Abstract:
This document defines a simplified profile of the TOSCA version 1.0 specification in a YAML rendering which is intended to simplify the authoring of TOSCA service templates. This profile defines a less verbose and more human-readable YAML rendering, reduced level of indirection between different modeling artifacts as well as the assumption of a base type system.

Status:
This document was last revised or approved by the OASIS Topology and Orchestration Specification for Cloud Applications (TOSCA) TC on the above date. The level of approval is also listed above. Check the “Latest version” location noted above for possible later revisions of this document. Any other numbered Versions and other technical work produced by the Technical Committee (TC) are listed at https://www.oasis-open.org/committees/tc_home.php?wg_abbrev=tosca#technical.

TC members should send comments on this specification to the TC’s email list. Others should send comments to the TC’s public comment list, after subscribing to it by following the instructions at the "Send A Comment" button on the TC’s web page at https://www.oasis-open.org/committees/tosca/.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the TC’s web page (https://www.oasis-open.org/committees/tosca/ipr.php).

1 Objective

The TOSCA Simple Profile in YAML specifies a rendering of TOSCA which aims to provide a more accessible syntax as well as a more concise and incremental expressiveness of the TOSCA DSL in order to minimize the learning curve and speed the adoption of the use of TOSCA to portably describe cloud applications.

This proposal describes a YAML rendering for TOSCA. YAML is a human friendly data serialization standard (http://yaml.org/) with a syntax much easier to read and edit than XML. As there are a number of DSLs encoded in YAML, a YAML encoding of the TOSCA DSL makes TOSCA more accessible by these communities.

This proposal prescribes an isomorphic rendering in YAML of a subset of the TOSCA v1.0 ensuring that TOSCA semantics are preserved and can be transformed from XML to YAML or from YAML to XML. Additionally, in order to streamline the expression of TOSCA semantics, the YAML rendering is sought to be more concise and compact through the use of the YAML syntax.
2 Summary of key TOSCA concepts

The TOSCA metamodel uses the concept of service templates to describe cloud workloads as a topology template, which is a graph of node templates modeling the components a workload is made up of and as relationship templates modeling the relations between those components. TOSCA further provides a type system of node types to describe the possible building blocks for constructing a service template, as well as relationship type to describe possible kinds of relations. Both node and relationship types may define lifecycle operations to implement the behavior an orchestration engine can invoke when instantiating a service template. For example, a node type for some software product might provide a ‘create’ operation to handle the creation of an instance of a component at runtime, or a ‘start’ or ‘stop’ operation to handle a start or stop event triggered by an orchestration engine. Those lifecycle operations are backed by implementation artifacts such as scripts or Chef recipes that implement the actual behavior.

An orchestration engine processing a TOSCA service template uses the mentioned lifecycle operations to instantiate single components at runtime, and it uses the relationship between components to derive the order of component instantiation. For example, during the instantiation of a two-tier application that includes a web application that depends on a database, an orchestration engine would first invoke the ‘create’ operation on the database component to install and configure the database, and it would then invoke the ‘create’ operation of the web application to install and configure the application (which includes configuration of the database connection).

The TOSCA simple profile assumes a number of base types (node types and relationship types) to be supported by each compliant environment such as a ‘Compute’ node type, a ‘Network’ node type or a generic ‘Database’ node type (see Appendix C). Furthermore, it is envisioned that a large number of additional types for use in service templates will be defined by a community over time. Therefore, template authors in many cases will not have to define types themselves but can simply start writing service templates that use existing types. In addition, the simple profile will provide means for easily customizing existing types, for example by providing a customized ‘create’ script for some software.
3 A “hello world” template for TOSCA Simple Profile in YAML

As mentioned before, the TOSCA simple profile assumes the existence of a small set of pre-defined, normative set of node types (e.g., a 'Compute' node) along with other types, which will be introduced through the course of this document, for creating TOSCA Service Templates. It is envisioned that many additional node types for building service templates will be created by communities some may be published as profiles that build upon the TOSCA Simple Profile specification. Using the normative TOSCA Compute node type, a very basic "Hello World" TOSCA template for deploying just a single server would look as follows:

Example 1 - TOSCA Simple "Hello World"

tosca_definitions_version: tosca_simple_yaml_1_0_0

description: Template for deploying a single server with predefined properties.

topology_template:
  node_templates:
    my_server:
      type: tosca.nodes.Compute
      capabilities:
        # Host container properties
        host:
          properties:
            num_cpus: 1
            disk_size: 10 GB
            mem_size: 4 MB
        # Guest Operating System properties
        os:
          properties:
            # host Operating System image properties
            architecture: x86_64
            type: linux
            distribution: rhel
            version: 6.5

The template above contains a very simple topology template with only a single ‘Compute’ node template that declares some basic values for properties within two of the several capabilities that are built into the Compute node type definition. All TOSCA Orchestrators are expected to know how to instantiate a Compute node since it is normative and expected to represent a well-known function that is portable across TOSCA implementations.

This expectation is true for all normative TOSCA Node and Relationship types that are defined in the Simple Profile specification. This means, with TOSCA’s approach, that the application developer does not need to provide any deployment or implementation artifacts that contain code or logic to orchestrate these common software components. TOSCA orchestrators simply select or allocate the correct node (resource) type that fulfils the application topologies requirements using the properties declared in the node and its capabilities.
In the above example, the “host” capability contains properties that allow application developers to optionally supply the number of CPUs, memory size and disk size they believe they need when the Compute node is instantiated in order to run their applications. Similarly, the “os” capability is used to provide values to indicate what host operating system the Compute node should have when it is instantiated.

The logical diagram of the “hello world” Compute node would look as follows:

As you can see, the Compute node also has attributes and other built-in capabilities, such as Bindable and Endpoint, each with additional properties that will be discussed in other examples later in this document.

Although the Compute node has no direct properties apart from those in its capabilities, other TOSCA node type definitions may have properties that are part of the node type itself in addition to having Capabilities. TOSCA orchestration engines are expected to validate all property values provided in a node template against the property definitions in their respective node type definitions referenced in the service template. The tosca_definitions_version keyname in the TOSCA service template identifies the versioned set of normative TOSCA type definitions to use for validating those types defined in the TOSCA Simple Profile including the Compute node type. Specifically, the value tosca_simple_yaml_1_0_0 indicates Simple Profile v1.0.0 definitions would be used for validation. Other type definitions may be imported from other service templates using the import keyword discussed later.

3.1 Requesting input parameters and providing output

Typically, one would want to allow users to customize deployments by providing input parameters instead of using hardcoded values inside a template. In addition, output values are provided to pass information that perhaps describes the state of the deployed template to the user who deployed it (such as the private IP address of the deployed server). A refined service template with corresponding inputs and outputs sections is shown below.

Example 2 - Template with input and output parameter sections

tosca_definitions_version: tosca_simple_yaml_1_0_0

description: Template for deploying a single server with predefined properties.

topology_template:
  inputs:
    cpus:
type: integer
description: Number of CPUs for the server.
constraints:
  - valid_values: [ 1, 2, 4, 8 ]

node_templates:
  my_server:
    type: tosca.nodes.Compute
    capabilities:
      # Host container properties
      host:
        properties:
          # Compute properties
          num_cpus: { get_input: cpus }
          mem_size: 4 MB
          disk_size: 10 GB

outputs:
  server_ip:
    description: The private IP address of the provisioned server.
    value: { get_attribute: [ my_server, private_address ] }

The inputs and outputs sections are contained in the topology_template element of the TOSCA template, meaning that they are scoped to node templates within the topology template. Input parameters defined in the inputs section can be assigned to properties of node template within the containing topology template; output parameters can be obtained from attributes of node templates within the containing topology template.

Note that the inputs section of a TOSCA template allows for defining optional constraints on each input parameter to restrict possible user input. Further note that TOSCA provides for a set of intrinsic functions like get_input, get_property or get_attribute to reference elements within the template or to retrieve runtime values.
4 TOSCA template for a simple software installation

Software installations can be modeled in TOSCA as node templates that get related to the node template for a server on which the software shall be installed. With a number of existing software node types (e.g. either created by the TOSCA work group or a community) template authors can just use those node types for writing service templates as shown below.

Example 3 - Simple (MySQL) software installation on a TOSCA Compute node

```yaml
tosca_definitions_version: tosca_simple_yaml_1_0_0
description: Template for deploying a single server with MySQL software on top.

topology_template:
  inputs:
    # omitted here for brevity

  node_templates:
    mysql:
      type: tosca.nodes.DBMS.MySQL
      properties:
        root_password: { get_input: my_mysql_rootpw }
        port: { get_input: my_mysql_port }
      requirements:
        - host: db_server

    db_server:
      type: tosca.nodes.Compute
      capabilities:
        # omitted here for brevity
```

The example above makes use of a node type `tosca.nodes.DBMS.MySQL` for the `mysql` node template to install MySQL on a server. This node type allows for setting a property `root_password` to adapt the password of the MySQL root user at deployment. The set of properties and their schema has been defined in the node type definition. By means of the `get_input` function, a value provided by the user at deployment time is used as value for the `root_password` property. The same is true for the `port` property.

The `mysql` node template is related to the `db_server` node template (of type `tosca.nodes.Compute`) via the `requirements` section to indicate where MySQL is to be installed. In the TOSCA metamodel, nodes get related to each other when one node has a requirement against some feature provided by another node. What kinds of requirements exist is defined by the respective node type. In case of MySQL, which is software that needs to be installed or hosted on a compute resource, the underlying node type named `DBMS` has a predefined requirement called `host`, which needs to be fulfilled by pointing to a node template of type `tosca.nodes.Compute`. 
The logical relationship between the `mysql` node and its host `db_server` node would appear as follows:

```
Within the requirements section, all entries simple entries are a map which contains the symbolic name of a requirement definition as the key and the identifier of the fulfilling node as the value. The value is essentially the symbolic name of the other node template; specifically, or the example above, the host requirement is fulfilled by referencing the `db_server` node template. The underlying TOSCA DBMS node type already defines a complete requirement definition for the host requirement of type Container and assures that a HostedOn TOSCA relationship will automatically be created and will only allow a valid target host node is of type Compute. This approach allows the template author to simply provide the name of a valid Compute node (i.e., `db_server`) as the value for the `mysql` node's host requirement and not worry about defining anything more complex if they do not want to.
```
5 Overriding behavior of predefined node types

Node types in TOSCA have associated implementations that provide the automation (e.g. in the form of scripts such as Bash, Chef or Python) for the normative lifecycle operations of a node. For example, the node type implementation for a MySQL database would associate scripts to TOSCA node operations like configure, start, or stop to manage the state of MySQL at runtime.

Many node types may already come with a set of operational scripts that contain basic commands that can manage the state of that specific node. If it is desired, template authors can provide a custom script for one or more of the operation defined by a node type in their node template which will override the default implementation in the type. The following example shows a mysql node template where the template author provides their own configure script:

Example 4 - Node Template overriding its Node Type's "configure" interface

```yaml
tosca_definitions_version: tosca_simple_yaml_1_0_0
description: Template for deploying a single server with MySQL software on top.

topology_template:
  inputs:
    # omitted here for brevity

node_templates:
  mysql:
    type: tosca.nodes.DBMS.MySQL
    properties:
      root_password: { get_input: my_mysql_rootpw }
      port: { get_input: my_mysql_port }
    requirements:
      - host: db_server
    interfaces:
      Standard:
        configure: scripts/my_own_configure.sh

  db_server:
    type: tosca.nodes.Compute
    capabilities:
      # omitted here for brevity
```

In the example above, the `my_own_configure.sh` script is provided for the configure operation of the MySQL node type’s Standard lifecycle interface. The path given in the example above (i.e., `scripts/`) is interpreted relative to the template file, but it would also be possible to provide an absolute URI to the location of the script.

In other words, operations defined by node types can be thought of as "hooks" into which automation can be injected. Typically, node type implementations provide the automation for those "hooks". However, within a
template, custom automation can be injected to run in a hook in the context of the one, specific node template (i.e. without changing the node type).
6 TOSCA template for database content deployment

In the example shown in section 4 the deployment of the MySQL middleware only, i.e. without actual database content was shown. The following example shows how such a template can be extended to also contain the definition of custom database content on-top of the MySQL DBMS software.

Example 5 - Template for deploying database content on-top of MySQL DBMS middleware

tosca_definitions_version: tosca_simple_yaml_1_0_0

description: Template for deploying MySQL and database content.

topology_template:
  inputs:
    # omitted here for brevity

node_templates:
  my_db:
    type: tosca.nodes.Database.MySQL
    properties:
      name: { get_input: database_name }
      user: { get_input: database_user }
      password: { get_input: database_password }
      port: { get_input: database_port }
    artifacts:
      db_content:
        implementation: files/my_db_content.txt
        type: tosca.artifacts.File
    requirements:
      - host: mysql

interfaces:
  Standard:
    create:
      implementation: db_create.sh
      inputs:
        # Copy DB file artifact to server’s staging area
        db_data: { get_artifact: [ SELF, db_content ] }

mysql:
  type: tosca.nodes.DBMS.MySQL
  properties:
    root_password: { get_input: mysql_rootpw }
    port: { get_input: mysql_port }
In the example above, the `my_db` node template or type `tosca.nodes.Database.MySQL` represents an actual MySQL database instance managed by a MySQL DBMS installation. The `requirements` section of the `my_db` node template expresses that the database it represents is to be hosted on a MySQL DBMS node template named `mysql` which is also declared in this template.

In its `artifacts` section of the `my_db` the node template, there is an artifact definition named `db_content` which represents a text file `my_db_content.txt` which in turn will be used to add content to the SQL database as part of the `create` operation. The `requirements` section of the `my_db` node template expresses that the database is hosted on a MySQL DBMS represented by the `mysql` node.

As you can see above, a script is associated with the `create` operation with the name `db_create.sh`. The TOSCA Orchestrator sees that this is not a named artifact declared in the node’s artifact section, but instead a filename for a normative TOCA implementation artifact script type (i.e., `tosca.artifacts.Implementation.Bash`). Since this is an implementation type for TOSCA, the orchestrator will execute the script automatically to create the node on `db_server`, but first it will prepare the local environment with the declared inputs for the operation. In this case, the orchestrator would see that the `db_data` input is using the `get_artifact` function to retrieve the file (`my_db_content.txt`) which is associated with the `db_content` artifact name prior to executing the `db_create.sh` script.

The logical diagram for this example would appear as follows:
Note that while it would be possible to define one node type and corresponding node templates that represent both the DBMS middleware and actual database content as one entity, TOSCA normative node types distinguish between middleware (container) and application (containee) node types. This allows on one hand to have better re-use of generic middleware node types without binding them to content running on top of them, and on the other hand this allows for better substitutability of, for example, middleware components like a DBMS during the deployment of TOSCA models.
7 TOSCA template for a two-tier application

The definition of multi-tier applications in TOSCA is quite similar to the example shown in section 4, with the only difference that multiple software node stacks (i.e., node templates for middleware and application layer components), typically hosted on different servers, are defined and related to each other. The example below defines a web application stack hosted on the web_server “compute” resource, and a database software stack similar to the one shown earlier in section 6 hosted on the db_server compute resource.

Example 6 - Basic two-tier application (web application and database server tiers)

tosca_definitions_version: tosca_simple_yaml_1_0_0

description: Template for deploying a two-tier application servers on two

topology_template:
   inputs:
      # Admin user name and password to use with the WordPress application
      wp_admin_username:
         type: string
      wp_admin_password:
         type: string
      wp_db_name:
         type: string
      wp_db_user:
         type: string
      wp_db_password:
         type: string
      wp_db_port:
         type: integer
      mysql_root_password:
         type: string
      mysql_port:
         type: integer
      context_root:
         type: string

    port: { get_input: mysql_port }
  requirements:
    - host: db_server
The web application stack consists of the `wordpress`, the `apache` and the `web_server` node templates. The `wordpress` node template represents a custom web application of type `tosca.nodes.WebApplication.WordPress` which is hosted on an Apache web server represented by the `apache` node template. This hosting relationship is expressed via the `host` entry in the `requirements` section of the `wordpress` node template. The `apache` node template, finally, is hosted on the `web_server` compute node.

The database stack consists of the `wordpress_db`, the `mysql` and the `db_server` node templates. The `wordpress_db` node represents a custom database of type `tosca.nodes.Database.MySQL` which is hosted on a MySQL DBMS represented by the `mysql` node template. This node, in turn, is hosted on the `db_server` compute node.

The `wordpress` node requires a connection to the `wordpress_db` node, since the WordPress application needs a database to store its data in. This relationship is established through the `database_endpoint` entry in the `requirements` section of the `wordpress` node template’s declared node type. For configuring the WordPress web application, information about the database to connect to is required as input to the `configure` operation. Therefore, the input parameters are defined and values for them are retrieved from the properties and attributes of the `wordpress_db` node via the `get_property` and `get_attribute` functions. In the above example, these inputs are defined at the interface-level and would be available to all operations of the `Standard` interface (i.e., the `tosca.interfaces.node.lifecycle.Standard` interface) within the `wordpress` node template and not just the `configure` operation.
8 Using a custom script to establish a relationship in a template

In previous examples, the template author did not have to think about explicit relationship types to be used to link a requirement of a node to another node of a model, nor did the template author have to think about special logic to establish those links. For example, the `host` requirement in previous examples just pointed to another node template and based on metadata in the corresponding node type definition the relationship type to be established is implicitly given.

In some cases it might be necessary to provide special processing logic to be executed when establishing relationships between nodes at runtime. For example, when connecting the WordPress application from previous examples to the MySQL database, it might be desired to apply custom configuration logic in addition to that already implemented in the application node type. In such a case, it is possible for the template author to provide a custom script as implementation for an operation to be executed at runtime as shown in the following example.

Example 7 – Providing a custom relationship script to establish a connection

```yaml

tosca_definitions_version: tosca_simple_yaml_1_0_0

description: Template for deploying a two-tier application on two servers.

topology_template:
  inputs:
    # omitted here for brevity

  node_templates:
    wordpress:
      type: tosca.nodes.WebApplication.WordPress
      properties:
      # omitted here for brevity
      requirements:
      - host: apache
      - database_endpoint:
          node: wordpress_db
        relationship: my_custom_database_connection

    wordpress_db:
      type: tosca.nodes.Database.MySQL
      properties:
      # omitted here for the brevity
      requirements:
      - host: mysql

  relationship_templates:
    my_custom_database_connection:
```
type: ConnectsTo
  interfaces:
    Configure:
      pre_configure_source: scripts/wp_db_configure.sh

# other resources not shown for this example ...

The node type definition for the `wordpress` node template is `WordPress` which declares the complete `database_endpoint` requirement definition. This `database_endpoint` declaration indicates it must be fulfilled by any node template that provides an `Endpoint.Database` Capability Type using a ConnectsTo relationship. The `wordpress_db` node template’s underlying `MySQL` type definition indeed provides the `Endpoint.Database` Capability type. In this example however, no explicit relationship template is declared; therefore TOSCA orchestrators would automatically create a ConnectsTo relationship to establish the link between the `wordpress` node and the `wordpress_db` node at runtime.

The ConnectsTo relationship (see C.5.4) also provides a default `Configure` interface with operations that optionally get executed when the orchestrator establishes the relationship. In the above example, the author has provided the custom script `wp_db_configure.sh` to be executed for the operation called `pre_configure_source`. The script file is assumed to be located relative to the referencing service template such as a relative directory within the TOSCA Cloud Service Archive (CSAR) packaging format. This approach allows for conveniently hooking in custom behavior without having to define a completely new derived relationship type.
9 Using custom relationship types in a TOSCA template

In the previous section it was shown how custom behavior can be injected by specifying scripts inline in the requirements section of node templates. When the same custom behavior is required in many templates, it does make sense to define a new relationship type that encapsulates the custom behavior in a re-usable way instead of repeating the same reference to a script (or even references to multiple scripts) in many places.

Such a custom relationship type can then be used in templates as shown in the following example.

Example 8 – A web application Node Template requiring a custom database connection type

```yaml
tosca_definitions_version: tosca_simple_yaml_1_0_0

description: Template for deploying a two-tier application on two servers.

topology_template:
  inputs:
    # omitted here for brevity

  node_templates:
    wordpress:
      type: tosca.nodes.WebApplication.WordPress
      properties:
        # omitted here for brevity
      requirements:
        - host: apache
        - database_endpoint:
          node: wordpress_db
          relationship: my.types.WordpressDbConnection

    wordpress_db:
      type: tosca.nodes.Database.MySQL
      properties:
        # omitted here for the brevity
      requirements:
        - host: mysql

    # other resources not shown here ...
```

In the example above, a special relationship type `my.types.WordpressDbConnection` is specified for establishing the link between the `wordpress` node and the `wordpress_db` node through the use of the `relationship` (keyword) attribute in the `database` reference. It is assumed, that this special relationship type provides some extra behavior (e.g., an operation with a script) in addition to what a generic “connects to” relationship would provide. The definition of this custom relationship type is shown in the following section.
9.1 Definition of a custom relationship type

The following YAML snippet shows the definition of the custom relationship type used in the previous section. This type derives from the base “ConnectsTo” and overrides one operation defined by that base relationship type. For the `pre_configure_source` operation defined in the `Configure` interface of the `ConnectsTo` relationship type, a script implementation is provided. It is again assumed that the custom configure script is located at a location relative to the referencing service template, perhaps provided in some application packaging format (e.g., the TOSCA Cloud Service Archive (CSAR) format).

Example 9 - Defining a custom relationship type

```yaml
tosca_definitions_version: tosca_simple_yaml_1_0_0

description: Definition of custom WordpressDbConnection relationship type

relationship_types:
  my.types.WordpressDbConnection:
    derived_from: tosca.relationships.ConnectsTo
    interfaces:
      Configure:
        pre_configure_source: scripts/wp_db_configure.sh
```

In the above example, the `Configure` interface is the specified alias or shorthand name for the TOSCA interface type with the full name of `tosca.interfaces.relationship.Configure` which is defined in the appendix.
10 Defining generic dependencies between nodes in a template

In some cases it can be necessary to define a generic dependency between two nodes in a template to influence orchestration behavior, i.e. to first have one node processed before another dependent node gets processed. This can be done by using the generic dependency requirement which is defined by the TOSCA Root Node Type and thus gets inherited by all other node types in TOSCA (see section C.7.1).

Example 10 - Simple dependency relationship between two nodes

```yaml
tosca_definitions_version: tosca_simple_yaml_1_0_0
description: Template with a generic dependency between two nodes.
topology_template:
  inputs:
    # omitted here for brevity
	node_templates:
  my_app:
    type: my.types.MyApplication
    properties:
      # omitted here for brevity
      requirements:
        - dependency: some_service

  some_service:
    type: some.nodetype.SomeService
    properties:
      # omitted here for brevity
```

As in previous examples, the relation that one node depends on another node is expressed in the requirements section using the built-in requirement named dependency that exists for all node types in TOSCA. Even if the creator of the MyApplication node type did not define a specific requirement for SomeService (similar to the database requirement in the example in section 8), the template author who knows that there is a timing dependency and can use the generic dependency requirement to express that constraint using the very same syntax as used for all other references.
11 Describing abstract requirements for nodes and capabilities in a TOSCA template

In TOSCA templates, nodes are either:

- **Concrete**: meaning that they have a deployment and/or one or more implementation artifacts that are declared on the “create” operation of the node’s Standard lifecycle interface, or they are
- **Abstract**: where the template describes the node type along with its required capabilities and properties that must be satisfied.

TOSCA Orchestrators, by default, when finding an abstract node in TOSCA Service Template during deployment will attempt to “select” a concrete implementation for the abstract node type that best matches and fulfills the requirements and property constraints the template author provided for that abstract node. The concrete implementation of the node could be provided by another TOSCA Service Template (perhaps located in a catalog or repository known to the TOSCA Orchestrator) or by an existing resource or service available within the target Cloud Provider’s platform that the TOSCA Orchestrator already has knowledge of.

TOSCA supports two methods for template authors to express requirements for an abstract node within a TOSCA service template.

1. **Using a target node_filter**: where a node template can describe a requirement (relationship) for another node without including it in the topology. Instead, the node provides a node_filter to describe the target node type along with its capabilities and property constrains.

2. **Using an abstract node template**: that describes the abstract node’s type along with its property constraints and any requirements and capabilities it also exports. This first method you have already seen in examples from previous chapters where the Compute node is abstract and selectable by the TOSCA Orchestrator using the supplied Container and OperatingSystem capabilities property constraints.

These approaches allows architects and developers to create TOSCA service templates that are composable and can be reused by allowing flexible matching of one template’s requirements to another’s capabilities. Examples of both these approaches are shown below.

11.1 Using a node_filter to define hosting infrastructure requirements for a software

Using TOSCA, it is possible to define only the software components of an application in a template and just express constrained requirements against the hosting infrastructure. At deployment time, the provider can then do a late binding and dynamically allocate or assign the required hosting infrastructure and place software components on top.

This example shows how a single software component (i.e., the mysql node template) can define its host requirements that the TOSCA Orchestrator and provider will use to select or allocate an appropriate host Compute node by using matching criteria provided on a node_filter.

```
tosca_definitions_version: tosca_simple_yaml_1_0_0
```
description: Template with requirements against hosting infrastructure.

topology_template:
  inputs:
    # omitted here for brevity

node_templates:
  mysql:
    type: tosca.nodes.DBMS.MySQL
    properties:
      # omitted here for brevity
    requirements:
      - host:
          node_filter:
            capabilities:
              # Constraints for selecting “host” (Container Capability)
              - host
                properties:
                  - num_cpus: { in_range: [ 1, 4 ] }
                  - mem_size: { greater_or_equal: 2 GB }
              # Constraints for selecting “os” (OperatingSystem Capability)
              - os:
                properties:
                  - architecture: { equal: x86_64 }
                  - type: linux
                  - distribution: ubuntu

In the example above, the mysql component contains a host requirement for a node of type Compute which it inherits from its parent DBMS node type definition; however, there is no declaration or reference to any node template of type Compute. Instead, the mysql node template augments the abstract “host” requirement with a node_filter which contains additional selection criteria (in the form of property constraints that the provider must use when selecting or allocating a host Compute node.

Some of the constraints shown above narrow down the boundaries of allowed values for certain properties such as mem_size or num_cpus for the “host” capability by means of qualifier functions such as greater_or_equal. Other constraints, express specific values such as for the architecture or distribution properties of the “os” capability which will require the provider to find a precise match.

Note that when no qualifier function is provided for a property (filter), such as for the distribution property, it is interpreted to mean the equal operator as shown on the architecture property.
11.2 Using an abstract node template to define infrastructure requirements for software

This previous approach works well if no other component (i.e., another node template) other than mysql node template wants to reference the same Compute node the orchestrator would instantiate. However, perhaps another component wants to also be deployed on the same host, yet still allow the flexible matching achieved using a node-filter. The alternative to the above approach is to create an abstract node template that represents the Compute node in the topology as follows:

```yaml
tosca_definitions_version: tosca_simple_yaml_1_0_0

description: Template with requirements against hosting infrastructure.

topology_template:
  inputs:
    # omitted here for brevity

  node_templates:
    mysql:
      type: tosca.nodes.DBMS.MySQL
      properties:
        # omitted here for brevity
      requirements:
        - host: mysql_compute

    mysql_compute:
      type: Compute
      capabilities:
        host:
          properties:
            num_cpus: { equal: 2 }
            mem_size: { greater_or_equal: 2 GB }
          os:
            properties:
              architecture: { equal: x86_64 }
              type: linux
              distribution: ubuntu
```

As you can see the resulting mysql_compute node template looks very much like the “hello world” template as shown in Chapter 3 (where the Compute node template was abstract), but this one also allows the TOSCA orchestrator more flexibility when “selecting” a host Compute node by providing flexible constraints for properties like mem_size.

As we proceed, you will see that TOSCA provides many normative node types like Compute for commonly found services (e.g., BlockStorage, WebServer, Network, etc.). When these TOSCA normative node types are used in your application’s topology they are always assumed to be “selectable” by TOSCA Orchestrators which work with target infrastructure providers to find or allocate the best match for them based upon your application’s requirements and constraints.

11.3 Using a node_filter to define requirements on a database for an application

In the same way requirements can be defined on the hosting infrastructure (as shown above) for an application, it is possible to express requirements against application or middleware components such as a database that is not
defined in the same template. The provider may then allocate a database by any means, (e.g. using a database-as-a-service solution).

tosca_definitions_version: tosca_simple_yaml_1_0_0

description: Template with a database requirement.

topology_template:
  inputs:
    # omitted here for brevity

node_templates:
  my_app:
    type: my.types.MyApplication
    properties:
      admin_user: { get_input: admin_username }
      admin_password: { get_input: admin_password }
      db_endpoint_url: { get_property: [SELF, database_endpoint, url_path ] }
    requirements:
      - database_endpoint:
          node: my.types.nodes.MyDatabase
          node_filter:
            properties:
              - db_version: { greater_or_equal: 5.5 }

In the example above, the application my_app requires a database node of type MyDatabase which has a db_version property value of greater_or_equal to the value 5.5.

This example also shows how the get_property intrinsic function can be used to retrieve the url_path property from the database node that will be selected by the provider and connected to my_app at runtime due to fulfillment of the database_endpoint requirement. To locate the property, the get_property’s first argument is set to the keyword SELF which indicates the property is being referenced from something in the node itself. The second parameter is the name of the requirement named database_endpoint which contains the property are looking for. The last argument is the name of the property itself (i.e., url_path) which contains the value we want to retrieve and assign to db_endpoint_url.
12 Using node template substitution for model composition

From an application perspective, it is often not necessary or desired to dive into platform details, but the platform/runtime for an application is abstracted. In such cases, the template for an application can use generic representations of platform components. The details for such platform components, such as the underlying hosting infrastructure at its configuration, can then be defined in separate template files that can be used for substituting the more abstract representations in the application level template file.

12.1 Understanding node template instantiation through a TOSCA Orchestrator

When a topology template is instantiated by a TOSCA Orchestrator, the orchestrator has to look for realizations of the single node templates according to the node types specified for each node template. Such realizations can either be node types that include the appropriate implementation artifacts and deployment artifacts that can be used by the orchestrator to bring to life the real-world resource modeled by a node template. Alternatively, separate topology templates may be annotated as being suitable for realizing a node template in the top-level topology template.

In the latter case, a TOSCA Orchestrator will use additional substitution mapping information provided as part of the substituting topology templates to derive how the substituted part get “wired” into the overall deployment, for example, how capabilities of a node template in the top-level topology template get bound to capabilities of node templates in the substituting topology template.

Thus, in cases where no “normal” node type implementation is available, or the node type corresponds to a whole subsystem that cannot be implemented as a single node, additional topology templates can be used for filling in more abstract placeholders in top level application templates.

12.2 Definition of the top-level service template

The following sample defines a web application `web_app` connected to a database `db`. In this example, the complete hosting stack for the application is defined within the same topology template: the web application is hosted on a web server `web_server`, which in turn is installed (hosted) on a compute node `server`.

The hosting stack for the database `db`, in contrast, is not defined within the same file but only the database is represented as a node template of type `tosca.nodes.Database`. The underlying hosting stack for the database is defined in a separate template file, which is shown later in this section. Within the current template, only a number of properties (`user`, `password`, `name`) are assigned to the database using hardcoded values in this simple example.
Figure 1: Using template substitution to implement a database tier

When a node template is to be substituted by another service template, this has to be indicated to an orchestrator by means of a special "substitutable" directive. This directive causes, for example, special processing behavior when validating the left-hand service template in Figure 1. The hosting requirement of the db node template is not bound to any capability defined within the service template, which would normally cause a validation error. When the "substitutable" directive is present, the orchestrator will however first try to perform substitution of the respective node template and after that validate if all mandatory requirements of all nodes in the resulting graph are fulfilled.

Note that in contrast to the use case described in section 0 (where a database was abstractly referred to in the requirements section of a node and the database itself was not represented as a node template), the approach shown here allows for some additional modeling capabilities in cases where this is required. For example, if multiple components shall use the same database (or any other sub-system of the overall service), this can be expressed by means of normal relations between node templates, whereas such modeling would not be possible in requirements sections of disjoint node templates.
tosca_definitions_version: tosca_simple_yaml_1_0

topology_template:
  description: Template of an application connecting to a database.

node_templates:
  web_app:
    type: tosca.nodes.WebApplication.MyWebApp
    requirements:
      - host: web_server
      - database_endpoint: db

  web_server:
    type: tosca.nodes.WebServer
    requirements:
      - host: server

  server:
    type: tosca.nodes.Compute
    # details omitted for brevity

  db:
    # This node is abstract (no Deployment or Implementation artifacts on create)
    # and can be substituted with a topology provided by another template
    # that exports a Database type's capabilities.
    type: tosca.nodes.Database
    properties:
      user: my_db_user
      password: secret
      name: my_db_name

12.3 Definition of the database stack in a service template

The following sample defines a template for a database including its complete hosting stack, i.e. the template includes a database node template, a template for the database management system (dbms) hosting the database, as well as a computer node server on which the DBMS is installed.

This service template can be used standalone for deploying just a database and its hosting stack. In the context of the current use case, though, this template can also substitute the database node template in the previous snippet and thus fill in the details of how to deploy the database.

In order to enable such a substitution, an additional metadata section substitution_mappings is added to the topology template to tell a TOSCA Orchestrator how exactly the topology template will fit into the context where it gets used. For example, requirements or capabilities of the node that gets substituted by the topology template have to be mapped to requirements or capabilities of internal node templates for allow for a proper wiring of the resulting overall graph of node templates.
In short, the `substitution_mappings` section provides the following information:

1. It defines what node templates, i.e. node templates of which type, can be substituted by the topology template.
2. It defines how capabilities of the substituted node (or the capabilities defined by the node type of the substituted node template, respectively) are bound to capabilities of node templates defined in the topology template.
3. It defines how requirements of the substituted node (or the requirements defined by the node type of the substituted node template, respectively) are bound to requirements of node templates defined in the topology template.

The `substitution_mappings` section in the sample below denotes that this topology template can be used for substituting node templates of type `tosca.nodes.Database`. It further denotes that the `database_endpoint` capability of the substituted node gets fulfilled by the `database_endpoint` capability of the `database` node contained in the topology template.
tosca_definitions_version: tosca_simple_yaml_1_0

topology_template:
  description: Template of a database including its hosting stack.

  inputs:
    db_user:
      type: string
    db_password:
      type: string
    # other inputs omitted for brevity

  substitution_mappings:
    node_type: tosca.nodes.Database
    capabilities:
      database_endpoint: [ database, database_endpoint ]

  node_templates:
    database:
      type: tosca.nodes.Database
      properties:
        user: { get_input: db_user }
        # other properties omitted for brevity
      requirements:
        - host: dbms

    dbms:
      type: tosca.nodes.DBMS
      # details omitted for brevity

    server:
      type: tosca.nodes.Compute
      # details omitted for brevity

Note that the substitution_mappings section does not define any mappings for requirements of the Database node type, since all requirements are fulfilled by other nodes templates in the current topology template. In cases where a requirement of a substituted node is bound in the top-level service template as well as in the substituting topology template, a TOSCA Orchestrator SHOULD raise a validation error.

Further note that no mappings for properties or attributes of the substituted node are defined. Instead, the inputs and outputs defined by the topology template have to match the properties and attributes or the substituted node. If there are more inputs than the substituted node has properties, default values must be defined for those inputs, since no values can be assigned through properties in a substitution case.
13 Using node template substitution for chaining subsystems

A common use case when providing an end-to-end service is to define a chain of several subsystems that together implement the overall service. Those subsystems are typically defined as separate service templates to (1) keep the complexity of the end-to-end service template at a manageable level and to (2) allow for the re-use of the respective subsystem templates in many different contexts. The type of subsystems may be specific to the targeted workload, application domain, or custom use case. For example, a company or a certain industry might define a subsystem type for company- or industry specific data processing and then use that subsystem type for various end-user services. In addition, there might be generic subsystem types like a database subsystem that are applicable to a wide range of use cases.

13.1 Defining the overall subsystem chain

Figure 3 shows the chaining of three subsystem types – a message queuing subsystem, a transaction processing subsystem, and a databank subsystem – that support, for example, an online booking application. On the front end, this chain provides a capability of receiving messages for handling in the message queuing subsystem. The message queuing subsystem in turn requires a number of receivers, which in the current example are two transaction processing subsystems. The two instances of the transaction processing subsystem might be deployed on two different hosting infrastructures or datacenters for high-availability reasons. The transaction processing subsystems finally require a database subsystem for accessing and storing application specific data. The database subsystem in the backend does not require any further component and is therefore the end of the chain in this example.

![Figure 3: Chaining of subsystems in a service template](image)

All of the node templates in the service template shown above are abstract and considered substitutable where each can be treated as their own subsystem; therefore, when instantiating the overall service, the orchestrator would realize each substitutable node template using other TOSCA service templates. These service templates would include more nodes and relationships that include the details for each subsystem. A simplified version of a TOSCA service template for the overall service is given in the following listing.
tosca_definitions_version: tosca_simple_yaml_1_0

topology_template:
  description: Template of online transaction processing service.

  node_templates:
    mq:
      type: example.QueuingSubsystem
      properties:
        # properties omitted for brevity
      capabilities:
        message_queue_endpoint:
          # details omitted for brevity
      requirements:
        - receiver: trans1
        - receiver: trans2

    trans1:
      type: example.TransactionSubsystem
      properties:
        mq_service_ip: { get_attribute: [ mq, service_ip ] }
        receiver_port: 8080
      capabilities:
        message_receiver:
          # details omitted for brevity
      requirements:
        - database_endpoint: dbsys

    trans2:
      type: example.TransactionSubsystem
      properties:
        mq_service_ip: { get_attribute: [ mq, service_ip ] }
        receiver_port: 8080
      capabilities:
        message_receiver:
          # details omitted for brevity
      requirements:
        - database_endpoint: dbsys

    dbsys:
      type: example.DatabaseSubsystem
      properties:
As can be seen in the example above, the subsystems are chained to each other by binding requirements of one subsystem node template to other subsystem node templates that provide the respective capabilities. For example, the receiver requirement of the message queuing subsystem node template `mq` is bound to transaction processing subsystem node templates `trans1` and `trans2`.

Subsystems can be parameterized by providing properties. In the listing above, for example, the IP address of the message queuing server is provided as property `mq_service_ip` to the transaction processing subsystems and the desired port for receiving messages is specified by means of the `receiver_port` property.

If attributes of the instantiated subsystems shall be obtained, this would be possible by using the `get_attribute` intrinsic function on the respective subsystem node templates.

### 13.2 Defining a subsystem (node) type

The types of subsystems that are required for a certain end-to-end service are defined as TOSCA node types as shown in the following example. Node templates of those node types can then be used in the end-to-end service template to define subsystems to be instantiated and chained for establishing the end-to-end service.

The realization of the defined node type will be given in the form of a whole separate service template as outlined in the following section.

Configuration parameters that shall be allowed for customizing the instantiation of any subsystem are defined as properties of the node type. In the current example, those are the properties `mq_service_ip` and `receiver_port` that had been used in the end-to-end service template in section 13.1.
Observable attributes of the resulting subsystem instances are defined as attributes of the node type. In the current case, those are the IP address of the message receiver as well as the actually allocated port of the message receiver endpoint.

### 13.3 Defining the details of a subsystem

The details of a subsystem, i.e. the software components and their hosting infrastructure, are defined as node templates and relationships in a service template. By means of substitution mappings that have been introduced in section 12.2, the service template is annotated to indicate to an orchestrator that it can be used as realization of a node template of certain type, as well as how characteristics of the node type are mapped to internal elements of the service template.

![Diagram](image)

*Figure 4: Defining subsystem details in a service template*

Figure 1 illustrates how a transaction processing subsystem as outlined in the previous section could be defined in a service template. In this example, it simply consists of a custom application `app` of type `SomeApp` that is hosted on a web server `websrv`, which in turn is running on a compute node.

The application named `app` provides a capability to receive messages, which is bound to the `message_receiver` capability of the substitutable node type. It further requires access to a database, so the application’s `database_endpoint` requirement is mapped to the `database_endpoint` requirement of the `TransactionSubsystem` node type.

Properties of the `TransactionSubsystem` node type are used to customize the instantiation of a subsystem. Those properties can be mapped to any node template for which the author of the subsystem service template wants to expose configurability. In the current example, the application `app` and the web server middleware `websrv` get configured through properties of the `TransactionSubsystem` node type. All properties of that node type are defined as `inputs` of the service template. The input parameters in turn get mapped to node templates by means of `get_input` function calls in the respective sections of the service template.

Similarly, attributes of the whole subsystem can be obtained from attributes of particular node templates. In the current example, attributes of the web server and the hosting compute node will be exposed as subsystem attributes. All exposed attributes that are defined as attributes of the substitutable `TransactionSubsystem` node type are defined as outputs of the subsystem service template.

An outline of the subsystem service template is shown in the listing below. Note that this service template could be used for stand-alone deployment of a transaction processing system as well, i.e. it is not restricted just for use...
in substitution scenarios. Only the presence of the `substitution_mappings` metadata section in the `topology_template` enables the service template for substitution use cases.
tosca_definitions_version: tosca_simple_yaml_1_0

topology_template:
  description: Template of a database including its hosting stack.

  inputs:
    mq_service_ip:
      type: string
      description: IP address of the message queuing server to receive messages from
    receiver_port:
      type: string
      description: Port to be used for receiving messages
  # other inputs omitted for brevity

substitution_mappings:
  node_type: example.TransactionSubsystem
  capabilities:
    message_receiver: [ app, message_receiver ]
  requirements:
    database_endpoint: [ app, database ]

node_templates:
  app:
    type: example.SomeApp
    properties:
      # properties omitted for brevity
    capabilities:
      message_receiver:
        properties:
          service_ip: { get_input: mq_service_ip }
          # other properties omitted for brevity
    requirements:
      - database:
        # details omitted for brevity
        - host: websrv

  websrv:
    type: tosca.nodes.WebServer
    properties:
      # properties omitted for brevity
    capabilities:
      data_endpoint:
properties:
  port_name: \{ get_input: receiver_port \}

  # other properties omitted for brevity
requirements:
  - host: server

server:
  type: tosca.nodes.Compute
  # details omitted for brevity

outputs:
  receiver_ip:
    description: private IP address of the message receiver application
    value: \{ get_attribute: [ server, private_address ] \}
  receiver_port:
    description: Port of the message receiver endpoint
    value: \{ get_attribute: [ app, app_endpoint, port ] \}
In designing applications composed of several interdependent software components (or nodes) it is often desirable to manage these components as a named group. This can provide an effective way of associating policies (e.g., scaling, placement, security or other) that orchestration tools can apply to all the components of group during deployment or during other lifecycle stages.

In many realistic scenarios it is desirable to include scaling capabilities into an application to be able to react on load variations at runtime. The example below shows the definition of a scaling web server stack, where a variable number of servers with apache installed on them can exist, depending on the load on the servers.

```
tosca_definitions_version: tosca_simple_yaml_1_0_0

description: Template for a scaling web server.

topology_template:
  inputs:
    # omitted here for brevity

  node_templates:
    apache:
      type: tosca.nodes.WebServer.Apache
      properties:
        # Details omitted for brevity
      requirements:
        - host: server

    server:
      type: tosca.nodes.Compute
      # details omitted for brevity

  groups:
    webserver_group:
      members: [ apache, server ]
      policies:
        - my_scaling_policy:
          # Specific policy definitions are considered domain specific and
          # are not included here
```

The example first of all uses the concept of grouping to express which components (node templates) need to be scaled as a unit – i.e. the compute nodes and the software on-top of each compute node. This is done by defining the `webserver_group` in the `groups` section of the template and by adding both the `apache` node template and the `server` node template as a member to the group.
Furthermore, a scaling policy is defined for the group to express that the group as a whole (i.e. pairs of server node and the apache component installed on top) should scale up or down under certain conditions.

In cases where no explicit binding between software components and their hosting compute resources is defined in a template, but only requirements are defined as has been shown in section 11, a provider could decide to place software components on the same host if their hosting requirements match, or to place them onto different hosts.

It is often desired, though, to influence placement at deployment time to make sure components get collocation or anti-collocated. This can be expressed via grouping and policies as shown in the example below.

```yaml
tosca_definitions_version: tosca_simple_yaml_1_0_0
description: Template hosting requirements and placement policy.
topology_template:
  inputs:
    # omitted here for brevity
  node_templates:
    wordpress_server:
      type: tosca.nodes.WebServer
      properties:
        # omitted here for brevity
      requirements:
        - host:
          # Find a Compute node that fulfills these additional filter reqs.
          node_filter:
            capabilities:
              - host:
                properties:
                  - mem_size: { greater_or_equal: 2 MB }
                  - disk_size: { greater_or_equal: 10 MB }
            os:
              properties:
                - architecture: x86_64
                - type: linux

    mysql:
      type: tosca.nodes.DBMS.MySQL
      properties:
        # omitted here for brevity
      requirements:
        - host:
          node: tosca.nodes.Compute
```
node_filter:
capabilities:
  - host:
    properties:
      - disk_size: { greater_or_equal: 1 GB }
  - os:
    properties:
      - architecture: x86_64
      - type: linux

groups:
  my_collocation_group:
    members: [ wordpress_server, mysql ]
    policies:
      - my_anti_collocation_policy:
        # Specific policy definitions are considered domain specific and
        # are not included here

In the example above, both software components **wordpress_server** and **mysql** have similar hosting requirements. Therefore, a provider could decide to put both on the same server as long as both their respective requirements can be fulfilled. By defining a group of the two components and attaching an anti-collocation policy to the group it can be made sure, though, that both components are put onto different hosts at deployment time.
Using YAML Macros to simplify templates

The YAML 1.2 specification allows for defining of aliases which allow for authoring a block of YAML (or node) once and indicating it is an “anchor” and then referencing it elsewhere in the same document as an “alias”. Effectively, YAML parsers treat this as a “macro” and copy the anchor block’s code to wherever it is referenced. Use of this feature is especially helpful when authoring TOSCA Service Templates where similar definitions and property settings may be repeated multiple times when describing a multi-tier application.

For example, an application that has a web server and database (i.e., a two-tier application) may be described using two Compute nodes (one to host the web server and another to host the database). The author may want both Compute nodes to be instantiated with similar properties such as operating system, distribution, version, etc. To accomplish this, the author would describe the reusable properties using a named anchor in the “dsl_definitions” section of the TOSCA Service Template and reference the anchor name as an alias in any Compute node templates where these properties may need to be reused. For example:

tosca_definitions_version: tosca_simple_yaml_1_0_0

description: >
  TOSCA simple profile that just defines a YAML macro for commonly reused Compute properties.

dsl_definitions:
  my_compute_node_props: &my_compute_node_props
disk_size: 10 GB
  num_cpus: 1
  mem_size: 4096 kB

topology_template:
  node_templates:
  my_server:
    type: Compute
    capabilities:
      - host:
        properties: *my_compute_node_props

  my_database:
    type: Compute
    capabilities:
      - host:
        properties: *my_compute_node_props
16 Passing information as inputs to Nodes and Relationships

It is possible for type and template authors to declare input variables within an `inputs` block on interfaces to nodes or relationships in order to pass along information needed by their operations (scripts). These declarations can be scoped such as to make these variable values available to all operations on a node or relationships interfaces or to individual operations. TOSCA orchestrators will make these values available as environment variables within the execution environments in which the scripts associated with lifecycle operations are run.

16.1 Example: declaring input variables for all operations on a single interface

```yml
node_templates:
  wordpress:
    type: tosca.nodes.WebApplication.WordPress
    requirements:
      ...
      - database_endpoint: mysql_database
    interfaces:
      Standard:
        inputs:
          wp_db_port: { get_property: [SELF, database_endpoint, port] }
```

16.2 Example: declaring input variables for a single operation

```yml
node_templates:
  wordpress:
    type: tosca.nodes.WebApplication.WordPress
    requirements:
      ...
      - database_endpoint: mysql_database
    interfaces:
      Standard:
        create: wordpress_install.sh
        configure:
          implementation: wordpress_configure.sh
        inputs:
          wp_db_port: { get_property: [SELF, database_endpoint, port] }
```

In the case where an input variable name is defined at more than one scope within the same interfaces section of a node or template definition, the lowest (or innermost) scoped declaration would override those declared at higher (or more outer) levels of the definition.
16.3 Example: setting output variables to an attribute

node_templates:
  frontend:
    type: MyTypes.SomeNodeType
    attributes:
      url: { get_operation_output: [ SELF, Standard, create, generated_url ] }
    interfaces:
      Standard:
        create:
          implementation: scripts/frontend/create.sh

In this example, the Standard create operation exposes / exports an environment variable named "generated_url" attribute which will be assigned to the WordPress node’s url attribute.

16.4 Example: passing output variables between operations

node_templates:
  frontend:
    type: MyTypes.SomeNodeType
    interfaces:
      Standard:
        create:
          implementation: scripts/frontend/create.sh
        configure:
          implementation: scripts/frontend/configure.sh
        inputs:
          data_dir: { get_operation_output: [ SELF, Standard, create, data_dir ] }

In this example, the Standard lifecycle’s create operation exposes / exports an environment variable named "data_dir" which will be passed as an input to the Standard lifecycle’s configure operation.
17 Topology Template Model versus Instance Model

A TOSCA service template contains a topology template, which models the components of an application, their relationships and dependencies (a.k.a., a topology model) that get interpreted and instantiated by TOSCA Orchestrators. The actual node and relationship instances that are created represent a set of resources distinct from the template itself, called a topology instance (model). The direction of this specification is to provide access to the instances of these resources for management and operational control by external administrators. This model can also be accessed by an orchestration engine during deployment – i.e. during the actual process of instantiating the template in an incremental fashion. That is, the orchestrator can choose the order of resources to instantiate (i.e., establishing a partial set of node and relationship instances) and have the ability, as they are being created, to access them in order to facilitate instantiating the remaining resources of the complete topology template.
Using attributes implicitly reflected from properties

Most entity types in TOSCA (e.g., Node, Relationship, Requirement and Capability Types) have property definitions which allow template authors to set the values for as inputs when these entities are instantiated by an orchestrator. These property values are considered to reflect the desired state of the entity by the author. Once instantiated, the actual values for these properties on the realized (instantiated) entity are obtainable via attributes on the entity with the same name as the corresponding property.

In other words, TOSCA orchestrators will automatically reflect (i.e., make available) any property defined on an entity making it available as an attribute of the entity with the same name as the property.

Use of this feature is shown in the example below where a source node named my_client, of type ClientNode, requires a connection to another node named my_server of type ServerNode. As you can see, the ServerNode type defines a property named notification_port which defines a dedicated port number which instances of my_client may use to post asynchronous notifications to it during runtime. In this case, the TOSCA Simple Profile assures that the notification_port property is implicitly reflected as an attribute in the my_server node (also with the name notification_port) when its node template is instantiated.

tosca_definitions_version: tosca_simple_yaml_1_0_0

description: >
   TOSCA simple profile that shows how the (notification_port) property is reflected as an attribute and can be referenced elsewhere.

node_types:
   ServerNode:
      derived_from: SoftwareComponent
      properties:
         notification_port:
            type: integer
      capabilities:
         # omitted here for brevity
   ClientNode:
      derived_from: SoftwareComponent
      properties:
         # omitted here for brevity
      requirements:
         - server:
            capability: Endpoint
            node: ServerNode
            relationship: ConnectsTo

topology_template:
node_templates:

my_server:
  type: ServerNode
  properties:
    notification_port: 8000

my_client:
  type: ClientNode
  requirements:
    - server:
      node: my_server
      relationship: my_connection

relationship_templates:
  my_connection:
    type: ConnectsTo
    interfaces:
      Configure:
        inputs:
          targ_notify_port: { get_attribute: [ TARGET, notification_port ] }
        # other operation definitions omitted here for brevity

Specifically, the above example shows that the ClientNode type needs the notification_port value anytime a node of ServerType is connected to it using the ConnectsTo relationship in order to make it available to its Configure operations (scripts). It does this by using the get_attribute function to retrieve the notification_port attribute from the TARGET node of the ConnectsTo relationship (which is a node of type ServerNode) and assigning it to an environment variable named targ_notify_port.

It should be noted that the actual port value of the notification_port attribute may or may not be the value 8000 as requested on the property; therefore, any node that is dependent on knowing its actual "runtime" value would use the get_attribute function instead of the get_property function.
Appendix A. TOSCA Simple Profile definitions in YAML

This section describes all of the YAML block structure for all keys and mappings that are defined for the TOSCA Version 1.0 Simple Profile specification that are needed to describe a TOSCA Service Template (in YAML).

A.1 TOSCA namespace and alias

The following table defines the namespace alias and (target) namespace values that SHALL be used when referencing the TOSCA Simple Profile version 1.0 specification.

<table>
<thead>
<tr>
<th>Alias</th>
<th>Target Namespace</th>
<th>Specification Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tosca_simple_yaml_1_0_0</td>
<td><a href="http://docs.oasis-open.org/tosca/ns/simple/yaml/1.0">http://docs.oasis-open.org/tosca/ns/simple/yaml/1.0</a></td>
<td>The TOSCA Simple Profile v1.0 (YAML) target namespace and namespace alias.</td>
</tr>
</tbody>
</table>

A.1.1 Rules to avoid namespace collisions

TOSCA Simple Profiles allows template authors to declare their own types and templates and assign them simple names with no apparent namespaces. Since TOSCA Service Templates can import other service templates to introduce new types and topologies of templates that can be used to provide concrete implementations (or substitute) for abstract nodes. Rules are needed so that TOSCA Orchestrators know how to avoid collisions and apply their own namespaces when import and nesting occur.

The following cases are considered:

- Duplicate property names within same entity (e.g., Node Type, Node Template, Relationship Type, etc.)
- Duplicate requirement names within same entity (e.g., Node Type, Node Template, Relationship Type, etc.)
- Duplicate capability names within same entity (e.g., Node Type, Node Template, Relationship Type, etc.)
- Collisions that occurs from “import” for any Type or Template.
- Collision that occurs from “substitution” of other Node Templates.

A.2 Parameter and property types

This clause describes the primitive types that are used for declaring normative properties, parameters and grammar elements throughout this specification.

A.2.1 Referenced YAML Types

Many of the types we use in this profile are built-in types from the YAML 1.2 specification (i.e., those identified by the “tag:yaml.org,2002” version tag).

The following table declares the valid YAML type URIs and aliases that SHALL be used when possible when defining parameters or properties within TOSCA Service Templates using this specification:

<table>
<thead>
<tr>
<th>Valid alias</th>
<th>Type URI</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>tag:yaml.org,2002:str (default)</td>
</tr>
<tr>
<td>integer</td>
<td>tag:yaml.org,2002:int</td>
</tr>
<tr>
<td>float</td>
<td>tag:yaml.org,2002:float</td>
</tr>
<tr>
<td>boolean</td>
<td>tag:yaml.org,2002:bool (i.e., a value either ‘true’ or ‘false’)</td>
</tr>
</tbody>
</table>
A.2.1.1 Notes

- The “string” type is the default type when not specified on a parameter or property declaration.
- While YAML supports further type aliases, such as “str” for “string”, the TOSCA Simple Profile specification promotes the fully expressed alias name for clarity.

A.2.2 TOSCA version

TOSCA supports the concept of “reuse” of type definitions, as well as template definitions which could be version and change over time. It is important to provide a reliable, normative means to represent a version string which enables the comparison and management of types and templates over time. Therefore, the TOSCA TC intends to provide a normative version type (string) for this purpose in future Working Drafts of this specification.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>version</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:version</td>
</tr>
</tbody>
</table>

A.2.2.1 Grammar

TOSCA version strings have the following grammar:

\[
<\text{major_version}>.\langle\text{minor_version}\rangle[.\langle\text{fix_version}\rangle[.\langle\text{qualifier}\rangle[\langle\text{build_version}\rangle] ] ]
\]

In the above grammar, the pseudo values that appear in angle brackets have the following meaning:

- **major_version**: is a required integer value greater than or equal to 0 (zero)
- **minor_version**: is a required integer value greater than or equal to 0 (zero).
- **fix_version**: is an optional integer value greater than or equal to 0 (zero).
- **qualifier**: is an optional string that indicates a named, pre-release version of the associated code that has been derived from the version of the code identified by the combination **major_version**, **minor_version** and **fix_version** numbers.
- **build_version**: is an optional integer value greater than or equal to 0 (zero) that can be used to further qualify different build versions of the code that has the same **qualifier_string**.

A.2.2.2 Version Comparison

- When comparing TOSCA versions, all component versions (i.e., major, minor and fix) are compared in sequence from left to right.
- TOSCA versions that include the optional qualifier are considered older than those without a qualifier.
- TOSCA versions with the same major, minor, and fix versions and have the same qualifier string, but with different build versions can be compared based upon the build version.
- Qualifier strings are considered domain-specific. Therefore, this specification makes no recommendation on how to compare TOSCA versions with the same major, minor and fix versions, but with different qualifiers strings and simply considers them different named branches derived from the same code.
### A.2.2.3 Examples

Example of a version with

```
# basic version strings
6.1
2.0.1

# version string with optional qualifier
3.1.0.beta

# version string with optional qualifier and build version
1.0.0.alpha-10
```

### A.2.2.4 Notes

- [Maven-Version] The TOSCA version type is compatible with the Apache Maven versioning policy.

### A.2.2.5 Additional Requirements

- A version value of zero (i.e., ‘0’, ‘0.0’, or ‘0.0.0’) SHALL indicate there no version provided.
- A version value of zero used with any qualifiers SHALL NOT be valid.

### A.2.3 TOCSA range type

The range type can be used to define numeric ranges with a lower and upper boundary. For example, this allows for specifying a range of ports to be opened in a firewall.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:range</td>
</tr>
</tbody>
</table>

#### A.2.3.1 Grammar

TOSCA range values have the following grammar:

```
[<lower_bound>, <upper_bound>]
```

In the above grammar, the pseudo values that appear in angle brackets have the following meaning:

- **lower_bound**: is a required integer value that denotes the lower boundary of the range.
- **upper_bound**: is a required integer value that denotes the upper boundary of the range. This value must be greater than **lower_bound**.

#### A.2.3.2 Keywords:

The following Keywords may be used in the TOSCA range type:

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Applicable Types</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Keyword</td>
<td>Applicable Types</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>UNBOUNDED</td>
<td>scalar</td>
<td>Used to represent an unbounded upper bounds (positive) value in a set for a scalar type.</td>
</tr>
</tbody>
</table>

### A.2.3.3 Examples

Example of a node template property with a range value:

```yaml
# numeric range between 1 and 100
a_range_property: [ 1, 100 ]

# a property that has allows any number 0 or greater
num_connections: [ 0, UNBOUNDED ]
```

### A.2.4 TOSCA list type

The list type allows for specifying multiple values for a parameter of property. For example, if an application allows for being configured to listen on multiple ports, a list of ports could be configured using the list data type.

Note that entries in a list for one property or parameter must be of the same type. The type (for simple entries) or schema (for complex entries) is defined by the `entry_schema` attribute of the respective property definition, attribute definitions, or input or output parameter definitions.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>list</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:list</td>
</tr>
</tbody>
</table>

### A.2.4.1 Grammar

TOSCA lists are essentially normal YAML lists with the following grammars:

#### A.2.4.1.1 Square bracket notation

```
[ <list_entry_1>, <list_entry_2>, ... ]
```

#### A.2.4.1.2 Bulleted (sequenced) list notation

```
- <list_entry_1>
- ...
- <list_entry_n>
```

In the above grammars, the pseudo values that appear in angle brackets have the following meaning:

- `<list_entry_*>`: represents one entry of the list.
A.2.4.2 Declaration Examples

A.2.4.2.1 List declaration using a simple type

The following example shows a list declaration with an entry schema based upon a simple integer type (which has additional constraints):

```yaml
<some_entity>:
  ...
  properties:
    listen_ports:
      type: list
      entry_schema:
        description: listen port entry (simple integer type)
        type: integer
        constraints:
          - rmax_length: 128
```

A.2.4.2.2 List declaration using a complex type

The following example shows a list declaration with an entry schema based upon a complex type:

```yaml
<some_entity>:
  ...
  properties:
    products:
      type: list
      entry_schema:
        description: Product information entry (complex type) defined elsewhere
        type: ProductInfo
```

A.2.4.3 Definition Examples

These examples show two notation options for defining lists:

- A single-line option which is useful for only short lists with simple entries.
- A multi-line option where each list entry is on a separate line; this option is typically useful or more readable if there is a large number of entries, or if the entries are complex.

A.2.4.3.1 Square bracket notation

```yaml
listen_ports: [ 80, 8080 ]
```

A.2.4.3.2 Bulleted list notation

```yaml
listen_ports:
  - 80
  - 8080
```
A.2.5 TOSCA map type

The map type allows for specifying multiple values for a parameter of property as a map. In contrast to the list type, where each entry can only be addressed by its index in the list, entries in a map are named elements that can be addressed by their keys.

Note that entries in a map for one property or parameter must be of the same type. The type (for simple entries) or schema (for complex entries) is defined by the entry_schema attribute of the respective property definition, attribute definition, or input or output parameter definition.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>map</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:map</td>
</tr>
</tbody>
</table>

A.2.5.1 Grammar

TOSCA maps are normal YAML dictionaries with following grammar:

A.2.5.1.1 Single-line grammar

```yaml
{ <entry_key_1>: <entry_value_1>, ..., <entry_key_n>: <entry_value_n> }
...
<entry_key_n>: <entry_value_n>
```

A.2.5.1.2 Multi-line grammar

```yaml
<entry_key_1>: <entry_value_1>
...
<entry_key_n>: <entry_value_n>
```

In the above grammars, the pseudo values that appear in angle brackets have the following meaning:

- `entry_key_*`: is the required key for an entry in the map
- `entry_value_*`: is the value of the respective entry in the map

A.2.5.2 Declaration Examples

A.2.5.2.1 Map declaration using a simple type

The following example shows a map with an entry schema definition based upon an existing string type (which has additional constraints):

```yaml
<some_entity>:
...
properties:
  emails:
    type: map
    entry_schema:
      description: basic email address
      type: string
      constraints:
```
A.2.5.2.2 Map declaration using a complex type

The following example shows a map with an entry schema definition for contact information:

```yaml
<some_entity>:
  ...
  properties:
    contacts:
      type: map
      entry_schema:
        description: simple contact information
        type: ContactInfo
```

A.2.5.3 Definition Examples

These examples show two notation options for defining maps:

- A single-line option which is useful for only short maps with simple entries.
- A multi-line option where each map entry is on a separate line; this option is typically useful or more readable if there is a large number of entries, or if the entries are complex.

A.2.5.3.1 Single-line notation

```yaml
# notation option for shorter maps
user_name_to_id_map: { user1: 1001, user2: 1002 }
```

A.2.5.3.2 Multi-line notation

```yaml
# notation for longer maps
user_name_to_id_map:
  user1: 1001
  user2: 1002
```

A.2.6 TOCSA scalar-unit type

The scalar-unit type can be used to define scalar values along with a unit from the list of recognized units provided below.

A.2.6.1 Grammar

TOSCA scalar-unit typed values have the following grammar:

```yaml
<scalar> <unit>
```

In the above grammar, the pseudo values that appear in angle brackets have the following meaning:

- **scalar**: is a required scalar value.
- **unit**: is a required unit value. The unit value MUST be type-compatible with the scalar.
A.2.6.2 Additional requirements

- **Whitespace**: any number of spaces (including zero or none) **SHALL** be allowed between the **scalar** value and the **unit** value.
- It **SHALL** be considered an error if either the scalar or unit portion is missing on a property or attribute declaration derived from any scalar-unit type.
- When performing constraint clause evaluation on values of the scalar-unit type, both the scalar value portion and unit value portion **SHALL** be compared together (i.e., both are treated as a single value). For example, if we have a property called `storage_size`, which is of type scalar-unit, a valid range constraint would appear as follows:
  - `storage_size: in_range [ 4 GB, 20 GB ]`

where `storage_size`’s range would be evaluated using both the numeric and unit values (combined together), in this case ’4 GB’ and ’20 GB’.

A.2.6.3 Concrete Types

<table>
<thead>
<tr>
<th>Shorthand Names</th>
<th>scalar-unit.size, scalar-unit.size</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Names</td>
<td>tosca:scalar-unit.size, tosca:scalar-unit.time</td>
</tr>
</tbody>
</table>

The scalar-unit type grammar is abstract and has two recognized concrete types in TOSCA:

- **scalar-unit.size** – used to define properties that have scalar values measured in size units.
- **scalar-unit.time** – used to define properties that have scalar values measured in size units.
- **scalar-unit.frequency** – used to define properties that have scalar values measured in units per second.

These types and their allowed unit values are defined below.

A.2.6.4 scalar-unit.size

A.2.6.4.1 Recognized Units

<table>
<thead>
<tr>
<th>Unit</th>
<th>Usage</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>size</td>
<td>byte</td>
</tr>
<tr>
<td>kB</td>
<td>size</td>
<td>kilobyte (1000 bytes)</td>
</tr>
<tr>
<td>KiB</td>
<td>size</td>
<td>kibibytes (1024 bytes)</td>
</tr>
<tr>
<td>MB</td>
<td>size</td>
<td>megabyte (1000000 bytes)</td>
</tr>
<tr>
<td>MiB</td>
<td>size</td>
<td>mebibyte (1048576 bytes)</td>
</tr>
<tr>
<td>GB</td>
<td>size</td>
<td>gigabyte (1000000000 bytes)</td>
</tr>
<tr>
<td>GiB</td>
<td>size</td>
<td>gibibytes (1073741824 bytes)</td>
</tr>
<tr>
<td>TB</td>
<td>size</td>
<td>terabyte (1000000000000 bytes)</td>
</tr>
<tr>
<td>TiB</td>
<td>size</td>
<td>tebibytes (1099511627776 bytes)</td>
</tr>
</tbody>
</table>
A.2.6.4.2 Examples

```yaml
# Storage size in Gigabytes
properties:
  storage_size: 10 GB
```

A.2.6.4.3 Notes

- The unit values recognized by TOSCA Simple Profile for size-type units are based upon a subset of those defined by GNU at [http://www.gnu.org/software/parted/manual/html_node/unit.html](http://www.gnu.org/software/parted/manual/html_node/unit.html), which is a non-normative reference to this specification.
- TOSCA treats these unit values as case-insensitive (e.g., a value of ‘kB’, ‘KB’ or ‘kb’ would be equivalent), but it is considered best practice to use the case of these units as prescribed by GNU.
- Some Cloud providers may not support byte-level granularity for storage size allocations. In those cases, these values could be treated as desired sizes and actual allocations would be based upon individual provider capabilities.

A.2.6.5 scalar-unit.time

A.2.6.5.1 Recognized Units

<table>
<thead>
<tr>
<th>Unit</th>
<th>Usage</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>d</td>
<td>time</td>
<td>days</td>
</tr>
<tr>
<td>h</td>
<td>time</td>
<td>hours</td>
</tr>
<tr>
<td>m</td>
<td>time</td>
<td>minutes</td>
</tr>
<tr>
<td>s</td>
<td>time</td>
<td>seconds</td>
</tr>
<tr>
<td>ms</td>
<td>time</td>
<td>milliseconds</td>
</tr>
<tr>
<td>us</td>
<td>time</td>
<td>microseconds</td>
</tr>
<tr>
<td>ns</td>
<td>time</td>
<td>nanoseconds</td>
</tr>
</tbody>
</table>

A.2.6.5.2 Examples

```yaml
# Response time in milliseconds
properties:
  response_time: 10 ms
```

A.2.6.5.3 Notes

- The unit values recognized by TOSCA Simple Profile for time-type units are based upon a subset of those defined by International System of Units whose recognized abbreviations are defined within the following reference:
- This document is a non-normative reference to this specification and intended for publications or grammars enabled for Latin characters which are not accessible in typical programming languages.
### A.2.6.6 scalar-unit.frequency

#### A.2.6.6.1 Recognized Units

<table>
<thead>
<tr>
<th>Unit</th>
<th>Usage</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hz</td>
<td>frequency</td>
<td>Hertz, or Hz. equals one cycle per second.</td>
</tr>
<tr>
<td>kHz</td>
<td>frequency</td>
<td>Kilo Hertz, or kHz, equals to 1,000 Hertz</td>
</tr>
<tr>
<td>MHz</td>
<td>frequency</td>
<td>Megahertz, or MHz, equals to 1,000,000 Hertz or 1,000 kHz</td>
</tr>
<tr>
<td>GHz</td>
<td>frequency</td>
<td>Gigahertz, or GHz, equals to 1,000,000,000 Hertz, or 1,000,000 kHz, or 1,000 MHz.</td>
</tr>
</tbody>
</table>

#### A.2.6.6.2 Examples

```yaml
# Processor raw clock rate
properties:
  clock_rate: 2.4 GHz
```

#### A.2.6.6.3 Notes

- The value for Hertz (Hz) is the International Standard Unit (ISU) as described by the Bureau International des Poids et Mesures (BIPM) in the "SI Brochure: The International System of Units (SI) [8th edition, 2006; updated in 2014]", http://www.bipm.org/en/publications/si-brochure/

### A.3 Normative values

#### A.3.1 Node States

As components (i.e., nodes) of TOSCA applications are deployed, instantiated and orchestrated over their lifecycle using normative lifecycle operations (see section C.6 for normative lifecycle definitions) it is important to define normative values for communicating the states of these components normatively between orchestration and workflow engines and any managers of these applications.

The following table provides the list of recognized node states for TOSCA Simple Profile that would be set by the orchestrator to describe a node instance’s state:

<table>
<thead>
<tr>
<th>Node State</th>
<th>Value</th>
<th>Transitional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>initial</td>
<td>no</td>
<td>Node is not yet created. Node only exists as a template definition.</td>
<td></td>
</tr>
<tr>
<td>creating</td>
<td>yes</td>
<td>Node is transitioning from initial state to created state.</td>
<td></td>
</tr>
<tr>
<td>created</td>
<td>no</td>
<td>Node software has been installed.</td>
<td></td>
</tr>
<tr>
<td>configuring</td>
<td>yes</td>
<td>Node is transitioning from created state to configured state.</td>
<td></td>
</tr>
<tr>
<td>configured</td>
<td>no</td>
<td>Node has been configured prior to being started.</td>
<td></td>
</tr>
</tbody>
</table>
### Node State

<table>
<thead>
<tr>
<th>Value</th>
<th>Transitional</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>starting</td>
<td>yes</td>
<td>Node is transitioning from <code>configured</code> state to <code>started</code> state.</td>
</tr>
<tr>
<td>started</td>
<td>no</td>
<td>Node is started.</td>
</tr>
<tr>
<td>stopping</td>
<td>yes</td>
<td>Node is transitioning from its current state to a <code>configured</code> state.</td>
</tr>
<tr>
<td>deleting</td>
<td>yes</td>
<td>Node is transitioning from its current state to one where it is deleted and its state is no longer tracked by the instance model.</td>
</tr>
<tr>
<td>error</td>
<td>no</td>
<td>Node is in an error state.</td>
</tr>
</tbody>
</table>

#### A.3.2 Directives

There are currently no directive values defined for this version of the TOSCA Simple Profile.

#### A.3.3 Network Name aliases

The following are recognized values that may be used as aliases to reference types of networks within an application model without knowing their actual name (or identifier) which may be assigned by the underlying Cloud platform at runtime.

<table>
<thead>
<tr>
<th>Alias value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRIVATE</td>
<td>An alias used to reference the first private network within a property or attribute of a Node or Capability which would be assigned to them by the underlying platform at runtime. A private network contains IP addresses and ports typically used to listen for incoming traffic to an application or service from the Intranet and not accessible to the public internet.</td>
</tr>
<tr>
<td>PUBLIC</td>
<td>An alias used to reference the first public network within a property or attribute of a Node or Capability which would be assigned to them by the underlying platform at runtime. A public network contains IP addresses and ports typically used to listen for incoming traffic to an application or service from the Internet.</td>
</tr>
</tbody>
</table>

#### A.3.3.1 Usage

These aliases would be used in the `tosca.capabilities.Endpoint` Capability type (and types derived from it) within the `network_name` field for template authors to use to indicate the type of network the Endpoint is supposed to be assigned an IP address from.

#### A.4 TOSCA Metamodel

This section defines all modelable entities that comprise the TOSCA Version 1.0 Simple Profile specification along with their keynames, grammar and requirements.

#### A.4.1 Required Keynames

The TOSCA metamodel includes complex types (e.g., Node Types, Relationship Types, Capability Types, Data Types, etc.) each of which include their own list of reserved keynames that are sometimes marked as `required`.
These types may be used to derive other types. These derived types (e.g., child types) do not have to provide
required keynames as long as they have been specified in the type they have been derived from (i.e., their parent
type).

A.5 Reusable modeling definitions

A.5.1 Description definition

This optional element provides a means include single or multiline descriptions within a TOSCA Simple Profile
template as a scalar string value.

A.5.1.1 Keyname

The following keyname is used to provide a description within the TOSCA Simple Profile specification:

```
description
```

A.5.1.2 Grammar

Description definitions have the following grammar:

```
description: <string>
```

A.5.1.3 Examples

Simple descriptions are treated as a single literal that includes the entire contents of the line that immediately
follows the `description` key:

```
description: This is an example of a single line description (no folding).
```

The YAML “folded” style may also be used for multi-line descriptions which “folds” line breaks as space
characters.

```
description: >
  This is an example of a multi-line description using YAML. It permits for line
  breaks for easier readability...
  
  if needed. However, (multiple) line breaks are folded into a single space
  character when processed into a single string value.
```

A.5.1.4 Notes

- Use of “folded” style is discouraged for the YAML string type apart from when used with the `description`
  keyname.

A.5.2 Constraint clause

A constraint clause defines an operation along with one or more compatible values that can be used to define a
constraint on a property or parameter’s allowed values when it is defined in a TOSCA Service Template or one of
its entities.
## A.5.2.1 Operator keynames

The following is the list of recognized operators (keynames) when defining constraint clauses:

<table>
<thead>
<tr>
<th>Operator</th>
<th>Type</th>
<th>Value Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>equal</td>
<td>scalar</td>
<td>any</td>
<td>Constrains a property or parameter to a value equal to ('=' the value declared.</td>
</tr>
<tr>
<td>greater_than</td>
<td>scalar</td>
<td>comparable</td>
<td>Constrains a property or parameter to a value greater than ('&gt;') the value declared.</td>
</tr>
<tr>
<td>greater_or_equal</td>
<td>scalar</td>
<td>comparable</td>
<td>Constrains a property or parameter to a value greater than or equal to ('&gt;=' the value declared.</td>
</tr>
<tr>
<td>less_than</td>
<td>scalar</td>
<td>comparable</td>
<td>Constrains a property or parameter to a value less than ('&lt;') the value declared.</td>
</tr>
<tr>
<td>less_or_equal</td>
<td>scalar</td>
<td>comparable</td>
<td>Constrains a property or parameter to a value less than or equal to ('&lt;=') the value declared.</td>
</tr>
<tr>
<td>in_range</td>
<td>dual scalar</td>
<td>comparable, range</td>
<td>Constrains a property or parameter to a value in range of (inclusive) the two values declared.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Note: subclasses or templates of types that declare a property with the in_range constraint MAY only further restrict the range specified by the parent type.</td>
</tr>
<tr>
<td>valid_values</td>
<td>list</td>
<td>any</td>
<td>Constrains a property or parameter to a value that is in the list of declared values.</td>
</tr>
<tr>
<td>length</td>
<td>scalar</td>
<td>string, list, map</td>
<td>Constrains the property or parameter to a value of a given length.</td>
</tr>
<tr>
<td>min_length</td>
<td>scalar</td>
<td>string, list, map</td>
<td>Constrains the property or parameter to a value to a minimum length.</td>
</tr>
<tr>
<td>max_length</td>
<td>scalar</td>
<td>string, list, map</td>
<td>Constrains the property or parameter to a value to a maximum length.</td>
</tr>
<tr>
<td>pattern</td>
<td>regex</td>
<td>string</td>
<td>Constrains the property or parameter to a value that is allowed by the provided regular expression.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Note: Future drafts of this specification will detail the use of regular expressions and reference an appropriate standardized grammar.</td>
</tr>
</tbody>
</table>

### A.5.2.1.1 Comparable value types

In the Value Type column above, an entry of “comparable” includes integer, float, timestamp, string, version, and scalar-unit types while an entry of “any” refers to any type allowed in the TOSCA simple profile in YAML.

### A.5.2.2 Additional Requirements

- If no operator is present for a simple scalar-value on a constraint clause, it SHALL be interpreted as being equivalent to having the “equal” operator provided; however, the “equal” operator may be used for clarity when expressing a constraint clause.

- The “length” operator SHALL be interpreted mean “size” for set types (i.e., list, map, etc.).

### A.5.2.3 Grammar

Constraint clauses have one of the following grammars:

```yaml
# Scalar grammar
<operator>: <scalar_value>

# Dual scalar grammar
```
<operator>: [ <scalar_value_1>, <scalar_value_2> ]

# List grammar
<operator> [ <value_1>, <value_2>, ..., <value_n> ]

# Regular expression (regex) grammar
pattern: <regular_expression_value>

In the above grammar, the pseudo values that appear in angle brackets have the following meaning:

- **operator**: represents a required operator from the specified list shown above (see section A.5.2.1 “Operator keynames”).
- **scalar_value, scalar_value_***: represents a required scalar (or atomic quantity) that can hold only one value at a time. This will be a value of a primitive type, such as an integer or string that is allowed by this specification.
- **value_***: represents a required value of the operator that is not limited to scalars.
- **regular_expression_value**: represents a regular expression (string) value.

**A.5.2.4 Examples**

Constraint clauses used on parameter or property definitions:

```yaml
# equal
equal: 2

# greater_than
greater_than: 1

# greater_or_equal
greater_or_equal: 2

# less_than
less_than: 5

# less_or_equal
less_or_equal: 4

# in_range
in_range: [ 1, 4 ]

# valid_values
valid_values: [ 1, 2, 4 ]

# specific length (in characters)
length: 32

# min_length (in characters)
```
A.5.2.5 Additional Requirements

- Values provided by the operands (i.e., values and scalar values) SHALL be type-compatible with their associated operations.
- Future drafts of this specification will detail the use of regular expressions and reference an appropriate standardized grammar.

A.5.3 Property Filter definition

A property filter definition defines criteria, using constraint clauses, for selection of a TOSCA entity based upon it property values.

A.5.3.1 Grammar

Property filter definitions have one of the following grammars:

A.5.3.1.1 Short notation:

The following single-line grammar may be used when only a single constraint is needed on a property:

```
<property_name>: <property_constraint_clause>
```

A.5.3.1.2 Extended notation:

The following multi-line grammar may be used when multiple constraints are needed on a property:

```
<property_name>:
  - <property_constraint_clause_1>
  - ...
  - <property_constraint_clause_n>
```

In the above grammars, the pseudo values that appear in angle brackets have the following meaning:

- `property_name`: represents the name of property that would be used to select a property definition with the same name (`property_name`) on a TOSCA entity (e.g., a Node Type, Node Template, Capability Type, etc.).
- `property_constraint_clause_*`: represents constraint clause(s) that would be used to filter entities based upon the named property’s value(s).

A.5.3.2 Additional Requirements

- Property constraint clauses must be type compatible with the property definitions (of the same name) as defined on the target TOSCA entity that the clause would be applied against.

A.5.4 Node Filter definition

A node filter definition defines criteria for selection of a TOSCA Node Template based upon the template’s property values, capabilities and capability properties.
### A.5.4.1 Keynames

The following is the list of recognized keynames recognized for a TOSCA node filter definition:

<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>properties</td>
<td>no</td>
<td>list of property filter definition</td>
<td>An optional sequenced list of property filters that would be used to select (filter) matching TOSCA entities (e.g., Node Template, Node Type, Capability Types, etc.) based upon their property definitions’ values.</td>
</tr>
<tr>
<td>capabilities</td>
<td>no</td>
<td>list of capability names or capability type names</td>
<td>An optional sequenced list of capability names or types that would be used to select (filter) matching TOSCA entities based upon their existence.</td>
</tr>
</tbody>
</table>

### A.5.4.2 Additional filtering on named Capability properties

Capabilities used as filters often have their own sets of properties which also can be used to construct a filter.

<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;capability name_or_type&gt; name&gt;</code>: properties</td>
<td>no</td>
<td>list of property filter definitions</td>
<td>An optional sequenced list of property filters that would be used to select (filter) matching TOSCA entities (e.g., Node Template, Node Type, Capability Types, etc.) based upon their capabilities’ property definitions’ values.</td>
</tr>
</tbody>
</table>

### A.5.4.3 Grammar

Node filter definitions have one of the following grammars:

```yaml
<filter_name>:
  properties:
    - <property_filter_def_1>
    - ...
    - <property_filter_def_n>
  capabilities:
    - <capability_name_or_type_1>:
      properties:
        - <cap_1_property_filter_def_1>
        - ...
        - <cap_m_property_filter_def_n>
    - ...
    - <capability_name_or_type_n>:
      properties:
        - <cap_1_property_filter_def_1>
        - ...
        - <cap_m_property_filter_def_n>
```

In the above grammar, the pseudo values that appear in angle brackets have the following meaning:
• property_filter_def_*: represents a property filter definition that would be used to select (filter) matching TOSCA entities (e.g., Node Template, Node Type, Capability Types, etc.) based upon their property definitions' values.

• property_constraint_clause_*: represents constraint clause(s) that would be used to filter entities based upon property values.

• capability_name_or_type_*: represents the type or name of a capability that would be used to select (filter) matching TOSCA entities based upon their existence.

• cap_*_property_def_*: represents a property filter definition that would be used to select (filter) matching TOSCA entities (e.g., Node Template, Node Type, Capability Types, etc.) based upon their capabilities' property definitions' values.

A.5.4.4 Additional requirements

• TOSCA orchestrators SHALL search for matching capabilities listed on a target filter by assuming the capability name is first a symbolic name and secondly it is a type name (in order to avoid namespace collisions).

A.5.4.5 Example

The following example is a filter that would be used to select a TOSCA Compute node based upon the values of its defined capabilities. Specifically, this filter would select Compute nodes that supported a specific range of CPUs (i.e., num_cpus value between 1 and 4) and memory size (i.e., mem_size of 2 or greater) from its declared "host" capability. In this example, the author also wants the Compute node to support an encryption capability of type mytypes.capabilities.compute.encryption which has properties that support a specific (AES) encryption algorithm and keylength (128).

```yaml
my_node_template:
  # other details omitted for brevity
  requirements:
    - host:
      node_filter:
        capabilities:
          # My "host" Compute node needs these properties:
          - host:
            properties:
              - num_cpus: { in_range: [ 1, 4 ] }
              - mem_size: { greater_or_equal: 2 MB }
            # and should also support this type of encryption and properties:
            - mytypes.capabilities.compute.encryption:
              properties:
                - algorithm: { equal: aes }
                - keylength: { valid_values: [ 128, 256 ] }
```

A.5.5 Artifact definition

An artifact definition defines a named, typed file that can be associated with Node Type or Node Template and used by orchestration engine to facilitate deployment and implementation of interface operations.
A.5.5.1 Keynames

The following is the list of recognized keynames recognized for a TOSCA artifact definition:

<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>yes</td>
<td>string</td>
<td>The required artifact type for the artifact definition.</td>
</tr>
<tr>
<td>implementation</td>
<td>no</td>
<td>string</td>
<td>The optional URI string (relative or absolute) which can be used to locate the artifact's file.</td>
</tr>
<tr>
<td>repository</td>
<td>no</td>
<td>string</td>
<td>The optional name of the repository definition which contains the location of the external repository that contains the artifact. The artifact is expected to be referenceable by its implementation URI within the repository.</td>
</tr>
<tr>
<td>description</td>
<td>no</td>
<td>description</td>
<td>The optional description for the artifact definition.</td>
</tr>
<tr>
<td>deploy_path</td>
<td>no</td>
<td>string</td>
<td>The file path the associated file would be deployed into within the target node's container.</td>
</tr>
</tbody>
</table>

A.5.5.2 Grammar

Artifact definitions have one of the following grammars:

A.5.5.2.1 Short notation

The following single-line grammar may be used when the artifact’s type and mime type can be inferred from the file URI:

```
<artifact_name>: <artifact_file_URI>
```

A.5.5.2.2 Extended notation:

The following multi-line grammar may be used when the artifact’s definition’s type and mime type need to be explicitly declared:

```
<artifact_name>:
   description: <artifact_description>
   type: <artifact_type_name>
   implementation: <artifact_file_URI>
   deploy_path: <file_deployment_path>
```

In the above grammars, the pseudo values that appear in angle brackets have the following meaning:

- **artifact_name**: represents the required symbolic name of the artifact as a string.
- **artifact_description**: represents the optional description for the artifact.
- **artifact_type_name**: represents the required artifact type the artifact definition is based upon.
- **artifact_file_URI**: represents the required URI string (relative or absolute) which can be used to locate the artifact's file.
- **file_deployment_path**: represents the optional path the artifact_file_URI would be copied into within the target node's container.

A.5.5.3 Example

The following represents an artifact definition:
A.5.6 Repository definition

A repository definition defines a named external repository which contains deployment and implementation artifacts that are referenced within the TOSCA Service Template.

A.5.6.1 Keynames

The following is the list of recognized keynames recognized for a TOSCA repository definition:

<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>no</td>
<td>description</td>
<td>None</td>
<td>The optional description for the repository.</td>
</tr>
<tr>
<td>url</td>
<td>yes</td>
<td>string</td>
<td>None</td>
<td>The required URL or network address used to access the repository.</td>
</tr>
<tr>
<td>credential</td>
<td>no</td>
<td>Credential</td>
<td>None</td>
<td>The optional Credential used to authorize access to the repository.</td>
</tr>
</tbody>
</table>

A.5.6.2 Grammar

Repository definitions have one the following grammars:

A.5.6.2.1 Single-line grammar (no credential):

```
<repository_name>: <repository_address>
```

A.5.6.2.2 Multi-line grammar

```
<repository_name>:
  description: <repository_description>
  url: <repository_address>
  credential: <authorization_credential>
```

In the above grammar, the pseudo values that appear in angle brackets have the following meaning:

- **repository_name**: represents the required symbolic name of the repository as a string.
- **repository_description**: contains an optional description of the repository.
- **repository_address**: represents the required URL of the repository as a string.
- **authorization_credential**: represents the optional credentials (e.g., user ID and password) used to authorize access to the repository.

A.5.6.3 Additional Requirements

- None

A.5.6.4 Example

The following represents a repository definition:

```
repositories:
  my_code_repo:
    description: My project’s code repository in GitHub
```
A.5.7 Property definition

A property definition defines a named, typed value and related data that can be associated with an entity defined in this specification (e.g., Node Types, Relationship Types, Capability Types, etc.). Properties are used by template authors to provide input values to TOSCA entities which indicate their “desired state” when they are instantiated. The value of a property can be retrieved using the get_property function within TOSCA Service Templates.

A.5.7.1 Attribute and Property reflection

The actual state of the entity, at any point in its lifecycle once instantiated, is reflected by Attribute definitions. TOSCA orchestrators automatically create an attribute for every declared property (with the same symbolic name) to allow introspection of both the desired state (property) and actual state (attribute).

A.5.7.2 Keynames

The following is the list of recognized keynames recognized for a TOSCA property definition:

<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>yes</td>
<td>string</td>
<td>None</td>
<td>The required data type for the property.</td>
</tr>
<tr>
<td>description</td>
<td>no</td>
<td>description</td>
<td>None</td>
<td>The optional description for the property.</td>
</tr>
<tr>
<td>required</td>
<td>no</td>
<td>boolean</td>
<td>default: true</td>
<td>An optional key that declares a property as required (true) or not (false).</td>
</tr>
<tr>
<td>default</td>
<td>no</td>
<td>&lt;any&gt;</td>
<td>None</td>
<td>An optional key that may provide a value to be used as a default if not provided by another means.</td>
</tr>
<tr>
<td>status</td>
<td>no</td>
<td>string</td>
<td>default: supported</td>
<td>The optional status of the property relative to the specification or implementation. See table below for valid values.</td>
</tr>
<tr>
<td>constraints</td>
<td>no</td>
<td>list of</td>
<td>None</td>
<td>The optional list of sequenced constraint clauses for the property.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>constraint clauses</td>
<td></td>
<td></td>
</tr>
<tr>
<td>entry_schema</td>
<td>no</td>
<td>string</td>
<td>None</td>
<td>The optional key that is used to declare the name of the Datatype definition for entries of set types such as the TOSCA list or map.</td>
</tr>
</tbody>
</table>

A.5.7.3 Status values

The following property status values are supported:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>supported</td>
<td>Indicates the property is supported. This is the default value for all property definitions.</td>
</tr>
<tr>
<td>unsupported</td>
<td>Indicates the property is not supported.</td>
</tr>
<tr>
<td>experimental</td>
<td>Indicates the property is experimental and has no official standing.</td>
</tr>
<tr>
<td>deprecated</td>
<td>Indicates the property has been deprecated by a new specification version.</td>
</tr>
</tbody>
</table>

A.5.7.4 Grammar

Named property definitions have the following grammar:

<property_name>:
In the above grammar, the pseudo values that appear in angle brackets have the following meaning:

- **property_name**: represents the required symbolic name of the property as a string.
- **property_description**: represents the optional description of the property.
- **property_type**: represents the required data type of the property.
- **property_required**: represents an optional boolean value (true or false) indicating whether or not the property is required. If this keyname is not present on a property definition, then the property SHALL be considered required (i.e., true) by default.
- **default_value**: contains a type-compatible value that may be used as a default if not provided by another means.
- **status_value**: a string that contains a keyword that indicates the status of the property relative to the specification or implementation.
- **property_constraints**: represents the optional sequenced list of one or more constraint clauses on the property definition.
- **entry_description**: represents the optional description of the entry schema.
- **entry_type**: represents the required type name for entries in a list or map property type.
- **entry_constraints**: represents the optional sequenced list of one or more constraint clauses on entries in a list or map property type.

### A.5.7.5 Additional Requirements

- Implementations of the TOSCA Simple Profile SHALL automatically reflect (i.e., make available) any property defined on an entity as an attribute of the entity with the same name as the property.
- A property SHALL be considered required by default (i.e., as if the required keyname on the definition is set to true) unless the definition’s required keyname is explicitly set to false.
- The value provided on a property definition’s default keyname SHALL be type compatible with the type declared on the definition’s type keyname.
- Constraints of a property definition SHALL be type-compatible with the type defined for that definition.

### A.5.7.6 Notes

- This element directly maps to the PropertiesDefinition element defined as part of the schema for most type and entities defined in the TOSCA v1.0 specification.
- In the TOSCA v1.0 specification constraints are expressed in the XML Schema definitions of Node Type properties referenced in the PropertiesDefinition element of NodeType definitions.
A.5.7.7 Example

The following represents an example of a property definition with constraints:

```yaml
num_cpus:
  type: integer
  description: Number of CPUs requested for a software node instance.
  default: 1
  required: true
  constraints:
    - valid_values: [ 1, 2, 4, 8 ]
```

A.5.8 Property assignment

This section defines the grammar for assigning values to named properties within TOSCA Node and Relationship templates which are defined in their corresponding named types.

A.5.8.1 Keynames

The TOSCA property assignment has no keynames.

A.5.8.2 Grammar

Property assignments have the following grammar:

A.5.8.2.1 Short notation:

The following single-line grammar may be used when a simple value assignment is needed:

```yaml
<property_name>: <property_value> | { <property_value_expression> }
```

In the above grammars, the pseudo values that appear in angle brackets have the following meaning:

- **property_name**: represents the name of a property that would be used to select a property definition with the same name within on a TOSCA entity (e.g., Node Template, Relationship Template, etc.) which is declared in its declared type (e.g., a Node Type, Node Template, Capability Type, etc.).

- **property_value**, **property_value_expression**: represent the type-compatible value to assign to the named property. Property values may be provided as the result from the evaluation of an expression or a function.

A.5.9 Attribute definition

An attribute definition defines a named, typed value that can be associated with an entity defined in this specification (e.g., a Node, Relationship or Capability Type). Specifically, it is used to expose the “actual state” of some property of a TOSCA entity after it has been deployed and instantiated (as set by the TOSCA orchestrator).

Attribute values can be retrieved via the `get_attribute` function from the instance model and used as values to other entities within TOSCA Service Templates.

A.5.9.1.1 Attribute and Property reflection

TOSCA orchestrators automatically create Attribute definitions for any Property definitions declared on the same TOSCA entity (e.g., nodes, node capabilities and relationships) in order to make accessible the actual (i.e., the current state) value from the running instance of the entity.
A.5.9.2 Keynames

The following is the list of recognized keynames recognized for a TOSCA attribute definition:

<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>yes</td>
<td>string</td>
<td>None</td>
<td>The required data type for the attribute.</td>
</tr>
<tr>
<td>description</td>
<td>no</td>
<td>description</td>
<td>None</td>
<td>The optional description for the attribute.</td>
</tr>
<tr>
<td>default</td>
<td>no</td>
<td>&lt;any&gt;</td>
<td>None</td>
<td>An optional key that may provide a value to be used as a default if not provided by another means.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>This value SHALL be type compatible with the type declared by the property definition’s type keyname.</td>
</tr>
<tr>
<td>status</td>
<td>no</td>
<td>string</td>
<td>default: supported</td>
<td>The optional status of the attribute relative to the specification or implementation. See supported status values defined under the Property definition section.</td>
</tr>
<tr>
<td>entry_schema</td>
<td>no</td>
<td>string</td>
<td>None</td>
<td>The optional key that is used to declare the name of the Datatype definition for entries of set types such as the TOSCA list or map.</td>
</tr>
</tbody>
</table>

A.5.9.3 Grammar

Attribute definitions have the following grammar:

```markdown
<attribute_name>:
  type: <attribute_type>
  description: <attribute_description>
  default: <default_value>
  status: <status_value>
```

In the above grammar, the pseudo values that appear in angle brackets have the following meaning:

- **attribute_name**: represents the required symbolic name of the attribute as a **string**.
- **attribute_type**: represents the required data type of the attribute.
- **attribute_description**: represents the optional **description** of the attribute.
- **default_value**: contains a type-compatible value that may be used as a default if not provided by another means.
- **status_value**: contains a value indicating the attribute’s status relative to the specification version (e.g., supported, deprecated, etc.). Supported status values for this keyname are defined under Property definition.

A.5.9.4 Additional Requirements

- In addition to any explicitly defined attributes on a TOSCA entity (e.g., Node Type, RelationshipType, etc.), implementations of the TOSCA Simple Profile **MUST** automatically reflect (i.e., make available) any property defined on an entity as an attribute of the entity with the same name as the property.
- Values for the default keyname **MUST** be derived or calculated from other attribute or operation output values (that reflect the actual state of the instance of the corresponding resource) and not hard-coded or derived from a property settings or inputs (i.e., desired state).

A.5.9.5 Notes

- Attribute definitions are very similar to Property definitions; however, properties of entities reflect an input that carries the template author’s requested or desired value (i.e., desired state) which the
orchestrator (attempts to) use when instantiating the entity whereas attributes reflect the actual value (i.e., actual state) that provides the actual instantiated value.

- For example, a property can be used to request the IP address of a node using a property setting; however, the actual IP address after the node is instantiated may by different and made available by an attribute.

A.5.9.6 Example

The following represents a required attribute definition:

```
actual_cpus:
  type: integer
  description: Actual number of CPUs allocated to the node instance.
```

A.5.10 Attribute assignment

This section defines the grammar for assigning values to named attributes within TOSCA Node and Relationship templates which are defined in their corresponding named types.

A.5.10.1 Keynames

The TOSCA attribute assignment has no keynames.

A.5.10.2 Grammar

Attribute assignments have the following grammar:

A.5.10.2.1 Short notation:

The following single-line grammar may be used when a simple value assignment is needed:

```
<attribute_name>: <attribute_value> | { <attribute_value_expression> }
```

A.5.10.2.2 Extended notation:

The following multi-line grammar may be used when a value assignment requires keys in addition to a simple value assignment:

```
<attribute_name>:
  description: <attribute_description>
  value: <attribute_value> | { <attribute_value_expression> }
```

In the above grammars, the pseudo values that appear in angle brackets have the following meaning:

- attribute_name: represents the name of an attribute that would be used to select an attribute definition with the same name within on a TOSCA entity (e.g., Node Template, Relationship Template, etc.) which is declared (or reflected from a Property definition) in its declared type (e.g., a Node Type, Node Template, Capability Type, etc.).
- attribute_value, attribute_value_expressions: represent the type-compatible value to assign to the named attribute. Attribute values may be provided as the result from the evaluation of an expression or a function.
- attribute_description: represents the optional description of the attribute.
A.5.10.3 Additional requirements

- Attribute values **MAY** be provided by the underlying implementation at runtime when requested by the `get_attribute` function or it **MAY** be provided through the evaluation of expressions and/or functions that derive the values from other TOSCA attributes (also at runtime).

A.5.11 Operation definition

An operation definition defines a named function or procedure that can be bound to an implementation artifact (e.g., a script).

A.5.11.1 Keynames

The following is the list of recognized keynames recognized for a TOSCA operation definition:

<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>no</td>
<td>description</td>
<td>The optional description string for the associated named operation.</td>
</tr>
<tr>
<td>implementation</td>
<td>no</td>
<td>string</td>
<td>The optional implementation artifact name (e.g., a script file name within a TOSCA CSAR file).</td>
</tr>
<tr>
<td>inputs</td>
<td>no</td>
<td>list of property definitions</td>
<td>The optional list of input properties definitions (i.e., parameter definitions) for operation definitions that are within TOSCA Node or Relationship Type definitions. This includes when operation definitions are included as part of a Requirement definition in a Node Type.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>list of property assignments</td>
<td>The optional list of input property assignments (i.e., parameters assignments) for operation definitions that are within TOSCA Node or Relationship Template definitions. This includes when operation definitions are included as part of a Requirement assignment in a Node Template.</td>
</tr>
</tbody>
</table>

The following is the list of recognized keynames to be used with the `implementation` keyname within a TOSCA operation definition:

<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>primary</td>
<td>no</td>
<td>string</td>
<td>The optional implementation artifact name (e.g., the primary script file name within a TOSCA CSAR file).</td>
</tr>
<tr>
<td>dependencies</td>
<td>no</td>
<td>list of string</td>
<td>The optional list of one or more dependent or secondary implementation artifact name which are referenced by the primary implementation artifact (e.g., a library the script installs or a secondary script).</td>
</tr>
</tbody>
</table>

A.5.11.2 Grammar

Operation definitions have the following grammars:

A.5.11.2.1 Short notation

The following single-line grammar may be used when only an operation’s implementation artifact is needed:

```
<operation_name>: <implementation_artifact_name>
```

A.5.11.2.2 Extended notation for use in Type definitions

The following multi-line grammar may be used in Node or Relationship Type definitions when additional information about the operation is needed:
A.5.11.2.3 Extended notation for use in Template definitions

The following multi-line grammar may be used in Node or Relationship Template definitions when additional information about the operation is needed:

```
<operation_name>:
    description: <operation_description>
    implementation: <implementation_artifact_name>
    inputs:
        <property_definitions>
```

In the above grammars, the pseudo values that appear in angle brackets have the following meaning:

- **operation_name**: represents the required symbolic name of the operation as a string.
- **operation_description**: represents the optional description string for the corresponding operation name.
- **implementation_artifact_name**: represents the optional name (string) of an implementation artifact definition (defined elsewhere), or the direct name of an implementation artifact’s relative filename (e.g., a service template-relative, path-inclusive filename or absolute file location using a URL).
- **property_definitions**: represents the optional list of property definitions which the TOSCA orchestrator would make available (i.e., or pass) to the corresponding implementation artifact during its execution.
- **property_assignments**: represents the optional list of property assignments for passing parameters to Node or Relationship Template operations providing values for properties defined in their respective type definitions.
- **list_of_dependent_artifact_names**: represents the optional list of one or more dependent or secondary implementation artifact name which are referenced by the primary implementation artifact.

A.5.11.3 Additional requirements

- The default sub-classing behavior for implementations of operations SHALL be override. That is, implementation artifacts assigned in subclasses override any defined in its parent class.
- Template authors may provide property assignments on operation inputs on templates that do not necessarily have a property definition defined in its corresponding type.
- Implementation artifact file names (e.g., script filenames) may include file directory path names that are relative to the TOSCA service template file itself when packaged within a TOSCA Cloud Service ARchive (CSAR) file.
A.5.11.4 Examples

A.5.11.4.1 Single-line implementation example

interfaces:
  Standard:
  start:
  implementation:
    primary: scripts/start_server.sh

A.5.11.4.2 Multi-line implementation example

interfaces:
  Configure:
  pre_configure_source:
  implementation:
    primary: scripts/pre_configure_source.sh
  dependencies:
    scripts/setup.sh
    binaries/library.rpm
    scripts/register.py

A.5.12 Interface definition

An interface definition defines a named interface that can be associated with a Node or Relationship Type

A.5.12.1 Keynames

The following is the list of recognized keynames recognized for a TOSCA interface definition:

<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inputs</td>
<td>no</td>
<td>list of property definitions</td>
<td>The optional list of input property definitions available to all defined operations for interface definitions that are within TOSCA Node or Relationship Type definitions. This includes when interface definitions are included as part of a Requirement definition in a Node Type.</td>
</tr>
<tr>
<td></td>
<td>no</td>
<td>list of property assignments</td>
<td>The optional list of input property assignments (i.e., parameters assignments) for interface definitions that are within TOSCA Node or Relationship Template definitions. This includes when interface definitions are referenced as part of a Requirement assignment in a Node Template.</td>
</tr>
</tbody>
</table>

A.5.12.2 Grammar

Interface definitions have the following grammar:

A.5.12.2.1 Extended notation for use in Type definitions

The following multi-line grammar may be used in Node or Relationship Type definitions:

```
<interface_definition_name>:
  type: <interface_type_name>
```
A.5.12.2.2 Extended notation for use in Template definitions

The following multi-line grammar may be used in Node or Relationship Type definitions:

```
<interface_definition_name>:
  inputs:
    <property_assignments>
    <operation_definitions>
```

In the above grammars, the pseudo values that appear in angle brackets have the following meaning:

- `interface_definition_name`: represents the required symbolic name of the interface as a string.
- `interface_type_name`: represents the required name of the Interface Type for the interface definition.
- `property definitions`: represents the optional list of property definitions (i.e., parameters) which the TOSCA orchestrator would make available (i.e., or pass) to all defined operations.
  
  - This means these properties and their values would be accessible to the implementation artifacts (e.g., scripts) associated to each operation during their execution.
- `property assignments`: represents the optional list of property assignments for passing parameters to Node or Relationship Template operations providing values for properties defined in their respective type definitions.
- `operation definitions`: represents the required name of one or more operation definitions.

A.6 Type-specific definitions

A.6.1 Capability definition

A capability definition defines a named, typed set of data that can be associated with Node Type or Node Template to describe a transparent capability or feature of the software component the node describes.

A.6.1.1 Keynames

The following is the list of recognized keynames for a TOSCA capability definition:

<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>yes</td>
<td>string</td>
<td>N/A</td>
<td>The required name of the Capability Type the capability definition is based upon.</td>
</tr>
<tr>
<td>description</td>
<td>no</td>
<td>description</td>
<td>N/A</td>
<td>The optional description of the Capability definition.</td>
</tr>
<tr>
<td>properties</td>
<td>no</td>
<td>list of property definitions</td>
<td>N/A</td>
<td>An optional list of property definitions for the Capability definition.</td>
</tr>
<tr>
<td>attributes</td>
<td>no</td>
<td>list of attribute definitions</td>
<td>N/A</td>
<td>An optional list of attribute definitions for the Capability definition.</td>
</tr>
</tbody>
</table>
### A.6.1.2 Grammar

Capability definitions have one of the following grammars:

#### A.6.1.2.1 Short notation

The following grammar may be used when only a list of capability definition names needs to be declared:

```
<capability_definition_name>: <capability_type>
```

#### A.6.1.2.2 Extended notation

The following multi-line grammar may be used when additional information on the capability definition is needed:

```
<capability_definition_name>:
  type: <capability_type>
  description: <capability_description>
  properties: 
    <property_definitions>
  attributes: 
    <attribute_definitions>
  valid_source_types: [ <node_type_names> ]
```

In the above grammars, the pseudo values that appear in angle brackets have the following meaning:

- **capability_definition_name**: represents the symbolic name of the capability as a string.
- **capability_type**: represents the required name of a capability type the capability definition is based upon.
- **capability_description**: represents the optional description of the capability definition.
- **property_definitions**: represents the optional list of property definitions for the capability definition.
- **attribute_definitions**: represents the optional list of attribute definitions for the capability definition.
- **node_type_names**: represents the optional list of one or more names of Node Types that the Capability definition supports as valid sources for a successful relationship to be established to itself.

### A.6.1.3 Examples

The following examples show capability definitions in both simple and full forms:
A.6.1.3.1 Simple notation example

```
# Simple notation, no properties defined or augmented
some_capability: mytypes.mycapabilities.MyCapabilityTypeName
```

A.6.1.3.2 Full notation example

```
# Full notation, augmenting properties of the referenced capability type
some_capability:
    type: mytypes.mycapabilities.MyCapabilityTypeName
    properties:
        limit:
            type: integer
            default: 100
```

A.6.1.4 Additional requirements

- Any Node Type (names) provides as values for the `valid_source_types` keyname SHALL be type-compatible (i.e., derived from the same parent Node Type) with any Node Types defined using the same keyname in the parent Capability Type.
- Capability symbolic names SHALL be unique; it is an error if a capability name is found to occur more than once.

A.6.1.5 Notes

- The Capability Type, in this example `MyCapabilityTypeName`, would be defined elsewhere and have an integer property named `limit`.
- This definition directly maps to the `CapabilitiesDefinition` of the Node Type entity as defined in the TOSCA v1.0 specification.

A.6.2 Requirement definition

The Requirement definition describes a named requirement (dependencies) of a TOSCA Node Type or Node template which needs to be fulfilled by a matching Capability definition declared by another TOSCA modelable entity. The requirement definition may itself include the specific name of the fulfilling entity (explicitly) or provide an abstract type, along with additional filtering characteristics, that a TOSCA orchestrator can use to fulfill the capability at runtime (implicitly).

A.6.2.1 Keynames

The following is the list of recognized keynames for a TOSCA requirement definition:

<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capability</td>
<td>yes</td>
<td>string</td>
<td>N/A</td>
<td>The required reserved keyname used that can be used to provide the name of a valid Capability Type that can fulfil the requirement.</td>
</tr>
<tr>
<td>node</td>
<td>no</td>
<td>string</td>
<td>N/A</td>
<td>The optional reserved keyname used to provide the name of a valid Node Type that contains the capability definition that can be used to fulfil the requirement.</td>
</tr>
<tr>
<td>relationship</td>
<td>no</td>
<td>string</td>
<td>N/A</td>
<td>The optional reserved keyname used to provide the name of a valid Relationship Type to construct when fulfilling the requirement.</td>
</tr>
</tbody>
</table>
### A.6.2.1.1 Additional Keynames for multi-line relationship grammar

The Requirement definition contains the Relationship Type information needed by TOSCA Orchestrators to construct relationships to other TOSCA nodes with matching capabilities; however, it is sometimes recognized that additional properties may need to be passed to the relationship (perhaps for configuration). In these cases, additional grammar is provided so that the Node Type may declare additional Property definitions to be used as inputs to the Relationship Type’s declared interfaces (or specific operations of those interfaces).

<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>occurrences</td>
<td>no</td>
<td>range of integer</td>
<td>implied default of [1,1]</td>
<td>The optional minimum and maximum occurrences for the requirement. Note: the keyword UNBOUNDED is also supported to represent any positive integer.</td>
</tr>
</tbody>
</table>

#### A.6.2.2 Grammar

Requirement definitions have one of the following grammars:

##### A.6.2.2.1 Simple grammar (Capability Type only)

```
<requirement_name>: <capability_type_name>
```

##### A.6.2.2.2 Extended grammar (with Node and Relationship Types)

```
<requirement_name>:
  capability: <capability_type_name>
  node: <node_type_name>
  relationship: <relationship_type_name>
  occurrences: [ <min_occurrences>, <max_occurrences> ]
```

##### A.6.2.2.3 Extended grammar for declaring Property Definitions on the relationship's Interfaces

The following additional multi-line grammar is provided for the relationship keyname in order to declare new Property definitions for inputs of known Interface definitions of the declared Relationship Type.

```
<requirement_name>:
  # Other keynames omitted for brevity
  relationship:
    type: <relationship_type_name>
    interfaces:
      <interface_definitions>
```
In the above grammars, the pseudo values that appear in angle brackets have the following meaning:

- **requirement_name**: represents the required symbolic name of the requirement definition as a string.
- **capability_type_name**: represents the required name of a Capability type that can be used to fulfil the requirement.
- **node_type_name**: represents the optional name of a TOSCA Node Type that contains the Capability Type definition the requirement can be fulfilled by.
- **relationship_type_name**: represents the optional name of a Relationship Type to be used to construct a relationship between this requirement definition (i.e., in the source node) to a matching capability definition (in a target node).
- **min_occurrences, max_occurrences**: represents the optional minimum and maximum occurrences of the requirement (i.e., its cardinality).
- **interface_definitions**: represents one or more already declared interfaces in the Relationship Type (as declared on the type keyname) allowing for the declaration of new Property definition for these interfaces or for specific Operation definitions of these interfaces.

### A.6.2.3 Additional Requirements

- Requirement symbolic names SHALL be unique; it is an error if a requirement name is found to occur more than once.
- If the occurrences keyname is not present, then the occurrence of the requirement SHALL be one and only one; that is a default declaration as follows would be assumed:
  
  ```plaintext
  occurrences: [1,1]
  ```

### A.6.2.4 Notes

- This element directly maps to the RequirementsDefinition of the Node Type entity as defined in the TOSCA v1.0 specification.
- The requirement symbolic name is used for identification of the requirement definition only and not relied upon for establishing any relationships in the topology.

### A.6.2.5 Requirement Type definition is a tuple

A requirement definition allows type designers to govern which types are allowed (valid) for fulfillment using three levels of specificity with only the Capability Type being required.

1. Node Type (optional)
2. Relationship Type (optional)
3. Capability Type (required)

The first level allows selection, as shown in both the simple or complex grammar, simply providing the node’s type using the node keyname. The second level allows specification of the relationship type to use when connecting the requirement to the capability using the relationship keyname. Finally, the specific named capability type on the target node is provided using the capability keyname.

#### A.6.2.5.1 Property filter

In addition to the node, relationship and capability types, a filter, with the keyname node_filter, may be provided to constrain the allowed set of potential target nodes based upon their properties and their capabilities’ properties. This allows TOSCA orchestrators to help find the “best fit” when selecting among multiple potential target nodes for the expressed requirements.
A.6.3 Artifact Type

An Artifact Type is a reusable entity that defines the type of one or more files which Node Types or Node Templates can have dependent relationships and used during operations such as during installation or deployment.

A.6.3.1 Keynames

The following is the list of recognized keynames for a TOSCA Artifact Type definition:

<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>derived_from</td>
<td>no</td>
<td>string</td>
<td>An optional parent Artifact Type name the Artifact Type derives from.</td>
</tr>
<tr>
<td>description</td>
<td>no</td>
<td>description</td>
<td>An optional description for the Artifact Type.</td>
</tr>
<tr>
<td>mime_type</td>
<td>no</td>
<td>string</td>
<td>The required mime type property for the Artifact Type.</td>
</tr>
<tr>
<td>file_ext</td>
<td>no</td>
<td>string[]</td>
<td>The required file extension property for the Artifact Type.</td>
</tr>
<tr>
<td>properties</td>
<td>no</td>
<td>list of property definitions</td>
<td>An optional list of property definitions for the Artifact Type.</td>
</tr>
</tbody>
</table>

A.6.3.2 Grammar

Artifact Types have following grammar:

```
<artifact_type_name>:
  derived_from: <parent_artifact_type_name>
  description: <artifact_description>
  mime_type: <mime_type_string>
  file_ext: [ <file_extensions> ]
  properties:
    <property_definitions>
```

In the above grammar, the pseudo values that appear in angle brackets have the following meaning:

- **artifact_type_name**: represents the name of the Artifact Type being declared as a string.
- **parent_artifact_type_name**: represents the name of the Artifact Type this Artifact Type definition derives from (i.e., its “parent” type).
- **artifact_description**: represents the optional description string for the Artifact Type.
- **mime_type_string**: represents the optional Multipurpose Internet Mail Extensions (MIME) standard string value that describes the file contents for this type of Artifact Type as a string.
- **file_extensions**: represents the optional list of one or more recognized file extensions for this type of artifact type as strings.
- **property_definitions**: represents the optional list of property definitions for the artifact type.

A.6.3.3 Examples

```
my_artifact_type:
  description: Java Archive artifact type
  derived_from: tosca.artifact.Root
  mime_type: application/java-archive
```
A.6.4 Interface Type

An Interface Type is a reusable entity that describes a set of operations that can be used to interact with or manage a node or relationship in a TOSCA topology.

A.6.4.1 Keynames

The following is the list of recognized keynames for a TOSCA Interface Type definition:

<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inputs</td>
<td>no</td>
<td>list of property definitions</td>
<td>The optional list of input parameter definitions.</td>
</tr>
</tbody>
</table>

A.6.4.2 Grammar

Interface Types have following grammar:

```
<interior_type_name>:
  inputs:
    <property_definitions>
  <operation_definitions>
```

In the above grammar, the pseudo values that appear in angle brackets have the following meaning:

- **interface_type_name**: represents the required name of the interface as a string.
- **property_definitions**: represents the optional list of property definitions (i.e., parameters) which the TOSCA orchestrator would make available (i.e., or pass) to all implementation artifacts for operations declared on the interface during their execution.
- **operation_definitions**: represents the required list of one or more operation definitions.

A.6.4.3 Example

The following example shows a custom interface used to define multiple configure operations.

```yaml
mycompany.mytypes.myinterfaces.MyConfigure:
  inputs:
    mode:
      type: string
    pre_configure_service:
      description: pre-configure operation for my service
    post_configure_service:
      description: post-configure operation for my service
```

A.6.4.4 Additional Requirements

- Interface Types MUST NOT include any implementations for defined operations; that is, the implementation keyname is invalid.
A.6.4.5 Notes

- The TOSCA Simple Profile specification does not yet provide a means to derive or extend an Interface Type from another Interface Type.

A.6.5 Data Type

A Data Type definition defines the schema for new named datatypes in TOSCA.

A.6.5.1 Keynames

The following is the list of recognized keynames for a TOSCA Data Type definition:

<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>derived_from</td>
<td>no</td>
<td>string</td>
<td>The optional key used when a datatype is derived from an existing TOSCA Data Type.</td>
</tr>
<tr>
<td>description</td>
<td>no</td>
<td>description</td>
<td>The optional description for the Data Type.</td>
</tr>
<tr>
<td>constraints</td>
<td>no</td>
<td>list of constraint clauses</td>
<td>The optional list of sequenced constraint clauses for the Data Type.</td>
</tr>
<tr>
<td>properties</td>
<td>no</td>
<td>list of property definitions</td>
<td>The optional list property definitions that comprise the schema for a complex Data Type in TOSCA.</td>
</tr>
</tbody>
</table>

A.6.5.2 Grammar

Data Types have the following grammar:

```yaml
data_type_name:
  derived_from: <existing_type_name>
  description: <datatype_description>
  constraints:
    - <type_constraints>
  properties:
    <property_definitions>
```

In the above grammar, the pseudo values that appear in angle brackets have the following meaning:

- **data_type_name**: represents the required symbolic name of the datatype as a string.
- **datatype_description**: represents the optional description for the datatype.
- **existing_type_name**: represents the optional name of a valid TOSCA type this new datatype would derive from.
- **type_constraints**: represents the optional sequenced list of one or more type-compatible constraint clauses that restrict the datatype.
- **property_definitions**: represents the optional list of one or more property definitions that provide the schema for the datatype.

A.6.5.3 Additional Requirements

- A valid datatype definition **MUST** have either a valid derived_from declaration or at least one valid property definition.
- Any constraint clauses **SHALL** be type-compatible with the type declared by the derived_from keyname.
• If a `properties` keyname is provided, it **SHALL** contain one or more valid property definitions.

### A.6.5.4 Examples

The following example represents a datatype definition based upon an existing string type:

#### A.6.5.4.1 Defining a complex datatype

```yaml
# define a new complex datatype
mytypes.phonenumber:
  description: my phone number datatype
  properties:
    countrycode:
      type: integer
    areacode:
      type: integer
    number:
      type: integer
```

#### A.6.5.4.2 Defining a datatype derived from an existing datatype

```yaml
# define a new datatype that derives from existing type and extends it
mytypes.phonenumber.extended:
  derived_from: mytypes.phonenumber
  description: custom phone number type that extends the basic phonenumber type
  properties:
    phone_description:
      type: string
    constraints:
      - max_length: 128
```

### A.6.6 Capability Type

A Capability Type is a reusable entity that describes a kind of capability that a Node Type can declare to expose.

Requirements (implicit or explicit) that are declared as part of one node can be matched to (i.e., fulfilled by) theCapabilities declared by another node.

#### A.6.6.1 Keynames

The following is the list of recognized keynames for a TOSCA Capability Type definition:

<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>derived_from</td>
<td>no</td>
<td>string</td>
<td>An optional parent capability type name this new Capability Type derives from.</td>
</tr>
<tr>
<td>description</td>
<td>no</td>
<td>description</td>
<td>An optional description for the Capability Type.</td>
</tr>
<tr>
<td>properties</td>
<td>no</td>
<td>list of property definitions</td>
<td>An optional list of property definitions for the Capability Type.</td>
</tr>
<tr>
<td>Keyname</td>
<td>Required</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>----------</td>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>attributes</td>
<td>no</td>
<td>list of attribute definitions</td>
<td>An optional list of attribute definitions for the Capability Type.</td>
</tr>
<tr>
<td>valid_source_types</td>
<td>no</td>
<td>string[]</td>
<td>An optional list of one or more valid names of Node Types that are supported as valid sources of any relationship established to the declared Capability Type.</td>
</tr>
</tbody>
</table>

### A.6.6.2 Grammar

Capability Types have following grammar:

```yaml
<capability_type_name>:
  derived_from: <parent_capability_type_name>
  description: <capability_description>
  properties:
    <property_definitions>
  attributes:
    <attribute_definitions>
  valid_source_types: [ <node_type_names> ]
```

In the above grammar, the pseudo values that appear in angle brackets have the following meaning:

- `capability_type_name`: represents the required name of the Capability Type being declared as a string.
- `parent_capability_type_name`: represents the name of the Capability Type this Capability Type definition derives from (i.e., its “parent” type).
- `capability_description`: represents the optional description string for the corresponding capability_type_name.
- `property_definitions`: represents an optional list of property definitions that the Capability type exports.
- `attribute_definitions`: represents the optional list of attribute definitions for the Capability Type.
- `node_type_names`: represents the optional list of one or more names of Node Types that the Capability Type supports as valid sources for a successful relationship to be established to itself.

### A.6.6.3 Example

```yaml
mycompany.mytypes.myapplication.MyFeature:
  derived_from: tosca_capabilities.Root
  description: a custom feature of my company’s application
  properties:
    my_feature_setting:
      type: string
    my_feature_value:
      type: integer
```
A.6.7 Requirement Type

A Requirement Type is a reusable entity that describes a kind of requirement that a Node Type can declare to expose. The TOSCA Simple Profile seeks to simplify the need for declaring specific Requirement Types from nodes and instead rely upon nodes declaring their features sets using TOSCA Capability Types along with a named Feature notation.

Currently, there are no use cases in this TOSCA Simple Profile in YAML specification that utilize an independently defined Requirement Type. This is a desired effect as part of the simplification of the TOSCA v1.0 specification.

A.6.8 Node Type

A Node Type is a reusable entity that defines the type of one or more Node Templates. As such, a Node Type defines the structure of observable properties via a Properties Definition, the Requirements and Capabilities of the node as well as its supported interfaces.

A.6.8.1 Keynames

The following is the list of recognized keynames for a TOSCA Node Type definition:

<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Definition/Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>derived_from</td>
<td>no</td>
<td>string</td>
<td>An optional parent Node Type name this new Node Type derives from.</td>
</tr>
<tr>
<td>description</td>
<td>no</td>
<td>description</td>
<td>An optional description for the Node Type.</td>
</tr>
<tr>
<td>properties</td>
<td>no</td>
<td>list of property definitions</td>
<td>An optional list of property definitions for the Node Type.</td>
</tr>
<tr>
<td>attributes</td>
<td>no</td>
<td>list of attribute definitions</td>
<td>An optional list of attribute definitions for the Node Type.</td>
</tr>
<tr>
<td>requirements</td>
<td>no</td>
<td>list of requirement definitions</td>
<td>An optional sequenced list of requirement definitions for the Node Type.</td>
</tr>
<tr>
<td>capabilities</td>
<td>no</td>
<td>list of capability definitions</td>
<td>An optional list of capability definitions for the Node Type.</td>
</tr>
<tr>
<td>interfaces</td>
<td>no</td>
<td>list of interface definitions</td>
<td>An optional list of interface definitions supported by the Node Type.</td>
</tr>
<tr>
<td>artifacts</td>
<td>no</td>
<td>list of artifacts definitions</td>
<td>An optional list of named artifact definitions for the Node Type.</td>
</tr>
</tbody>
</table>

A.6.8.2 Grammar

Node Types have following grammar:

```
<node_type_name>:
  derived_from:  <parent_node_type_name>
  description:  <node_type_description>
  properties:   <property_definitions>
  attributes:   <attribute_definitions>
  requirements: - <requirement_definitions>
  capabilities:
```

TOSCA-Simple-Profile-YAML-v1.0-csd03
Standards Track Work Product   Copyright © OASIS Open 2015. All Rights Reserved.
In the above grammar, the pseudo values that appear in angle brackets have the following meaning:

- `node_type_name`: represents the required symbolic name of the Node Type being declared.
- `parent_node_type_name`: represents the name (string) of the Node Type this Node Type definition derives from (i.e., its “parent” type).
- `node_type_description`: represents the optional description string for the corresponding node_type_name.
- `property_definitions`: represents the optional list of property definitions for the Node Type.
- `attribute_definitions`: represents the optional list of attribute definitions for the Node Type.
- `requirement_definitions`: represents the optional sequenced list of requirement definitions for the Node Type.
- `capability_definitions`: represents the optional list of capability definitions for the Node Type.
- `interface_definitions`: represents the optional list of one or more interface definitions supported by the Node Type.
- `artifact_definitions`: represents the optional list of artifact definitions for the Node Template that augment those provided by its declared Node Type.

**A.6.8.3 Additional Requirements**

- Requirements are intentionally expressed as a sequenced list of TOSCA Requirement definitions which SHOULD be resolved (processed) in sequence order by TOSCA Orchestrators.

**A.6.8.4 Best Practices**

- It is recommended that all Node Types SHOULD derive directly (as a parent) or indirectly (as an ancestor) of the TOSCA Root Node Type (i.e., `tosca.nodes.Root`) to promote compatibility and portability. However, it is permitted to author Node Types that do not do so.
- TOSCA Orchestrators, having a full view of the complete application topology template and its resultant dependency graph of nodes and relationships, MAY prioritize how they instantiate the nodes and relationships for the application (perhaps in parallel where possible) to achieve the greatest efficiency.

**A.6.8.5 Example**

```
my_company.my_types.my_app_node_type:
    derived_from: tosca.nodes.SoftwareComponent
description: My company’s custom applicaton
properties:
    my_app_password:
        type: string
description: application password
        constraints:
```
A.6.9 Relationship Type

A Relationship Type is a reusable entity that defines the type of one or more relationships between Node Types or Node Templates.

A.6.9.1 Keynames

The following is the list of recognized keynames for a TOSCA Relationship Type definition:

<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Definition/Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>derived_from</td>
<td>no</td>
<td>string</td>
<td>An optional parent Relationship Type name the Relationship Type derives from.</td>
</tr>
<tr>
<td>description</td>
<td>no</td>
<td>description</td>
<td>An optional description for the Relationship Type.</td>
</tr>
<tr>
<td>properties</td>
<td>no</td>
<td>list of property definitions</td>
<td>An optional list of property definitions for the Relationship Type.</td>
</tr>
<tr>
<td>attributes</td>
<td>no</td>
<td>list of attribute definitions</td>
<td>An optional list of attribute definitions for the Relationship Type.</td>
</tr>
<tr>
<td>interfaces</td>
<td>no</td>
<td>list of interface definitions</td>
<td>An optional list of interface definitions interfaces supported by the Relationship Type.</td>
</tr>
<tr>
<td>valid_target_types</td>
<td>no</td>
<td>string[]</td>
<td>An optional list of one or more names of Capability Types that are valid targets for this relationship.</td>
</tr>
</tbody>
</table>

A.6.9.2 Grammar

Relationship Types have following grammar:

```yaml
<relationship_type_name>:
  derived_from: <parent_relationship_type_name>
  description: <relationship_description>
  properties:
    <property_definitions>
  attributes:
    <attribute_definitions>
  interfaces:
    <interface_definitions>
```
valid_target_types: [ <capability_type_names> ]

In the above grammar, the pseudo values that appear in angle brackets have the following meaning:

- **relationship_type_name**: represents the required symbolic name of the Relationship Type being declared as a string.
- **parent_relationship_type_name**: represents the name (string) of the Relationship Type this Relationship Type definition derives from (i.e., its “parent” type).
- **relationship_description**: represents the optional description string for the corresponding relationship_type_name.
- **property_definitions**: represents the optional list of property definitions for the Relationship Type.
- **attribute_definitions**: represents the optional list of attribute definitions for the Relationship Type.
- **interface_definitions**: represents the optional list of one or more names of valid interface definitions supported by the Relationship Type.
- **capability_type_names**: represents one or more names of valid target types for the relationship (i.e., Capability Types).

### A.6.9.3 Best Practices

- For TOSCA application portability, it is recommended that designers use the normative Relationship types defined in this specification where possible and derive from them for customization purposes.
- The TOSCA Root Relationship Type (**tosca.relationships.Root**) SHOULD be used to derive new types where possible when defining new relationships types. This assures that its normative configuration interface (**tosca.interfaces.relationship.Configure**) can be used in a deterministic way by TOSCA orchestrators.

### A.6.9.4 Examples

```
mycompanytypes.myrelationships.AppDependency:
  derived_from: tosca.relationships.DependsOn
  valid_target_types: [ mycompanytypes.mycapabilities.SomeAppCapability ]
```

### A.7 Template-specific definitions

The definitions in this section provide reusable modeling element grammars that are specific to the Node or Relationship templates.

#### A.7.1 Capability assignment

A capability assignment allows node template authors to assign values to properties and attributes for a named capability definition that is part of a Node Template’s type definition.

#### A.7.1.1 Keynames

The following is the list of recognized keynames for a TOSCA capability assignment:
<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>properties</td>
<td>no</td>
<td>list of property assignments</td>
<td>An optional list of property definitions for the Capability definition.</td>
</tr>
<tr>
<td>attributes</td>
<td>no</td>
<td>list of attribute assignments</td>
<td>An optional list of attribute definitions for the Capability definition.</td>
</tr>
</tbody>
</table>

### A.7.1.2 Grammar

Capability assignments have one of the following grammars:

```
<capability_definition_name>:
  properties:
    <property_assignments>
  attributes:
    <attribute_assignments>
```

In the above grammars, the pseudo values that appear in angle brackets have the following meaning:

- **capability_definition_name**: represents the symbolic name of the capability as a string.
- **property_assignments**: represents the optional list of property assignments for the capability definition.
- **attribute_assignments**: represents the optional list of attribute assignments for the capability definition.

### A.7.1.3 Example

The following example shows a capability assignment:

```
node_templates:
  some_node_template:
    capabilities:
      some_capability:
        properties:
          limit: 100
```

### A.7.2 Requirement assignment

A Requirement assignment allows template authors to provide either concrete names of TOSCA templates or provide abstract selection criteria for providers to use to find matching TOSCA templates that are used to fulfill a named requirement’s declared TOSCA Node Type.

#### A.7.2.1 Keynames

The following is the list of recognized keynames for a TOSCA requirement assignment:
<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capability</td>
<td>no</td>
<td>string</td>
<td>The optional reserved keyname used to provide the name of either a: • <strong>Capability definition</strong> within a <em>target</em> node template that can fulfill the requirement. • <strong>Capability Type</strong> that the provider will use to select a type-compatible <em>target</em> node template to fulfill the requirement at runtime.</td>
</tr>
<tr>
<td>node</td>
<td>no</td>
<td>string</td>
<td>The optional reserved keyname used to identify the target node of a relationship. Specifically, it is used to provide either a: • <strong>Node Template</strong> name that can fulfill the target node requirement. • <strong>Node Type</strong> name that the provider will use to select a type-compatible node template to fulfill the requirement at runtime.</td>
</tr>
<tr>
<td>relationship</td>
<td>no</td>
<td>string</td>
<td>The optional reserved keyname used to provide the name of either a: • <strong>Relationship Template</strong> to use to relate the <em>source</em> node to the (capability in the) <em>target</em> node when fulfilling the requirement. • <strong>Relationship Type</strong> that the provider will use to select a type-compatible relationship template to relate the <em>source</em> node to the <em>target</em> node at runtime.</td>
</tr>
<tr>
<td>node_filter</td>
<td>no</td>
<td>node filter</td>
<td>The optional filter definition that TOSCA orchestrators or providers would use to select a type-compatible <em>target</em> node that can fulfill the associated abstract requirement at runtime.</td>
</tr>
</tbody>
</table>

The following is the list of recognized keynames for a TOSCA requirement assignment’s `relationship` keyname which is used when Property assignments need to be provided to inputs of declared interfaces or their operations:

<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>no</td>
<td>string</td>
<td>The optional reserved keyname used to provide the name of the Relationship Type for the requirement assignment’s <code>relationship</code> keyname.</td>
</tr>
<tr>
<td>properties</td>
<td>no</td>
<td>list of interface definitions</td>
<td>The optional reserved keyname used to reference declared (named) interface definitions of the corresponding Relationship Type in order to provide Property assignments for these interfaces or operations of these interfaces.</td>
</tr>
</tbody>
</table>

### A.7.2.2 Grammar

Named requirement assignments have one of the following grammars:

#### A.7.2.2.1 Short notation:

The following single-line grammar may be used if only a concrete Node Template for the target node needs to be declared in the requirement:

```yaml
<requirement_name>: <node_template_name>
```

This notation is only valid if the corresponding Requirement definition in the Node Template’s parent Node Type declares (at a minimum) a valid Capability Type which can be found in the declared target Node Template. A valid capability definition always needs to be provided in the requirement declaration of the *source* node to identify a specific capability definition in the *target* node the requirement will form a TOSCA relationship with.

#### A.7.2.2.2 Extended notation:

The following grammar would be used if the requirement assignment needs to provide more information than just the Node Template name:
A.7.2.2.3 Extended grammar with Property Assignments for the relationship's Interfaces

The following additional multi-line grammar is provided for the relationship keyname in order to provide new Property assignments for inputs of known Interface definitions of the declared Relationship Type.

Examples of uses for the extended requirement assignment grammar include:

- The need to allow runtime selection of the target node based upon an abstract Node Type rather than a concrete Node Template. This may include use of the node_filter keyname to provide node and capability filtering information to find the “best match” of a concrete Node Template at runtime.
- The need to further clarify the concrete Relationship Template or abstract Relationship Type to use when relating the source node’s requirement to the target node’s capability.
- The need to further clarify the concrete capability (symbolic) name or abstract Capability Type in the target node to form a relationship between.
- The need to (further) constrain the occurrences of the requirement in the instance model.

In the above grammars, the pseudo values that appear in angle brackets have the following meaning:

- requirement_name: represents the symbolic name of a requirement assignment as a string.
- node_template_name: represents the optional name of a Node Template that contains the capability this requirement will be fulfilled by.
- relationship_template_name: represents the optional name of a Relationship Type to be used when relating the requirement appears to the capability in the target node.
- capability_symbolic_name: represents the optional ordered list of specific, required capability type or named capability definition within the target Node Type or Template.
- node_type_name: represents the optional name of a TOSCA Node Type the associated named requirement can be fulfilled by. This must be a type that is compatible with the Node Type declared on the matching requirement (same symbolic name) the requirement’s Node Template is based upon.

<requirement_name>:
  node: <node_template_name> | <node_type_name>
  relationship: <relationship_template_name> | <relationship_type_name>
  capability: <capability_symbolic_name> | <capability_type_name>
  node_filter:
    <node_filter_definition>
  occurrences: [ min_occurrences, max_occurrences ]
- **relationship_type**: represents the optional name of a Relationship Type that is compatible with the Capability Type in the target node.

- **property_assignments**: represents the optional list of property value assignments for the declared relationship.

- **interface_assignments**: represents the optional list of interface definitions for the declared relationship used to provide property assignments on inputs of interfaces and operations.

- **capability_type**: represents the optional name of a Capability Type definition within the target Node Type this requirement needs to form a relationship with.

- **node_filter_definition**: represents the optional node filter TOSCA orchestrators would use to fulfill the requirement for selecting a target node. Note that this SHALL only be valid if the node keyname’s value is a Node Type and is invalid if it is a Node Template.

### A.7.2.3 Examples

#### A.7.2.3.1 Example 1 – Abstract hosting requirement on a Node Type

A web application node template named ‘my_application_node_template’ of type `WebApplication` declares a requirement named ‘host’ that needs to be fulfilled by any node that derives from the node type `WebServer`.

```
# Example of a requirement fulfilled by a specific web server node template
node_templates:
  my_application_node_template:
    type: tosca.nodes.WebApplication
    ...
    requirements:
      - host:
        node: tosca.nodes.WebServer
```

In this case, the node template’s type is `WebApplication` which already declares the Relationship Type `HostedOn` to use to relate to the target node and the Capability Type of `Container` to be the specific target of the requirement in the target node.

#### A.7.2.3.2 Example 2 - Requirement with Node Template and a custom Relationship Type

This example is similar to the previous example; however, the requirement named ‘database’ describes a requirement for a connection to a database endpoint (``Endpoint.Database``) Capability Type in a named node template (``my_database``). However, the connection requires a custom Relationship Type (``my.types.CustomDbConnection``) declared on the keyname ‘relationship’.

```
# Example of a (database) requirement that is fulfilled by a node template named # “my_database”, but also requires a custom database connection relationship
my_application_node_template:
  requirements:
    - database:
      node: my_database
      capability: Endpoint.Database
```
A.7.2.3.3 Example 3 - Requirement for a Compute node with additional selection criteria (filter)

This example shows how to extend an abstract 'host' requirement for a Compute node with a filter definition that further constrains TOSCA orchestrators to include additional properties and capabilities on the target node when fulfilling the requirement.

```
node_templates:
  mysql:
    type: tosca.nodes.DBMS.MySQL
    properties:
      # omitted here for brevity
    requirements:
      - host:
        node: tosca.nodes.Compute
        node_filter:
          capabilities:
            - host:
              properties:
                - num_cpus: { in_range: [ 1, 4 ] }
                - mem_size: { greater_or_equal: 2 MB }
            - os:
              properties:
                - architecture: { equal: x86_64 }
                - type: { equal: linux }
                - distribution: { equal: ubuntu }
            - mytypes.capabilities.compute.encryption:
              properties:
                - algorithm: { equal: aes }
                - keylength: { valid_values: [ 128, 256 ] }
```

A.7.3 Node Template

A Node Template specifies the occurrence of a manageable software component as part of an application’s topology model which is defined in a TOSCA Service Template. A Node template is an instance of a specified Node Type and can provide customized properties, constraints or operations which override the defaults provided by its Node Type and its implementations.

A.7.3.1 Keynames

The following is the list of recognized keynames for a TOSCA Node Template definition:

<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>yes</td>
<td>string</td>
<td>The required name of the Node Type the Node Template is based upon.</td>
</tr>
<tr>
<td>description</td>
<td>no</td>
<td>description</td>
<td>An optional description for the Node Template.</td>
</tr>
<tr>
<td>directives</td>
<td>no</td>
<td>string[]</td>
<td>An optional list of directive values to provide processing instructions to orchestrators and tooling.</td>
</tr>
<tr>
<td>properties</td>
<td>no</td>
<td>list of property assignments</td>
<td>An optional list of property value assignments for the Node Template.</td>
</tr>
<tr>
<td>attributes</td>
<td>no</td>
<td>list of attribute assignments</td>
<td>An optional list of attribute value assignments for the Node Template.</td>
</tr>
<tr>
<td>Keyname</td>
<td>Required</td>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>----------</td>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>requirements</td>
<td>no</td>
<td>list of requirement assignments</td>
<td>An optional sequenced list of requirement assignments for the Node Template.</td>
</tr>
<tr>
<td>capabilities</td>
<td>no</td>
<td>list of capability assignments</td>
<td>An optional list of capability assignments for the Node Template.</td>
</tr>
<tr>
<td>interfaces</td>
<td>no</td>
<td>list of interface definitions</td>
<td>An optional list of named interface definitions for the Node Template.</td>
</tr>
<tr>
<td>artifacts</td>
<td>no</td>
<td>list of artifact definitions</td>
<td>An optional list of named artifact definitions for the Node Template.</td>
</tr>
<tr>
<td>node_filter</td>
<td>no</td>
<td>node filter</td>
<td>The optional filter definition that TOSCA orchestrators would use to select the correct target node. This keyname is only valid if the directive has the value of “selectable” set.</td>
</tr>
<tr>
<td>copy</td>
<td>no</td>
<td>string</td>
<td>The optional (symbolic) name of another node template to copy into (all keynames and values) and use as a basis for this node template.</td>
</tr>
</tbody>
</table>

### A.7.3.2 Grammar

```yml
<node_template_name>:
  type: <node_type_name>
  description: <node_template_description>
  directives: [<directives>]
  properties:
    <property_assignments>
  attributes:
    <attribute_assignments>
  requirements:
    - <requirement_assignments>
  capabilities:
    <capability_assignments>
  interfaces:
    <interface_definitions>
  artifacts:
    <artifact_definitions>
  node_filter:
    <node_filter_definition>
  copy: <source_node_template_name>
```

In the above grammar, the pseudo values that appear in angle brackets have the following meaning:

- **node_template_name**: represents the required symbolic name of the Node Template being declared.
- **node_type_name**: represents the name of the Node Type the Node Template is based upon.
- **node_template_description**: represents the optional description string for Node Template.
- **directives**: represents the optional list of processing instruction keywords for treatment of the node for tooling and orchestrators.
- **property_assignments**: represents the optional list of property assignments for the Node Template that provide values for properties defined in its declared Node Type.

- **attribute_assignments**: represents the optional list of attribute assignments for the Node Template that provide values for attributes defined in its declared Node Type.

- **requirement_assignments**: represents the optional sequenced list of requirement assignments for the Node Template that allow assignment of type-compatible capabilities, target nodes, relationships and target (node filters) for use when fulfilling the requirement at runtime.

- **capability_assignments**: represents the optional list of capability assignments for the Node Template that augment those provided by its declared Node Type.

- **interface_definitions**: represents the optional list of interface definitions for the Node Template that augment those provided by its declared Node Type.

- **artifact_definitions**: represents the optional list of artifact definitions for the Node Template that augment those provided by its declared Node Type.

- **node_filter_definition**: represents the optional node filter TOSCA orchestrators would use for selecting a matching node template.

- **source_node_template_name**: represents the optional (symbolic) name of another node template to copy into (all keynames and values) and use as a basis for this node template.

### A.7.3.3 Additional requirements

- The node_filter keyword (and supporting grammar) **SHALL** only be valid if the Node Template has a directive keyname with the value of “selectable” set.

- The source node template provided as a value on the copy keyname **MUST NOT** itself use the copy keyname (i.e., it must itself be a complete node template description and not copied from another node template).

### A.7.3.4 Example

```yaml
node_templates:
  mysql:
    type: tosca.nodes.DBMS.MySQL
    properties:
      root_password: { get_input: my_mysql_rootpw }
      port: { get_input: my_mysql_port }
    requirements:
      - host: db_server
    interfaces:
      Standard:
        configure: scripts/my_own_configure.sh
```

### A.7.4 Relationship Template

A Relationship Template specifies the occurrence of a manageable relationship between node templates as part of an application's topology model which is defined in a TOSCA Service Template. A Relationship template is an instance of a specified Relationship Type and can provide customized properties, constraints or operations which override the defaults provided by its Relationship Type and its implementations.
The following is the list of recognized keynames for a TOSCA Relationship Template definition:

<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>yes</td>
<td>string</td>
<td>The required name of the Relationship Type the Relationship Template is based upon.</td>
</tr>
<tr>
<td>alias</td>
<td>no</td>
<td>string</td>
<td>The optional name of a different Relationship Template definition whose values are (effectively) copied into the definition for this Relationship Template (prior to any other overrides).</td>
</tr>
<tr>
<td>description</td>
<td>no</td>
<td>description</td>
<td>An optional description for the Relationship Template.</td>
</tr>
<tr>
<td>properties</td>
<td>no</td>
<td>list of property assignments</td>
<td>An optional list of property assignments for the Relationship Template.</td>
</tr>
<tr>
<td>attributes</td>
<td>no</td>
<td>list of attribute assignments</td>
<td>An optional list of attribute assignments for the Relationship Template.</td>
</tr>
<tr>
<td>interfaces</td>
<td>no</td>
<td>list of interface definitions</td>
<td>An optional list of named interface definitions for the Node Template.</td>
</tr>
<tr>
<td>copy</td>
<td>no</td>
<td>name</td>
<td>The optional (symbolic) name of another relationship template to copy into (all keynames and values) and use as a basis for this relationship template.</td>
</tr>
</tbody>
</table>

### A.7.4.1 Grammar

```yaml
<relationship_template_name>:
  type: <relationship_type_name>
  description: <relationship_type_description>
  properties:
    <property_assignments>
  attributes:
    <attribute_assignments>
  interfaces:
    <interface_definitions>
  copy:
    <source_relationship_template_name>
```

In the above grammar, the pseudo values that appear in angle brackets have the following meaning:

- **relationship_template_name**: represents the required symbolic name of the Relationship Template being declared.
- **relationship_type_name**: represents the name of the Relationship Type the Relationship Template is based upon.
- **relationship_template_description**: represents the optional description string for the Relationship Template.
- **property_assignments**: represents the optional list of property assignments for the Relationship Template that provide values for properties defined in its declared Relationship Type.
- **attribute_assignments**: represents the optional list of attribute assignments for the Relationship Template that provide values for attributes defined in its declared Relationship Type.
- **interface_definitions**: represents the optional list of interface definitions for the Relationship Template that augment those provided by its declared Relationship Type.
- **source_relationship_template_name**: represents the optional (symbolic) name of another relationship template to copy into (all keynames and values) and use as a basis for this relationship template.

### A.7.4.2 Additional requirements

- The source relationship template provided as a value on the `copy` keyname MUST NOT itself use the `copy` keyname (i.e., it must itself be a complete relationship template description and not copied from another relationship template).

### A.7.4.3 Example

```yaml
relationship_templates:
```

### A.8 Topology Template definition

This section defines the topology template of a cloud application. The main ingredients of the topology template are node templates representing components of the application and relationship templates representing links between the components. These elements are defined in the nested `node_templates` section and the nested `relationship_templates` sections, respectively. Furthermore, a topology template allows for defining input parameters, output parameters as well as grouping of node templates.

#### A.8.1 Grammar

The overall grammar of the `topology_template` section is shown below. Detailed grammar definitions of the each sub-sections are provided in subsequent subsections.

```yaml
topology_template:
    description:
        # a description of the topology template

    inputs:
        # definition of input parameters for the topology template

    node_templates:
        # definition of the node templates of the topology

    relationship_templates:
        # definition of the relationship templates of the topology

    outputs:
        # definition of output parameters for the topology template

    groups:
        # definition of logical groups of node templates within the topology

    substitution_mappings:
```
A.8.1.1 inputs

The inputs section provides a means to define parameters using TOSCA property definitions, their allowed values via constraints and default values within a TOSCA Simple Profile template. Input parameters defined in the inputs section of a topology template can be mapped to properties of node templates or relationship templates within the same topology template and can thus be used for parameterizing the instantiation of the topology template.

This section defines topology template-level input parameter section.

- Inputs here would ideally be mapped to BoundaryDefinitions in TOSCA v1.0.
- Treat input parameters as fixed global variables (not settable within template)
- If not in input take default (nodes use default)

A.8.1.1.1 Grammar

The grammar of the inputs section is as follows:

```yaml
inputs:
  <property_definition_1>
  ...
  <property_definition_n>
```

A.8.1.1.2 Examples

This section provides a set of examples for the single elements of a topology template.

Simple inputs example without any constraints:

```yaml
inputs:
  fooName:
    type: string
    description: Simple string typed property definition with no constraints.
    default: bar
```

Example of inputs with constraints:

```yaml
inputs:
  SiteName:
    type: string
    description: string typed property definition with constraints
    default: My Site
    constraints:
```
A.8.1.2 node_templates

The node_templates section lists the Node Templates that describe the (software) components that are used to compose cloud applications.

A.8.1.2.1 grammar

The grammar of the node_templates section is as follows:

```yaml
node_templates:
  <node_template_defn_1>
  ...
  <node_template_defn_n>
```

A.8.1.2.2 Example

Example of node_templates section:

```yaml
node_templates:
  my_webapp_node_template:
    type: WebApplication

  my_database_node_template:
    type: Database
```

A.8.1.3 relationship_templates

The relationship_templates section lists the Relationship Templates that describe the relations between components that are used to compose cloud applications.

A.8.1.3.1 Grammar

The grammar of the relationship_templates section is as follows:

```yaml
relationship_templates:
  <relationship_template_defn_1>
  ...
  <relationship_template_defn_n>
```

A.8.1.3.2 Example

Example of relationship_templates section:

```yaml
relationship_templates:
  my_connectsto_relationship:
```

- min_length: 9
A.8.1.4 outputs

The outputs section provides a means to define the output parameters that are available from a TOSCA Simple Profile service template. It allows for exposing attributes of node templates or relationship templates within the containing topology_template to users of a service.

A.8.1.4.1 Grammar

The grammar of the outputs section is as follows:

```
outputs:
  <attribute_assignments>
```

A.8.1.4.2 Example

Example of the outputs section:

```
outputs:
  server_address:
    description: The first private IP address for the provisioned server.
    value: { get_attribute: [ HOST, networks, private, addresses, 0 ] }
```

A.8.1.5 groups

The groups section allows for grouping one or more node templates within a TOSCA Service Template and for assigning special attributes like policies to the group.

A.8.1.5.1 Grammar

The grammar of the groups section is as follows:

```
groups:
  <group_symbolic_name_1>:
    members: [ node_template_name_1, ..., node_template_name_n ]
    policies:
      - <optional_list of policy_names_for_group_1>
    ...
  <group_symbolic_name_N>:
    members: [ node_template_name_1, ..., node_template_name_n ]
    policies:
      - <optional_list of policy_names_for_group_N>
```
A.8.1.5.2 Example

The following example shows the definition of three Compute nodes in the node_templates section of a topology_template as well as the grouping of two of the Compute nodes in a group server_group_1.

node_templates:
  server1:
    type: tosca.nodes.Compute
    # more details ...

  server2:
    type: tosca.nodes.Compute
    # more details ...

  server3:
    type: tosca.nodes.Compute
    # more details ...

groups:
  server_group_1:
    members: [ server1, server2 ]

  policies:
    - anti_collocation_policy:
        # specific policy declarations omitted, as this is not yet specified

A.8.2 Notes

- The parameters (properties) that are listed as part of the inputs block can be mapped to PropertyMappings provided as part of BoundaryDefinitions as described by the TOSCA v1.0 specification.
- The node templates listed as part of the node_templates block can be mapped to the list of NodeTemplate definitions provided as part of TopologyTemplate of a ServiceTemplate as described by the TOSCA v1.0 specification.
- The relationship templates listed as part of the relationship_templates block can be mapped to the list of RelationshipTemplate definitions provided as part of TopologyTemplate of a ServiceTemplate as described by the TOSCA v1.0 specification.
- The output parameters that are listed as part of the outputs section of a topology template can be mapped to PropertyMappings provided as part of BoundaryDefinitions as described by the TOSCA v1.0 specification.
  - Note, however, that TOSCA v1.0 does not define a direction (input vs. output) for those mappings, i.e. TOSCA v1.0 PropertyMappings are underspecified in that respect and TOSCA Simple Profile’s inputs and outputs provide a more concrete definition of input and output parameters.
A.9 Service Template definition

A TOSCA Service Template (YAML) document contains element definitions of building blocks for cloud application, or complete models of cloud applications. This section describes the top-level structural elements (TOSCA keynames) along with their grammars, which are allowed to appear in a TOSCA Service Template document.

A.9.1 Keynames

The following is the list of recognized keynames for a TOSCA Service Template definition:

<table>
<thead>
<tr>
<th>Keyname</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tosca_definitions_version</td>
<td>yes</td>
<td>string</td>
<td>Defines the version of the TOSCA Simple Profile specification the template (grammar) complies with.</td>
</tr>
<tr>
<td>tosca_default_namespace</td>
<td>no</td>
<td>string</td>
<td>Defines the namespace of the TOSCA schema to use for validation.</td>
</tr>
<tr>
<td>metadata</td>
<td>no</td>
<td>map of string</td>
<td>Defines a section used to declare additional metadata information. Domain-specific TOSCA profile specifications may define keynames that are required for their implementations.</td>
</tr>
<tr>
<td>description</td>
<td>no</td>
<td>description</td>
<td>Declares a description for this Service Template and its contents.</td>
</tr>
<tr>
<td>imports</td>
<td>no</td>
<td>list of string</td>
<td>Declares import statements external TOSCA Definitions documents. For example, these may be file location or URIs relative to the service template file within the same TOSCA CSAR file.</td>
</tr>
<tr>
<td>dsl_definitions</td>
<td>no</td>
<td>N/A</td>
<td>Declares optional DSL-specific definitions and conventions. For example, in YAML, this allows defining reusable YAML macros (i.e., YAML alias anchor) for use throughout the TOSCA Service Template.</td>
</tr>
<tr>
<td>repositories</td>
<td>no</td>
<td>list of Repository definitions</td>
<td>Declares the list of external repositories which contain artifacts that are referenced in the service template along with their addresses and necessary credential information used to connect to them in order to retrieve the artifacts.</td>
</tr>
<tr>
<td>data_types</td>
<td>no</td>
<td>list of Data Types</td>
<td>Declares a list of optional TOSCA Data Type definitions.</td>
</tr>
<tr>
<td>node_types</td>
<td>no</td>
<td>list of Node Types</td>
<td>This section contains a set of node type definitions for use in service templates.</td>
</tr>
<tr>
<td>relationship_types</td>
<td>no</td>
<td>list of Relationship Types</td>
<td>This section contains a set of relationship type definitions for use in service templates.</td>
</tr>
<tr>
<td>capability_types</td>
<td>no</td>
<td>list of Capability Types</td>
<td>This section contains an optional list of capability type definitions for use in service templates.</td>
</tr>
<tr>
<td>artifact_types</td>
<td>no</td>
<td>list of Artifact Types</td>
<td>This section contains an optional list of artifact type definitions for use in service templates.</td>
</tr>
<tr>
<td>interface_types</td>
<td>no</td>
<td>list of Interface Types</td>
<td>This section contains an optional list of interface type definitions for use in service templates.</td>
</tr>
<tr>
<td>topology_template</td>
<td>no</td>
<td>Topology Template</td>
<td>Defines the topology template of an application or service, consisting of node templates that represent the application’s or service’s components, as well as relationship templates representing relations between the components.</td>
</tr>
</tbody>
</table>

A.9.1.1 Metadata keynames

The following is the list of recognized metadata keynames for a TOSCA Service Template definition:
### Keyname | Required | Type | Description
--- | --- | --- | ---
template_name | no | string | Declares a descriptive name for the template.
template_author | no | string | Declares the author(s) or owner of the template.
template_version | no | string | Declares the version string for the template.

#### A.9.2 Grammar

The overall structure of a TOSCA Service Template and its top-level key collations using the TOSCA Simple Profile is shown below:

```yaml
tosca_definitions_version: # Required TOSCA Definitions version string
tosca_default_namespace:  # Optional. default namespace (for type schema)

# Optional metadata keyname: value pairs
metadata:
  template_name:         # Optional name of this service template
  template_author:      # Optional author of this service template
  template_version:     # Optional version of this service template
# Optional description of the definitions inside the file.
description: <template_type_description>

imports:
  # list of import statements for importing other definitions files

dsl_definitions:
  # list of YAML alias anchors (or macros)

repositories:
  # list of external repository definitions which host TOSCA artifacts

data_types:
  # list of TOSCA datatype definitions

node_types:
  # list of node type definitions

capability_types:
  # list of capability type definitions

relationship_types:
  # list of relationship type definitions
```
artifact_types:
    # list of artifact type definitions

interface_types
    # list of interface type definitions

topology_template:
    # topology template definition of the cloud application or service

A.9.2.1 Notes

- TOSCA Service Templates do not have to contain a topology_template and MAY contain simply type
  definitions (e.g., Artifact, Interface, Capability, Node, Relationship Types, etc.) and be imported for use
  as type definitions in other TOSCA Service Templates.

A.9.3 Top-level keyname definitions

A.9.3.1 tosca_definitions_version

This required element provides a means to include a reference to the TOSCA Simple Profile specification within
the TOSCA Definitions YAML file. It is an indicator for the version of the TOSCA grammar that should be used to
parse the remainder of the document.

A.9.3.1.1 Keyname

tosca_definitions_version

A.9.3.1.2 Grammar

Single-line form:

tosca_definitions_version: <tosca_simple_profile_version>

A.9.3.1.3 Examples:

TOSCA Simple Profile version 1.0 specification using the defined namespace alias (see Section A.1):

tosca_definitions_version: tosca_simple_yaml_1_0_0

TOSCA Simple Profile version 1.0 specification using the fully defined (target) namespace (see Section A.1):

tosca_definitions_version: http://docs.oasis-open.org/tosca/simple/1.0

A.9.3.2 template_name

This optional element declares the optional name of service template as a single-line string value.

A.9.3.2.1 Keyname

template_name
A.9.3.2.2 Grammar

```
template_name: <name string>
```

A.9.3.2.3 Example

```
template_name: My service template
```

A.9.3.2.4 Notes

- Some service templates are designed to be referenced and reused by other service templates. Therefore, in these cases, the `template_name` value SHOULD be designed to be used as a unique identifier through the use of namespaces techniques.

A.9.3.3 template_author

This optional element declares the optional author(s) of the service template as a single-line string value.

A.9.3.3.1 Keyname

```
template_author
```

A.9.3.3.2 Grammar

```
template_author: <author string>
```

A.9.3.3.3 Example

```
template_author: My service template
```

A.9.3.4 template_version

This element declares the optional version of the service template as a single-line string value.

A.9.3.4.1 Keyname

```
template_version
```

A.9.3.4.2 Grammar

```
template_version: <version>
```

A.9.3.4.3 Example

```
template_version: 2.0.17
```

A.9.3.4.4 Notes:

- Some service templates are designed to be referenced and reused by other service templates and have a lifecycle of their own. Therefore, in these cases, a `template_version` value SHOULD be included and used in conjunction with a unique `template_name` value to enable lifecycle management of the service template and its contents.
A.9.3.5 description

This optional element provides a means to include single or multiline descriptions within a TOSCA Simple Profile template as a scalar string value.

A.9.3.5.1 Keyname

description

A.9.3.6 imports

This optional element provides a way to import a block sequence of one or more TOSCA Definitions documents. TOSCA Definitions documents can contain reusable TOSCA type definitions (e.g., Node Types, Relationship Types, Artifact Types, etc.) defined by other authors. This mechanism provides an effective way for companies and organizations to define normative types and/or describe their software applications for reuse in other TOSCA Service Templates.

A.9.3.6.1 Keyname

imports

A.9.3.6.2 Grammar

imports:
- <tosca_definitions_file_URI_1>
- ...
- <tosca_definitions_file_URI_n>

A.9.3.6.3 Example

# An example import of definitions files from a location relative to the
# file location of the service template declaring the import.
imports:
- relative_path/my_defns/my_typesdefs_1.yaml
- ...
- relative_path/my_defns/my_typesdefs_n.yaml

A.9.3.7 dsl_definitions

This optional element provides a section to define macros (e.g., YAML-style macros when using the TOSCA Simple Profile in YAML specification).

A.9.3.7.1 Keyname

dsl_definitions

A.9.3.7.2 Grammar

dsl_definitions:
  <dsl_definition_1>
  ...
  <dsl_definition_n>
A.9.3.7.3 Example

dsl_definitions:
    ubuntu_image_props: &ubuntu_image_props
        architecture: x86_64
        type: linux
        distribution: ubuntu
        os_version: 14.04

    redhat_image_props: &redhat_image_props
        architecture: x86_64
        type: linux
        distribution: rhel
        os_version: 6.6

A.9.3.8 datatype_definitions

This optional element provides a section to define new datatypes in TOSCA.

A.9.3.8.1 Keyname

datatype_definitions

A.9.3.8.2 Grammar

datatype_definitions:
    <tosca_datatype_def_1>
    ...
    <tosca_datatype_def_n>

A.9.3.8.3 Example

datatype_definitions:
    # A complex datatype definition
    simple_contactinfo_type:
        properties:
            name:
                type: string
            email:
                type: string
            phone:
                type: string

    # datatype definition derived from an existing type
    full_contact_info:
        derived_from: simple_contact_info
A.9.3.9 node_types

This element lists the Node Types that provide the reusable type definitions for software components that Node Templates can be based upon.

A.9.3.9.1 Keyname

node_types

A.9.3.9.2 Grammar

node_types:
  <node_type_defn_1>
  ...
  <node_type_defn_n>

A.9.3.9.3 Example

node_types:
  my_webapp_node_type:
    derived_from: WebApplication
    properties:
      my_port:
        type: integer

  my_database_node_type:
    derived_from: Database
    capabilities:
      mytypes.myfeatures.transactSQL

A.9.3.9.4 Notes

- The node types listed as part of the node_types block can be mapped to the list of NodeType definitions as described by the TOSCA v1.0 specification.

A.9.3.10 relationship_types

This element lists the Relationship Types that provide the reusable type definitions that can be used to describe dependent relationships between Node Templates or Node Types.
A.9.3.10.1 Keyname

relationship_types

A.9.3.10.2 Grammar

relationship_types:
  <relationship_type_defn_1>
  ...
  <relationship_type_defn_n>

A.9.3.10.3 Example

relationship_types:
  mycompany.mytypes.myCustomClientServerType:
    derived_from: tosca.relationships.HostedOn
    properties:
      # more details ...

  mycompany.mytypes.myCustomConnectionType:
    derived_from: tosca.relationships.ConnectsTo
    properties:
      # more details ...

A.9.3.11 capability_types

This element lists the Capability Types that provide the reusable type definitions that can be used to describe features Node Templates or Node Types can declare they support.

A.9.3.11.1 Keyname

capability_types

A.9.3.11.2 Grammar

capability_types:
  <capability_type_defn_1>
  ...
  <capability_type_defn_n>

A.9.3.11.3 Example

capability_types:
  mycompany.mytypes.myCustomEndpoint:
    derived_from: tosca.capabilities.Endpoint
    properties:
      # more details ...
mycompany.mytypes.myCustomFeature:
  derived_from: tosca.capabilities.Feature
  properties:
    # more details ...
Appendix B. Functions

This section includes functions that are supported for use within a TOSCA Service Template.

B.1 Reserved Function Keywords

The following keywords MAY be used in some TOSCA function in place of a TOSCA Node or Relationship Template name. They will be interpreted by a TOSCA orchestrator at the time the function would be evaluated at runtime as described in the table below. Note that some keywords are only valid in the context of a certain TOSCA entity as also denoted in the table.

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Valid Contexts</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SELF</td>
<td>Node Template or Relationship Template</td>
<td>A TOSCA orchestrator will interpret this keyword as the Node or Relationship Template instance that contains the function at the time the function is evaluated.</td>
</tr>
<tr>
<td>SOURCE</td>
<td>Relationship Template only.</td>
<td>A TOSCA orchestrator will interpret this keyword as the Node Template instance that is at the source end of the relationship that contains the referencing function.</td>
</tr>
<tr>
<td>TARGET</td>
<td>Relationship Template only.</td>
<td>A TOSCA orchestrator will interpret this keyword as the Node Template instance that is at the target end of the relationship that contains the referencing function.</td>
</tr>
<tr>
<td>HOST</td>
<td>Node Template only</td>
<td>A TOSCA orchestrator will interpret this keyword to refer to the all nodes that “host” the node using this reference (i.e., as identified by its HostedOn relationship). Specifically, TOSCA orchestrators that encounter this keyword when evaluating the get_attribute or get_property functions SHALL search each node along the “HostedOn” relationship chain starting at the immediate node that hosts the node where the function was evaluated (and then that node’s host node, and so forth) until a match is found or the “HostedOn” relationship chain ends.</td>
</tr>
</tbody>
</table>

B.2 Environment Variable Conventions

B.2.1 Reserved Environment Variable Names and Usage

TOSCA orchestrators utilize certain reserved keywords in the execution environments that implementation artifacts for Node or Relationship Templates operations are executed in. They are used to provide information to these implementation artifacts such as the results of TOSCA function evaluation or information about the instance model of the TOSCA application.

The following keywords are reserved environment variable names in any TOSCA supported execution environment:

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Valid Contexts</th>
<th>Description</th>
</tr>
</thead>
</table>
| TARGETS | Relationship Template only. | • For an implementation artifact that is executed in the context of a relationship, this keyword, if present, is used to supply a list of Node Template instances in a TOSCA application’s instance model that are currently target of the context relationship.  
• The value of this environment variable will be a comma-separated list of identifiers of the single target node instances (i.e., the tosca_id attribute of the node). |
<table>
<thead>
<tr>
<th>Keyword</th>
<th>Valid Contexts</th>
<th>Description</th>
</tr>
</thead>
</table>
| TARGET  | Relationship Template only.  | • For an implementation artifact that is executed in the context of a relationship, this keyword, if present, identifies a Node Template instance in a TOSCA application’s instance model that is a target of the context relationship, and which is being acted upon in the current operation.   
  • The value of this environment variable will be the identifier of the single target node instance (i.e., the `tosca_id` attribute of the node). |
| SOURCES | Relationship Template only.  | • For an implementation artifact that is executed in the context of a relationship, this keyword, if present, is used to supply a list of Node Template instances in a TOSCA application’s instance model that are currently source of the context relationship.   
  • The value of this environment variable will be a comma-separated list of identifiers of the single source node instances (i.e., the `tosca_id` attribute of the node). |
| SOURCE  | Relationship Template only.  | • For an implementation artifact that is executed in the context of a relationship, this keyword, if present, identifies a Node Template instance in a TOSCA application’s instance model that is a source of the context relationship, and which is being acted upon in the current operation.   
  • The value of this environment variable will be the identifier of the single source node instance (i.e., the `tosca_id` attribute of the node). |

For scripts (or implementation artifacts in general) that run in the context of relationship operations, select properties and attributes of both the relationship itself as well as select properties and attributes of the source and target node(s) of the relationship can be provided to the environment by declaring respective operation inputs.

Declared inputs from mapped properties or attributes of the source or target node (selected via the `SOURCE` or `TARGET` keyword) will be provided to the environment as variables having the exact same name as the inputs. In addition, the same values will be provided for the complete set of source or target nodes, however prefixed with the ID if the respective nodes. By means of the `SOURCES` or `TARGETS` variables holding the complete set of source or target node IDs, scripts will be able to iterate over corresponding inputs for each provided ID prefix.

The following example snippet shows an imaginary relationship definition from a load-balancer node to worker nodes. A script is defined for the `add_target` operation of the Configure interface of the relationship, and the `ip_address` attribute of the target is specified as input to the script:

```yaml
node_templates:
  load_balancer:
    type: some.vendor.LoadBalancer
    requirements:
      - member:
          relationship: some.vendor.LoadBalancerToMember
            interfaces:
              Configure:
                add_target:
                  inputs:
                    member_ip: { get_attribute: [ TARGET, ip_address ] }
                  implementation: scripts/configure_members.py
```
The **add_target** operation will be invoked, whenever a new target member is being added to the load-balancer. With the above inputs declaration, a **member_ip** environment variable that will hold the IP address of the target being added will be provided to the *configure_members.py* script. In addition, the IP addresses of all current load-balancer members will be provided as environment variables with a naming scheme of `<target node ID>_member_ip`. This will allow, for example, scripts that always just write the complete list of load-balancer members into a configuration file to do so instead of updating existing list, which might be more complicated.

Assuming that the TOSCA application instance includes five load-balancer members, **node1** through **node5**, where **node5** is the current target being added, the following environment variables (plus potentially more variables) would be provided to the script:

```yaml
# the ID of the current target and the IDs of all targets
TARGET=node5
TARGETS=node1,node2,node3,node4,node5

# the input for the current target and the inputs of all targets
member_ip=10.0.0.5
node1_member_ip=10.0.0.1
node2_member_ip=10.0.0.2
node3_member_ip=10.0.0.3
node4_member_ip=10.0.0.4
node5_member_ip=10.0.0.5
```

With code like shown in the snippet below, scripts could then iterate of all provided **member_ip** inputs:

```python
#!/usr/bin/python
import os

targets = os.environ['TARGETS'].split(',

for t in targets:
    target_ip = os.environ.get('%s_member_ip' % t)
    # do something with target_ip ...
```

### B.2.2 Prefixed vs. Unprefixed TARGET names

The list target node types assigned to the **TARGETS** key in an execution environment would have names prefixed by unique IDs that distinguish different instances of a node in a running model. Future drafts of this specification will show examples of how these names/IDs will be expressed.

#### B.2.2.1 Notes

- Target of interest is always un-prefixed. Prefix is the target opaque ID. The IDs can be used to find the environment var. for the corresponding target. Need an example here.

- If you have one node that contains multiple targets this would also be used (add or remove target operations would also use this you would get set of all current targets).
### B.3 Intrinsic functions

These functions are supported within the TOSCA template for manipulation of template data.

#### B.3.1 concat

The `concat` function is used to concatenate two or more string values within a TOSCA service template.

#### B.3.1.1 Grammar

```
concat: [<string_value_expressions_*> ]
```

#### B.3.1.2 Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;string_value_expressions_*&gt;</code></td>
<td>yes</td>
<td>list of string or string value expressions</td>
<td>A list of one or more strings (or expressions that result in a string value) which can be concatenated together into a single string.</td>
</tr>
</tbody>
</table>

#### B.3.1.3 Examples

```yaml
outputs:
  description: Concatenate the URL for a server from other template values
  server_url:
  value: { concat: [ 'http://',
                    get_attribute: [ server, public_address ],
                    ':' ,
                    get_attribute: [ server, port ] ] }
```

#### B.3.1 token

The `token` function is used within a TOSCA service template on a string to parse out (tokenize) substrings separated by one or more token characters within a larger string.

#### B.3.1.1 Grammar

```
token: [ <string_with_tokens>, <string_of_token_chars>, <substring_index> ]
```

#### B.3.1.2 Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>string_with_tokens</code></td>
<td>yes</td>
<td>string</td>
<td>The composite string that contains one or more substrings separated by token characters.</td>
</tr>
<tr>
<td><code>string_of_token_chars</code></td>
<td>yes</td>
<td>string</td>
<td>The string that contains one or more token characters that separate substrings within the composite string.</td>
</tr>
<tr>
<td><code>substring_index</code></td>
<td>yes</td>
<td>integer</td>
<td>The integer indicates the index of the substring to return from the composite string. Note that the first substring is denoted by using the '0' (zero) integer value.</td>
</tr>
</tbody>
</table>
B.3.1.3 Examples

```
outputs:
  webserver_port:
    description: the port provided at the end of my server’s endpoint’s IP address
    value: { token: [ get_attribute: [ my_server, data_endpoint, ip_address ],
        ':
        1 ] }
```

B.4 Property functions

These functions are used within a service template to obtain property values from property definitions declared elsewhere in the same service template. These property definitions can appear either directly in the service template itself (e.g., in the inputs section) or on entities (e.g., node or relationship templates) that have been modeled within the template.

Note that the `get_input` and `get_property` functions may only retrieve the static values of property definitions of a TOSCA application as defined in the TOSCA Service Template. The `get_attribute` function should be used to retrieve values for attribute definitions (or property definitions reflected as attribute definitions) from the runtime instance model of the TOSCA application (as realized by the TOSCA orchestrator).

B.4.1 get_input

The `get_input` function is used to retrieve the values of properties declared within the `inputs` section of a TOSCA Service Template.

B.4.1.1 Grammar

```
get_input: <input_property_name>
```

B.4.1.2 Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;input_property_name&gt;</code></td>
<td>yes</td>
<td>string</td>
<td>The name of the property as defined in the <code>inputs</code> section of the service template.</td>
</tr>
</tbody>
</table>

B.4.1.3 Examples

```
inputs:
  cpus:
    type: integer

node_templates:
  my_server:
    type: tosca.nodes.Compute
    capabilities:
      host:
        properties:
```
B.4.2 get_property

The `get_property` function is used to retrieve property values between modelable entities defined in the same service template.

B.4.2.1 Grammar

\[
\text{get_property: [ <modelable_entity_name>, <optional_req_or_cap_name>, <property_name>, <nested_property_name_or_index_1>, ..., <nested_property_name_or_index_n> ]}
\]

B.4.2.2 Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;modelable_entity_name&gt;</code></td>
<td>yes</td>
<td>string</td>
<td>The required name of a modelable entity (e.g., Node Template or Relationship Template name) as declared in the service template that contains the named property definition the function will return the value from. See section B.1 for valid keywords.</td>
</tr>
<tr>
<td><code>&lt;optional_req_or_cap_name&gt;</code></td>
<td>no</td>
<td>string</td>
<td>The optional name of the requirement or capability name within the modelable entity (i.e., the <code>&lt;modelable_entity_name&gt;</code>) which contains the named property definition the function will return the value from. Note: If the property definition is located in the modelable entity directly, then this parameter MAY be omitted.</td>
</tr>
<tr>
<td><code>&lt;property_name&gt;</code></td>
<td>yes</td>
<td>string</td>
<td>The name of the property definition the function will return the value from.</td>
</tr>
<tr>
<td><code>&lt;nested_property_name_or_index_*&gt;</code></td>
<td>no</td>
<td>string</td>
<td>integer</td>
</tr>
</tbody>
</table>

B.4.2.3 Examples

The following example shows how to use the `get_property` function with an actual Node Template name:

```yaml
node_templates:

  mysql_database:
    type: tosca.nodes.Database
    properties:
      name: sql_database1

  wordpress:
    type: tosca.nodes.WebApplication.WordPress
```

`num_cpus: { get_input: cpus }`
The following example shows how to use the `get_property` function using the SELF keyword:

```yaml
interfaces:
  Standard:
    configure:
      inputs:
        wp_db_name: { get_property: [ mysql_database, name ] }
```

The following example shows how to use the `get_property` function using the TARGET keyword:

```yaml
node_templates:

  mysql_database:
    type: tosca.nodes.Database
    ...
    capabilities:
      database_endpoint:
        properties:
          port: 3306

  wordpress:
    type: tosca.nodes.WebApplication.WordPress
    requirements:
      ...
      - database_endpoint: mysql_database

  interfaces:
    Standard:
      create: wordpress_install.sh
      configure:
        implementation: wordpress_configure.sh
      inputs:
        ...
      wp_db_port: { get_property: [ SELF, database_endpoint, port ] }
```

**B.5 Attribute functions**

These functions (attribute functions) are used within an instance model to obtain attribute values from instances of nodes and relationships that have been created from an application model described in a service template. The instances of nodes or relationships can be referenced by their name as assigned in the service template or relative to the context where they are being invoked.
B.5.1 get_attribute

The get_attribute function is used to retrieve the values of named attributes declared by the referenced node or relationship template name.

B.5.1.1 Grammar

```
get_attribute: [ <modelable_entity_name>, <optional_req_or_cap_name>,
(attribute_name), <nested_attribute_name_or_index_1>, ..., <nested_attribute_name_or_index_n>,   ]
```

B.5.1.2 Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;modelable_entity_name&gt;</td>
<td>yes</td>
<td>string</td>
<td>The required name of a modelable entity (e.g., Node Template or Relationship Template name) as declared in the service template that contains the named attribute definition the function will return the value from. See section B.1 for valid keywords.</td>
</tr>
<tr>
<td>&lt;optional_req_or_cap_name&gt;</td>
<td>no</td>
<td>string</td>
<td>The optional name of the requirement or capability name within the modelable entity (i.e., the &lt;modelable_entity_name&gt; which contains the named attribute definition the function will return the value from.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>Note:</strong> If the attribute definition is located in the modelable entity directly, then this parameter MAY be omitted.</td>
</tr>
<tr>
<td>&lt;attribute_name&gt;</td>
<td>yes</td>
<td>string</td>
<td>The name of the attribute definition the function will return the value from.</td>
</tr>
<tr>
<td>&lt;nested_attribute_name_or_index_&gt;</td>
<td>no</td>
<td>string</td>
<td>integer</td>
</tr>
</tbody>
</table>

B.5.1.3 Examples:

The attribute functions are used in the same way as the equivalent Property functions described above. Please see their examples and replace “get_property” with “get_attribute” function name.

B.5.1.4 Notes

These functions are used to obtain attributes from instances of node or relationship templates by the names they were given within the service template that described the application model (pattern).

B.5.1.4.1 Notes:

- These functions only work when the orchestrator can resolve to a single node or relationship instance for the named node or relationship. This essentially means this is acknowledged to work only when the node or relationship template being referenced from the service template has a cardinality of 1 (i.e., there can only be one instance of it running).
B.6 Operation functions

These functions are used within an instance model to obtain values from interface operations. These can be used in order to set an attribute of a node instance at runtime or to pass values from one operation to another.

B.6.1 get_operation_output

The `get_operation_output` function is used to retrieve the values of variables exposed / exported from an interface operation.

**B.6.1.1 Grammar**

```
get_operation_output: <modelable_entity_name>, <interface_name>, <operation_name>, <output_variable_name>
```

**B.6.1.2 Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;modelable_entity_name&gt;</code></td>
<td>yes</td>
<td>string</td>
<td>The required name of a modelable entity (e.g., Node Template or Relationship Template name) as declared in the service template that implements the named interface and operation.</td>
</tr>
<tr>
<td><code>&lt;interface_name&gt;</code></td>
<td>Yes</td>
<td>string</td>
<td>The required name of the interface which defines the operation.</td>
</tr>
<tr>
<td><code>&lt;operation_name&gt;</code></td>
<td>yes</td>
<td>string</td>
<td>The required name of the operation whose value we would like to retrieve.</td>
</tr>
<tr>
<td><code>&lt;output_variable_name&gt;</code></td>
<td>Yes</td>
<td>string</td>
<td>The required name of the variable that is exposed / exported by the operation.</td>
</tr>
</tbody>
</table>

**B.6.1.3 Notes**

- If operation failed, then ignore its outputs. Orchestrators should allow orchestrators to continue running when possible past deployment in the lifecycle. For example, if an update fails, the application should be allowed to continue running and some other method would be used to alert administrators of the failure.

B.7 Navigation functions

- This version of the TOSCA Simple Profile does not define any model navigation functions.

B.7.1 get_nodes_of_type

The `get_nodes_of_type` function can be used to retrieve a list of all known instances of nodes of the declared Node Type.

**B.7.1.1 Grammar**

```
get_nodes_of_type: <node_type_name>
```
### B.7.1.2 Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;node_type_name&gt;</code></td>
<td>yes</td>
<td>string</td>
<td>The required name of a Node Type that a TOSCA orchestrator would use to search a running application instance in order to return all unique, named node instances of that type.</td>
</tr>
</tbody>
</table>

### B.7.1.3 Returns

### B.7.1.4

<table>
<thead>
<tr>
<th>Return Key</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TARGETS</td>
<td><code>&lt;see above&gt;</code></td>
<td>The list of node instances from the current application instance that match the <code>node_type_name</code> supplied as an input parameter of this function.</td>
</tr>
</tbody>
</table>

### B.8 Artifact functions

#### B.8.1 get_artifact

The `get_artifact` function is used to retrieve artifact location between modelable entities defined in the same service template.

#### B.8.1.1 Grammar

```
get_artifact: [ <modelable_entity_name>, <artifact_name>, <location>, <remove> ]
```

#### B.8.1.2 Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;modelable_entity_name&gt;</code></td>
<td>SELF</td>
<td>SOURCE</td>
<td>TARGET</td>
</tr>
<tr>
<td><code>&lt;artifact_name&gt;</code></td>
<td>yes</td>
<td>string</td>
<td>The name of the artifact definition the function will return the value from.</td>
</tr>
<tr>
<td><code>&lt;location&gt;</code></td>
<td>no</td>
<td>string</td>
<td>Location value must be either a valid path e.g. <code>/etc/var/my_file</code> or <code>LOCAL_FILE</code>.</td>
</tr>
</tbody>
</table>

If the value is `LOCAL_FILE` the orchestrator is responsible for providing a path as the result of the `get_artifact` call where the artifact file can be accessed. The orchestrator will also remove the artifact from this location at the end of the operation.

If the location is a path specified by the user the orchestrator is responsible to copy the artifact to the specified location. The orchestrator will return the path as the value of the `get_artifact` function and leave the file here after the execution of the operation.
### B.8.1.3 Examples

The following example shows how to use the `get_artifact` function with an actual Node Template name:

#### B.8.1.3.1 Example: Retrieving artifact without specified location:

```yaml
node_templates:

  wordpress:
    type: tosca.nodes.WebApplication.WordPress
    ...
    interfaces:
      Standard:
        configure:
          create:
            implementation: wordpress_install.sh
            inputs:
              wp_zip: { get_artifact: [ SELF, zip ] }
        artifacts:
          zip: /data/wordpress.zip
```

In such implementation the tosca orchestrator may provide the `wordpress.zip` archive as a local url (example: `file:///home/user/wordpress.zip`) or a remote one (example: `http://cloudrepo:80/files/wordpress.zip`) (some orchestrator may indeed provide some global artifact repository management features).

#### B.8.1.3.2 Example: Retrieving artifact as a local path:

The following example explains how to force the orchestrator to copy the file locally before calling the operation’s implementation script:

```yaml
node_templates:

  wordpress:
    type: tosca.nodes.WebApplication.WordPress
    ...
    interfaces:
      Standard:
        configure:
```

---

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remove</td>
<td>no</td>
<td>boolean</td>
<td>Boolean flag to override the orchestrator default behavior so it will remove or not the artifact at the end of the operation execution.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If not specified the removal will depends of the location e.g. removes it in case of <code>'LOCAL_FILE'</code> and keeps it in case of a path.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>If true the artifact will be removed by the orchestrator at the end of the operation execution, if false it will not be removed.</td>
</tr>
</tbody>
</table>
create:
  implementation: wordpress_install.sh
inputs
  wp_zip: { get_artifact: [ SELF, zip, LOCAL_FILE] }
artifacts:
  zip: /data/wordpress.zip

In such implementation the tosca orchestrator must provide the wordpress.zip archive as a local path (example: /tmp/wordpress.zip) and **will remove it** after the operation is completed.

**B.8.1.3.3 Example: Retrieving artifact in a specified location:**

The following example explains how to force the orchestrator to copy the file locally to a specific location before calling the operation’s implementation script:

```yaml
node_templates:

  wordpress:
    type: tosca.nodes.WebApplication.WordPress
    ...  
    interfaces:
      Standard:
        configure:
          create:
            implementation: wordpress_install.sh
            inputs
              wp_zip: { get_artifact: [ SELF, zip, C:/wpdata/wp.zip ] }
          artifacts:
            zip: /data/wordpress.zip
```

In such implementation the tosca orchestrator must provide the wordpress.zip archive as a local path (example: C:/wpdata/wp.zip) and **will let it** after the operation is completed.

**B.9 Context-based Entity name (global)**

TBD

Goal:

- Using the full paths of modelable entity names to qualify context with the future goal of a more robust `get_attribute` function: e.g., `get_attribute( <context-based-entity-name>, <attribute name>)`
Appendix C. TOSCA normative type definitions

The declarative approach is heavily dependent of the definition of basic types that a declarative container must understand. The definition of these types must be very clear such that the operational semantics can be precisely followed by a declarative container to achieve the effects intended by the modeler of a topology in an interoperable manner.

C.1 Assumptions

- Assumes alignment with/dependence on XML normative types proposal for TOSCA v1.1
- Assumes that the normative types will be versioned and the TOSCA TC will preserve backwards compatibility.
- Assumes that security and access control will be addressed in future revisions or versions of this specification.

C.2 Data Types

C.2.1 tosca.datatypes.Credential

The Credential type is a complex TOSCA data Type used when describing authorization credentials used to access network accessible resources.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>Credential</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:Credential</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.datatypes.Credential</td>
</tr>
</tbody>
</table>

C.2.1.1 Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>protocol</td>
<td>yes</td>
<td>string</td>
<td>None</td>
<td>The required protocol name.</td>
</tr>
<tr>
<td>token_type</td>
<td>yes</td>
<td>string</td>
<td>default: password</td>
<td>The required token type.</td>
</tr>
<tr>
<td>token</td>
<td>yes</td>
<td>string</td>
<td>None</td>
<td>The required token used as a credential for authorization or access to a networked resource.</td>
</tr>
<tr>
<td>keys</td>
<td>no</td>
<td>map of string</td>
<td>None</td>
<td>The optional list of protocol-specific keys or assertions.</td>
</tr>
<tr>
<td>user</td>
<td>no</td>
<td>string</td>
<td>None</td>
<td>The optional user (name or ID) used for non-token based credentials.</td>
</tr>
</tbody>
</table>

C.2.1.2 Definition

The TOSCA Credential type is defined as follows:

```yaml
tosca.datatypes.Credential:
  properties:
    protocol:
      type: string
```
required: false
token_type:
  type: string
default: password
token:
  type: string
keys:
  type: map
required: false
entry_schema:
  type: string
user:
  type: string
required: false

C.2.1.3 Additional requirements

- TOSCA Orchestrators SHALL interpret and validate the value of the `token` property based upon the value of the `token_type` property.

C.2.1.4 Notes

- Specific token types and encoding them using network protocols are not defined or covered in this specification.
- The use of transparent user names (IDs) or passwords are not considered best practice.

C.2.1.5 Examples

C.2.1.5.1 Provide a simple user name and password without a protocol or standardized token format

```yaml
<some_tosca_entity>:
  properties:
    my_credential:
      type: Credential
      properties:
        user: myusername
        token: mypassword
```

C.2.1.5.2 HTTP Basic access authentication credential

```yaml
<some_tosca_entity>:
  properties:
    my_credential:
      type: Credential
      properties:
        protocol: http
```
### C.2.1.5.3 X-Auth-Token credential

```yaml
<some_tosca_entity>:
  properties:
    my_credential:
      type: Credential
      properties:
        protocol: xauth
        token_type: X-Auth-Token
        # token encoded in Base64
        token: 604bbe45ac7143a79e14f3158df67091
```

### C.2.1.5.4 OAuth bearer token credential

```yaml
<some_tosca_entity>:
  properties:
    my_credential:
      type: Credential
      properties:
        protocol: oauth2
        token_type: bearer
        # token encoded in Base64
        token: 8ao9nE2Dejr1zCsicWmpBC
```

### C.2.2 tosca.datatypes.network.NetworkInfo

The `Network` type is a complex TOSCA data type used to describe logical network information.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>NetworkInfo</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:NetworkInfo</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.datatypes.network.NetworkInfo</td>
</tr>
</tbody>
</table>

#### C.2.2.1 Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>network_name</td>
<td>string</td>
<td>None</td>
<td>The name of the logical network. e.g., “public”, “private”, “admin”. etc.</td>
</tr>
<tr>
<td>network_id</td>
<td>string</td>
<td>None</td>
<td>The unique ID of for the network generated by the network provider.</td>
</tr>
<tr>
<td>addresses</td>
<td>string []</td>
<td>None</td>
<td>The list of IP addresses assigned from the underlying network.</td>
</tr>
</tbody>
</table>
C.2.2.2 Definition

The TOSCA NetworkInfo data type is defined as follows:

```yaml
tosca.datatypes.network.NetworkInfo:
  properties:
    network_name:
      type: string
    network_id:
      type: string
    addresses:
      type: list
      entry_schema:
        type: string
```

C.2.2.3 Examples

Example usage of the NetworkInfo data type:

```yaml
private_network:
  network_name: private
  network_id: 3e54214f-5c09-1bc9-9999-44100326da1b
  addresses: [ 10.111.128.10 ]
```

C.2.2.4 Additional Requirements

- It is expected that TOSCA orchestrators MUST be able to map the `network_name` from the TOSCA model to underlying network model of the provider.
- The properties (or attributes) of NetworkInfo may or may not be required depending on usage context.

C.2.3 `tosca.datatypes.network.PortInfo`

The PortInfo type is a complex TOSCA data type used to describe network port information.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>PortInfo</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:PortInfo</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.datatypes.network.PortInfo</td>
</tr>
</tbody>
</table>

C.2.3.1 Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port_name</td>
<td>string</td>
<td>None</td>
<td>The logical network port name.</td>
</tr>
<tr>
<td>port_id</td>
<td>string</td>
<td>None</td>
<td>The unique ID for the network port generated by the network provider.</td>
</tr>
<tr>
<td>network_id</td>
<td>string</td>
<td>None</td>
<td>The unique ID for the network.</td>
</tr>
<tr>
<td>mac_address</td>
<td>string</td>
<td>None</td>
<td>The unique media access control address (MAC address) assigned to the port.</td>
</tr>
</tbody>
</table>
### 2.3.2 Definition

The TOSCA Port type is defined as follows:

```yaml
tosca.datatypes.network.PortInfo:
  properties:
    port_name:
      type: string
    port_id:
      type: string
    network_id:
      type: string
    mac_address:
      type: string
    addresses:
      type: list
      entry_schema:
        type: string
```

### 2.3.3 Examples

Example usage of the PortInfo data type:

```yaml
ethernet_port:
  port_name: port1
  port_id: 2c0c7a37-691a-23a6-7709-2d10ad041467
  network_id: 3e54214f-5c09-1bc9-9999-44100326da1b
  mac_address: f1:18:3b:41:92:1e
  addresses: [ 172.24.9.102 ]
```

### 2.3.4 Additional Requirements

- It is expected that TOSCA orchestrators MUST be able to map the `port_name` from the TOSCA model to underlying network model of the provider.
- The properties (or attributes) of PortInfo may or may not be required depending on usage context.

### 2.4 tosca.datatypes.network.PortDef

The PortDef type is a TOSCA data Type used to define a network port.
C.2.4.1 Definition
The TOSCA PortDef type is defined as follows:

```yaml
tosca.datatypes.network.PortDef:
  derived_from: integer
  constraints:
    - in_range: [ 1, 65535 ]
```

C.2.4.2 Examples
Example use of a PortDef property type:

```yaml
listen_port:
  type: PortDef
  default: 9000
  constraints:
    - in_range: [ 9000, 9090 ]
```

C.2.5 tosca.datatypes.network.PortSpec
The PortSpec type is a complex TOSCA data Type used when describing port specifications for a network connection.

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>protocol</td>
<td>yes</td>
<td>string</td>
<td>default: tcp</td>
<td>The required protocol used on the port.</td>
</tr>
<tr>
<td>source</td>
<td>no</td>
<td>PortDef</td>
<td>See PortDef</td>
<td>The optional source port.</td>
</tr>
<tr>
<td>source_range</td>
<td>no</td>
<td>range</td>
<td>in_range: [ 1, 65536 ]</td>
<td>The optional range for source port.</td>
</tr>
<tr>
<td>target</td>
<td>no</td>
<td>PortDef</td>
<td>See PortDef</td>
<td>The optional target port.</td>
</tr>
<tr>
<td>target_range</td>
<td>no</td>
<td>range</td>
<td>in_range: [ 1, 65536 ]</td>
<td>The optional range for target port.</td>
</tr>
</tbody>
</table>

C.2.5.2 Definition
The TOSCA PortSpec type is defined as follows:

```yaml
tosca.datatypes.network.PortSpec:
```
properties:
  protocol:
    type: string
    required: true
    default: tcp
    constraints:
      - valid_values: [ udp, tcp, igmp ]
  target:
    type: integer
    entry_schema:
      type: PortDef
  target_range:
    type: range
    constraints:
      - in_range: [ 1, 65535 ]
  source:
    type: integer
    entry_schema:
      type: PortDef
  source_range:
    type: range
    constraints:
      - in_range: [ 1, 65535 ]

C.2.5.3 Additional requirements

- A valid PortSpec must have at least one of the following properties: target, target_range, source or source_range.

C.2.5.4 Examples

Example usage of the PortSpec data type:

```yaml
# example properties in a node template
some_endpoint:
  properties:
    ports:
      user_port:
        protocol: tcp
        target: 50000
        target_range: [ 20000, 60000 ]
        source: 9000
        source_range: [ 1000, 10000 ]
```
C.3 Capabilities Types

C.3.1 tosca.capabilities.Root
This is the default (root) TOSCA Capability Type definition that all other TOSCA Capability Types derive from.

C.3.1.1 Definition

tosca.capabilities.Root:
    description: The TOSCA root Capability Type all other TOSCA base Capability Types derive from

C.3.2 tosca.capabilities.Node
The Node capability indicates the base capabilities of a TOSCA Node Type.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>Node</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:Node</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.capabilities.Node</td>
</tr>
</tbody>
</table>

C.3.2.1 Definition

tosca.capabilities.Node:
    derived_from: tosca.capabilities.Root

C.3.3 tosca.capabilities.Container
The Container capability, when included on a Node Type or Template definition, indicates that the node can act as a container for (or a host for) one or more other declared Node Types.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>Container</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:Container</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.capabilities.Container</td>
</tr>
</tbody>
</table>

C.3.3.1 Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>num_cpus</td>
<td>no</td>
<td>integer</td>
<td>greater_or_equal: 1</td>
<td>Number of (actual or virtual) CPUs associated with the Compute node.</td>
</tr>
<tr>
<td>cpu_frequency</td>
<td>no</td>
<td>scalar-unit.frequency</td>
<td>greater_or_equal: 0.1 GHz</td>
<td>Specifies the operating frequency of CPU’s core. This property expresses the expected frequency of one (1) CPU as provided by the property “num_cpus”.</td>
</tr>
<tr>
<td>disk_size</td>
<td>no</td>
<td>scalar-unit.size</td>
<td>greater_or_equal: 0 MB</td>
<td>Size of the local disk available to applications running on the Compute node (default unit is MB).</td>
</tr>
<tr>
<td>mem_size</td>
<td>no</td>
<td>scalar-unit.size</td>
<td>greater_or_equal: 0 MB</td>
<td>Size of memory available to applications running on the Compute node (default unit is MB).</td>
</tr>
</tbody>
</table>
C.3.3.2 Definition

tosca.capabilities.Container:
  derived_from: tosca.capabilities.Root
  properties:
    num_cpus:
      type: integer
      required: false
      constraints:
        - greater_or_equal: 1
    cpu_frequency:
      type: scalar-unit.frequency
      required: false
      constraints:
        - greater_or_equal: 0.1 GHz
    disk_size:
      type: scalar-unit.size
      required: false
      constraints:
        - greater_or_equal: 0 MB
    mem_size:
      type: scalar-unit.size
      required: false
      constraints:
        - greater_or_equal: 0 MB

C.3.4 tosca.capabilities.Endpoint

This is the default TOSCA type that should be used or extended to define a network endpoint capability. This includes the information to express a basic endpoint with a single port or a complex endpoint with multiple ports. By default the Endpoint is assumed to represent an address on a private network unless otherwise specified.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>Endpoint</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:Endpoint</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.capabilities.Endpoint</td>
</tr>
</tbody>
</table>

C.3.4.1 Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>protocol</td>
<td>yes</td>
<td>string</td>
<td>default: tcp</td>
<td>The name of the protocol (i.e., the protocol prefix) that the endpoint accepts (any OSI Layer 4-7 protocols)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Examples: http, https, ftp, tcp, udp, etc.</td>
</tr>
<tr>
<td>Name</td>
<td>Required</td>
<td>Type</td>
<td>Constraints</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>----------</td>
<td>-------------</td>
<td>--------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>port</td>
<td>no</td>
<td>PortDef</td>
<td>greater_or_equal: 1 less_or_equal: 65535</td>
<td>The optional port of the endpoint.</td>
</tr>
<tr>
<td>secure</td>
<td>no</td>
<td>boolean</td>
<td>default: false</td>
<td>Requests for the endpoint to be secure and use credentials supplied on the ConnectsTo relationship.</td>
</tr>
<tr>
<td>url_path</td>
<td>no</td>
<td>string</td>
<td>None</td>
<td>The optional URL path of the endpoint’s address if applicable for the protocol.</td>
</tr>
<tr>
<td>port_name</td>
<td>no</td>
<td>string</td>
<td>None</td>
<td>The optional name (or ID) of the network port this endpoint should be bound to.</td>
</tr>
<tr>
<td>network_name</td>
<td>no</td>
<td>string</td>
<td>default: PRIVATE</td>
<td>The optional name (or ID) of the network this endpoint should be bound to.</td>
</tr>
<tr>
<td>initiator</td>
<td>no</td>
<td>string</td>
<td>one of: source target peer</td>
<td>The optional indicator of the direction of the connection.</td>
</tr>
<tr>
<td>ports</td>
<td>no</td>
<td>map of PortSpec</td>
<td>None</td>
<td>The optional map of ports the Endpoint supports (if more than one)</td>
</tr>
</tbody>
</table>

### C.3.4.2 Attributes

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip_address</td>
<td>yes</td>
<td>string</td>
<td>None</td>
<td>Note: This is the IP address as propagated up by the associated node’s host (Compute) container.</td>
</tr>
</tbody>
</table>

### C.3.4.3 Definition

```yml
tosca.capabilities.Endpoint:
  derived_from: tosca.capabilities.Root
  properties:
    protocol:
      type: string
      default: tcp
    port:
      type: PortDef
      required: false
    secure:
      type: boolean
      default: false
    url_path:
      type: string
      required: false
    port_name:
```
C.3.4.4 Additional requirements

- Although both the port and ports properties are not required, one of port or ports must be provided in a valid Endpoint.

C.3.5 tosca.capabilities.Endpoint.Public

This capability represents a public endpoint which is accessible to the general internet (and its public IP address ranges).

This public endpoint capability also can be used to create a floating (IP) address that the underlying network assigns from a pool allocated from the application’s underlying public network. This floating address is managed by the underlying network such that can be routed an application’s private address and remains reliable to internet clients.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>Endpoint.Public</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:Endpoint.Public</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.capabilities.Endpoint.Public</td>
</tr>
</tbody>
</table>

C.3.5.1 Definition

tosca.capabilities.Endpoint.Public:
  derived_from: tosca.capabilities.Endpoint
properties:
  # Change the default network_name to use the first public network found
  network_name: PUBLIC
  floating:
    description: >
      indicates that the public address should be allocated from a pool of
      floating IPs that are associated with the network.
    type: boolean
    default: false
    status: experimental
  dns_name:
    description: The optional name to register with DNS
    type: string
    required: false
    status: experimental

C.3.5.2 Additional requirements

- If the network_name is set to the reserved value PRIVATE or if the value is set to the name of network
  (or subnetwork) that is not public (i.e., has non-public IP address ranges assigned to it) then TOSCA
  Orchestrators SHALL treat this as an error.
- If a dns_name is set, TOSCA Orchestrators SHALL attempt to register the name in the (local) DNS registry
  for the Cloud provider.

C.3.6 tosca.capabilities.Endpoint.Admin

This is the default TOSCA type that should be used or extended to define a specialized administrator endpoint
capability.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>Endpoint.Admin</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:Endpoint.Admin</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.capabilities.Endpoint.Admin</td>
</tr>
</tbody>
</table>

C.3.6.1 Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
</tr>
</tbody>
</table>

C.3.6.2 Definition

tosca.capabilities.Endpoint.Admin:
  derived_from: tosca.capabilities.Endpoint
  # Change Endpoint secure indicator to true from its default of false
  properties:
    secure: true
C.3.6.3 Additional requirements

- TOSCA Orchestrator implementations of Endpoint.Admin (and connections to it) \textbf{SHALL} assure that network-level security is enforced if possible.

C.3.7 \texttt{tosca.capabilities.Endpoint.Database}

This is the default TOSCA type that should be used or extended to define a specialized database endpoint capability.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>Endpoint.Database</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>\texttt{tosca:Endpoint.Database}</td>
</tr>
<tr>
<td>Type URI</td>
<td>\texttt{tosca.capabilities.Endpoint.Database}</td>
</tr>
</tbody>
</table>

C.3.7.1 Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
</tr>
</tbody>
</table>

C.3.7.2 Definition

\texttt{tosca.capabilities.Endpoint.Database:}
\hspace{1em} derived\_from: \texttt{tosca.capabilities.Endpoint}

C.3.8 \texttt{tosca.capabilities.Attachment}

This is the default TOSCA type that should be used or extended to define an attachment capability of a (logical) infrastructure device node (e.g., \texttt{BlockStorage} node).

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>Attachment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>\texttt{tosca:Attachment}</td>
</tr>
<tr>
<td>Type URI</td>
<td>\texttt{tosca.capabilities.Attachment}</td>
</tr>
</tbody>
</table>

C.3.8.1 Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
</tr>
</tbody>
</table>

C.3.8.2 Definition

\texttt{tosca.capabilities.Attachment:}
\hspace{1em} derived\_from: \texttt{tosca.capabilities.Root}

C.3.9 \texttt{tosca.capabilities.OperatingSystem}

This is the default TOSCA type that should be used to express an Operating System capability for a node.
### C.3.9.1 Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>architecture</td>
<td>no</td>
<td>string</td>
<td>None</td>
<td>The Operating System (OS) architecture. Examples of valid values include: x86_32, x86_64, etc.</td>
</tr>
<tr>
<td>type</td>
<td>no</td>
<td>string</td>
<td>None</td>
<td>The Operating System (OS) type. Examples of valid values include: linux, aix, mac, windows, etc.</td>
</tr>
<tr>
<td>distribution</td>
<td>no</td>
<td>string</td>
<td>None</td>
<td>The Operating System (OS) distribution. Examples of valid values for an “type” of “Linux” would include: debian, fedora, rhel and ubuntu.</td>
</tr>
<tr>
<td>version</td>
<td>no</td>
<td>version</td>
<td>None</td>
<td>The Operating System version.</td>
</tr>
</tbody>
</table>

### C.3.9.2 Definition

```yaml
tosca.capabilities.OperatingSystem:
  derived_from: tosca.capabilities.Root
  properties:
    architecture:
      type: string
      required: false
    type:
      type: string
      required: false
    distribution:
      type: string
      required: false
    version:
      type: version
      required: false
```

### C.3.9.3 Additional Requirements

- Please note that the string values for the properties architecture, type and distribution SHALL be normalized to lowercase by processors of the service template for matching purposes. For example, if a “type” value is set to either “Linux”, “LINUX” or “linux” in a service template, the processor would normalize all three values to “linux” for matching purposes.
C.3.9.4 Notes

- None

C.3.10 tosca.capabilities.Scalable

This is the default TOSCA type that should be used to express a scalability capability for a node.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>Scalable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:Scalable</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.capabilities.Scalable</td>
</tr>
</tbody>
</table>

C.3.10.1 Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>min_instances</td>
<td>yes</td>
<td>integer</td>
<td>default: 1</td>
<td>This property is used to indicate the minimum number of instances that should be created for the associated TOSCA Node Template by a TOSCA orchestrator.</td>
</tr>
<tr>
<td>max_instances</td>
<td>yes</td>
<td>integer</td>
<td>default: 1</td>
<td>This property is used to indicate the maximum number of instances that should be created for the associated TOSCA Node Template by a TOSCA orchestrator.</td>
</tr>
<tr>
<td>default_instances</td>
<td>no</td>
<td>integer</td>
<td>N/A</td>
<td>An optional property that indicates the requested default number of instances that should be the starting number of instances a TOSCA orchestrator should attempt to allocate.</td>
</tr>
</tbody>
</table>

Note: The value for this property MUST be in the range between the values set for ‘min_instances’ and ‘max_instances’ properties.

C.3.10.2 Definition

```yaml
tosca.capabilities.Scalable:
  derived_from: tosca.capabilities.Root
  properties:
    min_instances:
      type: integer
      default: 1
    max_instances:
      type: integer
      default: 1
    default_instances:
      type: integer
      default: 1
```

C.3.10.3 Notes

- The actual number of instances for a node may be governed by a separate scaling policy which conceptually would be associated to either a scaling-capable node or a group of nodes in which it is defined to be a part of. This is a planned future feature of the TOSCA Simple Profile and not currently described.
C.3.11 tosca.capabilities.networkBindable

A node type that includes the Bindable capability indicates that it can be bound to a logical network association via a network port.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>networkBindable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:networkBindable</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.capabilities.networkBindable</td>
</tr>
</tbody>
</table>

C.3.11.1 Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
</tr>
</tbody>
</table>

C.3.11.2 Definition

tosca.capabilities.networkBindable:
  derived_from: tosca.capabilities.Node

C.4 Requirement Types

There are no normative Requirement Types currently defined in this working draft. Typically, Requirements are described against a known Capability Type.

C.5 Relationship Types

C.5.1 tosca.relationships.Root

This is the default (root) TOSCA Relationship Type definition that all other TOSCA Relationship Types derive from.

C.5.1.1 Attributes

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tosca_id</td>
<td>yes</td>
<td>string</td>
<td>None</td>
<td>A unique identifier of the realized instance of a Relationship Template that derives from any TOSCA normative type.</td>
</tr>
<tr>
<td>tosca_name</td>
<td>yes</td>
<td>string</td>
<td>None</td>
<td>This attribute reflects the name of the Relationship Template as defined in the TOSCA service template. This name is not unique to the realized instance model of corresponding deployed application as each template in the model can result in one or more instances (e.g., scaled) when orchestrated to a provider environment.</td>
</tr>
</tbody>
</table>

C.5.1.2 Definition

tosca.relationships.Root:
  description: The TOSCA root Relationship Type all other TOSCA base Relationship Types derive from
attributes:
  tosca_id:
    type: string
  tosca_name:
    type: string

interfaces:
  Configure:
    type: tosca.interfaces.relationship.Configure

C.5.2 tosca.relationships.DepsOn

This type represents a general dependency relationship between two nodes.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>DependsOn</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:DependsOn</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.relationships.DepsOn</td>
</tr>
</tbody>
</table>

C.5.2.1 Definition

tosca.relationships.DepsOn:
  derived_from: tosca.relationships.Root
  valid_target_types: [ tosca.capabilities.Node ]

C.5.3 tosca.relationships.HostedOn

This type represents a hosting relationship between two nodes.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>HostedOn</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:HostedOn</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.relationships.HostedOn</td>
</tr>
</tbody>
</table>

C.5.3.1 Definition

tosca.relationships.HostedOn:
  derived_from: tosca.relationships.Root
  valid_target_types: [ tosca.capabilities.Container ]
C.5.4 tosca.relationships.ConnectsTo

This type represents a network connection relationship between two nodes.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>ConnectsTo</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type Qualified Name</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>tosca:ConnectsTo</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type URI</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>tosca.relationships.ConnectsTo</td>
</tr>
</tbody>
</table>

C.5.4.1 Definition

tosca.relationships.ConnectsTo:

derived_from: tosca.relationships.Root
valid_target_types: [ tosca.capabilities.Endpoint ]

properties:
  credential:
    type: tosca.datatypes.Credential
    required: false

C.5.4.2 Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential</td>
<td>no</td>
<td>Credential</td>
<td>None</td>
<td>The security credential to use to present to the target endpoint to for either authentication or authorization purposes.</td>
</tr>
</tbody>
</table>

C.5.5 tosca.relationships.AttachesTo

This type represents an attachment relationship between two nodes. For example, an AttachesTo relationship type would be used for attaching a storage node to a Compute node.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>AttachesTo</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type Qualified Name</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>tosca:AttachesTo</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Type URI</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>

### C.5.6.3 Definition

tosca.relationships.RoutesTo:
  derived_from: tosca.relationships.ConnectsTo
  valid_target_types: [tosca.capabilities.Endpoint]
C.6 Interface Types

Interfaces are reusable entities that define a set of operations that can be included as part of a Node type or Relationship Type definition. Each named operations may have code or scripts associated with them that orchestrators can execute for when transitioning an application to a given state.

C.6.1 Additional Requirements

- Designers of Node or Relationship types are not required to actually provide/associate code or scripts with every operation for a given interface it supports. In these cases, orchestrators SHALL consider that a “No Operation” or “no-op”.
- The default behavior when providing scripts for an operation in a sub-type (sub-class) or a template of an existing type which already has a script provided for that operation SHALL be override. Meaning that the subclasses’ script is used in place of the parent type’s script.

C.6.2 Best Practices

- When TOSCA Orchestrators substitute an implementation for an abstract node in a deployed service template it SHOULD be able to present a confirmation to the submitter to confirm the implementation chosen would be acceptable.

C.6.3 tosca.interfaces.node.lifecycle.Standard

This lifecycle interface defines the essential, normative operations that TOSCA nodes may support.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca: Standard</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.interfaces.node.lifecycle.Standard</td>
</tr>
</tbody>
</table>

C.6.3.1 Definition

tosca.interfaces.node.lifecycle.Standard:
  create:
    description: Standard lifecycle create operation.
  configure:
    description: Standard lifecycle configure operation.
  start:
    description: Standard lifecycle start operation.
  stop:
    description: Standard lifecycle stop operation.
  delete:
    description: Standard lifecycle delete operation.

C.6.3.2 Create operation

The create operation is generally used to create the resource or service the node represents in the topology.

TOSCA orchestrators expect node templates to provide either a deployment artifact or an implementation artifact of a defined artifact type that it is able to process. This specification defines normative deployment and
C.6.3.3 Using TOSCA artifacts with interface operations

# Bash script whose location is described in the TOSCA CSAR file

# 1) LOCAL SCOPE: symbolic artifact name <or> 2) GLOBAL: actual file name from CSAR

C.6.3.4 TOSCA Orchestrator processing of Deployment artifacts

TOSCA Orchestrators, when encountering a deployment artifact on the create operation; will automatically attempt to deploy the artifact based upon its artifact type. This means that no implementation artifacts (e.g., scripts) are needed on the create operation to provide commands that deploy or install the software.

For example, if a TOSCA Orchestrator is processing an application with a node of type SoftwareComponent and finds that the node's template has a create operation that provides a filename (or references to an artifact which describes a file) of a known TOSCA deployment artifact type such as an Open Virtualization Format (OVF) image it will automatically deploy that image into the SoftwareComponent's host Compute node.

C.6.3.5 Operation sequencing and node state

The following diagrams show how TOSCA orchestrators sequence the operations of the Standard lifecycle in normal node startup and shutdown procedures.

The following key should be used to interpret the diagrams:

<table>
<thead>
<tr>
<th>Operation Invocation</th>
<th>Node State</th>
<th>Transition State</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&lt;state&gt;</td>
<td>&lt;state&gt;</td>
</tr>
</tbody>
</table>

C.6.3.5.1 Normal node startup sequence diagram

The following diagram shows how the TOSCA orchestrator would invoke operations on the Standard lifecycle to shut down a node.
**C.6.3.5.2 Normal node shutdown sequence diagram**

The following diagram shows how the TOSCA orchestrator would invoke operations on the Standard lifecycle to shut down a node.

![Normal node shutdown sequence diagram](image)

**C.6.4 tosca.interfaces.relationship.Configure**

The lifecycle interfaces define the essential, normative operations that each TOSCA Relationship Types may support.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>Configure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:Configure</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.interfaces.relationship.Configure</td>
</tr>
</tbody>
</table>

**C.6.4.1 Definition**

tosca.interfaces.relationship.Configure:
  - pre_configure_source:
    - description: Operation to pre-configure the source endpoint.
  - pre_configure_target:
    - description: Operation to pre-configure the target endpoint.
  - post_configure_source:
    - description: Operation to post-configure the source endpoint.
  - post_configure_target:
    - description: Operation to post-configure the target endpoint.
  - add_target:
    - description: Operation to notify the source node of a target node being added via a relationship.
  - add_source:
    - description: Operation to notify the target node of a source node which is now available via a relationship.
  - target_changed:
    - description: Operation to notify source some property or attribute of the target
changed
  remove_target:
    description: Operation to remove a target node.
C.6.4.2 Invocation Conventions

TOSCA relationships are directional connecting a source node to a target node. When TOSCA Orchestrator connects a source and target node together using a relationship that supports the Configure interface it will "interleave" the operations invocations of the Configure interface with those of the node’s own Standard lifecycle interface. This concept is illustrated below:

C.6.4.3 Normal node start sequence with Configure relationship operations

The following diagram shows how the TOSCA orchestrator would invoke Configure lifecycle operations in conjunction with Standard lifecycle operations during a typical startup sequence on a node.
C.6.4.3.1 Node-Relationship configuration sequence

Depending on which side (i.e., source or target) of a relationship a node is on, the orchestrator will:

- Invoke either the `pre_configure_source` or `pre_configure_target` operation as supplied by the relationship on the node.
- Invoke the node’s `configure` operation.
- Invoke either the `post_configure_source` or `post_configure_target` as supplied by the relationship on the node.

Note that the `pre_configure_xxx` and `post_configure_xxx` are invoked only once per node instance.

C.6.4.3.2 Node-Relationship add, remove and changed sequence

Since a topology template contains nodes that can dynamically be added (and scaled), removed or changed as part of an application instance, the Configure lifecycle includes operations that are invoked on node instances that to notify and address these dynamic changes.

For example, a source node, of a relationship that use the Configure lifecycle, will have the relationship operations `add_target`, or `remove_target` invoked on it whenever a target node instance is added or removed to the running application instance. In addition, whenever the node state of its target node changes, the `target_changed` operation is invoked on it to address this change. Conversely, the `add_source` and `remove_source` operations are invoked on the source node of the relationship.

C.6.4.4 Notes

- The target (provider) MUST be active and running (i.e., all its dependency stack MUST be fulfilled) prior to invoking `add_target`
  - In other words, all Requirements MUST be satisfied before it advertises its capabilities (i.e., the attributes of the matched Capabilities are available).
  - In other words, it cannot be “consumed” by any dependent node.
  - Conversely, since the source (consumer) needs information (attributes) about any targets (and their attributes) being removed before it actually goes away.
  - The `remove_target` operation should only be executed if the target has had `add_target` executed. BUT in truth we’re first informed about a target in `pre_configure_source`, so if we execute that the source node should see `remove_target` called to cleanup.
  - Error handling: If any node operation of the topology fails processing should stop on that node template and the failing operation (script) should return an error (failure) code when possible.

C.7 Node Types

C.7.1 tosca.nodes.Root

The TOSCA Root Node Type is the default type that all other TOSCA base Node Types derive from. This allows for all TOSCA nodes to have a consistent set of features for modeling and management (e.g., consistent definitions for requirements, capabilities and lifecycle interfaces).
**Shorthand Name** | Root  
---|---  
**Type Qualified Name** | tosca:Root  
**Type URI** | tosca.nodes.Root

interfaces:
  Standard:
C.7.1.4 Additional Requirements

- All Node Type definitions that wish to adhere to the TOSCA Simple Profile SHOULD extend from the TOSCA Root Node Type to be assured of compatibility and portability across implementations.

C.7.2 tosca.nodes.Compute

The TOSCA Compute node represents one or more real or virtual processors of software applications or services along with other essential local resources. Collectively, the resources the compute node represents can logically be viewed as a (real or virtual) “server”.

<table>
<thead>
<tr>
<th>Shorthand Name</th>

</table>
C.7.3.3 Definition

tosca.nodes.SoftwareComponent:
  derived_from: tosca.nodes.Root
  properties:
    # domain-specific software component version
    component_version:
      type: version
      required: false
    admin_credential:
      type: tosca.datatypes.Credential
      required: false
  requirements:
    - host:
        capability: tosca.capabilities.Container
        node: tosca.nodes.Compute
        relationship: tosca.relationships.HostedOn

C.7.3.4 Additional Requirements

- Nodes that can directly be managed and run by a TOSCA Compute Node Type SHOULD extend from this type.

C.7.4 tosca.nodes.WebServer

This TOSA WebServer Node Type represents an abstract software component or service that is capable of hosting and providing management operations for one or more WebApplication nodes.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>WebServer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:WebServer</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.nodes.WebServer</td>
</tr>

<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
<td>N/A</td>
</tr>
</tbody>
</table>
C.7.4.2 Definition

tosca.nodes.WebServer:
  derived_from: tosca.nodes.SoftwareComponent
capabilities:
  # Private, layer 4 endpoints
data_endpoint: tosca.capabilities.Endpoint
admin_endpoint: tosca.capabilities.Endpoint.Admin
host:
  type: tosca.capabilities.Container
  valid_source_types: [ tosca.nodes.WebApplication ]

C.7.4.3 Notes and Additional Requirements

- This node SHALL export both a secure endpoint capability (i.e., admin_endpoint), typically for administration, as well as a regular endpoint (i.e., data_endpoint) for serving data.

C.7.5 tosca.nodes.WebApplication

The TOSCA WebApplication node represents a software application that can be managed and run by a TOSCA WebServer node. Specific types of web applications such as Java, etc. could be derived from this type.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>WebApplication</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca: WebApplication</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.nodes.WebApplication</td>

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>context_root</td>
<td>no</td>
<td>string</td>
<td>None</td>
<td>The web application's context root which designates the application's URL path within the web server it is hosted on.</td>
</tr>
</tbody>
</table>

C.7.5.2 Definition

tosca.nodes.WebApplication:
  derived_from: tosca.nodes.Root
properties:
  context_root:
    type: string
capabilities:
  app_endpoint:
    type: tosca.capabilities.Endpoint
requirements:
  - host:
    capability: tosca.capabilities.Container
node: tosca.nodes.WebServer
relationship: tosca.relationships.HostedOn

### C.7.5.3 Additional Requirements

- None

### C.7.6 tosca.nodes.DBMS

The TOSCA **DBMS** node represents a typical relational, SQL Database Management System software component or service.

#### C.7.6.1 Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>root_password</td>
<td>no</td>

<td>no</td>
<td>integer</td>
<td>None</td>
<td>The DBMS server’s port.</td>
</tr>
</tbody>
</table>

#### C.7.6.2 Definition

```yaml
tosca.nodes.DBMS:
  derived_from: tosca.nodes.SoftwareComponent
  properties:
    root_password:
      type: string
      required: false
      description: the optional root password for the DBMS service
    port:
      type: integer
      required: false
      description: the port the DBMS service will listen to for data and requests
  capabilities:
    host:
      type: tosca.capabilities.Container
  valid_source_types: [ tosca.nodes.Database ]
```

### C.7.6.3 Additional Requirements

- None

### C.7.7 tosca.nodes.Database

The TOSCA **Database** node represents a logical database that can be managed and hosted by a TOSCA **DBMS** node.
<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>Database</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:Database</td>

</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>yes</td>
<td>string</td>
<td>None</td>
<td>The logical database Name</td>
</tr>
<tr>
<td>port</td>
<td>no</td>
<td>integer</td>
<td>None</td>
<td>The port the database service will use to listen for incoming data and requests.</td>
</tr>
<tr>
<td>user</td>
<td>no</td>
<td>string</td>
<td>None</td>
<td>The special user account used for database administration.</td>
</tr>
<tr>
<td>password</td>
<td>no</td>
<td>string</td>
<td>None</td>
<td>The password associated with the user account provided in the ‘user’ property.</td>
</tr>
</tbody>
</table>

### C.7.7.2 Definition

tosca.nodes.Database:
  derived_from: tosca.nodes.Root
  properties:
    name:
      type: string
      description: the logical name of the database
    port:
      type: integer
      description: the port the underlying database service will listen to for data
    user:
      type: string
      description: the optional user account name for DB administration
      required: false
    password:
      type: string
      description: the optional password for the DB user account
      required: false
  requirements:
    - host:
      capability: tosca.capabilities.Container
      node: tosca.nodes.DBMS
      relationship: tosca.relationships.HostedOn
  capabilities:
    database_endpoint:
      type: tosca.capabilities.Endpoint.Database
C.7.8 tosca.nodes.ObjectStorage

The TOSCA ObjectStorage node represents storage that provides the ability to store data as objects (or BLOBs of data) without consideration for the underlying filesystem or devices.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>ObjectStorage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:ObjectStorage</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.nodes.ObjectStorage</td>
</tr>
</tbody>
</table>

C.7.8.1 Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>yes</td>
<td>string</td>
<td>None</td>
<td>The logical name of the object store (or container).</td>
</tr>
<tr>
<td>size</td>
<td>no</td>
<td>scalar-unit.size</td>
<td>greater_or_equal: 0 GB</td>
<td>The requested initial storage size (default unit is in Gigabytes).</td>
</tr>
<tr>
<td>maxsize</td>
<td>no</td>
<td>scalar-unit.size</td>
<td>greater_or_equal: 0 GB</td>
<td>The requested maximum storage size (default unit is in Gigabytes).</td>
</tr>
</tbody>
</table>

C.7.8.2 Definition

tosca.nodes.ObjectStorage:
   derived_from: tosca.nodes.Root
   properties:
      name:
         type: string
      size:
         type: scalar-unit.size
         constraints:
            - greater_or_equal: 0 GB
      maxsize:
         type: scalar-unit.size
         constraints:
            - greater_or_equal: 0 GB
   capabilities:
      storage_endpoint:
         type: tosca.capabilities.Endpoint

C.7.8.3 Notes:

- Subclasses of the ObjectStorage node may impose further constraints on properties. For example, a subclass may constrain the (minimum or maximum) length of the ‘name’ property or include a regular expression to constrain allowed characters used in the ‘name’ property.

C.7.9 tosca.nodes.BlockStorage

The TOSCA BlockStorage node currently represents a server-local block storage device (i.e., not shared) offering evenly sized blocks of data from which raw storage volumes can be created.
**Note:** In this draft of the TOSCA Simple Profile, distributed or Network Attached Storage (NAS) are not yet considered (nor are clustered file systems), but the TC plans to do so in future drafts.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>BlockStorage</th>
</tr>

</table>

### C.7.9.3 Definition

```yaml
tosca.nodes.BlockStorage:
    derived_from: tosca.nodes.Root
    properties:
        size:
            type: scalar-unit.size
            constraints:
                - greater_or_equal: 1 MB
        volume_id:
            type: string
            required: false
        snapshot_id:
            type: string
            required: false
    capabilities:
        attachment:
            type: tosca.capabilities.Attachment
```
C.7.9.4 Additional Requirements

- The `size` property is required when an existing volume (i.e., `volume_id`) is not available. However, if the property `volume_id` is provided, the `size` property is ignored.

C.7.9.5 Notes

- Resize is of existing volumes is not considered at this time.
- It is assumed that the volume contains a single filesystem that the operating system (that is hosting an associate application) can recognize and mount without additional information (i.e., it is operating system independent).
- Currently, this version of the Simple Profile does not consider regions (or availability zones) when modeling storage.

C.7.10 `tosca.nodes.Container.Runtime`

The TOSCA `Container` Runtime node represents operating system-level virtualization technology used to run multiple application services on a single Compute host.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>Container.Runtime</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:Container.Runtime</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.nodes.Container.Runtime</td>
</tr>
</tbody>
</table>

C.7.10.1 Definition

tosca.nodes.Container.Runtime:
   derived_from: tosca.nodes.SoftwareComponent
   capabilities:
      host:
         type: tosca.capabilities.Container
      scalable:
         type: tosca.capabilities.Scalable

C.7.11 `tosca.nodes.Container.Application`

The TOSCA `Container` Application node represents an application that requires `Container`-level virtualization technology.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>Container.Application</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:Container.Application</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.nodes.Container.Application</td>
</tr>
</tbody>
</table>

C.7.11.1 Definition

tosca.nodes.Container.Application:
   derived_from: tosca.nodes.Root
   requirements:
- host:
  capability: tosca.capabilities.Container
  node: tosca.nodes.Container
  relationship: tosca.relationships.HostedOn

C.7.12 tosca.nodes.LoadBalancer

The TOSCA Load Balancer node represents logical function that be used in conjunction with a Floating Address to distribute an application’s traffic (load) across a number of instances of the application (e.g., for a clustered or scaled application).

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>LoadBalancer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:LoadBalancer</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.nodes.LoadBalancer</td>
</tr>
</tbody>
</table>

C.7.12.1 Definition

tosca.nodes.LoadBalancer:
  derived_from: tosca.nodes.Root
  properties:
    # TBD
    algorithm:
      type: string
      required: false
      status: experimental
  capabilities:
    client:
      type: tosca.capabilities.Endpoint.Public
      occurrences: [0, UNBOUNDED]
      description: the Floating (IP) client’s on the public network can connect to
  requirements:
    - application:
      capability: tosca.capabilities.Endpoint
      relationship: tosca.relationships.RoutesTo
      occurrences: [0, UNBOUNDED]
      description: Connection to one or more load balanced applications

C.7.13 Notes:

- A LoadBalancer node can still be instantiated and managed independently of any applications it would serve; therefore, the load balancer’s application requirement allows for zero occurrences.

C.8 Artifact Types

TOSCA Artifacts represent the packages and imperative used by the orchestrator when invoking TOSCA Interfaces on Node or Relationship Types. Currently, artifacts are logically divided into three categories:
• **Deployment Types**: includes those artifacts that are used during deployment (e.g., referenced on create and install operations) and include packaging files such as RPMs, ZIPs, or TAR files.

• **Implementation Types**: includes those artifacts that represent imperative logic and are used to implement TOSCA Interface operations. These typically include scripting languages such as Bash (`.sh`), Chef and Puppet.

• **Runtime Types**: includes those artifacts that are used during runtime by a service or component of the application. This could include a library or language runtime that is needed by an application such as a PHP or Java library.

**Note**: Normative TOSCA Artifact Types will be developed in future drafts of this specification.

### C.8.1 tosca.artifacts.Root

This is the default (root) TOSCA Artifact Type definition that all other TOSCA base Artifact Types derive from.

**C.8.1.1 Definition**

```yaml
tosca.artifacts.Root:
  description: The TOSCA Artifact Type all other TOSCA Artifact Types derive from
```

### C.8.2 tosca.artifacts.File

This artifact type is used when an artifact definition needs to have its associated file simply treated as a file and no special handling/handlers are invoked (i.e., it is not treated as either an implementation or deployment artifact type).

**C.8.2.1 Definition**

```yaml
tosca.artifacts.File:
  derived_from: tosca.artifacts.Root
```

### C.8.3 Deployment Types

#### C.8.3.1 tosca.artifacts.Deployment

This artifact type represents the parent type for all deployment artifacts in TOSCA. This class of artifacts typically represents a binary packaging of an application or service that is used to install/create or deploy it as part of a node’s lifecycle.

**C.8.3.1.1 Definition**

```yaml
tosca.artifacts.Deployment:
```
C.8.3.2 tosca.artifacts.Deployment.Image

This artifact type represents a parent type for any “image” which is an opaque packaging of a TOSCA Node’s deployment (whether real or virtual) whose contents are typically already installed and pre-configured (i.e., “stateful”) and prepared to be run on a known target container.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>Deployment.Image</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:Deployment.Image</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.artifacts.Deployment.Image</td>
</tr>
</tbody>
</table>

C.8.3.2.1 Definition

tosca.artifacts.Deployment.Image:

derived_from: tosca.artifacts.Root

description: TOSCA base type for deployment artifacts

C.8.4 tosca.artifacts.Deployment.Image.VM

This artifact represents the parent type for all Virtual Machine (VM) image and container formatted deployment artifacts. These images contain a stateful capture of a machine (e.g., server) including operating system and installed software along with any configurations and can be run on another machine using a hypervisor which virtualizes typical server (i.e., hardware) resources.

C.8.4.1 Definition

tosca.artifacts.Deployment.Image.VM:

derived_from: tosca.artifacts.Deployment.Image

description: Virtual Machine (VM) Image

C.8.4.2 Notes:

- Future drafts of this specification may include popular standard VM disk image (e.g., ISO, VMI, VMDX, QCOW2, etc.) and container (e.g., OVF, bare, etc.) formats. These would include consideration of disk formats such as:

C.8.5 Implementation Types

C.8.5.1 tosca.artifacts.Implementation

This artifact type represents the parent type for all implementation artifacts in TOSCA. These artifacts are used to implement operations of TOSCA interfaces either directly (e.g., scripts) or indirectly (e.g., config. files).

C.8.5.1.1 Definition

tosca.artifacts.Implementation:

derived_from: tosca.artifacts.Root
C.8.5.2 tosca.artifacts.Implementation.Bash

This artifact type represents a Bash script type that contains Bash commands that can be executed on the Unix Bash shell.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>Bash</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:Bash</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.artifacts.Implementation.Bash</td>
</tr>
</tbody>
</table>

C.8.5.2.1 Definition

tosca.artifacts.Implementation.Bash:
  derived_from: tosca.artifacts.Implementation
  description: Script artifact for the Unix Bash shell
  mime_type: application/x-sh
  file_ext: [ sh ]

C.8.5.3 tosca.artifacts.Implementation.Python

This artifact type represents a Python file that contains Python language constructs that can be executed within a Python interpreter.

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>Python</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:Python</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.artifacts.Implementation.Python</td>
</tr>
</tbody>
</table>

C.8.5.3.1 Definition

tosca.artifacts.Implementation.Python:
  derived_from: tosca.artifacts.Implementation
  description: Artifact for the interpreted Python language
  mime_type: application/x-python
  file_ext: [ py ]
Appendix D. Non-normative type definitions

This section defines non-normative types used in examples or use cases within this specification.

D.1 Artifact Types

This artifact represents a Docker “image” (a TOSCA deployment artifact type) which is a binary comprised of one or more (a union of read-only and read-write) layers created from snapshots within the underlying Docker Union File System.

D.1.1.1 Definition

    derived_from: tosca.artifacts.Deployment.Image
description: Docker Container Image

D.1.2 tosca.artifacts.Deployment.Image.VM.ISO

A Virtual Machine (VM) formatted as an ISO standard disk image.

D.1.2.1 Definition

tosca.artifacts.Deployment.Image.VM.ISO:
    derived_from: tosca.artifacts.Deployment.Image.VM
description: Virtual Machine (VM) image in ISO disk format

D.2 Capability Types

D.2.1 tosca.capabilities.Container.Docker

The type indicates capabilities of a Docker runtime environment (client).

<table>
<thead>
<tr>
<th>Shorthand Name</th>
<th>Container.Docker</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type Qualified Name</td>
<td>tosca:Container.Docker</td>
</tr>
<tr>
<td>Type URI</td>
<td>tosca.capabilities.Container.Docker</td>
</tr>
</tbody>
</table>

D.2.1.1 Properties

<table>
<thead>
<tr>
<th>Name</th>
<th>Required</th>
<th>Type</th>
<th>Constraints</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>no</td>
<td>version[]</td>
<td>None</td>
<td>The Docker version capability (i.e., the versions supported by the capability).</td>
</tr>
<tr>
<td>publish_all</td>
<td>no</td>
<td>boolean</td>
<td>default: false</td>
<td>Indicates that all ports (ranges) listed in the dockerfile using the EXPOSE keyword be published.</td>
</tr>
<tr>
<td>publish_ports</td>
<td>no</td>
<td>list of PortSpec</td>
<td>None</td>
<td>List of ports mappings from source (Docker container) to target (host) ports to publish.</td>

```
tosca.nodes.Container.Application.Docker:
  derived_from: `tosca.nodes.Container.Application`
  requirements:
    - host:
      
        capability: `tosca.capabilities.Container.Docker`
```
Appendix E. TOSCA Cloud Service Archive (CSAR) Format

TOSCA Simple Profile definitions along with all accompanying artifacts (e.g. scripts, binaries, configuration files) can be packaged together in a CSAR file as already defined in the TOSCA version 1.0 specification [TOSCA-1.0]. In contrast to the TOSCA 1.0 CSAR file specification (see chapter 16 in [TOSCA-1.0]), this simple profile makes a few simplifications both in terms of overall CSAR file structure as well as meta-file content as described below.

E.1 Overall Structure of a CSAR

A CSAR zip file is required to contain a TOSCA-Metadata directory, which in turn contains the TOSCA.meta metadata file that provides entry information for a TOSCA orchestrator processing the CSAR file.

The CSAR file may contain other directories with arbitrary names and contents. Note that in contrast to the TOSCA 1.0 specification, it is not required to put TOSCA definitions files into a special “Definitions” directory, but definitions YAML files can be placed into any directory within the CSAR file.

E.2 TOSCA Meta File

The TOSCA.meta file structure follows the exact same syntax as defined in the TOSCA 1.0 specification. However, it is only required to include block_0 (see section 16.2 in [TOSCA-1.0]) with the Entry-Definitions keyword pointing to a valid TOSCA definitions YAML file that a TOSCA orchestrator should use as entry for parsing the contents of the overall CSAR file.

Note that it is not required to explicitly list TOSCA definitions files in subsequent blocks of the TOSCA.meta file, but any TOSCA definitions files besides the one denoted by the Entry-Definitions keyword can be found by a TOSCA orchestrator by processing respective imports statements in the entry definitions file (or in recursively imported files).

Note also that any additional artifact files (e.g. scripts, binaries, configuration files) do not have to be declared explicitly through blocks in the TOSCA.meta file. Instead, such artifacts will be fully described and pointed to by relative path names through artifact definitions in one of the TOSCA definitions files contained in the CSAR.

Due to the simplified structure of the CSAR file and TOSCA.meta file compared to TOSCA 1.0, the CSAR-Version keyword listed in block_0 of the meta-file is required to denote version 1.1.

E.2.1 Example

The following listing represents a valid TOSCA.meta file according to this TOSCA Simple Profile specification.

```
TOSCA-Meta-File-Version: 1.0
CSAR-Version: 1.1
Created-By: OASIS TOSCA TC
Entry-Definitions: definitions/tosca_elk.yaml
```

This TOSCA.meta file indicates its simplified TOSCA Simple Profile structure by means of the CSAR-Version keyword with value 1.1. The Entry-Definitions keyword points to a TOSCA definitions YAML file with the name tosca_elk.yaml which is contained in a directory called definitions within the root of the CSAR file.
Appendix F. Networking

This describes how to express and control the application centric network semantics available in TOSCA.

F.1 Networking and Service Template Portability

TOSCA Service Templates are application centric in the sense that they focus on describing application components in terms of their requirements and interrelationships. In order to provide cloud portability, it is important that a TOSCA Service Template avoid cloud specific requirements and details. However, at the same time, TOSCA must provide the expressiveness to control the mapping of software component connectivity to the network constructs of the hosting cloud.

TOSCA Networking takes the following approach.

1. The application component connectivity semantics and expressed in terms of Requirements and Capabilities and the relationships between these. Service Template authors are able to express the interconnectivity requirements of their software components in an abstract, declarative, and thus highly portable manner.

2. The information provided in TOSCA is complete enough for a TOSCA implementation to fulfill the application component network requirements declaratively (i.e., it contains information such as communication initiation and layer 4 port specifications) so that the required network semantics can be realized on arbitrary network infrastructures.

3. TOSCA Networking provides full control of the mapping of software component interconnectivity to the networking constructs of the hosting cloud network independently of the Service Template, providing the required separation between application and network semantics to preserve Service Template portability.

4. Service Template authors have the choice of specifying application component networking requirements in the Service Template or completely separating the application component to network mapping into a separate document. This allows application components with explicit network requirements to express them while allowing users to control the complete mapping for all software components which may not have specific requirements. Usage of these two approaches is possible simultaneously and required to avoid having to re-write components network semantics as arbitrary sets of components are assembled into Service Templates.

5. Defining a set of network semantics which are expressive enough to address the most common application connectivity requirements while avoiding dependencies on specific network technologies and constructs. Service Template authors and cloud providers are able to express unique/non-portable semantics by defining their own specialized network Requirements and Capabilities.

F.2 Connectivity Semantics

TOSCA’s application centric approach includes the modeling of network connectivity semantics from an application component connectivity perspective. The basic premise is that applications contain components which need to communicate with other components using one or more endpoints over a network stack such as TCP/IP, where connectivity between two components is expressed as a <source component, source address, source port, target component, target address, target port> tuple. Note that source and target components are added to the traditional 4 tuple to provide the application centric information, mapping the network to the source or target component involved in the connectivity.
Software components are expressed as Node Types in TOSCA which can express virtually any kind of concept in a TOSCA model. Node Types offering network based functions can model their connectivity using a special Endpoint Capability, `tosca.capabilities.Endpoint`, designed for this purpose. Node Types which require an Endpoint can specify this as a TOSCA requirement. A special Relationship Type, `tosca.relationships.ConnectsTo`, is used to implicitly or explicitly relate the source Node Type's endpoint to the required endpoint in the target node type. Since `tosca.capabilities.Endpoint` and `tosca.relationships.ConnectsTo` are TOSCA types, they can be used in templates and extended by subclassing in the usual ways, thus allowing the expression of additional semantics as needed.

The following diagram shows how the TOSCA node, capability and relationship types enable modeling the application layer decoupled from the network model intersecting at the Compute node using the `Bindable` capability type.

As you can see, the Port node type effectively acts a broker node between the Network node description and a host Compute node of an application.

### F.3 Expressing connectivity semantics

This section describes how TOSCA supports the typical client/server and group communication semantics found in application architectures.

#### F.3.1 Connection initiation semantics

The `tosca.relationships.ConnectsTo` expresses that requirement that a source application component needs to be able to communicate with a target software component to consume the services of the target. `ConnectsTo` is a component interdependency semantic in the most general sense and does not try imply how the communication between the source and target components is physically realized.

Application component intercommunication typically has conventions regarding which component(s) initiate the communication. Connection initiation semantics are specified in `tosca.capabilities.Endpoint`. Endpoints at each end of the `tosca.relationships.ConnectsTo` must indicate identical connection initiation semantics.

The following sections describe the normative connection initiation semantics for the `tosca.relationships.ConnectsTo` Relationship Type.

#### F.3.1.1 Source to Target

The Source to Target communication initiation semantic is the most common case where the source component initiates communication with the target component in order to fulfill an instance of the
tosca.relationships.ConnectsTo relationship. The typical case is a “client” component connecting to a “server”
component where the client initiates a stream oriented connection to a pre-defined transport specific port or set of
ports.

It is the responsibility of the TOSCA implementation to ensure the source component has a suitable network path
to the target component and that the ports specified in the respective tosca.capabilities.Endpoint are not blocked.
The TOSCA implementation may only represent state of the tosca.relationships.ConnectsTo relationship as
fulfilled after the actual network communication is enabled and the source and target components are in their
operational states.

Note that the connection initiation semantic only impacts the fulfillment of the actual connectivity and does not
impact the node traversal order implied by the tosca.relationships.ConnectsTo Relationship Type.

F.3.1.2 Target to Source

The Target to Source communication initiation semantic is a less common case where the target component
initiates communication with the source component in order to fulfill an instance of the
tosca.relationships.ConnectsTo relationship. This “reverse” connection initiation direction is typically required due
to some technical requirements of the components or protocols involved, such as the requirement that SSH mush
only be initiated from target component in order to fulfill the services required by the source component.

It is the responsibility of the TOSCA implementation to ensure the source component has a suitable network path
to the target component and that the ports specified in the respective tosca.capabilities.Endpoint are not blocked.
The TOSCA implementation may only represent state of the tosca.relationships.ConnectsTo relationship as
fulfilled after the actual network communication is enabled and the source and target components are in their
operational states.

Note that the connection initiation semantic only impacts the fulfillment of the actual connectivity and does not
impact the node traversal order implied by the tosca.relationships.ConnectsTo Relationship Type.

F.3.1.3 Peer-to-Peer

The Peer-to-Peer communication initiation semantic allows any member of a group to initiate communication with
any other member of the same group at any time. This semantic typically appears in clustering and distributed
services where there is redundancy of components or services.

It is the responsibility of the TOSCA implementation to ensure the source component has a suitable network path
between all the member component instances and that the ports specified in the respective
tosca.capabilities.Endpoint are not blocked, and the appropriate multicast communication, if necessary, enabled.
The TOSCA implementation may only represent state of the tosca.relationships.ConnectsTo relationship as
fulfilled after the actual network communication is enabled such that at least one member component of the group
may reach any other member component of the group.

Endpoints specifying the Peer-to-Peer initiation semantic need not be related with a
tosca.relationships.ConnectsTo relationship for the common case where the same set of component instances
must communicate with each other.

Note that the connection initiation semantic only impacts the fulfillment of the actual connectivity and does not
impact the node traversal order implied by the tosca.relationships.ConnectsTo Relationship Type.
F.3.2 Specifying layer 4 ports

TOSCA Service Templates must express enough details about application component intercommunication to enable TOSCA implementations to fulfill these communication semantics in the network infrastructure. TOSCA currently focuses on TCP/IP as this is the most pervasive in today’s cloud infrastructures. The layer 4 ports required for application component intercommunication are specified in tosca.capabilities.Endpoint. The union of the port specifications of both the source and target tosca.capabilities.Endpoint which are part of the tosca.relationships.ConnectsTo Relationship Template are interpreted as the effective set of ports which must be allowed in the network communication.

The meaning of Source and Target port(s) corresponds to the direction of the respective tosca.relationships.ConnectsTo.

F.4 Network provisioning

F.4.1 Declarative network provisioning

TOSCA orchestrators are responsible for the provisioning of the network connectivity for declarative TOSCA Service Templates (Declarative TOSCA Service Templates don’t contain explicit plans). This means that the TOSCA orchestrator must be able to infer a suitable logical connectivity model from the Service Template and then decide how to provision the logical connectivity, referred to as “fulfillment”, on the available underlying infrastructure. In order to enable fulfillment, sufficient technical details still must be specified, such as the required protocols, ports and QOS information. TOSCA connectivity types, such as tosca.capabilities.Endpoint, provide well defined means to express these details.

F.4.2 Implicit network fulfillment

TOSCA Service Templates are by default network agnostic. TOSCA’s application centric approach only requires that a TOSCA Service Template contain enough information for a TOSCA orchestrator to infer suitable network connectivity to meet the needs of the application components. Thus Service Template designers are not required to be aware of or provide specific requirements for underlying networks. This approach yields the most portable Service Templates, allowing them to be deployed into any infrastructure which can provide the necessary component interconnectivity.

F.4.3 Controlling network fulfillment

TOSCA provides mechanisms for providing control over network fulfillment. This mechanism allows the application network designer to express in service template or network template how the networks should be provisioned.

For the use cases described below let’s assume we have a typical 3-tier application which is consisting of FE (frontend), BE (backend) and DB (database) tiers. The simple application topology diagram can be shown below:
**F.4.3.1 Use case: OAM Network**

When deploying an application in service provider’s on-premise cloud, it’s very common that one or more of the application’s services should be accessible from an ad-hoc OAM (Operations, Administration and Management) network which exists in the service provider backbone.

As an application network designer, I’d like to express in my TOSCA network template (which corresponds to my TOSCA service template) the network CIDR block, start ip, end ip and segmentation ID (e.g. VLAN id).

The diagram below depicts a typical 3-tiers application with specific networking requirements for its FE tier server cluster:
2549

2550 **F.4.3.2 Use case: Data Traffic network**

2551 The diagram below defines a set of networking requirements for the backend and DB tiers of the 3-tier app mentioned above.
4. My BE servers runs a legacy code (millions of LOC for a network appliance product!) that expects:
- Data network on eth0
- Admin network on eth1

5. As part of a transition to IPv6, we’ve started to “port” BE and DB codebase to support IPv6 for the Data traffic, hence I’d like to create network with:
- IPv6 CIDR: 2001:db8:92a4:0:0:6b3a:180:abcd/64

F.4.3.3 Use case: Bring my own DHCP

The same 3-tier app requires for its admin traffic network to manage the IP allocation by its own DHCP which runs autonomously as part of application domain.

For this purpose, the app network designer would like to express in TOSCA that the underlying provisioned network will be set with DHCP_ENABLED=false. See this illustrated in the figure below:
6. The IPAM of the Admin network is done by internal DHCP service. Thus, I’d like to create a segmented network (broadcast domain) by setting: `DHCP_ENABLED = false`

</tbody>
</table>

F.5.5.1 Definition

tosca.relationships.network.BindsTo:
    derived_from: tosca.relationships.DepsDependsOn
    valid_target_types: [ tosca.capabilities.network.Bindable ]

F.6 Network modeling approaches

F.6.1 Option 1: Specifying a network outside the application’s Service Template

This approach allows someone who understands the application’s networking requirements, mapping the details of the underlying network to the appropriate node templates in the application.

The motivation for this approach is providing the application network designer a fine-grained control on how networks are provisioned and stitched to its application by the TOSCA orchestrator and underlying cloud infrastructure while still preserving the portability of his service template. Preserving the portability means here not doing any modification in service template but just “plug-in” the desired network modeling. The network modeling can reside in the same service template file but the best practice should be placing it in a separated self-contained network template file.

This “pluggable” network template approach introduces a new normative node type called Port, capability called `tosca.capabilities.network.Linkable` and relationship type called `tosca.relationships.network.LinksTo`.

The idea of the Port is to elegantly associate the desired compute nodes with the desired network nodes while not “touching” the compute itself.

The following diagram series demonstrate the plug-ability strength of this approach.
Let's assume an application designer has modeled a service template as shown in Figure 1 that describes the application topology nodes (compute, storage, software components, etc.) with their relationships. The designer ideally wants to preserve this service template and use it in any cloud provider environment without any change.

![Figure-6: Generic Service Template](image)

When the application designer comes to consider its application networking requirement they typically call the network architect/designer from their company (who has the correct expertise). The network designer, after understanding the application connectivity requirements and optionally the target cloud provider environment, is able to model the network template and plug it to the service template as shown in Figure 2:

![Figure-7: Service template with network template A](image)

When there's a new target cloud environment to run the application on, the network designer is simply creates a new network template B that corresponds to the new environmental conditions and provide it to the application designer which packs it into the application CSAR.
The node templates for these three networks would be defined as follows:

```yaml
node_templates:
  frontend:
    type: tosca.nodes.Compute
    properties: # omitted for brevity
  backend:
    type: tosca.nodes.Compute
    properties: # omitted for brevity
  database:
    type: tosca.nodes.Compute
    properties: # omitted for brevity
  oam_network:
    type: tosca.nodes.network.Network
    properties: # omitted for brevity
  admin_network:
    type: tosca.nodes.network.Network
    properties: # omitted for brevity
  data_network:
```

Figure 8: Service template with network template B
type: tosca.nodes.network.Network
properties: # omitted for brevity

# ports definition
fe_oam_net_port:
  type: tosca.nodes.network.Port
  properties:
    is_default: true
    ip_range_start: { get_input: fe_oam_net_ip_range_start }
    ip_range_end: { get_input: fe_oam_net_ip_range_end }
  requirements:
    - link: oam_network
    - binding: frontend

fe_admin_net_port:
  type: tosca.nodes.network.Port
  requirements:
    - link: admin_network
    - binding: frontend

be_admin_net_port:
  type: tosca.nodes.network.Port
  properties:
    order: 0
  requirements:
    - link: admin_network
    - binding: backend

be_data_net_port:
  type: tosca.nodes.network.Port
  properties:
    order: 1
  requirements:
    - link: data_network
    - binding: backend

db_data_net_port:
  type: tosca.nodes.network.Port
  requirements:
    - link: data_network
    - binding: database
F.6.2 Option 2: Specifying network requirements within the application’s Service Template

This approach allows the Service Template designer to map an endpoint to a logical network.

The use case shown below examines a way to express in the TOSCA YAML service template a typical 3-tier application with their required networking modeling:

```yaml
node_templates:
  frontend:
    type: tosca.nodes.Compute
    properties: # omitted for brevity
    requirements:
      - network_oam: oam_network
      - network_admin: admin_network
  backend:
    type: tosca.nodes.Compute
    properties: # omitted for brevity
    requirements:
      - network_admin: admin_network
      - network_data: data_network
  database:
    type: tosca.nodes.Compute
    properties: # omitted for brevity
    requirements:
      - network_data: data_network
  oam_network:
    type: tosca.nodes.network.Network
    properties:
      ip_version: { get_input: oam_network_ip_version }
      cidr: { get_input: oam_network_cidr }
      start_ip: { get_input: oam_network_start_ip }
      end_ip: { get_input: oam_network_end_ip }
  admin_network:
    type: tosca.nodes.network.Network
    properties:
      ip_version: { get_input: admin_network_ip_version }
      dhcp_enabled: { get_input: admin_network_dhcp_enabled }
  data_network:
    type: tosca.nodes.network.Network
```
properties:
  ip_version:  { get_input: data_network_ip_version }
  cidr: { get_input: data_network_cidr }
Appendix G. Component Modeling Use Cases

G.1.1 Use Case: Exploring the HostedOn relationship using WebApplication and WebServer

This use case examines the ways TOSCA YAML can be used to express a simple hosting relationship (i.e., HostedOn) using the normative TOSCA WebServer and WebApplication node types defined in this specification.

G.1.1.1 WebServer declares its “host” capability

For convenience, relevant parts of the normative TOSCA Node Type for WebServer are shown below:

```yaml
tosca.nodes.WebServer
  derived_from: SoftwareComponent
  capabilities:
    ...
    host:
      type: tosca.capabilities.Container
      valid_source_types: [ tosca.nodes.WebApplication ]
```

As can be seen, the WebServer Node Type declares its capability to “contain” (i.e., host) other nodes using the symbolic name “host” and providing the Capability Type tosca.capabilities.Container. It should be noted that the symbolic name of “host” is not a reserved word, but one assigned by the type designer that implies at or betokens the associated capability. The Container capability definition also includes a required list of valid Node Types that can be contained by this, the WebServer, Node Type. This list is declared using the keyname of valid_source_types and in this case it includes only allowed type WebApplication.

G.1.1.2 WebApplication declares its “host” requirement

The WebApplication node type needs to be able to describe the type of capability a target node would have to provide in order to “host” it. The normative TOSCA capability type tosca.capabilities.Container is used to describe all normative TOSCA hosting (i.e., container-containee pattern) relationships. As can be seen below, the WebApplication accomplishes this by declaring a requirement with the symbolic name “host” with the capability keyname set to tosca.capabilities.Container.

Again, for convenience, the relevant parts of the normative WebApplication Node Type are shown below:

```yaml
tosca.nodes.WebApplication:
  derived_from: tosca.nodes.Root
  requirements:
    - host:
        capability: tosca.capabilities.Container
        node: tosca.nodes.WebServer
        relationship: tosca.relationships.HostedOn
```

G.1.1.2.1 Notes

- The symbolic name “host” is not a keyword and was selected for consistent use in TOSCA normative node types to give the reader an indication of the type of requirement being referenced. A valid
HostedOn relationship could still be established between WebApplication and WebServer in a TOSCA Service Template regardless of the symbolic name assigned to either the requirement or capability declaration.

G.1.2 Use Case: Establishing a ConnectsTo relationship to WebServer

This use case examines the ways TOSCA YAML can be used to express a simple connection relationship (i.e., ConnectsTo) between some service derived from the SoftwareComponent Node Type, to the normative WebServer node type defined in this specification.

The service template that would establish a ConnectsTo relationship as follows:

```yaml
node_types:
  MyServiceType:
    derived_from: SoftwareComponent
    requirements:
      # This type of service requires a connection to a WebServer’s data_endpoint
      - connection1:
        node: WebServer
        relationship: ConnectsTo
        capability: Endpoint

topology_template:
  node_templates:
    my_web_service:
      type: MyServiceType
      ...
      requirements:
        - connection1:
          node: my_web_server

    my_web_server:
      # Note, the normative WebServer node type declares the “data_endpoint”
      # capability of type tosca.capabilities.Endpoint.
      type: WebServer
```

Since the normative WebServer Node Type only declares one capability of type tosca.capabilities.Endpoint (or Endpoint, its alias in TOSCA) using the symbolic name data_endpoint, the my_web_service node template does not need to declare that symbolic name on its requirement declaration. If however, the my_web_server node was based upon some other node type that declared more than one capability of type Endpoint, then the capability keyname could be used to supply the desired symbolic name if necessary.

G.1.2.1 Best practice

It should be noted that the best practice for designing Node Types in TOSCA should not export two capabilities of the same type if they truly offer different functionality (i.e., different capabilities) which should be distinguished using different Capability Type definitions.
G.1.3 Use Case: Attaching (local) BlockStorage to a Compute node

This use case examines the ways TOSCA YAML can be used to express a simple AttachesTo relationship between a Compute node and a locally attached BlockStorage node.

The service template that would establish an AttachesTo relationship follows:

```yaml
node_templates:
  my_server:
    type: Compute
    ...
  requirements:
    # contextually this can only be a relationship type
    - local_storage:
      # capability is provided by Compute Node Type
      node: my_block_storage
      relationship:
        type: AttachesTo
        properties:
          location: /path1/path2
          # This maps the local requirement name ‘local_storage’ to the
          # target node’s capability name ‘attachment’

  my_block_storage:
    type: BlockStorage
    properties:
      size: 10 GB
```

G.1.4 Use Case: Reusing a BlockStorage Relationship using Relationship Type or Relationship Template

This builds upon the previous use case (G.1.3) to examine how a template author could attach multiple Compute nodes (templates) to the same BlockStorage node (template), but with slightly different property values for the AttachesTo relationship.

Specifically, several notation options are shown (in this use case) that achieve the same desired result.

G.1.4.1 Simple Profile Rationale

Referencing an explicitly declared Relationship Template is a convenience of the Simple Profile that allows template authors an entity to set, constrain or override the properties and operations as defined in its declared (Relationship) Type much as allowed now for Node Templates. It is especially useful when a complex Relationship Type (with many configurable properties or operations) has several logical occurrences in the same Service (Topology) Template; allowing the author to avoid configuring these same properties and operations in multiple Node Templates.

G.1.4.2 Notation Style #1: Augment AttachesTo Relationship Type directly in each Node Template

This notation extends the methodology used for establishing a HostedOn relationship, but allowing template author to supply (dynamic) configuration and/or override of properties and operations.
Note: This option will remain valid for Simple Profile regardless of other (following) notation (or aliasing) options being discussed or adopted.

node_templates:

  my_block_storage:
    type: BlockStorage
    properties:
      size: 10

  my_web_app_tier_1:
    type: Compute
    requirements:
      - local_storage:
        node: my_block_storage
        relationship: MyAttachesTo
        # use default property settings in the Relationship Type definition

  my_web_app_tier_2:
    type: Compute
    requirements:
      - local_storage:
        node: my_block_storage
        relationship:
          type: MyAttachesTo
          # Override default property setting for just the 'location' property
          properties:
            location: /some_other_data_location

relationship_types:

  MyAttachesTo:
    derived_from: AttachesTo
    properties:
      location: /default_location
    interfaces:
      Configure:
      post_configure_target:
        implementation: default_script.sh
G.1.4.3 Notation Style #2: Use the ‘template’ keyword on the Node Templates to specify which named Relationship Template to use

This option shows how to explicitly declare different named Relationship Templates within the Service Template as part of a relationship_templates section (which have different property values) and can be referenced by different Compute typed Node Templates.

```yaml
node_templates:

  my_block_storage:
    type: BlockStorage
    properties:
      size: 10

  my_web_app_tier_1:
    derived_from: Compute
    requirements:
      - attachment:
        node: my_block_storage
        relationship: storage_attaches_to_1

  my_web_app_tier_2:
    derived_from: Compute
    requirements:
      - attachment:
        node: my_block_storage
        relationship: storage_attaches_to_2

relationship_templates:

  storage_attaches_to_1:
    type: MyAttachesTo
    properties:
      location: /my_data_location

  storage_attaches_to_2:
    type: MyAttachesTo
    properties:
      location: /some_other_data_location

relationship_types:

  MyAttachesTo:
    derived_from: AttachesTo
```
interfaces:
  some_interface_name:
    some_operation:
      implementation: default_script.sh

G.1.4.4 Notation Style #3: Using the “copy” keyname to define a similar Relationship Template

How does TOSCA make it easier to create a new relationship template that is mostly the same as one that exists without manually copying all the same information? TOSCA provides the copy keyname as a convenient way to copy an existing template definition into a new template definition as a starting point or basis for describing a new definition and avoid manual copy. The end results are cleaner TOSCA Service Templates that allows the description of only the changes (or deltas) between similar templates.

The example below shows that the Relationship Template named storage_attaches_to_1 provides some overrides (conceptually a large set of overrides) on its Type which the Relationship Template named storage_attaches_to_2 wants to “copy” before perhaps providing a smaller number of overrides.

```
node_templates:

  my_block_storage:
    type: BlockStorage
    properties:
      size: 10

  my_web_app_tier_1:
    derived_from: Compute
    requirements:
      - attachment:
        node: my_block_storage
        relationship: storage_attaches_to_1

  my_web_app_tier_2:
    derived_from: Compute
    requirements:
      - attachment:
        node: my_block_storage
        relationship: storage_attaches_to_2

relationship_templates:
  storage_attaches_to_1:
    type: MyAttachesTo
    properties:
      location: /my_data_location
```
interfaces:
  some_interface_name:
    some_operation_name_1: my_script_1.sh
    some_operation_name_2: my_script_2.sh
    some_operation_name_3: my_script_3.sh

storage_attachesto_2:
  # Copy the contents of the "storage_attachesto_1" template into this new one
  copy: storage_attachesto_1
  # Then change just the value of the location property
  properties:
    location: /some_other_data_location

relationship_types:

MyAttachesTo:
  derived_from: Attachesto
  interfaces:
    some_interface_name:
      some_operation:
        implementation: default_script.sh
# Appendix H. Complete Application Modeling Use Cases

## H.1 Use cases

### H.1.1 Overview

H.1.2 Compute: Hosting a Virtual Machine (VM) on a single instance

H.1.2.1 Description

This use case demonstrates how the TOSCA Simple Profile specification can be used to stand up a single instance of a Virtual Machine (VM) image using a normative TOSCA Compute node. The TOSCA Compute node is declarative in that the service template describes both the processor and host operating system platform characteristics (i.e., properties declared on the capability named “os”) that are desired by the template author. The cloud provider would attempt to fulfill these properties (to the best of its abilities) during orchestration.

H.1.2.2 Features

This use case introduces the following TOSCA Simple Profile features:

- A node template that uses the normative TOSCA Compute Node Type along with showing an exemplary set of its properties being configured.
- Use of the TOSCA Service Template inputs section to declare a configurable value the template user may supply at runtime. In this case, the “host” property named “num_cpus” (of type integer) is declared.
  - Use of a property constraint to limit the allowed integer values for the “num_cpus” property to a specific list supplied in the property declaration.
- Use of the TOSCA Service Template outputs section to declare a value the template user may request at runtime. In this case, the property named “instance_ip” is declared.
  - The “instance_ip” output property is programmatically retrieved from the Compute node’s “public_address” attribute using the TOSCA Service Template-level get_attribute function.

H.1.2.3 Logical Diagram

H.1.2.4 Sample YAML

```yaml
tosca_definitions_version: tosca_simple_yaml_1_0_0

description: >
  TOSCA simple profile that just defines a single compute instance. Note, this example does not include default values on inputs properties.
```
topology_template:
  inputs:
    cpus:
      type: integer
      description: Number of CPUs for the server.
      constraints:
        - valid_values: [ 1, 2, 4, 8 ]
  node_templates:
    my_server:
      type: Compute
      capabilities:
        host:
          properties:
            disk_size: 10 GB
            num_cpus: { get_input: cpus }
            mem_size: 4 MB
        os:
          properties:
            architecture: x86_64
            type: Linux
            distribution: ubuntu
            version: 12.04
  outputs:
    private_ip:
      description: The private IP address of the deployed server instance.
      value: { get_attribute: [my_server, private_address] }

H.1.2.5 Notes
- This use case uses a versioned, Linux Ubuntu distribution on the Compute node.

H.1.3 Block Storage 1: Using the normative AttachesTo Relationship Type

H.1.3.1 Description
This use case demonstrates how to attach a TOSCA BlockStorage node to a Compute node using the normative AttachesTo relationship.

    value: \{ get_attribute: [my_storage, volume_id] \}
H.1.6 Block Storage 4: Single Block Storage shared by 2-Tier Application with custom AttachesTo Type and implied relationships

H.1.6.1 Description

This use case shows 2 compute instances (2 tiers) with one BlockStorage node, and also uses a custom AttachesTo Relationship that provides a default mount point (i.e., location) which the 1st tier uses, but the 2nd tier provides a different mount point.

Please note that this use case assumes both Compute nodes are accessing different directories within the shared, block storage node to avoid collisions.

H.1.6.2 Logical Diagram

H.1.6.3 Sample YAML

H.1.9 Object Storage 1: Creating an Object Storage service

H.1.9.1 Description

H.1.9.2 Logical Diagram

H.1.9.3 Sample YAML

```yaml
tosca_definitions_version: tosca_simple_yaml_1_0_0

description: >
  Tosca template for creating an object storage service.

topology_template:
  inputs:
    objectstore_name:
      type: string

  node_templates:
    obj_store_server:
      type: tosca.nodes.ObjectStorage
      properties:
        name: { get_input: objectstore_name }
        size: 1024 kB
        maxsize: 1 GB
```

H.1.10 Network 1: Server bound to a new network

H.1.10.1 Description

Introduces the TOSCA Network and Port nodes used for modeling logical networks using the LinksTo and BindsTo Relationship Types. In this use case, the template is invoked without an existing network_name as an input property so a new network is created using the properties declared in the Network node.
H.1.10.2 Logical Diagram

H.1.10.3 Sample YAML

tosca_definitions_version: tosca_simple_yaml_1_0_0

description: >
  TOSCA simple profile with 1 server bound to a new network

topology_template:

  inputs:
    network_name:
      type: string
      description: Network name

  node_templates:
    my_server:
      type: tosca.nodes.Compute
      capabilities:
        host:
          properties:
            disk_size: 10 GB
            num_cpus: 1
            mem_size: 512 MB
        os:
          properties:
            architecture: x86_64
            type: Linux
H.1.11 Network 2: Server bound to an existing network

H.1.11.1 Description

This use case shows how to use a network_name as an input parameter to the template to allow a server to be associated with an existing network.

H.1.11.2 Logical Diagram

H.1.11.3 Sample YAML

tosca_definitions_version: tosca_simple_yaml_1_0_0
description: >
  TOSCA simple profile with 1 server bound to an existing network

topology_template:
  inputs:
    network_name:
      type: string
      description: Network name

node_templates:
  my_server:
    type: tosca.nodes.Compute
    properties:
      disk_size: 10
      num_cpus: 1
      mem_size: 512
    capabilities:
      os:
        properties:
          architecture: x86_64
          type: Linux
          distribution: CirrOS
          version: 0.3.2

  my_network:
    type: tosca.nodes.network.Network
    properties:
      network_name: { get_input: network_name }

  my_port:
    type: tosca.nodes.network.Port
    requirements:
      - binding:
        node: my_server
      - link:
        node: my_network

---

H.1.12 Network 3: Two servers bound to a single network

H.1.12.1 Description

This use case shows how two servers (Compute nodes) can be bound to the same Network (node) using two logical network Ports.
H.1.12.2 Logical Diagram

H.1.12.3 Sample YAML

tosca_definitions_version: tosca_simple_yaml_1_0_0

description: >
  TOSCA simple profile with 2 servers bound to the 1 network

topology_template:

  inputs:
    network_name:
      type: string
      description: Network name
    network_cidr:
      type: string
      default: 10.0.0.0/24
      description: CIDR for the network
    network_start_ip:
      type: string
      default: 10.0.0.100
      description: Start IP for the allocation pool
    network_end_ip:
      type: string
      default: 10.0.0.150
      description: End IP for the allocation pool
node_templates:
  my_server:
    type: tosca.nodes.Compute
    capabilities:
      host:
        properties:
          disk_size: 10 GB
          num_cpus: 1
          mem_size: 512 MB
      os:
        properties:
          architecture: x86_64
          type: Linux
          distribution: CirrOS
          version: 0.3.2

  my_server2:
    type: tosca.nodes.Compute
    capabilities:
      host:
        properties:
          disk_size: 10 GB
          num_cpus: 1
          mem_size: 512 MB
      os:
        properties:
          architecture: x86_64
          type: Linux
          distribution: CirrOS
          version: 0.3.2

  my_network:
    type: tosca.nodes.network.Network
    properties:
      ip_version: 4
      cidr: { get_input: network_cidr }
      network_name: { get_input: network_name }
      start_ip: { get_input: network_start_ip }
      end_ip: { get_input: network_end_ip }

  my_port:
H.1.13 Network 4: Server bound to three networks

H.1.13.1 Description
This use case shows how three logical networks (Network), each with its own IP address range, can be bound to with the same server (Compute node).

H.1.13.2 Logical Diagram

H.1.13.3 Sample YAML

```yaml
tosca_definitions_version: tosca_simple_yaml_1_0_0

description: |
  TOSCA simple profile with 1 server bound to 3 networks
```

H.1.14 WebServer-DBMS 1: WordPress + MySQL, single instance

H.1.14.1 Description

TOSCA simple profile service showing the WordPress web application with a MySQL database hosted on a single server (instance).
**H.1.14.2 Logical Diagram**

**H.1.14.3 Sample YAML**

```yaml
tosca_definitions_version: tosca_simple_yaml_1_0_0

description: >
  TOSCA simple profile with WordPress, a web server, a MySQL DBMS hosting the application’s database content on the same server. Does not have input defaults or constraints.

topology_template:
  inputs:
    cpus:
      type: integer
      description: Number of CPUs for the server.
    db_name:
      type: string
      description: The name of the database.
    db_user:
      type: string
      description: The username of the DB user.
```
db_pwd:
  type: string

db_root_pwd:
  type: string
  description: Root password for MySQL.

db_port:
  type: PortDef
  description: Port for the MySQL database

node_templates:

    description: URL for Wordpress wiki.
    value: { get_attribute: [server, public_address] }

### H.1.14.4 Sample scripts

Where the referenced implementation scripts in the example above would have the following contents

#### H.1.14.4.1 wordpress_install.sh

```bash
yum -y install wordpress
```

#### H.1.14.4.2 wordpress_configure.sh

```bash
sed -i "/Deny from All/d" /etc/httpd/conf.d/wordpress.conf
sed -i "s/Require local/Require all granted/" /etc/httpd/conf.d/wordpress.conf
sed -i s/database_name_here/name/ /etc/wordpress/wp-config.php
sed -i s/username_here/user/ /etc/wordpress/wp-config.php
sed -i s/password_here/password/ /etc/wordpress/wp-config.php
systemctl restart httpd.service
```

#### H.1.14.4.3 mysql_database_postconfigure.sh

```bash
# Setup MySQL root password and create user
cat << EOF | mysql -u root --password=db_root_password
CREATE DATABASE name;
GRANT ALL PRIVILEGES ON name.* TO "user"@"localhost"
IDENTIFIED BY "password";
FLUSH PRIVILEGES;
EXIT
EOF
```

#### H.1.14.4.4 mysql_dbms_install.sh

```bash
yum -y install mysql mysql-server
# Use systemd to start MySQL server at system boot time
systemctl enable mysqld.service
```

#### H.1.14.4.5 mysql_dbms_start.sh

```bash
# Start the MySQL service (NOTE: may already be started at image boot time)
```
systemctl start mysqld.service

H.1.14.4.6 mysql_dbms_configure

# Set the MySQL server root password
mysqladmin -u root password db_root_password

H.1.14.4.7 webserver_install.sh

yum -y install httpd
systemctl enable httpd.service

H.1.14.4.8 webserver_start.sh

# Start the httpd service (NOTE: may already be started at image boot time)
systemctl start httpd.service

H.1.15 WebServer-DBMS 2: WordPress + MySQL + Floating IPs, single instance

H.1.15.1 Description

This use case is based upon OpenStack Heat's Cloud Formation (CFN) template:

Note: Future drafts of this specification will detail this use case.

H.1.15.2 Logical Diagram

TBD

H.1.15.3 Sample YAML

TBD

H.1.15.4 Notes

- The Heat/CFN use case also introduces the concept of “Elastic IP” (EIP) addresses which is the Amazon AWS term for floating IPs.
- The Heat/CFN use case provides a “key_name” as input which we will not attempt to show in this use case as this is a future security/credential topic.
- The Heat/CFN use case assumes that the “image” uses the “yum” installer to install Apache, MySQL and Wordpress and installs, starts and configures them all in one script (i.e., under Compute). In TOSCA we represent each of these software components as their own Nodes each with independent scripts.
**H.1.16 WebServer-DBMS 3: Nodejs with PayPal Sample App and MongoDB on separate instances**

**H.1.16.1 Description**

This use case instantiates a 2-tier application with Nodejs and its (PayPal sample) WebApplication on one tier which connects to a MongoDB database (which stores its application data) using a ConnectsTo relationship.

**H.1.16.2 Logical Diagram**

![Logical Diagram](Attachment)

**H.1.16.3 Sample YAML**

```yaml
tosca_definitions_version: tosca_simple_yaml_1_0_0

description: >
  TOSCA simple profile with a nodejs web server hosting a PayPal sample application which connects to a mongodb database.

imports:
  - custom_types/paypalpizzastore_nodejs_app.yaml

dsl_definitions:
  ubuntu_node: &ubuntu_node
    disk_size: 10 GB
```

    value: { get_attribute: [mongo_server, private_address] }

H.1.16.4 Notes:
- Scripts referenced in this example are assumed to be placed by the TOSCA orchestrator in the relative directory declared in TOSCA.meta of the TOSCA CSAR file.

H.1.17 Multi-Tier-1: Elasticsearch, Logstash, Kibana (ELK) use case with multiple instances

H.1.17.1 Description
TOSCA simple profile service showing the Nodejs, MongoDB, Elasticsearch, Logstash, Kibana, rsyslog and collectd installed on a different server (instance).

This use case also demonstrates:
- Use of TOSCA macros or dsl_definitions
- Multiple SoftwareComponents hosted on same Compute node
- Multiple tiers communicating to each other over ConnectsTo using Configure interface.

H.1.17.2 Logical Diagram
tosca_definitions_version: tosca_simple_yaml_1_0_0

description: >
This TOSCA simple profile deploys nodejs, mongodb, elasticsearch, logstash and
kibana each on a separate server with monitoring enabled for nodejs server where a
sample nodejs application is running. The syslog and collectd are installed on a
nodejs server.

imports:

```
H.1.17.4 Sample scripts

Where the referenced implementation scripts in the example above would have the following contents

H.1.18 Container-1: Containers using Docker single Compute instance
(Containers only)

H.1.18.1.1 Description

This use case shows a minimal description of two Container nodes (only) providing their Docker Requirements allowing platform (orchestrator) to select/provide the underlying Docker implementation (Capability). Specifically, wordpress and mysql Docker images are referenced from Docker Hub.

This use case also demonstrates:
- Abstract description of Requirements (i.e., Container and Docker) allowing platform to dynamically select the appropriate runtime Capabilities that match.
- Use of external repository (Docker Hub) to reference image artifact.

H.1.18.2 Logical Diagram

TBD

H.1.18.3 Sample YAML

H.1.18.3.1 G1.8.3.1 Two Docker “Container” nodes (Only) with Docker Requirements

tosca_definitions_version: tosca_simple_yaml_1_0_0

description: >
  TOSCA simple profile with wordpress, web server and mysql on the same server.

inputs:
  wp_host_port:
    type: integer
description: The host port that maps to port 80 of the WordPress container.

db_root_pwd:
  type: string
  description: Root password for MySQL.

# Repositories to retrieve code artifacts from
repositories:
docker_hub: https://registry.hub.docker.com/

topology_template:
  node_templates:

# The MYSQL container based on official MySQL image in Docker hub
mysql_container:
  type: tosca.nodes.Container.Application.Docker
  capabilities:
    database_endpoint: tosca.capabilities.Endpoint.Database
  artifacts:
    - my_image: mysql
      repository: docker_hub
  interfaces:
    tosca.interfaces.node.lifecycle.Standard:
      create:
        implementation: my_image
        inputs:
          db_root_password: { get_input: db_root_pwd }

# The WordPress container based on official WordPress image in Docker hub
wordpress_container:
  type: tosca.nodes.Container.Application.Docker
  requirements:
    - database_endpoint: mysql_container
  artifacts:
    - my_image: wordpress
      repository: docker_hub
  interfaces:
    tosca.interfaces.node.lifecycle.Standard:
      create:
        implementation: my_image
        inputs:
host_port: { get_input: wp_host_port }
Appendix I. Policies (Placeholder)

I.1 Types of policies

Policies typically address two major areas of concern for customer workloads:

- Assure governance and compliance with industry and company policies and regulations.
- Assure Quality-of-Service and continuity/SLA

I.1.1 SLA policy concerns

- Affinity/Anti-affinity: of deployed workloads; that is, what code is allowed to be placed where
- Performance (scalability): What resources are an application allowed to consume and

I.1.2 Governance policy concerns

- In addition to deploying to a Cloud platform and using a pattern-based approach, customers concerns over “loss of control” are increased. There must be control mechanisms in place that accept governance policies.

I.1.3 Rules considerations

- Natural language rules are not realistic, too much to represent in our specification; however, regular expressions can be used that include simple operations and operands that include symbolic names for TOSCA metamodel entities, properties and attributes.
- Complex rules can actually be directed to an external policy engine (to check for violation) returns true|false then policy says what to do (trigger or action).
- Actions/Triggers could be:
  - Autonomic/Platform corrects against user-supplied criteria
  - External monitoring service could be utilized to monitor policy rules/conditions against metrics, the monitoring service could coordinate corrective actions with external services (perhaps Workflow engines that can analyze the application and interact with the TOSCA instance model).

I.1.4 Definition:

Policies are used to convey a set of capabilities, requirements and general characteristics of an entity.

I.1.5 Policy (Combined requirement)

Work-in-progress:

```yaml
- name: “my policy”
- type: TBD # categories: affinity (anti-affinity), scaling, performance
```

I.1.6 Requirement (Assertion) Group (grouping construct)

- “ignorable” | “best can” | “all”
- “choice” (e.g., “one of”)
I.1.7 Policy Requirement (Assertions)

Use case: Compute1 and Compute2 are 2 node templates. Compute1 has 10 instances, 5 in one region 5 in other region

```yaml
# ----- affinity example ----------
- name: MyAntiAffinityPolicy
- type: tosca.policy.affinity.
- rule: fn.separate [ Compute1, Compute2 ] # implies stack-level control
- trigger: <script>

# ---scaling example ----

- name: MyScaleUpPolicy
- type: tosca.policy.scale.up | tosca.policy.scale.down
- rule: fn.utilization [ Compute1, Compute2 ], greater_than: 80%
- trigger: <script>
```
Appendix J. References

J.1 Known Extensions to TOSCA v1.0

The following items will need to be reflected in the TOSCA (XML) specification to allow for isomorphic mapping between the XML and YAML service templates.

J.1.1 Model Changes

- The “TOSCA Simple ‘Hello World’” example introduces this concept in Section 3. Specifically, a VM image assumed to accessible by the cloud provider.
- Introduce template Input and Output parameters
- The “Template with input and output parameter” example introduces concept in Section 3.1.
- “Inputs” could be mapped to BoundaryDefinitions in TOSCA v1.0. Maybe needs some usability enhancement and better description.
- “outputs” are a new feature.
- Grouping of Node Templates
- This was part of original TOSCA proposal, but removed early on from v1.0. This allows grouping of node templates that have some type of logically managed together as a group (perhaps to apply a scaling or placement policy).
- Lifecycle Operation definition independent/separate from Node Types or Relationship types (allows reuse).
  For now we added definitions for “node.lifecycle” and “relationship.lifecycle”.
- Override of Interfaces (operations) in the Node Template.
- Service Template Naming/Versioning
  - Should include TOSCA spec. (or profile) version number (as part of namespace)
- Allow the referencing artifacts using a URL (e.g., as a property value).
- Repository definitions in Service Template.
- Substitution mappings for Topology template.

J.1.2 Normative Types

- Constraints
  - constraint clauses, regex
- Types / Property / Parameters
  - list, map, range, scalar-unit types
  - Includes YAML intrinsic types
  - NetworkInfo, PortInfo, PortDef, PortSpec, Credential
  - TOSCA Version based on Maven
- Node
  - Root, Compute, ObjectStorage, BlockStorage, Network, Port, SoftwareComponent, WebServer, WebApplication, DBMS, Database, Container, and others
- Relationship
  - Root, DependsOn, HostedOn, ConnectsTo, AttachesTo, RoutesTo, BindsTo, LinksTo and others
- Artifact
  - Deployment: Image Types (e.g., VM, Container), ZIP, TAR, etc.
  - Implementation: File, Bash, Python, etc.
- Requirements
  - None
- Capabilities
J.2 Terminology

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in

J.3 Normative References

J.4 Non-Normative References

J.5 Glossary

The following terms are used throughout this specification and have the following definitions when used in context of this document.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instance Model</td>
<td>A deployed service is a running instance of a Service Template. More precisely, the instance is derived by instantiating the Topology Template of its Service</td>
</tr>
</tbody>
</table>
Template, most often by running a special plan defined for the Service Template, often referred to as a build plan.

| Node Template | A Relationship Template specifies the occurrence of a software component node as part of a Topology Template. Each Node Template refers to a Node Type that defines the semantics of the node (e.g., properties, attributes, requirements, capabilities, interfaces). Node Types are defined separately for reuse purposes. |
| Relationship Template | A Relationship Template specifies the occurrence of a relationship between nodes in a Topology Template. Each Relationship Template refers to a Relationship Type that defines the semantics relationship (e.g., properties, attributes, interfaces, etc.). Relationship Types are defined separately for reuse purposes. |
| Service Template | A Service Template is typically used to specify the “topology” (or structure) and “orchestration” (or invocation of management behavior) of IT services so that they can be provisioned and managed in accordance with constraints and policies. Specifically, TOSCA Service Templates optionally allow definitions of a TOSCA Topology Template, TOSCA types (e.g., Node, Relationship, Capability, Artifact, etc.), groupings, policies and constraints along with any input or output declarations. |
| Topology Model | The term Topology Model is often used synonymously with the term Topology Template with the use of “model” being prevalent when considering a Service Template’s topology definition as an abstract representation of an application or service to facilitate understanding of its functional components and by eliminating unnecessary details. |
| Topology Template | A Topology Template defines the structure of a service in the context of a Service Template. A Topology Template consists of a set of Node Template and Relationship Template definitions that together define the topology model of a service as a (not necessarily connected) directed graph. The term Topology Template is often used synonymously with the term Topology Model. The distinction is that a topology template can be used to instantiate and orchestrate the model as a reusable pattern and includes all details necessary to accomplish it. |

## Appendix M. Revision History

<table>
<thead>
<tr>
<th>Revision</th>
<th>Date</th>
<th>Editor</th>
<th>Changes Made</th>
</tr>
</thead>
<tbody>
<tr>
<td>WD05, Rev01</td>
<td>2014-12-11</td>
<td>Matt Rutkowski, IBM</td>
<td>• Initial WD05, Revision 01 baseline.</td>
</tr>
<tr>
<td>WD05, Rev02</td>
<td>2015-01-18</td>
<td>Matt Rutkowski, IBM</td>
<td>• Separated out scalar-unit.size while adding base 2 values and added scalar-unit.time with examples and informative references.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Fixed constraints in Endpoint to allow for either (optionally) port as PortDef or map of PortSpec.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Updated properties using old scalar-unit to use scalar-unit.size</td>
</tr>
<tr>
<td>WD05, Rev03</td>
<td>2015-01-21</td>
<td>Matt Rutkowski, IBM</td>
<td>• Fixed missing requires=false clauses on port and ports properties of Endpoint.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Removed anonymous types for lists and maps. Removed reference from schema definition form Properties and adjusted Properties to reflect</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>resulting set of reduced properties for entry0-schema.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Incorporated comments from Chris L. addressed/fixed typos and non-material corrections identified.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Fixed PortSpec definition and example from Victor.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Updated other typos found while integrating Chris’ comments.</td>
</tr>
<tr>
<td>WD05, Rev04</td>
<td>2015-01-29</td>
<td>Matt Rutkowski, IBM</td>
<td>• Removed Simple interface to prevent invalid YAML on the TOSCA Root node type and avoids describing multiple instance/sequencing of methods with different names and would cause type proliferation (standard vs. simple types).</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Section 18 example: Fixed invalid YAML and assured TOSCA-191 has correct problem stated.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• A.4.14, C.2.3 Removed the “type” keyword from schema (datatype) definitions as there should be only one keyword (i.e., “derived_from”) used</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>to define new types. It also made no sense to continue existing paradigm of using “derived_from” as we have in all other places.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• A.4.2.1: Added range type to in_range constraint and map and list types to some length-based constraints. Added scalar-unit types to list of</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>comparable types with requirements to include units in comparison.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• A.4.4: The “type” keyname on a Property Definition is no longer mandatory as new datatypes are not required to derive from an existing type.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Formerly A.4.14: Removed “type” keyname from schema in favor of “derived_from” as both were not needed since data_types were added.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• A.4.14, A.4.15: merged “Schema Definition” from A4.14 into “Datatype definition” as this is the only place this grammar is referenced since</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>removing it from “entry_schema” grammar.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• A.4.21: Fixed unclear use/description of property filters under named capabilities listed on the overall filter definition.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• A.4.21: Added “attributes” keyname (and attribute definitions) to the Capability Type.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• A.4.26: Added Attribute value assignment section (A4.26)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• A.4.27: Added Property value assignment section (A4.26)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• A.5.1: Changed “datatype_definitions” to just “data_types” to match the names of other keys used in the service template (e.g., node_types,</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>relationship_types, etc.).</td>
</tr>
<tr>
<td>WD05, Rev05</td>
<td>2015-02-02</td>
<td>Matt Rutkowski, IBM</td>
<td>• A.4.5: documented “status_value” in grammar</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• A.5.2.2 – Fixed map example; missing ContactInfo and copy-paste error.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• TOSCA-218 - A.4.22, C.3.1.1 – Changed “valid_node_types” from a property</td>
</tr>
</tbody>
</table>
• Merged in numerous additional comments from Chris against WD05, Rev03, mostly in Sections 1-14 but also a few grammar comments in the topology template section.
• Port Type requirements “binding” and “link” were not ordered list (fixed) and link should appear before binding. Fixed network example to match.
• Added a section A.4.1 to clearly state that required keynames do not have to appear in types that derive from another (parent) type that already provides them.
• Changed meta-level keynames “valid_node_types” to the key “valid_types” which allows more than nodes as sources for a capability type.
• Added a “Required” column for most of the Keyname tables for Appendix A in order to better see which keynames are required.
• A.4.3.2 - Clarified that the “equals” constraint (operand) is optional and if a value simply appears it should be interpreted as “equals”.
• Fixed examples in sections 6 and 7 to reference the latest non-normative and normative type properties and methods (e.g., get_attribute for ip_address).
• A.4.18, F.1.3 – Identified issues in Requirement definition (A.4.18) as shown use case in F.1.3. Documented as “mustfix”.
• Appendix H: Added a placeholder section with early considerations for policies, their grammar and use cases.
• Resolved to preserve the description of direction (i.e., source and target) in the name of “valid_types” keynames that indicate what nodes types are allowed on each end of a TOSCA Relationship.
  o A.4.25 - In the case of Relationship Types, we will use “valid_target_types” to indicate what types a relationship can be connected to (point to or target).
  o A.4.23 - For Capability Types we use “valid_source_types” to indicate what source node types are allowed to form relationships to the nodes the capability are declared in.
  o Adjusted all examples to use new keynames.
• C.5.1 – The key “valid_target_type” for tosca.relationships.Root should not have been included and was removed. It had indicated that any tosca.nodes.Root.
• F.1.4 – Removed duplication of normative type definitions included in modeling use case /example. This caused us to maintain normative types accurate in two places and was confusing to readers.
• G.1.4.4, G.1.4.5 – Moved custom AttachesTo relationship from x.5 to x.4 and adjusted to use current grammar.
• E.5.2 - Fixed tosca.nodes.network.Port definition to use correct “node” keyword
• E.6 - Adjusted example templates in E.6.1 and E.6.2 to change “tosca.nodes.Port” to “tosca.nodes.network.Port” for all occurrences.
• E.6 - Adjusted example templates in E.6.1 and E.6.2 to change “tosca.nodes.Network” to “tosca.nodes.network.Network” for all occurrences.
• A.2.3: Added “UNBOUNDED” keyword to TOSCA range type
• A.4.18: Added “occurrences” keyname to Requirement def.
• C.3.2, C.5.2: Added “tosca.capabilities.node” and added it as the default target type for the DependsOn relationship.
• C.7.1: Fixed “tosca.nodes.root definition”
  o Added “state” attribute def. to grammar
  o Fixed the built-in “dependency” requirement adding cardinality default of [0, UNBOUNDED]. This allows section 10 example to remain valid AND fixes all normative node type definitions.
  o Added “feature” capability of type “tosca.capabilities.node”
• C.5.2.1: Added the tosca.capabilities.Root to “valid_target_types” of the DependsOn Relationship type.
• Section 13.2, Section 14: Merged in template “substitution” use cases in place of old “nested templates” to reflect current WG focus in this area.
• C.5.3.1: HostedOn now derives from tosca.relationships.Root.
• A.3.2: Directives section to describe reserved values for “directives” keyname and added “substitutable” value for Node Templates.
• C.5.3: Changed HostedOn to derive from Root instead of DependsOn
• D.2.4: Changed “database_endpoint” requirement to “wordpress_database_requirement” and fixed it have the ConnectsTo relationship and “database_endpoint” capability values. This will allow us to test the ability to connect a relationship to a type-compatible capability in another node when the symbolic names do not match. Updated use cases for wordpress.
• Appendix A: Reorganized section to group reusable element, types and template definitions together. Also removed simple “list” element definitions as they served little purpose and moved their grammars in-line to where they were referenced.
• A.6.4 - Added the Interface Type to allow new interfaces to be defined; it is slightly different than an interface definition (more restrictive). Please read “Additional Requirements”. Also, added a means to define them in the Service Template using the interfaces keyword.
• C.5.1, C.7.1 - Changed the “interfaces” keyword grammar for both tosca.nodes.Root and tosca.relationships.Root to reflect the correct way to declare an interface (not using a simple list).
• A.5.9 - Added “type” keyword to Interfaces definition and changed example to better distinguish it from Interface Type example.
• A.6 Service Template - Added note describing how Types can be defined in Service Templates (no topology-template) for import/use in other service templates.
• C.3.5 - Changed tosca.capabilities.DatabaseEndpoint to tosca.capabilities.EndPoint.Database. Updated MySQL Node Type to reflect this change. We do not need to specify an Endpoint.Database.MySQL capability type as the requirement should differentiate the database by its Node Type (MySQL) and not its capability.
• C.7.2: added “local_storage” requirement (occurrences [0,unbounded]) to actually allow us a built-in way to attach BlockStorage nodes.
• C.3.5: Added tosca.capabilities.Endpoint.Admin
• C.5.4: Added Credential property to ConnectsTo relationship

WD05, Rev07 2015-03-02 Matt Rutkowski, IBM

• A.5.7: Added the “final” keyname to the Property definition. Added final: true to the Endpoint.Admin capability property “secure” so subclasses cannot change this value.
• Clarified C.5.5 AttachesTo relationship properties.
• B.4.2, B.5.1 – Fixed get_attribute and get_property grammar to not confuse the square bracket “[” meaning “optional parameter” with the YAML square bracket for simple list (set).
<table>
<thead>
<tr>
<th>WD05, Rev08</th>
<th>2015-03-03</th>
<th>Matt Rutkowski, IBM</th>
</tr>
</thead>
</table>
| • B.3, B.3.1: Added “Intrinsic function section and the definition of the “concat” function to address TOSCA-212.  
• F.1.1: Fixed “valid_source_types” still listed as a property and corrected description of its use in the prose  
• A.6.1: Assured valid_source_types” was in Capability definition.  
• C.7.10: Containee Node Type placeholder. | • A.5.7: Removed “final” from properties until we have a comprehensive discussion on a “final” designator for Type definitions (Nodes, Rels. Data, etc.) and on interfaces/operations (to lock down implementation scripts).  
  o Opened JIRA issue TOSCA-228 to discuss  
• A.5.8: Fixed Operation definition to include different grammars for use in Types versus Templates (Node and Relationship). Also provided new Additional requirements that describe artifact override behaviors.  
• A.5.8: Fixed Operation definition to include different grammars for use in Types versus Templates (Node and Relationship).  
• A.6.2: Removed “node_filter” (keyword and grammar) from Node Type requirement definitions as it should only be valid on Node Template definitions.  
• A.7.4: Node Template: Added the “node_filter” keyname (with node filter grammar) and additional requirements on usage in conjunction with the “selectable” directive.  
• A.3.2: Added “selectable” directive keyword.  
• A.6.1: Added valid_source_types to Capability definition and added a requirement that only allows for subclasses to provide Node Types (names) for this keyname that are type-compatible and derived from types declared in their parent class.  
• 11.1: Authored a section to show how “selectable” can be used as an alternative way to provide dynamic matching to what is described earlier in Section 11.  
• Assure the consistent use of “keyname” versus “keyword” throughout the document.  
• 17.1: Removed Use case: “Providing input properties for all interfaces” which has no comparison in other language designs. In addition, we had no real or practical examples for this nor had we added the grammar for this.  
• 19: Fixed example to use a relationship template, previously we were using get_attribute to retrieve a value on the abstract ConnectsTo relationship directly on a Node Type definition which is illegal in the grammar.  
• 8: Fixed example to use a relationship template for a custom connection as the grammar dos not allow behaviors (scripts) to be provided on abstract ConnectsTo relationship types on Requirement definitions.  
• F.1.4: Removed invalid use of “default” keyname on Relationship Type examples.  
• F.1.5: Removed placeholder (empty) section for examples of “add_target”, “remove_target” and “target_changed” operations as we should explore these as part of then-tier logging use case in Section G.1.9. | • Sections 1-19: added “highlighting” to keywords in code samples that were being featured in the surrounding text (to better highlight or feature the new idea being introduced by that section).  
• A.7.4, A.7.5: Added the “copy” keyname to Node and Relationship Template definitions / grammars. This was described in use case in section F.1.4 which was updated to reflect the name change to “copy” from “alias” which was not a good descriptive keyname. |
- B.2.1: Clarified where the IDs come from (i.e., tosca_id attribute).
- C.3.8.1: OperatingSystem Capability type, changed type and architecture to optional from required allowing more nodes to use this capability.
- A2, C.7: Added the type name (i.e., shortname, qualified and typeURI) for every TOSCA datatype that did not have one declared.
- A.2.2: Added constraints for TOSCA version type
- C.7.6, C.7.7: Removed prefixes on properties to follow working group decision to not use prefixes and have already removed them on other node types. This means prefixes “db_” and “dbms_” are removed from property names on Database and DBMS Node Types respectively.
- C.7.8: Remove “store_” prefix from ObjectStore
- C.7.9: Removed redundant attribute “Volumeld” as we have “volume_id” as a property which would be the (reflected) attribute we would use to retrieve the ID assigned by the platform.
- D.1.4: removed “db_” prefix from non-normative WordPress node type.
- A.8.1: Added example for relationship template
- G.1.9: Renamed the “N-Tier” use case to Elasticsearch, Logstash, Kibana (ELK) use case to better feature the new open source components the use case is adding.
- A.5.8: Removed “default” keyname from attribute.
- A.5.9: Added clarification (additional requirement) that allows implementations to provide attribute values at runtime apart from template-included value expressions.
- C.7.2, C.7.3: Removed deprecated ip_address property from Compute and SoftwareComponent node types. This was used for demos in early drafts and should not be in v1.0, especially now that we have a proper network model supporting multiple IP addresses. We now have clearly distinguishable “public_address” and “private_address” attributes in Compute node. Cascade the name change across all use cases in document.
- E.5.2: Removed redundant “ip_address” attribute (since it already is a property it is automatically also an attribute).
- C.3.8: Fixed copy-paste error for OperatingSystem “Definition” (YAML). The properties were copied from Scalable and did not reflect the properties listed in the table.
- C.3.8.1: Added “TOSCA version” to OS capability instead of string. TOSCA-134 fix.
- A.6.1: Removed TOSCA-225 comments (cardinality) as we now have “occurrences” keyword for this.
- F.1.1: Fixed use case to use ONLY the current requirement and capability grammar, removed use cases that showed grammar that was no longer supported. Adjusted text, notes and best practice text to reflect the current design of the normative WebServer and WebApplication types.
- A.7.1: Reworked the Requirement assignment grammar and use cases to reflect the desired requirement grammar within Node Templates. Removed 2 examples in this section that are no longer valid and fixed the remaining three examples to be accurate to the new grammar. Note, some additional work may need to be done on the examples, but the grammar SHOULD be final barring any unforeseen problems during TC review.

WD05, Rev10 2015-03-20 Matt Rutkowski, IBM

- A.2.6: Added scalar-unit.frequency to allow for properties that provide values that measure in units per second such as CPU clock rate / processing speed (e.g., operations per second).
- C.7.2, C.3.3: Moved num_cpus, mem_size and disk_size properties from
<table>

<tr>
<td>Appendix E: Inserted chapter that describes minor changes to the CSAR file format over the version described in TOSCA v1.0. Thanks Thomas for authoring.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Ch 7, 14.3, 15, 16, 17.3, 17.4 – Incorporated fixes and address comments received from Chris.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>A.2.3: UNBOUNDED definition updated to be clearer. (addressed comment from Chris)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>A.5.8 Attribute Defn. – was missing entry_schema (Chris found)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>A.7.2: adjusted Requirement Def. description to be correct.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>A.7.3: copy had wrong declared type, changed to string. Adjusted ‘copy’ grammar to be single line.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>C.3.10.2: BindsTo derived_from updated.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>C.5.4: missing Credential property from ConnectsTo definition (grammar).</td>
<td></td>
<td></td>
</tr>
<tr>
<td>C.5.5: Changed “AttachTo” type to “AttachesTo” to match all other “active” names used in Relationship Types. This caused cascading changes to many examples and use cases. (Chris)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>F.5.2: Port Node Type now needs “relationship” type in definition. (Chris caught)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>F.5.3: Linkable needs to derive from Node capability type. (Chris)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>G.1.2: Missing topology_template in example (Chris)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>G.1.3: Missing “GB” on scalar unit type (Chris)</td>
<td></td>
<td></td>
</tr>

</table>
| WD05, Rev13| 2015-04-28      | - A.5.6.5: Property definition: Moved requirement language buried in the keynames table to the actual “Additional requirements” section.  
- A.5.11: Operation definition: Added the ability to have both a “primary” artifact (script) and other dependent artifacts for a single operation.  
- A.5.6: Repository definition: added definition to allow definition of external (artifact) repositories that can be used to host/hold TOSCA artifacts.  
- A.5.5: Artifact definition: added “repository” keyname to definition to allow artifacts to be located in an external repository.  
- A.9: Service Template: added “repositories” keyname to allow one or more repository definitions.  
- D.3.6: tosca.nodes.Docker.Container: a non-normative “Docker friendly” Node Type for use when modeling Docker “containers” which in TOSCA are really “Containees”.
- A.7.2: Requirement assignment: Added “properties” keyname to allow property assignments to the relationship keyname.  
- C.3.4: Endpoint: made “PRIVATE” default for “network_name” for implementations to default to the first IP address found on the first private network if user does not specific otherwise (as an input or in the template).  
- A.3.3: Added more complete definitions for PUBLIC versus PRIVATE networks.  
- C.7.10, C.7.11: Container.Runtime and Container.Application replace Container and Containee to better adapt to semantic of the Linux container communities such as Docker and Rocket. Note this mirrors WebServer and WebApplication and can be applied to Java runtimes and apps as well.  
- H.1.10.3, H.1.10.4: Provided latest “master” service template for ELK and removed scripts as there are too many to reasonable list. Instead we are moving to providing a URL to the live repo.  
- H1: Completely revamped section to reflect actual running use cases with links to current code. Removed use cases that did not make sense, added others that showed interesting TOSCA concepts.  
- H1: Added URL links to all use cases master/entry definition Service Template as it is stored in OpenStack for reference.  
- H.3.2-H.3.6 now lists each Block storage variation (use case) as its own top-level use case.  
- H.3.8: ObjectStorage use case: Moved up and reworked to new style and latest service template  
- H.3.9-H.3.11: Network use cases: we now have 3 different variant network use cases thanks to Simeon Monov.  
- H.1: added Docker use case description  
- H2: removed outdated Blockstorage use cases which are now covered by new ones or did not make sense (e.g., multiple block storage example).  
- F.5.1. Network Node: Added network type and physical network optional properties per Simeon Monov suggestion.  
- C.8.3, C.8.4: Added base artifact types for both implementation and deployment types.  
- C.7.2: Compute: Changed “Endpoint” to “Endpoint.Admin”  
- C.7.7: Database: Simplified description of Database node type.  
- C.8: Added “Type URI”, “Qualified” and “Shortname” names for TOSCA artifact types.  
- C.8.3: Added Python implementation type.  
- C.2.1: Credential: No longer has “network” in type URI  
- C.5.4: ConnectsTo: Use full TypeURI for Credential in definition. |

</tbody>
</table>

- A.8.1.15: Fixed “groups” grammar.
- A.9.1: TOSCA-232: metadata keyname added and several optional keynames of the service template were moved under it. This was a requirement that came from the NFV work group.
- C.7.13: LoadBalancer: added occurrences and explained why it allows zero applications on its application requirement.

- Note: These changes reflect changes agreed to during the 5/7/2016 half-day Simple Profile spec. review.
- A.3.2: Directives: Preserved the keyname “directives” for node templates, but here removed values “selectable” and “substitutable” since we no longer need them as all nodes are “selectable” and “substitutable” was determined to be equivalent to selectable.
- Ch. 11: Re-authored to define “concrete” vs. “abstract” nodes and all nodes that are “abstract” in TOSCA are selectable (and therefore substitutable).
- Ch. 12: Moved this to Ch. 11.3 as another use case for using node-filter to fulfill an abstract node through selection.
- Ch. 13: Substitution for chaining: Removed the need to use the “substitutable” directive” (only use of it anywhere in the spec.); all abstract nodes can be “substitutable” including the Transaction and Queueing subsystems described in the use case in this chapter.
- Ch. 3-6: Added logical diagrams to help visualize use cases described only as YAML templates.
- D.1.2.1: VM: Added a note that future subclasses of the VM artifact type might include popular standard image and container formats
- H.1.16, H.1.17, H.1.18: Updated use cases YAML to latest draft.
