines 1071-1074 to clarify position of signature and add
1609 guidance when CBC-mode encryption is used.

1610 Original:

1611 The <AuthnRequest> message SHOULD be signed. Per the rules specified by the browser SSO profile,
1612 the assertions enclosed in the <Response> MUST be signed. The delivery of the response in the SOAP
1613 envelope via PAOS is essentially analogous to the use of the HTTP POST binding and security
1614 countermeasures appropriate to that binding are used.

1615 New:

1616 The <AuthnRequest> message SHOULD be signed. Per the rules specified by the browser SSO profile,
1617 the assertions enclosed in the <Response>, or the <Response> itself, MUST be signed. The delivery of
1618 the response in the SOAP envelope via PAOS is essentially analogous to the use of the HTTP POST
1619 binding and security countermeasures appropriate to that binding are used.

1620 Note that if `<EncryptedAssertion>` elements are present and a CBC-mode algorithm is used, then the
1621 `<Response>` SHOULD be signed to ensure the ciphertext is integrity protected (see section 6.2 of
1622 [SAMLCore]). Some deployments may require both the `<Response>` and any `<Assertion>` elements be
1623 signed to address both the encryption issue and non-repudiation of the assertion (the latter being outside the
1624 scope of SAML).

1625 Add text to Section 6.4.2 of [SAMLProf], after line 1562:

1626 Note that if `<EncryptedAssertion>` elements are present and a CBC-mode algorithm is used, then the
1627 `<Response>` SHOULD be signed to ensure the ciphertext is integrity protected (see section 6.2 of
1628 [SAMLCore]). Some deployments may require both the `<Response>` and any `<Assertion>` elements be
1629 signed to address both the encryption issue and non-repudiation of the assertion (the latter being outside the
1630 scope of SAML).

1631 Add text to Section 4.2.2 of [SAMLSec], at line 371:

1632 See section 4.6 for additional considerations related to the use of XML Encryption.

1633 Add new Section 4.6 to [SAMLSec], after line 492:

1634 4.6 XML Encryption Considerations

1635 The XML Encryption specification [XMLEnc] includes important information for implementers and deployers
1636 that should be reviewed in conjunction with the use of the specification. In addition, take note that
1637 subsequent to the publication of the original 1.0 specification, vulnerabilities have been found with some of
1638 the algorithms defined as mandatory to implement and that are in common usage [Enc2011], [RFC3218].

1639 For example, the use of PKCS 1.5 as a Key Transport algorithm is subject to attacks that require mitigation
1640 by implementations. The use of RSA-OAEP as an alternative algorithm is recommended as a replacement,
1641 regardless of the type or size of symmetric key.

1642 In addition, the use of CBC mode algorithms for data encryption have been found vulnerable to attacks
1643 when used without a surrounding layer of integrity protection. Mitigating these attacks is difficult and in some
1644 cases impractical, and it is strongly advised that data encrypted with these algorithms only be processed
1645 with integrity protection in place. The use of TLS or XML Signature is often used for this purpose.
1646 Alternatively, implementations may be able to migrate to newer algorithms that include integrity protection as
1647 a feature, such as Galois/Counter Mode [800-38D].

1648 Implementers are encouraged to review all of the available literature to fully understand these issues.

1649 **E94: Discussion of metadata caching mixes in validity**

1650 The discussion of metadata caching in Section 4.3.1 of [SAMLMeta] is a mixture of strict validity
1651 enforcement and caching behavior that leads to overly brittle implementations if literally followed.
1652 Separating the two considerations allows for, without requiring, more useful implementations.
1653 Change lines 320-321, 380-381, 561-562, and 955-956 of [SAMLMeta] to:

1654 Optional attribute indicates the maximum length of time a consumer should cache the metadata contained in
1655 the element and any contained elements before attempting to refresh it.

1656 Change Section 4.3.1, lines 1396-1400 of [SAMLMeta]:

1657 Old:

1658 Document caching MUST NOT exceed the `validUntil` or `cacheDuration` attribute of the subject
1659 element(s). If metadata elements have parent elements which contain caching policies, the parent element
1660 takes precedence.

1661 To properly process the `cacheDuration` attribute, consumers MUST retain the date and time when the
1662 document was retrieved.

1663 New:

1664 Document caching MUST be based on the duration indicated by the `cacheDuration` attribute of the
1665 subject element(s). If metadata elements have parent elements which contain caching policies, the parent
1666 element takes precedence. To properly process the `cacheDuration` attribute, consumers must retain the

1667 date and time when an instance was obtained.

1668

1669 Note that cache expiration does not imply a lack of validity in the absence of a `validUntil` attribute or
1670 other information; failure to update a cached instance (e.g., due to network failure) need not render
1671 metadata invalid, although implementations may offer such controls to deployers.

1672 Add new Section 4.3.2 to [SAMLMeta], after line 1405:

1673 4.3.2 Metadata Instance Validity

1674

1675 Metadata MUST be considered invalid upon reaching the time specified in a `validUntil` attribute of the
1676 subject element(s). The effective expiration may be adjusted downward by parent element(s) with earlier
1677 expirations. Invalid metadata MUST NOT be used. This contrasts with "stale" metadata that may be beyond
1678 its optimum cache duration but is not explicitly invalid. Such metadata remains valid and MAY be used at the
1679 discretion of the implementation.

1680 3 Acknowledgments

1681 The editor would like to acknowledge the contributions of the OASIS Security Services Technical Commit-
1682 tee, whose voting members at the time of publication were:

- 1683 • Scott Cantor, Internet2
- 1684 • Nate Klingenstein, Internet2
- 1685 • Chad LaJoie, Internet2
- 1686 • Thomas Hardjono, M.I.T.
- 1687 • John Bradley, Open Identity Exchange
- 1688 • Hal Lockhart, Oracle
- 1689 • Anil Saldhana, Red Hat

1690 The editors also would like to gratefully acknowledge **Jahan Moreh** of Sigaba and **Eve Maler** (then at
1691 Sun Microsystems), who during their tenures on the TC were editors of the errata working document and
1692 made major substantive contributions to all of the errata materials.
