Abstract:
This document lists errata for the OASIS UOML (Unstructured Operation Markup Language)
Version 1.0 Standard product by the UOML-X (Extended) Technical Committee (TC).

Status:
This document was last revised by the OASIS Unstructured Operation Markup Language
eXtended (UOML-X) on the above date. The level of approval is also listed above. Check the
“Latest Version” or “Latest Approved Version” location noted above for possible later revisions of
this document.

Technical Committee members should send comments on this specification to the Technical
Committee’s email list. Others should send comments to the Technical Committee by using the
“Send A Comment” button on the Technical Committee’s web page at http://www.oasis-open.org/committees/uoml-x/.

For information on whether any patents have been disclosed that may be essential to
implementing this specification, and any offers of patent licensing terms, please refer to the
Intellectual Property Rights section of the Technical Committee web page (http://www.oasis-
open.org/committees/uoml-x/ipr.php).

The non-normative errata page for this specification is located at http://www.oasis-
open.org/committees/uoml-x/.

**List of Changes**

1. Summary .................................................................................................................. 6
2. Proposed Specification Restructure. .......................................................................... 6
3. Add Introductory Text for the Introduction Clause. .................................................. 6
4. Editorially Modify the Terminology Clause and add new terms. ............................. 7
5. Add a new Scope clause (Normative). ................................................................. 10
6. Add a Notational Conventions Clause (Normative). ............................................. 10
7. Add an Acronyms and Abbreviations Clause (Informative). ............................... 10
8. Add a General Description Clause (Normative). .................................................. 11
9. Enhance and Editorially Modify the Overview Clause. ........................................ 12
10. Add items to the Normative References Clause.................................................... 13
11. Slight Editorial Change to the one Non-Normative Reference. ............................. 15
12. Rename the UOML Document Structure Clause to Abstract Document Model. . 15
13. Reword Introduction to Abstract Document Model clause.................................... 15
14. Rename Document Architecture sub-clause ....................................................... 16
15. Uses of docbase, docset and document in paragraph text all become lowercase. . 16
16. Reword current Document Architecture sub-clause which is the proposed Overview sub-clause.................................................. 16
17. Move Figures 1 and 2 to new proposed sub-clause Overview. .............................. 17
18. Modify Figure 2 for extended consistency and clarity .............................................. 17
19. Move all of the UOML objects in Document Architecture (old) to the UOML Objects clause (new). ................................................................. 18
20. Remove Internal Structure sub-clause. ................................................................ 19
21. Remove the phrase “Document Global Data” from the spec. ................................. 20
22. Add a new Docbase sub-clause ......................................................................... 20
23. Add new Docset sub-clause. ............................................................................ 20
24. Add new Document sub-clause .......................................................................... 21
25. Remove the Font Definition sub-clause .............................................................. 21
26. Rename the Page Data sub-clause to Page and edit for better clarity ................. 21
27. Add a new Layer sub-clause ............................................................................. 22
28. Add a new Object Stream sub-clause .................................................................. 22
29. Rename Graphics Objects to Graphics Object sub-clause and edit for better clarity .................................................. 22
30. Rename Command Objects to Command Object sub-clause and edit for better clarity .................................................. 23
31. Add a UML Diagram of UOML sub-clause ......................................................... 23
32. Minor changes in the Page Rendering Model sub-clause ................................... 24
33. Move the Coordinate and Path Encoding Rules sub-clause to the proposed new Graphics Objects clause.......................... 25
34. Move the Definition of Referenced Type sub-to the proposed new Command Objects clause .................................................. 25
35. Move the Default Value of Graphics State sub-clause to a new clause after the newly proposed Command Objects clause .................................................................................................................. 25
36. Expand introduction to the UOML Instructions clause and modify editorially .......... 25
37. Modify all Example titles in the specification to a new format ................................ 26
38. Ensure all examples in the document include namespace information in the outer XML elements .................................................. 26
39. Change all XML fragments to Courier Font ............................................................ 26
40. Make editorial changes within some Instructions. ...................................................... 27
41. Add a Note to the Semantics of the USE Instruction. ............................................ 28
42. Reformat the GET Instruction. ............................................................................ 28
43. Modify the pos: property in the INSERT instruction to clarify position numbers .................................................. 32
44. Modify the semantics of DELETE instruction to clarify position numbers ............ 33
45. Add a new UOML Objects clause with introductory wording ................................... 33
46. Add a New Logical Coordinate System and Units sub-clause ............................. 33
47. Add a New Graphics State sub-clause ................................................................. 33
48. Editorial changes to some of the UOML object semantics, properties, etc ............... 34
49. Remove Sub-Object items from some UOML object descriptions .......................... 36
50. Change the semantics of objects to reflect the descriptions provided in the newly proposed Abstract Document Model clause .................................................................................................................. 37
51. Move Font Definition clause from old Document Architecture clause to proposed UOML Object clause and re-edit. .......................................................... 37
52. Move the originally specified “Note:” items to the semantics. .............................................................................................................. 39
53. Add Units for PAGE properties ......................................................................................................................................................... 40
54. Add New Graphics Objects Clause to proposed new clause 4 ........................................................................................................ 40
55. Add New Command Objects clause to the proposed new clause 4 .................................................................................................. 41
56. Change the description of the angle property of ARC ......................................................................................................................... 41
57. Change the semantics wording of BEIZER ................................................................................................................................. 41
58. Add valid ranges and units to the properties of various objects and made editorial changes ...................................................... 42
59. Modify wording in PATH to clarify that it is the actual element and not conceptual and edit as needed ....................................... 46
60. Add an example in SUBPATH for clarity and edited as needed ........................................................................................................ 48
61. Add further description for the properties of TEXT and make appropriate editorial changes too ...................................................... 48
62. Add thickness to the semantics of LINE_WIDTH .......................................................................................................................... 50
63. Clarify wording in the RASTER_OP properties ........................................................................................................................... 50
64. Restructure the semantics of TEXT_DIR to clarify text direction ................................................................................................ 51
65. Clarify the meaning of character direction in the CHAR_DIR clause ............................................................................................ 52
66. Add wording saying the v1 property in CHAR_SLANT is regardless of reading direction ........................................................... 52
67. Provide default value information and cardinalities for CHAR_WEIGHT .......................................................................................... 53
68. Add further details for the possible values of the v1 property of CHAR_STYLE ............................................................................ 53
69. Add that the TEXT_MATRIX object applies to each character individually .................................................................................... 55
70. Add that SHADOW_WIDTH represents the thickness of the outline of a shadow ........................................................................ 55
71. Add that SHADOW_LEN represents the displacement of the shadow with respect to the character ............................................. 56
72. Add further description to SHADOW_DIR ................................................................................................................................ 56
73. Added an illustrative example to SHADOW_ATL ............................................................................................................................ 58
74. Add captions to the SHADOW_NEG picture illustrations ................................................................................................................ 59
75. Add further explanation to the CLIP_AREA specification ............................................................................................................. 60
76. Create a table for the Default Value of Graphics State ................................................................................................................ 61
77. Add a short introduction to the Definition of Referenced Type sub-clause ................................................................................. 63
78. Add a Data Ranges sub-clause ......................................................................................................................................................... 63
79. Rename CMD’s name property values clause ............................................................................................................................... 63
80. Expand the Conformance clause ..................................................................................................................................................... 63
81. Expand and add to all inline specification examples to be more informational ..................................................................... 64
82. Acknowledgments move from Annex A to Annex C ........................................................................................................................ 71
83. Change normative schema to reflect informative schema in proposed Annex A ........................................................................ 73
84. Add a copy of the UOML XML Schema as Annex A ....................................................................................................................... 74
85. Add Detailed UOML Examples as Annex B .................................................................................................................................. 85
86. Add a RELAX NG Representation of the UOML XML Schema as an Annex C ........................................................................ 91
List of Changes

1. **Summary**
   There is a proposal to edit the UOML specification substantially. The specification will be reformatted, restructured and thoroughly edited. New normative wording will be added for preciseness (however, breaking changes have been minimized). This errata document will be extensive in nature because the resulting update to the specification will be quite different from the 1.0 standard, especially from a clause arrangement and formatting perspective. However, there are no breaking changes to implementers amongst all of these changes. The flow of this errata document attempts to be in order of the original specification while showing the new structure of any updated specification.

2. **Proposed Specification Restructure.**
   Instead of four primary clauses, there will now be five primary clauses (not including Annexes).

   **Before (4 primary clauses)**
   1. Introduction
   2. UOML Document Structure
   3. UOML Instructions
   4. Conformance
   5. Appendix A

   **After (5 primary clauses)**
   1. Introduction
   2. Abstract Document Model
   3. UOML Instructions
   4. UOML Objects
   5. Conformance
   6. Appendices

3. **Add Introductory Text for the Introduction Clause.**
   Proposal to provide some context to the UOML specification within the introductory clause.

   **Current clause 1; proposed new clause 1**

   Introduction

   **This text is informative**

   This OASIS standard specifies an XML schema, called the Unstructured Operation Markup Language,
which defines an XML-based instruction set to access the visual appearance of unstructured documents and associated information.

This OASIS standard specifies an operation interface for accessing and manipulating the visual appearance of documents. It first defines an abstract document model, which is a set of standard objects and the way they are organized. Secondly, it defines a set of standard operations as an interface to access and manipulate these objects.

In the Unstructured Operation Markup Language (UOML), the term “document” is restricted to its visual appearance. With UOML, programmers can build, modify, and manage documents and their contents. UOML provides a unified interface to access and manipulating documents that simplifies the work to access them.

The goal of UOML is to enable the implementation of the UOML interface by the widest set of tools and platforms; thus fostering interoperability across multiple vendors, applications and platforms. There are two types of UOML implementations: Docbase Management System (DCMS) implementations that execute UOML instructions and application software implementations that issues UOML instructions.

UOML is valuable for document interoperation. Document editing software usually processes documents in its own proprietary format. With UOML, operation on a document is performed through a DCMS. Document editing software can cooperate with multiple DCMS and can edit a document regardless of its format. Conversely, a DCMS can cooperate with various document-editing software. Thus, interoperability is achieved.

With the help of UOML, document-editing software can put its focus on editing functionality and need not handle document formats, while a DCMS can put its focus on the functionality and performance of document operation and need not care about specific software applications. Industry division is thus realized, and free market competition is encouraged.

End of informative text

4. Editorially Modify the Terminology Clause and add new terms.

Enhanced the Terminology introductory text. Alphabetized the terminology list. Added new terms for application software, DCMS, graphics state, graphics state stack, layer, object, page bitmap, stack, sub-element. Editorially modified the definitions for command object, DCMS, docbase, Docbase Management System, docset, graphics object, layer, object stream, Path, sub-object, UOML.

Before (current clause 1.1)

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in [RFC2119].

Keywords:

UOML: short for “Unstructured Operation Markup Language”.

Comment [JM4]: NO-04 – use the word “terminology” instead of “keywords”
DE-09 – docbase, docset
GB-10 – docbase, docset
GB-23 – document global object
GB-51 – graphics state stack
GB-29 – implementation dependent
GB-11 – layer
GB-56 – page bitmap
GB-12 – path
GB-29 – position number
DE-12 – sub-element
GB-22 – sub-element
DE-08 – general expansion and changes to the Terminology clause
GB-07 – general expansion and changes to the Terminology clause
NL-02 – general expansion and changes to the Terminology clause
GB-25: add detail about object model to Terminology
DE-25: POP_GS and PUSH_GS explanation
GB-09: Add more detail to terminology
Docbase: comes from "Database", means document base, is the container of mass documents; it is the root level of the UOML document structure.

**Docbase Management System**: the software which implements the function defined by UOML, short as DCMS.

**Docset**: a set of documents, like directory in file system.

**Layer**: a page is composed of one or more layers, each layer has the same size as the page, and the visual appearance of the page is added up by these layers.

**Path**: refers to the open or closed region collection, which consists of one or multiple line/curve segment(s), its first letter should always be uppercase. In this document, we also use 'path' (all lowercase) to refer to filename, location of Docbase or image file, it is different from 'Path'.

**Graphics Object**: refers to the objects that could make render engine to draw, it is used to describe the appearance of a page. It includes: text, image, Path, etc.

**Command Object**: uses for modifying the current graphics state that holds current graphics control parameters, such as text size, typeface and color.

**Object Stream**: a sequence of graphics objects and command objects.

**Sub-object**: in a tree structure, the upper level object is called parent object, and its' connected lower level object is called sub-object. One parent object can connect multiple sub-objects, but one sub-object can only have one parent object. Sub-object is created by INSERT instruction.

**After (proposed new clause 1.1)**

**Terminology**

For the purposes of this document, the following terms and definitions apply. Other terms are defined where they appear in *italics* typeface. Terms not explicitly defined in this OASIS standard are not to be presumed to refer implicitly to similar terms defined elsewhere.

Throughout this OASIS standard, the terminology "must", "must not", "required", "shall", "shall not", "should", "should not", "recommended", "may" and "optional" in this document shall be interpreted as described in RFC 2119, *Keywords for use in RFCs to Indicate Requirement Levels*. [RFC2119].

**DCMS**: Abbreviated for "Docbase Management System".

**docbase**: The root level of the UOML abstract document model. Abbreviated for "document base", it is the container of one or many documents. A docbase contains one and only one root docset. [Note: The docbase is analogous to a file system on a modern operating system. The term docbase is derived from the term "database". The docset is analogous to a directory within a file system on a modern operating system. The root docset is analogous to the root directory of a file system. *end note*].

**Docbase Management System**: The software that implements the functionality defined by the UOML specification. Abbreviated as DCMS.

**docset**: A set of documents. A docset may contain one to many docsets. [Note: The docset is analogous to a directory within a file system on a modern operating system. *end note*].

**document global object**: A document global object may include a fontlist, fontmap and/or embedfont.

**graphics object**: An object that is drawable by the render engine. It describes part or all of the
appearance on a page. Examples include images and text.

**graphics state:** An internal structure maintained by the DCMS to hold current graphics control parameters. A command object changes one or multiple parameters in the current graphics state.

**graphics state stack:** A sequence of graphics states where the first one in is the last one out. A DCMS shall maintain a stack for graphics states, called the graphics state stack. [Note: The command object PUSH_GS saves a copy of the current graphics state onto the stack. The command object POP_GS restores the saved copy, remove it from the stack and make it the current graphics state. end note]

**Implementation-dependent:** indicates an aspect of this specification that may differ between implementations, is not specified by this specification, and is not required to be specified by the implementer for any particular implementation.

**layer:** A page is composed of one or more layers. A layer has the same size as the page on which it is constructed. The visual appearance of a page is a combination of all of the layers of the page.

**object:** The UOML abstract document model is a tree structure, and a node in the tree is called a UOML object, abbreviated as object.

**object stream:** A sequence of graphics objects and command objects. A layer holds object streams.

**page bitmap:** A raster image that represents the visual appearance of the page. The number of pixels of the raster image depends on the resolution of the raster image. The number of pixels in the horizontal direction equals the page width multiplied by the resolution; the number of pixels in the vertical direction equals the page height multiplied by the resolution. [Note: The resolution is the same for both the horizontal and vertical direction. end note]

**Path:** A Path is a graphics object composed of straight and/or curved line segments, which may or may not be connected. [Note: that in this document, ‘path’ (all lowercase) refers to a filename, location of docbase or image file. This is different from this current definition of “Path” (with the uppercase ‘P’). end note]

**position number:** Integer starting at 0 to some implementation-dependent maximum, which defines a sequence of objects. [Note: the order of a specific sub-object amongst all sub-objects belong to same parent object. It is a continual integer starting at 0 end note]

**sub-element:** In a UOML object XML representation, a sub-element is the child XML node of its parent XML node. [Note:

In UOML a sub-element is a child XML element in the UOML object's XML representation. For example, the XML representation of a CMD object in UOML could be:

```
<CMD name="COLOR_LINE">
<rgb r="128" g="3" b="255" a="120"/>
</CMD>
```

where rgb is a sub element of CMD.

end note]

**Sub-object:** In the UOML abstract document model tree structure instance, a sub-object is the child node of its parent object node. Each sub-object has only one parent node. A parent node may have multiple sub-objects as child nodes. [Note: A sub-object is created by the UOML INSERT instruction. A sub-object
describes part of the logical model of the UOML object tree. For example, a logical model of a document could be:

docbase
docset
document
  page
  layer
  object stream

where the child object is the sub-object of the parent object. For example, document is the sub-object of
docset, page is the sub-object of document, etc. However, there is no single XML representation of the
whole UOML docbase since UOML does not specify the format of document. The XML schema of each
UOML object describes the object itself, not including its sub-object, and should only be used as a part of
a UOML instruction.  

end note]

UOML: abbreviation of “Unstructured Operation Markup Language”.

5. Add a new Scope clause (Normative).

proposed new clause 1.2

Scope

This OASIS standard describes the abstract document model of UOML and the operations available on it.
Specifically, operations providing functionality for read/write/edit and display/print on layout-based
documents are described. This standard does not define any binding for the operations on the UOML
document model. Such bindings are implementation-defined or will be defined in other parts of this
standard.

6. Add a Notational Conventions Clause (Normative).

proposed new clause 1.3

Notational Conventions

The following typographical conventions are used in this OASIS standard:

The first occurrence of a new term is written in italics, as in “normative”.

In each definition of a term in §1.1 (Terminology), the term is written in bold, as in “docset”.

7. Add an Acronyms and Abbreviations Clause (Informative).

proposed new clause 1.4

Acronyms and Abbreviations

This clause is informative

The following acronyms and abbreviations are used throughout this OASIS standard:

DCMS — Docbase Management System
IEC — the International Electrotechnical Commission
ISO — the International Organization for Standardization
UOML — Unstructured Operation Markup Language
W3C — World Wide Web Consortium

End of informative text

8. **Add a General Description Clause (Normative).**

A proposal to add a clause describing the structure of the document and how informative text is described.

**proposed new clause 1.5**

General Description

This OASIS standard is divided into the following subdivisions:

1. Front matter (clause summary);
2. Main body (clauses 2-4);
3. Conformance (clause 5);
4. Annexes

Examples are provided to illustrate possible forms of the constructions described. References are used to refer to related clauses. Notes may be provided to give advice or guidance to implementers or programmers.

The following form the normative pieces of this Part of this OASIS standard:

- Clauses 1 (except subclauses 1.4, 1.6, and 1.8) and 2–5

The following form the informative pieces of this Part of this OASIS standard:

- Introductory text in clause 1
- Subclauses 1.4, 1.6, and 1.8
- All annexes
- All notes and examples

Except for whole clauses or annexes that are identified as being informative, informative text that is contained within normative text is indicated in the following ways:

1. [Example: code fragment, possibly with some narrative … end example]
2. [Note: narrative … end note]

Comment [JMB]: NO-03: make specification more ISO friendly

NL-04: Strengthen specification quality
9. **Enhance and Editorially Modify the Overview Clause.**

Added wording about relationship to PDF, future UOML Parts, and made general editorial changes.

**Before (current clause 1.2)**

Overview

UOML is interface standard to process unstructured document; it plays the similar role as SQL (Structured Query Language) to structured data. UOML is expressed with standard XML, featuring compatibility and openness.

UOML deals with layout-based document and its related information (such as metadata, rights, etc.). Layout-based document is two dimensional, static paging information, i.e. information can be recorded on traditional paper. The software which implements the UOML defined function, is called DCMS, applications can process the document by sending UOML instructions to DCMS.

UOML first defines abstract document model, then operations to the model. Those operations include read/write, edit, display/print, query, security control; it covers the operations which required by all different kinds of application software to process documents. UOML is based on XML description, and is platform-independent, application-independent, programming language-independent, and vendor neutral. This standard will not restrict manufacturers to implement DCMS in their own specific way.

This specification is the 1st part of UOML, which defines the operations used for read/write, edit, and display/print layout-based document.

This specification defines UOML objects and UOML instructions as following.

**After (proposed new clause 1.6)**

Overview

This clause is informative

This OASIS standard specifies an instruction set of XML elements and attributes describing operations on unstructured, fixed-layout documents. These instructions are for the processing of these documents to accomplish various functionality, such as display and edit.

UOML is to unstructured documents as SQL (Structured Query Language) is to structured data. UOML is expressed using standard XML via an instance of an XML schema. UOML handles fixed-layout documents and its associated information (e.g., metadata, security rights, etc.) Fixed-layout documents are two-dimensional and contain static paging information (i.e., information that can be recorded on traditional paper). Thus, the document stores fixed-layout 2D static information that describes the visual appearance.

Software that implements a conforming implementation of the UOML specification is called a DoCbase Management System (DCMS). Applications process a UOML document by sending UOML instructions (operations) to the DCMS.
The UOML graphics object model is similar to the graphics model specified by ISO/IEC 32000-1:2008, the Portable Document Format (PDF) standard. For example, both standards describe a page layout using logical coordinate systems, and the positions of the graphics objects are specified using coordinates in the logical coordinate systems. The similarity of the two models allows UOML to be used as an interface standard for PDF.

This OASIS standard forms the foundation of UOML. Other standards building upon this standard may be created in the future.

End of informative text

10. Add items to the Normative References Clause.

Items were added to the normative references clause. Also slight changes were made to existing normative references: XML 1.0, xml-names, xmlschema-1, xmlschema-2, RFC2119, PNG, JBIG, JPEG, OpenFont. Editorial edits were made as well.

**Before (current clause 1.3)**

Normative References

[XML1.0] Tim Bray, Jean Paoli, C. M. Sperberg-McQueen, Eve Maler, François Yergeau, Extensible Markup Language (XML) 1.0 (Third Edition),

[JBIG] ISO/IEC 11544, Coded representation of picture and audio information -- Progressive bi-level image compression

[JPEG] ISO/IEC 10918, Digital compression and coding of continuous-tone still images

**After (proposed new clause 1.7)**

Comment [JM10]: DE-20: BMP, TIFF
GB-16: BMP, TIFF
GB-41: RGB
GB-54: IANA
GB-39: BNF
CZ-01: UOML Schema given accepted change to Conformance clause
DE-10: Add schema as normative part of specification
CZ-02: XML Namespaces and unify look and feel of XML references
DE-24: accepted that schema was normative
JP-08: BNF (ISO/IEC 14977)
Normative References

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

11. **Slight Editorial Change to the one Non-Normative Reference.**

   The document title in the non-normative reference has been italicized.

   **Before (current clause 1.4)**

   [PDF] ISO/IEC FDIS 32000, Portable Document Format based on PDF1.7: Part 1

   **After (proposed new clause 1.8)**

12. **Rename the UOML Document Structure Clause to Abstract Document Model.**

    The "UOML Document Structure" clause was renamed to "Abstract Document Model".

    **current clause: 2; proposed new clause: 2**

13. **Reword Introduction to Abstract Document Model clause.**

    **Before (current clause 2)**

    UOML works on abstract document model. The abstract document model can be regarded as a hierarchy of objects, the UOML instructions deal with these objects. This chapter specifies what kinds of objects are included in abstract document model, and also addresses the detailed description of each object.

    This chapter covers the following issues:
    
    - Document Architecture: the relationships among DOCBASE, DOCSET and DOC
    - Internal Structure of Document: Global Data and Page Data
    - Document Global Data: Metadata and Font
    - Page Data
    - Graphics Objects
    - Command Objects
    - Default Value of Graphics State

    **After (proposed new clause 2)**
UOML is based on an abstract document model. [Note: This abstract document model can describe any visual appearance; thus an arbitrary document that can be displayed and printed can be described using this abstract document model. end note] Description of document data using this abstract document model results in an instance of the abstract document model. An instance of the abstract document model is a hierarchy of objects, or a tree structure, on which instructions interact. This clause specifies and describes the objects of the UOML abstract document model.

14. **Rename Document Architecture sub-clause.**

The Document Architecture sub-clause in UOML Document Structure was renamed to Overview.

*current clause 2.1; proposed new clause 2.1*

15. **Uses of docbase, docset and document in paragraph text all become lowercase.**

Anywhere in the specification where the term “Docbase”, “Docset” or “Document” is currently used within the specification (except for clause heading titles and the beginning of sentences, or where grammatically appropriate) will be changed to lowercase versions “docbase”, “docset” and “document”.

Current lines for docbase: 12, 25, 108 (all instances), 111, 119, 121, 122, 841, 856, 858, 860, 862, 1040, 1044, 1045,

Current lines for docset: 18, 108, 109 (all instances), 110, 111 (all instances), 117 (all instances), 118 (all instances), 124, 127, 129, 131

Current lines for document: 108 (all instances), 110 (all instances), 111, 139

For example, current clause 2.1, line 108:

**Before**

Documents are organized with Docbase, Docset and Document

**After**

Documents are organized with docbase, docset and document

16. **Reword current Document Architecture sub-clause which is the proposed Overview sub-clause.**

**Before (current clause 2.1)**

Documents are organized with Docbase, Docset and Document. Within one Docbase, it must have one and only one Docset, as the root Docset, which is the collection and entrance for all the documents, similar to the root directory of a file system. As the container for Document, Docset can be embedded, which means it may contain sub-Docset. Therefore, Docbase, Docset and Document can construct a multiple level tree structure, just like the file system.

**After (proposed new clause 2.1)**

In the UOML abstract document model, documents are organized hierarchically via docbase, docset and document objects (see Figure 1). There are two sub-objects of a document object: document global objects and page related objects. Document global objects include font objects. Page related objects are organized hierarchically via pages, layers, object streams, command objects and graphics objects (see Figure 2).
One docbase shall have one and only one docset, known as the root docset. The root docset is the parent of all documents, similar to the root directory of a file system. As the container for documents, docsets may be nested (i.e., a docset may be a child of another docset). Figure 1 shows how a docbase, docset and document can construct a multiple level UOML-based tree structure, similar to a file system.

< Figures 1 and 2 here>

The following clauses provide a description of each object type.

17. **Move Figures 1 and 2 to new proposed sub-clause Overview.**

Move the figures to the near the end of the text in proposed new clause 2.1. See errata 16 for their exact location.

18. **Modify Figure 2 for extended consistency and clarity**

**Before**

![Diagram of Document Structure](image1)

**After**

![Updated Diagram of Document Structure](image2)

---

**Comment [JM17]:** NL-04: allows for restructuring and reformatting for better quality. As well as strengthening technical details.

FR-02 – allows for the entire specification restructure

GB-21: Figures should be normative

**Comment [JM18]:** CZ-03: figure 2 update

DE-04: based on result of CZ-03

GB-21: Figures should be normative
19. Move all of the UOML objects in Document Architecture (old) to the UOML Objects clause (new).

All specific UOML objects in the old Document Architecture clause (docbase, docset, doc, metalist, etc.) were moved to a new UOML Objects clause. These include current clauses 2.1.1, 2.1.2, 2.1.3, 2.3.1, 2.3.1.1, 2.3.1.2, 2.3.2.1, 2.3.2.2, 2.3.2.3, 2.4.1, 2.4.2, 2.4.3, 2.5.1 through 2.5.13, 2.5.13.1, 2.5.13.2, 2.6.1, 2.6.2, 2.6.2.1 through 2.6.2.35, 2.7. Propose to move these to a new clause 4. Here are the pairings from old clause \(\rightarrow\) new clause.

2.1.1 \(\rightarrow\) 4.3
2.1.2 \(\rightarrow\) 4.4
2.1.3 \(\rightarrow\) 4.5
2.3.1 \(\rightarrow\) 4.5.1
2.3.1.1 \(\rightarrow\) 4.5.1.1
2.3.1.2 \(\rightarrow\) 4.5.1.2
2.3.2.1 \(\rightarrow\) 4.6.1
2.3.2.2 \(\rightarrow\) 4.6.2
2.3.2.3 \(\rightarrow\) 4.6.3
2.4.1 \(\rightarrow\) 4.7
2.4.2 \(\rightarrow\) 4.8
20. **Remove Internal Structure sub-clause.**

Remove the Internal Structure of the Document sub-clause from the specification. Associated wording to be rewritten and repurposed to other clauses, specifically the Font and Page sub-clauses.

**Before (current clause 2.2)**

Document is consisted of Document Global Data and Page Data.

Document Global Data can be used globalize among the document, it includes Metadata and Font. Metadata is the list for a set of keys and values, and is a sub-object of DOC, while Font is a list of font mappings (FONTMAP) and is also a sub-object of DOC. Each font mapping describes a font type used in the document, including font name, font sequential number defined in the document, and optional embedded Font.

Page Data may include 0 to multiple page(s) (PAGE). Each page has properties to describe width, height, resolution; each page may contain one to multiple layer(s) (LAYER), and each layer may contain one to multiple object stream; each object stream may contain a sequence of objects, which include graphics objects (details about this, see 2.5 Graphics objects) and non-displayable command objects (CMD) (details about this, see 2.6 Command Objects).

**After (proposed new clauses 2.5, 2.6)**

**Font (proposed clause 2.5)**

In the UOML abstract document model, three objects (fontlist, fontmap and embedfont), called font objects, are used to describe font information used in a document. A document object may contain zero or more fontlist sub-objects; a fontlist object may contain zero or more fontmap sub-objects; a fontmap may contain zero or one embedfont sub-object.

Fontlist is a list of fontmaps. Each fontmap describes one font used in the document, including font name and font sequential number used in the document. A document may optionally have font data embedded within it.
A page object corresponds to a page in the document. Its sub-object is a layer object. A page object is composed of zero or more layer objects. The visual appearance of a page is a combination of all layers of the page.

Each page has its own size and resolution. The origin of a page’s coordinate system is the top left corner of the page. The unit of a page’s logical coordinate is defined by its resolution.

In this specification, the page object is described using PAGE (§4.7).

[Note: A document with no pages is permitted. It is an intermediate state. One can create such a document, then open and add pages at a future time. end note]

21. **Remove the phrase “Document Global Data” from the spec.**

Remove the Document Global Data phrase from the spec. Metadata and Font remain as entities, but just not under the Document Global Data name. Document Global Data is repetitive and the discussion around Metadata and Font covers the discussion regarding Document Global Data. This term is proposed to be removed from current clause 2.1.3 and the entire current clause 2.3 has been removed.

*Current clause 2.1.3, line number 139*

*Current clause 2.3, remove the entire clause*

22. **Add a new Docbase sub-clause.**

Add a description of the docbase object (not its direct implementation specification) to the proposed Abstract Document Model clause.

*proposed new clause 2.2*

The docbase is the root of the UOML abstract document model structure. A docbase has only one docset sub-object called the root docset [Note: Other docsets and documents are a docset’s sub-objects. end note].

The root docset is generated automatically when the docbase is created (see Figure 1). In this specification, the docbase object is specified using DOCBASE (§4.3).

*Sub-object: docset.*

23. **Add new Docset sub-clause.**

Add description of the docset object (not its direct implementation specification) to the proposed Abstract Document Model clause.

*proposed new clause 2.3*

A docset is an object whose sub-object can be a document, or another docset. In other words, a docset is a set of documents and/or docsets. In this specification, the docset object is specified using DOCSET (§4.4).

*Sub-object: document, docset.*
24. **Add new Document sub-clause.**

Add description of the Document object (not its direct implementation specification) to the proposed Abstract Document Model clause.

**proposed new clause 2.4**

The document object is the root node of document information (see Figure 2). A document contains static information for fixed-layout 2D documents. [Note: In future UOML parts or future versions of this part, other types of document information may be supported, including audio/video, 3D information, etc. end note]. A single document has zero to multiple pages. In this specification, a document object is specified using DOC. (§4.5).

[Note: A document with no pages is permitted. It is an intermediate state. One can create such a document, then open and add pages at a future time. end note]

**Sub-object:** fontlist, page.

25. **Remove the Font Definition sub-clause**

The Font Definition clause in 2.3.2 is proposed to be removed as it will be superseded by a new Font clause (see errata #20) and a new rewording of Font Definition (see errata #51).

**current clause 2.3.2, lines 176-179; proposed new clause 2.5 (see errata #20), proposed new, reworded clause 4.6 (see errata #51).**

26. **Rename the Page Data sub-clause to Page and edit for better clarity.**

**Before (current clause 2.4)**

Page Data

Page data includes PAGE, LAYER, OBJSTREAM, Graphics Objects and Command Objects, please check Figure 2 for their structure.

LAYER is PAGE's sub-object, OBJSTREAM is LAYER's sub-object, Graphics Objects and Command Objects are OBJSTREAM's sub-object, they can be generated by UOML INSERT instruction. Graphics Objects refers all the visible objects, check 2.5 for details. Command Objects refers objects that can control graphics state of the render engine, check 2.6 for details.

**After (proposed new clause 2.6)**

Page

A page object corresponds to a page in the document. Its sub-object is a layer object. A page object is composed of zero or more layer objects. The visual appearance of a page is a combination of all layers of the page.

Each page has its own size and resolution. The origin of a page's coordinate system is the top left corner of the page. The unit of a page's logical coordinate is defined by its resolution.
In this specification, the page object is described using PAGE (§4.7).

[Note: A document with no pages is permitted. It is an intermediate state. One can create such a document, then open and add pages at a future time. end note]

Sub-object: layer.

27. **Add a new Layer sub-clause.**

A description of the Layer object (not its direct implementation specification) will be added to the proposed Abstract Document Model clause.

Proposed new clause 2.7

Layer

A layer object corresponds to one layer in a page. When a page has multiple layers, the order of a layer determines the order it appears on the page, with subsequent specified layers imposed on top of earlier-specified layers.

[Note: When a renderer processes multiple layers, the renderer processes the layers in sequence (i.e., after processing all of the objects in the first layer, then move to process the objects in the second layer, and so on). For example, suppose a page has 2 layers. The first layer has one object stream with three objects OA1, OA2, OA3, and the second layer has one object stream with two objects OB1, OB2. The renderer should treat the rendering result as a Layer with an object stream containing objects OA1, OA2, OA3, OB1, and OB2 in sequence. In summary, the layers should be treated as one layer containing all of the graphics objects and command objects in sequence. There is no particular blending effect between layers. Any overlapping effect is controlled by command object with type ROP (Raster_OP), which will change the current graphics state of ROP. end note]

In this specification, the layer object is described using LAYER.

Sub-object: object stream.

28. **Add a new Object Stream sub-clause.**

Add a description of the Document object (not its direct implementation specification) to the proposed Abstract Document Model clause.

proposed new clause 2.8

Object Stream

An object stream is a sequence of zero or more graphics objects and/or command objects.

A layer holds 0 or more object streams. The reason a layer can hold many object streams is that multiple object streams may be needed to specify a related set of graphics and command objects, each of which is combined in one layer. The different object streams can then be handled separately; for example, for future extensions for such functionality as security control.

Sub-object: graphics object, command object.

29. **Rename Graphics Objects to Graphics Object sub-clause and edit for better clarity**

(Note that a new Graphics Objects clause is being proposed to be added to the newly proposed clause 4...
as clause 4.10. See errata #55 below)

**Before (current clause 2.5)**

Graphics objects refer to the objects that could make render engine to draw, such as text, image, and Path. They describe the appearance of the page. The types and definitions of graphics objects are given as follows.

**After (proposed new clause 2.9)**

A graphics object is a set of objects that could allow the render engine to draw text, image, and Path. Graphics objects describe the appearance of the page. The graphics objects in UOML includes arc, Bezier, circle, ellipse, image, line, rectangle, round rectangle, Path and text objects.

### 30. Rename Command Objects to Command Object sub-clause and edit for better clarity.

(Note that an updated Command Objects clause is being proposed to be added to the newly proposed clause 4 as clause 4.11. See errata #56 below)

**Before (current clause 2.6)**

Command objects are Page Data's sub-object, are used for modifying the current graphics state that holds current graphics control parameters, such as text size, typeface and color. The properties include command name, command value and other possible data (such as clip, transformation matrix, color and so on).

**After (proposed new clause 2.10)**

A command object changes one or multiple parameters in the current graphics state. The graphics state is initialized at the beginning of the rendering of each layer with the default values specified in section §4.13. The rendering of a graphics object relies on the current parameters in the graphics state.

### 31. Add a UML Diagram of UOML sub-clause.

At the request of the NBs, a UML diagram is proposed for the abstract document model.

**proposed new clause 2.11**

**UML Diagram of UOML**

The following is a UML diagram of the UOML abstract document model. It shows the tree structure of UOML along with cardinalities associated with the objects discussed in this clause.
32. Minor changes in the Page Rendering Model sub-clause.

Before (current clause 2.4.4)

Page rendering steps:
1. Repeat the following step from the first layer to the last layer.
   1. Initialize the current graphics state of the render engine with the default value (refer to 2.7).
   2. Loop through the object streams of the current layer.
      1. Then loop through the objects of each object stream.
         1. Draw the object if it is graphics object.
         2. Otherwise update the graphics state according to the content of the command object.
2. Page rendering completes.

After (proposed new clause 2.12)

The following are the steps to render a page:
1. Repeat the following step from the first layer to the last layer by position number.
   a. Initialize the current graphics state of the rendering engine with the default value (§4.13).
   b. Loop through the object streams of the current layer by position number.
      i. Then loop through the objects of each object stream by position number.
         1. Draw the object if it is a graphics object.
         2. Otherwise, the object is a command object; update the graphics state according to the object.
2. Page rendering completes.

Comment [JM32]: GB-29: the page rendering algorithm loop through the object stream by position number (add “by position number” to the end of lines 318, 320, 321 in WD 1.0.1)
33. **Move the Coordinate and Path Encoding Rules sub-clause to the proposed new Graphics Objects clause.**

Move the Coordinate and Path Encoding Rules sub-clause to the newly proposed UOML Graphics Objects clause.

**current clause 2.5.12, lines 379-417; proposed new clause 4.10.12**

34. **Move the Definition of Referenced Type sub-to the proposed new Command Objects clause.**

Move the Definition of Referenced Type sub-clause to the newly proposed UOML Command Objects clause.

**current clause 2.5.13, lines 418-457; proposed new clause 4.11.3**

35. **Move the Default Value of Graphics State sub-clause to a new clause after the newly proposed Command Objects clause.**

Move the Default Value of Graphics State sub-clause to a new clause after the newly proposed Command Objects clause.

**current clause 2.7, lines 811-838; proposed new clause 4.12**

36. **Expand introduction to the UOML Instructions clause and modify editorially.**

**Before (current clause 3)**

UOML Instructions are used to define operations to UOML objects, such as create a Docbase, insert a sub-object, delete a object, change attribute of a object, etc.

This chapter will define the syntax and semantics of the following UOML instructions

1. OPEN
2. CLOSE
3. USE
4. GET
5. SET
6. INSERT
7. DELETE
8. SYSTEM
9. RET

**After (proposed new clause 3)**

UOML Instructions are used to define operations that interact with UOML objects, such as creating a docbase, inserting a sub-object, deleting an object, changing an attribute of an object, etc.
This clause defines the syntax and semantics of the UOML instructions. The order of UOML instructions are OPEN, followed by zero or many operations except OPEN or CLOSE, ended by CLOSE. There are no dependencies among operations between OPEN and CLOSE; thus there is no order for those operations.

37. **Modify all Example titles in the specification to a new format**

The new format for examples would be:

[Example: .... end example]

Affects all clauses with examples.

This new format will affect examples starting on lines 477, 482, 485, 868, 876, 886, 948, 951, 956, 961, 992, 1011, 1018, 1033, 1048, 1080

For example, in current clause 2.6.1, line 477, the change would be:

**Before**

EXAMPLE 1:

```xml
<CMD name="COLOR_LINE" >
  <rgb r="128" g="3" b="255" a="120"/>
</CMD>
```

**After**

```xml
[Example:]

<CMD name="COLOR_LINE" >
  <rgb r="128" g="3" b="255" a="120"/>
</CMD>
end example]
```

38. **Ensure all examples in the document include namespace information in the outer XML elements**

Here is an example of the change in the OPEN instruction, current clause 3.1, line 868:

This new format will affect examples starting on lines 477, 482, 485, 868, 876, 886, 948, 951, 956, 961, 992, 1011, 1018, 1033, 1048, 1080

```xml
<uoml:OPEN path="/home/admin/storage/1.sep" create="true" del_exist="false"/>
```

39. **Change all XML fragments to Courier Font.**

This new font will affect XML fragments between (inclusively) line ranges 478-480, 483, 486-488, 869, 879, 889, 949, 952-954, 957-959, 962-969, 993-995, 1012-1016, 1019-1023, 1034, 1049-1051, 1081-1085
40. Make editorial changes within some Instructions.

Minor editorial changes are proposed to be made throughout some of the UOML instructions to bring them to better English grammatical compliance, as well as add some more clarity.

Before (current clauses 3.1, 3.2, 3.6, 3.8)

OPEN (clause 3.1)

path: a character string value, representing the path of a Docbase.

CLOSE (clause 3.2)

handle: a character string value, representing the handle of the Docbase to be closed.

INSERT (clause 3.6)

Semantics:
INSERT inserts an object under another one as its sub-object.

SYSTEM (clause 3.8)

Semantics:
SYSTEM executes system maintenance. Within this version, it has only one function: to save the docbase. It includes a sub-element:
flush—to save the Docbase

After (proposed new clauses 3.1, 3.2, 3.6, 3.8)

OPEN (clause 3.1)

path: a character string value, representing the location of a docbase. There is no defined format for the path value (e.g., URI, URL, fully-qualified file system directory path, absolute value, relative value, etc.). Valid values for this property, and their appropriate interpretation, are implementation-defined. [Note: A path should be a format such that it could be used to find the location of the docbase. end note]

CLOSE (clause 3.2)

handle: a character string value, representing the handle of the docbase to be closed.

INSERT (clause 3.6)

Semantics:
INSERT inserts an object as a sub-object of a specific parent object.

SYSTEM (clause 3.8)

Semantics:
SYSTEM executes system maintenance, such as saving the docbase. [Note: Within this Part of the UOML specification, SYSTEM has only one function: to save the docbase. end note]
41. **Add a Note to the Semantics of the USE Instruction.**

*current clause 3.3, line 882; proposed new clause 3.3*

[Note: USE sets an object in the document to the current object of focus. The current object is used when the destination object is not specified within an instruction (e.g. INSERT). *end note*]

42. **Reformat the GET Instruction.**

*Before (current clause 3.4)*

**Semantics:**

GET can retrieve the sub-object handle, the count of sub-objects, the property value of an object, a page bitmap.

**Properties:**

- **usage:** a character string value, representing the usage of GET. The possible values include GET_SUB, GET_SUB_COUNT, GET_PROP, GET_PAGE_BMP, representing respectively getting sub-object, getting sub-object count, getting properties, getting page bitmap.
- **handle:** a character string value, representing object handle of the current operation. It is optional, if not exists, use the handle set by USE instead.

**Sub-elements:**

- **pos:** used when usage=GET_SUB. It has one property listed below.
  - Property of this sub-element:
    - **val:** represents position number of the specified sub-object, starts from 0.
  - Sub-element of this sub-element: N/A

- **property:** used when usage=GET_PROP. It has one property listed below.
  - Property of this sub-element:
    - **name:** represents the getting property name.
  - Sub-element of this sub-element: N/A

- **disp_cont:** used when usage=GET_PAGE_BMP. It has five properties and one option sub-element listed below.
  - Properties of this sub-element:
    - **end_layer:** represents the end layer of drawing operation (the drawing operation ends at this layer and this layer is not drawn any more)
    - **resolution:** represents resolution of bitmap
    - **format:** represents bitmap format. The only valid value is "bmp", representing the uncompressed BMP format.
    - **output:** represents whether to put out to the file or to the memory and the value to be chosen is FILE or MEMORY;
    - **addr:** represents the path of output file or memory address.
  - Sub-element of this sub-element:
    - **clip:** represents clip area for output, PATH type.

**Usage Value / Return Value:**

return value based on usage value.

Comment [JM41]: KR-03: note describing object and current object.

Comment [JM42]: GB-07: allows for editorial changes to be made for clarity.

NL-04: allows for restructure and reformatting for better quality. As well as strengthening technical details.
GET_SUB_COUNT: If the usage is GET_SUB_COUNT, indicates to get the number of sub-objects of this specific object. In this case, there is no sub-element needed. The return value, which is within RET, contains one 'intVal' sub-element, and its 'name' property is "sub_count", 'val' property represents number of sub-objects.

GET_SUB: If the usage is GET_SUB, indicate to get the handle of some specific sub-object. In this case, GET contains sub-element of 'pos'. The return value, which is within RET, contains one 'stringVal' sub-element, and its 'name' property is handle, its 'val' property presents this sub-object's handle.

GET_PROP: If the usage is GET_PROP, indicate to get some specific property of this specific object. In this case UOML instruction GET shall contain sub-element of 'property'. If the operation succeeds, the sub-element of return value, which is within RET, is not certain and the concrete sub-element name relies on the type it has got, the 'name' property of the sub-element is the property name to get, 'val' property is the value of the property.

GET_PAGE_BMP: If the usage is GET_PAGE_BMP, indicate to get the this specific page bitmap. In this case, GET shall contain sub-element 'disp_conf'; It only use return value defined by RET. When it fails, the return value is defined by RET.

EXAMPLE 1:  get the total number of sub-objects of the specific object
<uoml:GET handle="obj_handle_xxx" usage="GET_SUB_COUNT"/>

EXAMPLE 2:  get a specific sub-object handle
<uoml:GET handle="obj_handle_xxx" usage="GET_SUB">  
<pos val="0"/>
</uoml:GET>

EXAMPLE 3:  get specific property of the object
<uoml:GET handle="obj_handle_xxxxx" usage="GET_PROP">  
<property name="start"/>
</uoml:GET>

EXAMPLE 4:  get specific page's bitmap
<uoml:GET handle="page_obj_handle_xxx" usage="GET_PAGE_BMP">  
<disp_conf format="bmp" output="FILE" end_layer="1" resolution="600" path="/home/admin/output/page.bmp">  
<clip>  
<SUBPATH data="s 0,0 l 3000,0 l 3000, 5000 l 0, 5000 l 0,0"/>
</clip>
</disp_conf>
</uoml:GET>
After (proposed new clause 3.4)

Semantics:
GET retrieves information such as a sub-object handle, the count of sub-objects, the property value of an object, or a page bitmap.

Properties:
- **usage**: a character string value, representing the usage of GET. The possible values of this property are GET_SUB, GET_SUB_COUNT, GET_PROP, GET_PAGE_BMP, representing getting a sub-object, getting the sub-object count, getting properties, and getting a page bitmap, respectively.
- **handle**: a character string value, representing the object handle of the current operation. This property is optional. If this property is not used, then the current handle set by the USE instruction is used.

Sub-elements:
- **pos**: used when usage=GET_SUB.
  - Property of this sub-element:
    - **val**: specifies the position number of the specified sub-object, starting from 0.
  - Sub-element of this sub-element: N/A

- **property**: used when usage=GET_PROP.
  - Property of this sub-element:
    - **name**: specifies the name of the property whose value is returned, if *name* is an empty string, the type of the object is retrieved.
  - Sub-element of this sub-element: N/A

- **disp_conf**: used when usage=GET_PAGE_BMP.
  - Properties of this sub-element:
    - **end_layer**: specifies the handle of the end layer of the operation (the drawing operation ends at this layer and this layer is not drawn any more)
    - **resolution**: represents resolution of bitmap
    - **format**: represents the bitmap format. The only valid value is "bmp", representing the uncompressed BMP format.
    - **output**: represents whether to put out to the file or to the memory. Possible values for this property are FILE or MEMORY;
    - **addr**: represents the path of output file or memory address.
  - Sub-element of this sub-element:
    - **clip**: represents clip area for output, PATH type.

Usage value / Return value:
The return value is based on the usage value:
- GET_SUB_COUNT: If the usage is GET_SUB_COUNT, this indicates to get the number of sub-objects of this specific object. In this case, there is no sub-element needed for the GET instruction. The return value, which is returned via the RET instruction, contains one 'intVal' sub-element. Its 'name' property is "sub_count" and the 'val' property represents number of sub-objects.
[Example:
Get the total number of sub-objects of the specific object:

```xml
<GET handle="obj_handle_xxx" usage="GET_SUB_COUNT"/>
```

RET instruction returns the number:

```xml
<RET>
  <boolVal name="SUCCESS" val="true"/>
  <intVal name="sub_count" val="1"/>
</RET>
```

end example]

- **GET_SUB**: If the usage is GET_SUB, this indicates to get the handle of some specific sub-object. In this case, GET shall contain the sub-element of 'pos'. The return value, which is returned via the RET instruction, contains one 'stringVal' sub-element. Its 'name' property is "handle" and its 'val' property represents the sub-object's handle.

[Example:
Get a specific sub-object handle:

```xml
<GET handle="obj_handle_page01" usage="GET_SUB">
  <pos val="0"/>
</GET>
```

RET instruction returns the handle of the sub-object:

```xml
<RET>
  <boolVal name="SUCCESS" val="true"/>
  <stringVal name="handle" val="obj_handle_layer01"/>
</RET>
```

end example]

- **GET_PROP**: If the usage is GET_PROP, this indicates to get some specific property of a specific object. If the name property is a non-empty string, GET shall contain the sub-element of 'property'. If the operation succeeds, the sub-element of return value, which is returned via RET instruction, is variant; the sub-element name relies on the type it has retrieved, the 'name' property of the sub-element is the property name to get, 'val' property is the value of the property; otherwise if the name property is an empty string, the RET instruction returns a stringVal value representing the type of the object, which is the element name of the XML description of the object without the namespace prefix.

[Example:
Get specific property of the object

```xml
<GET handle="obj_handle_xxxxx" usage="GET_PROP">
  <property name="start"/>
</GET>
```

RET instruction returns the start property, which is a coordinate:
<RET>
  <boolVal name="SUCCESS" val="true"/>
  <stringVal name="start" val="200,300"/>
</RET>

end example]

  o  GET_PAGE_BMP: If the usage is GET_PAGE_BMP, this indicates to get the specific
  page bitmap. In this case, GET shall contain the sub-element 'disp_conf'. The requested
  bitmap should be placed/returned where the 'addr' and 'output' property of the 'disp_conf'
  element is specified.

[Example:

Get specific page's bitmap

<GET handle="page_obj_handle_xxx" usage="GET_PAGE_BMP">
  <disp_conf format="bmp" output="FILE" end_layer="1" resolution="600"
  path="/home/admin/output/page.bmp">
    <clip>
      <subpath data="s 0,0 l 3000,0 l 3000, 5000 l 0, 5000 l 0,0"/>
    </clip>
  </disp_conf>
</GET>

end example]

  o  When GET fails, the return value is defined by RET.

[Example:

<RET>
  <boolVal name="SUCCESS" val="false"/>
  <stringVal name="ERR_INFO" val="disk full"/>
</RET>

end example]

43. **Modify the pos: property in the INSERT instruction to clarify position numbers**

**Before (current clause 3.6, line 1003)**

pos: int value, starting from 0, representing the insert location. The object shall be inserted
before the object at pos. This property is optional. If this property is not used, insert after the
last sub-object.

**After (proposed new clause 3.6)**

pos: int value, starting from 0, representing the insert location. The object shall be inserted
before the object at pos. This property is optional. If this property is not used, insert after the
last sub-object. If pos is greater than or equal to the number of items in the sequence then the
insertion point is implementation-defined. After the insertion, the position numbers of all items
after the inserted item are increased by one.

Comment [JM43]: GB-29: position number clarification
GB-31: error handling
44. **Modify the semantics of DELETE instruction to clarify position numbers**

*Before (current clause 3.7, line 1026)*

DELETE deletes an object.

*After (proposed new clause 3.7)*

`pos`: DELETE deletes and object. After a deletion, the position numbers of all items after the deleted item are decreased by one. [*Note: In other words, the range of items should not include any empty position spots. end note]*

45. **Add a new UOML Objects clause with introductory wording.**

*Proposed new clause 4*

This clause describes the objects defined by the UOML abstract document model. The description shows the XML representation of each object. These objects are used as part of the UOML instructions.

The formal definitions of the XML vocabulary for these objects are specified in the UOML XML Schema Definition located at [UOMLSchema].

46. **Add a New Logical Coordinate System and Units sub-clause.**

*Proposed new clause 4.1*

A UOML document uses a logical coordinate system. The terms *position, point* and *coordinate* may be used interchangeably. They refer to a logical point in the logical coordinate system. The origin of the logical coordinate system is the top left point. The direction of the x-axis is left to right. The direction of the y-axis is top to bottom.

The length of the units along each axis depends on the resolution property of the page. If the resolution of a page is x, the length of the unit along each axis is \( \frac{2.54}{x} \) cm. A logical unit indicates one inch divided by the resolution of the page.

The resolution of each page is the same along the x and y axis.

UOML uses radians as the unit of measurement for angles. [*Note: Though different from PDF, XSL-FO and SVG, conversion can be easily made without any loss of information. end note]*

47. **Add a New Graphics State sub-clause.**

*(Proposed new clause 4.2)*
A DCMS shall maintain an internal data structure called the **graphics state** that holds the current graphics control parameters. The graphics state is initialized at the beginning of each layer with the default values specified in section §4.13. The rendering of a graphics object relies on the current parameters in the graphics state. A command object changes one or many parameters in the current graphics state.

### 48. Editorial changes to some of the UOML object semantics, properties, etc.

Editorial changes are proposed to be made throughout many of the UOML objects clause to bring them to better English grammatical compliance, as well as to enhance clarity. Referenced clauses in the proposed “After” text refer to proposed clauses (e.g., XML representation of the docbase object (§2.2).)

**Before (current clauses 2.1.1, 2.1.2, 2.1.3, 2.4.1, 2.4.2, 2.4.3, 2.5.1)**

**DOCBASE (clause 2.1.1)**

**Semantics:** UOML document structure's top level. It has only one root DOCSET, other DOCSET and DOC are the root DOCSET's direct or indirect sub-objects. The root DOCSET will be generated automatically when the DOCBASE is created.

**Properties:**
- *name:* name of Docbase.
- *path:* location of the Docbase.

**DOCSET (clause 2.1.2)**

**Semantics:** a set of DOC and/or DOCSET.

**DOC (clause 2.1.3)**

**Semantics:** refers layout-based document, a single document has 0 to multiple pages

**PAGE (clause 2.4.1)**

**Semantics:** page within document.

**LAYER (clause 2.4.2)**

**Semantics:** layers inside page.

**OBSTREAM (clause 2.4.3)**

**Semantics:** a sequence of objects.

**ARC (clause 2.5.1)**

Comment [JM48]: GB-07: allows for editorial changes to be made for clarity.
NL-04: allows for restructure and reformatting for better quality. As well as strengthening technical details.
FR-02: allows for the entire specification restructure.
**Semantics:**
ARC includes five properties: starting point, ending point, center, direction and angle.

**Properties:**
- *start*: starting position of arc.
- *end*: ending position of arc.
- *center*: center of ellipse arc.
- *clockwise*: direction for arc is from the starting point to the ending point, which can be clockwise or anti-clockwise. It is a Boolean value, “true” means clockwise, “false” means anti-clockwise.
- *angle*: inclination from coordinate system's x-axis to arc's x-axis. It is calculated by radian. Positive value means anti-clockwise, negative value means clockwise.

**After (proposed new clauses 4.3, 4.4, 4.5, 4.7, 4.8, 4.9, 4.10.1)**

**DOCBASE (proposed 4.3)**

**Semantics:** XML representation of the docbase object (§2.2).

**Properties:**
- *name*: name of docbase.
- *path*: specifies the location of the docbase. *path* is readonly. Its value is the same value of the ‘path’ property of OPEN when this docbase was created.

**DOCSET (proposed 4.4)**

**Semantics:** XML representation of the docset object (§2.3).

**DOC (proposed 4.5)**

**Semantics:** XML representation of the document object (§2.4).

**PAGE (proposed 4.7)**

**Semantics:** XML description of the page object (§2.6).

**LAYER (proposed 4.8)**

**Semantics:** XML description of the layer object (§2.7).

**OBSTREAM (proposed 4.9)**

**Semantics:** XML description of the object stream object (§2.8).
ARC (proposed 4.10.1)

Semantics:
An arc of an ellipse, specified by a starting, ending, and center position, along with a direction and angle.

Properties:
start: starting position of the arc.
end: ending position of the arc.
center: center of the arc’s ellipse.
clockwise: the direction for arc is from the starting point to the ending point, which can be clockwise or counterclockwise. As a Boolean value, "true" represents clockwise and "false" represents counterclockwise.
angle: inclination from coordinate system’s x-axis to arc’s x-axis. It is specified using a radian value. A positive value represents counterclockwise and a negative value represents clockwise.

49. **Remove Sub-Object items from some UOML object descriptions.**

2.1.1, 2.1.2, 2.1.3, 2.3.1.1, 2.3.2.1, 2.3.2.2, 2.3.2.3, 2.4.1, 2.4.2, 2.4.3, 2.5.1 through 2.5.11, 2.5.13.1, 2.5.13.2, 2.6.1 are all of the current clauses that would affected.

Lines that begin with
**Sub-object: XXXXXX**
in the above clauses will be removed:

2.1.1 -> line 124
2.1.2 -> line 131
2.1.3 -> line 139
2.3.1.1 -> line 166
2.3.1.2 -> line 174
2.3.2.1 -> line 185
2.3.2.2 -> line 193
2.3.2.3 -> line 199
2.4.1 -> line 219
2.4.2 -> line 224
2.4.3 -> line 230
2.5.1 – 2.5.11 -> lines 258, 269, 281, 293, 307, 320, 330, 342, 352, 366, 377
2.5.13.1 → line 427
2.5.13.2 → line 439
2.6.1 → line 476

50. **Change the semantics of objects to reflect the descriptions provided in the newly proposed Abstract Document Model clause.**

Before (current clauses 2.3.1.1, 2.4.1)

**Metadata (current clause 2.3.1.1)**

General information, such as the document's title, author, creation and modification date, is called metadata. Metadata consists of a METALIST, the METALIST consists of 1 to multiple META.

PAGE (current clause 2.4.1)

**Semantics:** page within document.

After (proposed new clauses 4.5.1, 4.7)

**Metadata (proposed 4.5.1)**

General information, such as the document's title, author, creation and modification date, is called metadata. Metadata is defined using keys and values. [Note: A key is not necessarily unique. A detailed specification of the keys and value falls outside the scope of this specification. end note]. In this specification, metadata is described using METALIST and META.

PAGE (proposed 4.7)

**Semantics:** XML description of the page object (§2.6).
**Properties:**
- width: positive float value representing the width of the page in pixels.
- height: positive float value representing the height of the page in pixels.
- resolution: positive integer value representing the resolution of the page, which defines the unit of a pixel (§4.1).
**Sub-elements:** N/A

51. **Move Font Definition clause from old Document Architecture clause to proposed UOML Object clause and re-edit.**

Before (current clauses 2.3.2, 2.3.2.1, 2.3.2.2, 2.3.2.3)

**Font Definition (current clause 2.3.2)**

Font contains of a FONTLIST, the FONTLIST consists of 1 to multiple FONTMAP, and FONTMAP consists of zero or one EMBEDFONT. EMBEDFONT, FONTMAP, FONTLIST in the order given above, the previous one is the sub-object of the latter one, and can be generated by UOML’s INSERT instruction.
FONTLIST (current clause 2.3.2.1)
Semantics: a list of all the fonts used in the document
Properties: N/A
Sub-element: N/A
Sub-object: FONTMAP

FONTMAP (current clause 2.3.2.2)
Semantics: defines one font used in the document.
Properties:
   name: name of the font
   no: the id of the font quoted in document.
Sub-element: N/A
Sub-object: EMBEDFONT

EMBEDFONT (current clause (2.3.2.3)
Semantics: one embedded font type.
Properties: N/A
Sub-element: N/A
Sub-object: N/A
Note:
   Use OpenFont as embedded font type. After encoding OpenFont using base64 format, put the
   result into EMBEDFONT's content section as the embed font data

After (proposed new clauses 4.6, 4.6.1, 4.6.2, 4.6.3)
FONT DEFINITION (proposed 4.6)

Fontlist, fontmap and embedfont are called font objects. This clause gives the XML description of these
objects.

FONTLIST (proposed 4.6.1)
Semantics: A list of all the fonts used in the document. It is the XML description of the fontlist object
(§2.5).
Properties: N/A
Sub-elements: N/A
FONTMAP (proposed 4.6.2)

**Semantics:** Defines one font used in the document. It is the XML description of the fontmap object (§2.5).

**Properties:**

- `name`: name of the font
- `no`: non-negative integer value representing the id of the font quoted in document. It is used for fast quoting. If its value is zero, the font need not be fast quoted. If its value is non-zero, the result is unique within the scope of the document.

**Sub-elements:** N/A

EMBEDFONT (proposed 4.6.3)

**Semantics:** Defines one embedded font type. It is the XML description of the embedfont object (§2.5).

Use OpenFont as an embedded font type. After encoding OpenFont using base64 format, put the result into EMBEDFONT's content section as the embedded font data.

**Properties:** N/A

**Sub-elements:** N/A

52. **Move the originally specified “Note:” items to the semantics.**

In the original specification, “Note:” in object definitions were placed after the properties, sub-elements and/or sub-objects. However, many of these will now be moved as informative notes within the actual semantic wording. Thus in the lines below, when you see a “Note:”, it will be moved to the semantics.

For example, here is the change to IMAGE, current clause 2.5.5, lines 308-311 (the wording from the “Before” note to the “After” note has been changed due to GB-34 and NB other comments):

**Before**

Image includes four properties: coordinates of top-left corner, coordinates of bottom-right corner, image type, image file pathname or inline image data.

**Properties:**

- `tl`: coordinates of top-left corner as the image is displayed in the page
- `br`: coordinates of the bottom-right corner as the image is displayed in the page
- `type`: image type, possible value includes "bmp", "png", "jpeg", "jbig", "tiff", representing BMP, PNG, JPEG, JBIG, TIFF image respectively.
- `path(optional)`: path of the image file. If present, the content of IMAGE element should leave blank, otherwise the content of IMAGE element contains the base64 encoded raw image data.

**Sub-element:** N/A

**Sub-object:** N/A

**Note:**

Image may contains large amount of bytes, and it will greatly reduce the performance of XML parser, it is recommended to transfer large image using a file by specifying the filename in the 'imgpath' property.
After

Semantics: An image, specified by top-left and bottom-right corner coordinates, the image type, and either the image location or the image content. The intrinsic image aspect ratio may be different than the aspect ratio of the box described by the two corners; in this case, the image should be stretched to fit the box described by the two corners. [Note: An image may contain a large amount of data, and parsing this data may greatly reduce the performance of an XML processor. It is recommended to specify large images using a file and its location (e.g., path). end note]

Properties:
  - tl: coordinates of the top-left corner of the image
  - br: coordinates of the bottom-right corner of the image
  - type: image type, possible values include "bmp", "png", "jpeg", "jbig", "tiff", representing BMP, PNG, JPEG, JBIG, TIFF images respectively.
  - path: path of the image file. This is an optional property, but if present, the content of IMAGE element should be left blank; otherwise the content of IMAGE element contains the base64 encoded raw image data.

Sub-elements: N/A
Sub-objects: N/A

53. Add Units for PAGE properties.

(current clause: 2.4.1, Proposed new clause 4.7)

Before (current clause 2.4.1)

Properties:
  - width: width of the page.
  - height: height of the page.
  - resolution: resolution of the page.

After (proposed clause 4.7)

Properties:
  - width: positive float value representing the width of the page in pixels.
  - height: positive float value representing the height of the page in pixels.
  - resolution: positive integer value representing the resolution of the page, which defines the unit of a pixel (§4.1).

54. Add New Graphics Objects Clause to proposed new clause 4.

(proposed clause 4.10)

Graphics objects describe the appearance of the page. The following clauses gives the XML description of each graphics object.
55. **Add New Command Objects clause to the proposed new clause 4.**

**proposed new clause 4.11**

A command object is used for modifying the graphics, such as text size, typeface and color.

56. **Change the description of the angle property of ARC**

**Before (current clause 2.5.1)**

angle: inclination from coordinate system's x-axis to arc's x-axis. It is calculated by the radian. A positive value represents counterclockwise and a negative value represents clockwise.

**After (proposed new clause 4.10.1)**

angle: inclination from coordinate system's x-axis to arc's x-axis. It is specified using a radian value. A positive value represents counterclockwise and a negative value represents clockwise.

57. **Change the semantics wording of BEIZER**

**Before (current clause 2.5.2)**

Bezier curve includes four properties: starting point, control point 1, control point 2 and ending point.

**After (proposed clause 4.10.2)**

A second-order or third-order Bezier curve. A Bezier curve is specified using three or four properties: the starting point, the ending point, one control point and, optionally, a second control point. A second-order Bezier curve is specified when only one control point is used. A third-order Bezier curve is specified when a second control point is used.
Add valid ranges and units to the properties of various objects and made editorial changes

Before (current clauses: 2.5.3, 2.5.4, 2.5.8, 2.6.2.6, 2.6.2.9, 2.6.2.16, 2.6.2.17, 2.6.2.26, 2.6.2.27, 2.6.2.33, 2.6.2.34, 2.6.2.35)

CIRCLE (proposed clause 2.5.3)
Semantics:
Circle includes two properties: center and radius.
Properties:
- center: coordinate of circle center
- radius: radius of circle
Sub-elements: N/A
Sub-object: N/A

ELLIPSE (proposed clause 2.5.4)
Semantics:
Ellipse includes four properties: center, radius x, radius y and rotation angle.
Properties:
- center: coordinates of ellipse center.
- xr: length of radius x.
- yr: length of radius y.
- angle: inclination from coordinate system's x-axis to ellipse's x-axis. It is calculated by radian. Positive value means anti-clockwise, negative value means clockwise.
Sub-element: N/A
Sub-object: N/A

ROUNDRECT (proposed clause 2.5.8)
Semantics:
Round rectangle has four properties: coordinates of the top-left corner, coordinates of the bottom-right corner, radius x and radius y.
Properties:
- tl: coordinates of the top-left corner of the rectangle
- br: coordinates of the bottom-right corner of the rectangle
- xr: radius x of the round corner
- yr: radius y of the round corner
Sub-element: N/A
Sub-object: N/A

LINE_WIDTH (proposed clause 2.6.2.6)
Semantics: set the current line width
Properties:
- v1: a floating point number, representing width of line.
MITER_LIMIT (proposed clause 2.6.2.9)
Semantics:
    impose a maximum on the ratio of the miter length to the line width. When the limit is exceeded, the join is converted from a miter to a bevel.
Properties:
    $v_1$: a floating point number, representing the maximum ratio.
Sub-elements: N/A

CHAR_SLANT (proposed clause 2.6.2.16)
Semantics: set slant of the current character.
Properties:
    $v_1$: a floating point number, representing the character slanting radian, $0 \sim \pi/2$ representing right slant, $3\pi/2 \sim 2\pi$ representing left slant, and 0 representing non-slant; other values are not used.
Sub-elements: N/A

CHAR_SIZE (proposed clause 2.6.2.17)
Semantics: set the current character width and height.
Properties:
    $v_1$: a floating point number, representing the character width.
    $v_2$: a floating point number, representing the character height.
Sub-elements: N/A

SHADOW_WIDTH (proposed clause 2.6.2.26)
Semantics: set the border width of the current character shadow.
Properties:
    $v_1$: a floating point number, representing shadow border width.
Sub-elements: N/A

SHADOW_LEN (proposed clause 2.6.2.27)
Semantics: set the length of the current character shadow.
Properties:
    $v_1$: floating point number, representing the character shadow length.
Sub-elements: N/A

OUTLINE_BORDER (proposed clause 2.6.2.33)
Semantics: set the border width of the current outline character.
Properties:
v1: a floating point number, representing the border width.

**Sub-elements:** N/A

**OUTLINE_WIDTH (proposed clause 2.6.2.34)**

**Semantics:** set the outline width of the current outline character

**Properties:**

- v1: a floating point number, representing the outline width.

**Sub-elements:** N/A

**HOLLOW_BORDER (proposed clause 2.6.2.35)**

**Semantics:** set the border width of the current hollow character

**Properties:**

- v1: a floating point number, representing the border width.

**Sub-elements:** N/A

**CIRCLE (proposed clause 4.10.3)**

**Semantics:**

A circle, specified by a center and radius.

**Properties:**

- center: coordinate of the circle center.
- radius: positive integer value representing the radius of the circle.

**Sub-elements:** N/A

**ELLIPSE (proposed clause 4.10.4)**

**Semantics:**

An ellipse, specified by a center, x and y radius, and a rotation angle.

**Properties:**

- center: coordinates of ellipse center.
- xr: positive integer value representing the length of the x-radius.
- yr: positive integer value representing the length of the y-radius.
- angle: inclination from coordinate system's x-axis to ellipse's x-axis. It is specified using a radian value of type xs:float. A positive value represents counterclockwise and a negative value represents clockwise.

**Sub-elements:** N/A
ROUNDRECT (proposed clause 4.10.8)

Semantics:
A rectangle with round corners. The round corner of a round rectangle is a quarter of an ellipse.

Properties:
- tl: coordinates of the top-left corner of the rectangle.
- br: coordinates of the bottom-right corner of the rectangle.
- xr: positive integer value representing the x-radius of the round corner.
- yr: positive integer value representing the y-radius of the round corner.

Sub-elements: N/A

LINE_WIDTH (proposed clause 4.11.2.6)

Semantics: set the current line width/thickness

Properties:
- v1: a positive floating point number, representing the width of the line.

Sub-elements: N/A

MITER_LIMIT (proposed clause 4.11.2.9)

Semantics: Impose a maximum on the ratio of the miter length to the line width. When the limit is exceeded, the join is converted from a miter to a bevel.

Properties:
- v1: a positive floating point number, representing the maximum ratio.

Sub-elements: N/A

CHAR_SLANT (proposed clause 4.11.2.16)

Semantics: Set the slant of the current character.

Properties:
- v1: a floating point number, representing the character slanting radian, regardless of reading direction. 0~π/2 represents right slant, 3π/2~2π represents left slant, and 0 represents non-slant; other values are not used.

Sub-elements: N/A

CHAR_SIZE (proposed clause 4.11.2.17)

Semantics: Set the current character width and height.

Properties:
- v1: a positive floating point number, representing the character width.
- v2: a positive floating point number, representing the character height.

Sub-elements: N/A
SHADOW_WIDTH (proposed clause 4.11.2.26)
Semantics: Set the border width of the current character shadow. SHADOW_WIDTH represents the thickness of the outline of a shadow.

Properties:
- v1: a non-negative floating point number, representing the shadow border width.
Sub-elements: N/A

SHADOW_LEN (proposed clause 4.11.2.27)
Semantics: Set the length of the current character shadow. SHADOW_LEN represents the displacement of the shadow with respect to the character.

Properties:
- v1: a non-negative floating point number, representing the character shadow length.
Sub-elements: N/A

OUTLINE_BORDER (proposed clause 4.11.2.33)
Semantics: Set the border width of the current outline character

Properties:
- v1: a non-negative floating point number, representing the border width.
Sub-elements: N/A

OUTLINE_WIDTH (proposed clause 4.11.2.34)
Semantics: Set the outline width of the current outline character

Properties:
- v1: a non-negative floating point number, representing the outline width.
Sub-elements: N/A

HOLLOW_BORDER (proposed clause 4.11.2.35)
Semantics: Set the border width of the current hollow character

Properties:
- v1: a non-negative floating point number, representing the border width.

59. **Modify wording in PATH to clarify that it is the actual element and not conceptual and edit as needed.**

Before (current clause 2.5.10)
Semantics:
Path refers to the open or closed region collection consist of one or multiple sub-path(s), circle(s), ellipse(s), rectangle(s) and round rectangle(s). PATH itself does not have data.

Properties: N/A

Sub-element:
- circle: CIRCLE type, defines a circle.
- ellipse: ELLIPSE type, defines ellipse.
- rect: RECT type, defines rectangle.
- roundrect: ROUNDRECT type, defines rectangle with round corners.
- subpath: SUBPATH type, defines sub-path.

Sub-object: N/A

After (proposed new clause 4.10.10)

Semantics:
A Path specifies an open or closed region consisting of a collection of one or many subpaths, circles, ellipses, rectangles and round rectangles expressed using sub-elements. The PATH element itself does not contain any properties or data.

Properties: N/A

Sub-elements:
- circle: CIRCLE type, defines a circle.
- ellipse: ELLIPSE type, defines an ellipse.
- rect: RECT type, defines a rectangle.
- roundrect: ROUNDRECT type, defines a rectangle with round corners.
- subpath: SUBPATH type, defines a subpath.

Example: The following example demonstrates a PATH consisting of two sub elements: a rectangle and a circle.

```xml
<xobj>
<path>
  <circle center="167,251" radius="70" />
  <rect tl="124,135" br="345,257"/>
</path>
</xobj>
```

end example].
60. **Add an example in SUBPATH for clarity and edited as needed**

**Before (current clause 2.5.9)**

**Semantics:**
Sub-path refers to an irregular chain of curves consists of lines, Bezier curves and arcs, it can be either closed or not.

**Properties:**
- `data`: defines the starting point and ending point of the sub-path, as well as each curve segment which makes up the sub-path.

**Sub-element:** N/A

**Sub-object:** N/A

**Note:** for encoding of property 'data', please refer to 2.5.12

**After (proposed new clause 4.10.9)**

**Semantics:**
A subpath specifies a chain of curves consisting of lines, Bezier curves and arcs. It can be either closed or open.

**Properties:**
- `data`: specifies the ordered set of graphics objects describing the subpath from the starting point of the first object, through each of the subsequent objects, to the ending point of the last object. It is an ordered set of operands and coordinate arguments for each operand expressed in a single string value. [Note: Refer to §4.11.12 for the encoding of property data. end note]

**Sub-elements:** N/A

**Example:** The following example demonstrates inserting of a Path object using INSERT instruction. The Path consists of two subpaths: a rectangle formed by four straight lines, and a curved line segment formed by Bezier curves.

```xml
<INSERT pos="2" handle="vs03">
  <xobj>
    <path>
      <subpath data="s 214,193 l 368,193 l 368,298 l 214,298"/>
      <subpath data="s 417,206 B 417,186 426,167 435,167 B 443,167 452,230 452,293"/>
    </path>
  </xobj>
</INSERT>
```

**Comment [JM60]:** GB-36: example for SUBPATH
- GB-07: allows for editorial changes to be made for clarity.
- NL-04: allows for restructure and reformating for better quality. As well as strengthening technical details.

61. **Add further description for the properties of TEXT and make appropriate editorial changes too.**

**Before (current clause 2.5.11)**

**Comment [JM61]:** GB-38: add further description to origin and spaces properties
- DE-21: further clarification on origin and spaces properties
- GB-07: allows for editorial changes to be made for clarity.
- NL-04: allows for restructure and reformating for better quality. As well as strengthening technical details.
**Semantics:**
Text has four properties: origin, encoding information, text data and character spacing list.

**Properties:**
- **origin:** the coordinate of the first character's origin. The origin of a character is defined by its font information.
- **encode:** character set or encoding of text data. The valid value for this property should be one of the character encodings registered (as charsets) with the Internet Assigned Numbers Authority (IANA-CHARSETS), otherwise it should use names starting with an x- prefix.
- **text:** character data contained in text, base64 encoded string data.
- **spaces:** an optional, ordered set of distances that specifies distances between adjacent characters' origins, separated by a comma.

The origin of a character refers to the point (0, 0) in the coordinate system of the character glyph, as illustrated in the Figure 4. When a text object with only one character is specified and the text object has coordinate (x, y), the rendering engine should place the origin of the character at (x, y) and render the character.

![Figure 4. spaces of text](image)

The spaces property is the offset or distance between the x coordinates of two adjacent characters. It is always positive. The number of comma-separated values shall be one fewer than the number of characters in the string. The values should override the widths of the characters as
specified by the font used. The values are used to calculate the coordinate to place the origin of each character.

Sub-elements: N/A

62. **Add thickness to the semantics of LINE_WIDTH.**

*Before (current clause 2.6.2.6, line 526)*

Semantics: set the current line width

*After (proposed new clause 4.11.2.6)*

Semantics: set the current line width/thickness

63. **Clarify wording in the RASTER_OP properties**

*Before (current clause 2.6.2.12)*

Semantics: set the current raster operation.

**Properties:**

v1: a character string, representing raster operation. Its possible value includes ROP_COPY, ROP_N_COPY, ROP_RESET, ROP_SET, ROP_NOP, ROP_REV, ROP_AND, ROP_AND_N, ROP_N_AND, ROP_N_AND_N, ROP_OR, ROP_OR_N, ROP_N_OR, ROP_N_OR_N, ROP_XOR, and ROP_EOR.

Sub-elements: N/A

**Note:**

ROP_COPY: pixel_color = src
ROP_N_COPY: pixel_color = ~src
ROP_RESET: pixel_color = 0 (all bits of pixel_color are set zero)
ROP_SET: pixel_color = 1 (all bits of pixel_color are set 1)
ROP_NOP: pixel_color = dest
ROP_REV: pixel_color = ~dest
ROP_AND: pixel_color = src & dest
ROP_AND_N: pixel_color = src & ~dest
ROP_N_AND: pixel_color = ~src & dest
ROP_N_AND_N: pixel_color = ~src & ~dest
ROP_OR: pixel_color = src | dest
ROP_OR_N: pixel_color = src | ~dest
ROP_N_OR: pixel_color = ~src | dest
ROP_N_OR_N: pixel_color = ~src | ~dest
ROP_XOR: pixel_color = src ^ dest
ROP_EOR: pixel_color = src ^ ~dest

Here, pixel color is the color after rendering; ‘src’ is the current used color, also called foreground color; ‘dest’ is the current color the page has, also called background. ‘&’ is bitwise AND,”|” is bitwise OR,”^” is bitwise XOR,”~” is bitwise NOT. Also ‘~’ has the highest priority.

**Comment [JM62]:** GB-07: allows for editorial changes to be made for clarity.

**Comment [JM63]:** GB-44: “Note:” becomes “Details”

NL-04: allows for restructure and reformatting for better quality. As well as strengthening technical details.
After (proposed clause 4.11.2.12)

Semantics: Set the current raster operation.

Properties:

v1: a character string, representing the raster operation. The possible values for this property are ROP_COPY, ROP_N_COPY, ROP_RESET, ROP_SET, ROP_NOP, ROP_REV, ROP_AND, ROP_AND_N, ROP_N_AND, ROP_N_AND_N, ROP_OR, ROP_OR_N, ROP_N_OR, ROP_N_OR_N, ROP_XOR, and ROP_EOR. In the following, ‘pixel color’ represents the color after a raster operation; ‘src’ is the currently used color; ‘dest’ is the current color of the destination bitmap to be drawn upon; ‘&’ is bitwise AND; ‘|’ is bitwise OR; ‘^’ is bitwise XOR; and ‘~’ is bitwise NOT, which has the highest priority over the other logical operators.

Details

ROP_COPY: pixel_color = src
ROP_N_COPY: pixel_color = ~src
ROP_RESET: pixel_color = 0 (all bits of pixel_color are set zero)
ROP_SET: pixel_color = 1 (all bits of pixel_color are set 1)
ROP_NOP: pixel_color = dest
ROP_REV: pixel_color = ~dest
ROP_AND: pixel_color = src & dest
ROP_AND_N: pixel_color = src & ~dest
ROP_N_AND: pixel_color = ~src & dest
ROP_N_AND_N: pixel_color = ~src & ~dest
ROP_OR: pixel_color = src | dest
ROP_OR_N: pixel_color = src | ~dest
ROP_N_OR: pixel_color = ~src | dest
ROP_N_OR_N: pixel_color = ~src | ~dest
ROP_XOR: pixel_color = src ^ dest
ROP_EOR: pixel_color = src ^ ~dest

Sub-elements: N/A

64. Restructure the semantics of TEXT_DIR to clarify text direction.

Before (current clause 2.6.2.13, line 640)

Semantics: set the current text direction. The direction is from the end of a text row to the beginning.

After (proposed new clause 4.11.2.13)

Semantics: Set the current text direction. The direction specifies that line along which

Comment [JM64]: GB-07: allows for editorial changes to be made for clarity.
NL-04: allows for restructure and reformattting for better quality. As well as strengthening technical details.
successive character origin points are placed (see figure 4); that is the line from one glyph origin to the next glyph origin.

65. **Clarify the meaning of character direction in the CHAR_DIR clause**

**Before (current clause 2.6.2.14)**

Semantics: set the current character direction, the direction is from the bottom to the top of the character.

Properties:

- \( v1 \): a character string, representing character direction. The possible values include HEAD_LEFT, HEAD_RIGHT, HEAD_TOP and HEAD_BOTTOM.

Sub-elements: N/A

Note:

- HEAD_LEFT: the character is heading left.
- HEAD_RIGHT: the character is heading right.
- HEAD_TOP: the character is heading up.
- HEAD_BOTTOM: the character is heading down.

**After (proposed new clause 4.11.2.14)**

Semantics: Set the current character direction (e.g., the direction in which a character is rendered). The heading direction is from the bottom of a character to the top.

Properties:

- \( v1 \): a character string representing the character direction. The possible values for this property are HEAD_LEFT, HEAD_RIGHT, HEAD_TOP and HEAD_BOTTOM. HEAD_LEFT is the character’s heading direction is left. HEAD_RIGHT is the character’s heading direction is right. HEAD_TOP is the character’s heading direction is up. HEAD_BOTTOM is the character’s heading direction is down.

Sub-elements: N/A

66. **Add wording saying the \( v1 \) property in CHAR_SLANT is regardless of reading direction.**

**Before (current clause 2.6.2.16, lines 673-675)**

Properties:

- \( v1 \): a floating point number, representing the character slanting radian, \( 0 \sim \pi/2 \) representing right slant, \( 3\pi/2 \sim 2\pi \) representing left slant, and 0 representing non-slant; other values are not used.

**After (proposed new clause 4.11.2.16)**

Properties:

- \( v1 \): a floating point number, representing the character slanting radian, regardless of reading direction. \( 0 \sim \pi/2 \) represents right slant, \( 3\pi/2 \sim 2\pi \) represents left slant, and 0 represents non-slant; other values are not used.
67. **Provide default value information and cardinalities for CHAR_WEIGHT**

**Before (current clause 2.6.2.18)**

Semantics: set the current character weight.

Properties:
- v1: a floating point number, from 0 to 1, representing the character weight.

Sub-elements: N/A

**After (proposed new clause 4.11.2.18)**

Semantics: Set the current character weight. The default value is 0. The thickness of a character stoke shall be the normal thickness plus weight*(character height). The minimum thickness of a character’s stroke is zero.

Properties:
- v1: a floating point number, ranging between -1 to 1, inclusively, representing the character weight.

Sub-elements: N/A

68. **Add further details for the possible values of the v1 property of CHAR_STYLE**

**Before (current clause 2.6.2.19)**

Semantics: set the current character style.

Properties:
- v1: a character string, representing the character style. The possible values include SHADOW, HOLLOW and OUTLINE, or some of them connected with commas. If the string is empty, that means to clean the old setting.

Sub-elements: N/A

Note:
- SHADOW: set shadow style.
- HOLLOW: set hollow style.

Comment [JM67]: GB-48: specify algorithm for applying character outline.
- GB-20: add cardinalities

Comment [JM68]: DE-25: specify CHAR_STYLE
- GB-49: add details and algorithm
- GB-07: allows for editorial changes to be made for clarity.
- NL-04: allows for restructure and reformatting for better quality. As well as strengthening technical details.
After (proposed new clause 4.11.2.19)

**Semantics:** Set the current character style

**Properties:**

- `v1`: a character string, representing the character style. The possible values for this property are SHADOW, HOLLOW and OUTLINE, or some combination of the three, separated by commas. If the string is set to empty, then any previous setting is cleared.

SHADOW: set shadow style. If this character style is set, then the following algorithm is used to render the shadow effect:

- If SHADOW_NEG (§4.11.2.30) is false, the character is extended with a distance of SHADOW_LEN (§4.11.2.27) along the shadow direction (§4.11.2.28), then a hollowed character with raster operation ROP_COPY is drawn in the original position. The border width of the hollowed character is SHADOW_WIDTH (§4.11.2.26).

- If SHADOW_NEG is true, the character position is moved with a distance of SHADOW_LEN along the shadow direction, and extended SHADOW_WIDTH along the shadow direction; then the character is drawn in the original position with background color and raster operation ROP_COPY, and extended with a distance SHADOW_LEN along the shadow direction; then in the original position, a character with normal color and raster operation ROP_COPY is drawn.
HOLLOW: set hollow style. If this character style is set, a line with thickness HOLLOW_BORDER (§4.11.2.35) should be drawn along the outline of the character.

OUTLINE: set outline style. If this character style is set, a line with thickness OUTLINE_BORDER (§4.11.2.33), and with distance OUTLINE_WIDTH (§4.11.2.34) from the outline of the character, should be drawn along the outline of the character.

Sub-elements: N/A

69. **Add that the TEXT_MATRIX object applies to each character individually.**

**Before (current clause 2.6.2.20, lines 704-706)**

Semantics:

set the current text transformation matrix. The visual effect of transforming a character is shown below:

**After (proposed new clause 4.11.2.20)**

Semantics: Set the current text transformation matrix. This command applies to each character individually within a TEXT object. The visual effect of transforming a character is shown below:

70. **Add that SHADOW_WIDTH represents the thickness of the outline of a shadow.**

**Before (current clause 2.6.2.26, line 737)**

Semantics: set the border width of the current character shadow.

**After (proposed new clause 4.11.2.26)**
Semantics: Set the border width of the current character shadow. SHADOW_WIDTH represents the thickness of the outline of a shadow.

71. **Add that SHADOW_LEN represents the displacement of the shadow with respect to the character.**

Before (current clause: 2.6.2.27, line 743)
Semantics: set the length of the current character shadow

After (proposed new clause: 4.11.2.27)
Semantics: Set the length of the current character shadow. SHADOW_LEN represents the displacement of the shadow with respect to the character.

72. **Add further description to SHADOW_DIR**

Before (current clause: 2.6.2.28)
Semantics: set the direction of the current character shadow

Properties:

\( v1: \) a character string. The possible values include SHADOW_LT, SHADOW_LB, SHADOW_RT and SHADOW_RB.

Sub-elements: N/A

Note:

SHADOW_LT: the character shadow direction is top left.

SHADOW_LB: the character shadow direction is bottom left.

SHADOW_RT: the character shadow direction is top right.
SHADOW_RB: the character shadow direction is bottom right.

After (proposed new clause: 4.11.2.28)

Semantics: Set the direction of the current character shadow

Properties:

v1: a character string. The possible values for this property are SHADOW_LT, SHADOW_LB, SHADOW_RT and SHADOW_RB. Choosing one of these values specifies which direction the character shadow will be seen.

SHADOW_LT: the character shadow direction is top left.

SHADOW_LB: the character shadow direction is bottom left.
SHADOW_RT: the character shadow direction is top right.

SHADOW_RB: the character shadow direction is bottom right.

Sub-elements: N/A

73. **Added an illustrative example to SHADOW_ATL.**

Before (current clause 2.6.2.29)

Semantics: set whether to adjust the coordinates of a character when the direction of character shadow is to the left or top

Properties:

- \( v1 \): a boolean value, representing whether to alter the coordinates of a character

Sub-elements: N/A

Comment [JM73]: GB-52: Add further description to SHADOW_ATL
After (proposed new clause 4.11.2.29)

**Semantics:** Set whether to adjust the coordinates of a character when the direction of character shadow is to the left or bottom.

**Properties:**

- \( v1 \): a Boolean value, representing whether to alter the coordinates of a character. The value "true" specifies that the coordinates are altered.

**Sub-elements:** N/A

[Example: Illustrated in the figures below, when a character is shadowed, the bounding box of its outline is bigger. If two characters that are not shadowed are adjacent, their baselines are aligned horizontally. A shadow effect will break this horizontal alignment. Also, a shadow to the left will occupy the space between this character and its left neighbor. When a rendering engine draws the character, it can position the character based on the specific coordinate; or it can adjust the coordinate so that the bottom left point of the shadowed character’s outline bounding box moves to the specific coordinate. This is made by offset \( x \) or \( y \) coordinates by the distance of SHADOW_LEN divided by the square root of 2. When the shadow is to the bottom of the character, subtract \( y \) by the distance; when the shadow is to the left, add \( x \) by the distance. Make both adjustments when the shadow is to the bottom left. This explains the parameter SHADOW_ATL. When SHADOW_ATL is false, the specific coordinate is used without adjustment; when it is true, an adjustment should be made. The first figure illustrates the effect before adjustment, while the second figure illustrates the effect after adjustment.]

74.  **Add captions to the SHADOW_NEG picture illustrations.**

Before (current clause 2.6.2.30)

**Semantics:** set the current shadow character as an intaglio character

**Properties:**

- \( v1 \): a boolean value, representing whether it is an intaglio character

**Sub-elements:** N/A
After (proposed new clause 4.11.2.30)

Semantics: Set the current shadow character as an intaglio character as illustrated in the following figures.

```
SHADOW_NEG is false

SHADOW_NEG is true
```

Properties:
- \( v1 \): a boolean value, representing whether the current shadow character is an intaglio character. A ‘true’ value specifies an intaglio character.

Sub-elements: N/A

75. **Add further explanation to the CLIP_AREA specification.**

Before (current clause 2.6.2.31)

Semantics: set the current clip area

Properties: N/A

*Comment [JM75]*: DE-25: Specify CLIP_AREA

GB-53: clarify how clip area is applicable to command objects and/or object streams.
Sub-elements:
  
  *cliparea*: PATH type, representing the clip area

**After (proposed new clause 4.11.2.31)**

**Semantics**: Set the current clip area

**Properties**: N/A

**Sub-elements**:

  *cliparea*: PATH type, representing the new clip area.

  The Path specified by a CLIP_AREA command object is relative to the page. The portions of graphic objects that lie outside of the current clip area are not rendered.

76. **Create a table for the Default Value of Graphics State.**

**Before (current clause 2.7)**

<table>
<thead>
<tr>

77. **Add a short introduction to the Definition of Referenced Type sub-clause.**

*Before* (current clause 3.10)

<No introduction>

*After* (proposed new clause 2.15.13)

This clause specifies the definition of the data types referenced in the UOML XML schema definition.

78. **Add a Data Ranges sub-clause.**

Provided general rules for data ranges and cardinalities of objects. It is important to remember that the normative XML schema provides information on data and data types.

*Proposed new clause 4.14*

Data Ranges

The following are the general rules for data ranges:

1. Unless otherwise specified, all numeric values may be positive, negative or zero.
2. Positive, negative, or zero integer values are allowed for coordinates and points in the logical coordinate system (e.g. -1, 3).
3. Integer values are 32-bit precision; the range of integer values is as defined by xs:integer in XML Schema 1.0 Part 2.
4. Float values use double-precision; the valid range is as defined by xs:double in XML Schema 1.0 Part 2.
5. API calls that set values outside a valid range (either specifically specified or within the ranges above) will fail with a return of RET.
6. A special case is COLOR_RGB. RGB32 is used, thus each property of COLOR_RGB( r, g, b, a) falls within a range of integer values between 0-255.
7. Valid ranges and formats for a date are as defined by xs:date in XML Schema 1.0 Part 2.

79. **Rename CMD’s name property values clause**

*Before* (current clause 2.6.2, line 491)

CMD’s name property values

*After* (proposed new clause 4.11.2)

Value’s for CMD’s ‘name’ property

80. **Expand the Conformance clause.**

*Before* (current clause 4)

In order to conform to this specification, an implementation:
• SHALL support all the functional and interface requirements defined in this specification.
• SHALL NOT specify any requirements that would contradict or cause non-conformance to this specification.

A conformance implementation SHALL satisfy the conformance requirements of the applicable parts of this specification.

After (proposed new clause 5)

The text in this OASIS standard is divided into normative and informative categories. Unless documented otherwise, all features specified in normative text of this OASIS standard shall be implemented. Text marked informative (using the mechanisms described in §1.5) is for information purposes only. Unless stated otherwise, all text is normative.

Use of the word “shall” indicates required behavior.

Any behavior that is not explicitly specified by this OASIS standard is implicitly unspecified (§4).

DCMS Conformance

A UOML Document Management System (DCMS) has conformance if it implements all of the UOML instructions in compliance with the syntax as described in the schema [UOMLSchema] and semantics in this OASIS standard.

Application Conformance

A UOML application is conformant if both of the following are true:

• The application issues UOML instructions as schema-valid XML as specified in this OASIS standard to the DCMS; and
• The application parses the return instructions from the DCMS according to this OASIS standard.

81. Expand and add to all inline specification examples to be more informational.

The examples that are inline to the specification (see errata below for a new proposed stand-alone Annex containing more examples) should be modified to be more informational and correct. (current clause: 2.6.1, 3.1 through 3.9, Proposed new clauses: 4.11.1, 3.1 through 3.9)

Before (current clauses 2.6.1, 3.1 – 3.9)

CMD (clause 2.6.1)

EXAMPLE 1:

```xml
<CMD name="COLOR_LINE">
  <rgb r="128" g="3" b="255" a="120"/>
</CMD>
```

Comment [JM81]: GB-13: add namespace prefixes to outer elements. Make sure examples are informative.

GB-20: Agree with GB-13
CZ-06: Agree with GB-13
DE-05: Agree with GB-13
GB-07: allows for editorial changes to be made for clarity.
NL-04: allows for restructure and reformatting for better quality. As well as strengthening technical details.
GB-31: refine spec with examples
EXAMPLE 2:
<CMD name="LINE_CAP" v1="END_BUT"/>

EXAMPLE 3:
<CMD name="TEXT_MATRIX">
  <matrix f11="2" f12="0" f21="0" f22="1.5" f31="10" f32="20"/>
</CMD>

OPEN (clause 3.1)
EXAMPLE: create a docbase, named 1.sep
<uoml:OPEN path="/home/admin/storage/1.sep" create="true" del_exist="false"/>

CLOSE (clause 3.2)
EXAMPLE: close a docbase.
<uoml:CLOSE handle="db_handle_xxxxx"/>

USE (clause 3.3)
EXAMPLE: set up the handle represented object as current object.
<uoml:USE handle="obj_handle_xxxxxx"/>

GET (clause 3.4)
EXAMPLE 1: get the total number of sub-objects of the specific object
<uoml:GET handle="obj_handle_xxx" usage="GET_SUB_COUNT"/>

EXAMPLE 2: get a specific sub-object handle
<uoml:GET handle="obj_handle_xxx" usage="GET_SUB">
  <pos val="0"/>
</uoml:GET>

EXAMPLE 3: get specific property of the object
<uoml:GET handle="obj_handle_xxxxx" usage="GET_PROP">
  <property name="start"/>
</uoml:GET>

EXAMPLE 4: get specific page's bitmap
<uoml:GET handle="page_obj_handle_xxx" usage="GET_PAGE_BMP">
  <disp_conf format="bmp" output="FILE" end_layer="1" resolution="600"
    path="/home/admin/output/page.bmp">
    <clip>
      <SUBPATH data="s 0,0 l 3000,0 l 3000, 5000 l 0, 5000 l 0,0"/>
    </clip>
  </disp_conf>
</uoml:GET>
SET (clause 3.5)
EXAMPLE: set specific object's angle property.
   <uoml:SET handle="obj_handle_xxxxx">
       <floatVal name="angle" val="0.1"/></floatVal>
   </uoml:SET>

INSERT (clause 3.6)
EXAMPLE 1: insert a text data
   <uoml:INSERT pos="1"/>
       <xobj>
           <TEXT origin="100, 200" encode="ASCII" text="UOML" spaces="20,20,20"/>
       </xobj>
   </uoml:INSERT>

EXAMPLE 2: insert a layer.
   <uoml:INSERT handle="page_obj_handle_xxxxx">
       <xobj>
           <LAYER/>
       </xobj>
   </uoml:INSERT>

DELETE (clause 3.7)
EXAMPLE: delete an object
   <uoml:DELETE handle="img_obj_handle_xxx"/>

SYSTEM (clause 3.8)
EXAMPLE: save the Docbase example.sep
   <uoml:SYSTEM>
       <flush handle="docbase_handle_xxxxx" path="/home/admin/storage/example.sep"/>
   </uoml:SYSTEM>

RET (clause 3.9)
EXAMPLE: Return three values.
   <uoml:RET>
       <intVal name="xxx" val="0"/>
       <boolVal name="SUCCESS" val="false"/>
       <stringVal name="ERR_INFO" val="required resource not available"/>
   </uoml:RET>

After (proposed new clauses: 4.11.1, 3.1 - 3.9)

CMD (proposed clause 4.11.1)
[Example:
   <INSERT pos="2" handle="vs03"/>]
<xobj>
  <cmd name="COLOR_LINE" >
    <rgb r="128" g="3" b="255" a="120"/>
  </cmd>
</xobj>
</INSERT>

end example]

[Example:

<INSERT pos="2" handle="vs03">
  <xobj>
    <cmd name="LINE_CAP" v1="END_BUT"/>
  </xobj>
</INSERT>

end example]

[Example:

<INSERT pos="2" handle="vs03">
  <xobj>
    <cmd name="TEXT_MATRIX">
      <matrix f11="2" f12="0" f21="0" f22="1.5" f31="10" f32="20"/>
    </cmd>
  </xobj>
</INSERT>

end example]

**OPEN (proposed clause 3.1)**

[Example:

Create a docbase, named 1.sep. If the DCMS successfully processed the OPEN instruction, it will return a RET instruction.

```xml
<OPEN path="/home/admin/storage/1.sep" create="true" del_exist="false"/>
```

Return element if OPEN succeeds:

```xml
<RET>
  <boolVal name="SUCCESS" val="true"/>
  <stringVal name="HANDLE" val="db_handle_xxxxx"/>
</RET>
```

Return element if OPEN fails:
CLOSE (proposed clause 3.2)
[Example:
Close a docbase.

\[
\text{<CLOSE handle="db_handle_xxxxx"/>}
\]
end example]

USE (proposed clause 3.3)
[Example:
Set up the handle represented object as the current object.

\[
\text{<USE handle="obj_handle_xxxxx"/>}
\]
end example]

GET (proposed clause 3.4)
[Example:
Get the total number of sub-objects of the specific object:

\[
\text{<GET handle="obj_handle_xxx" usage="GET_SUB_COUNT"/>}
\]
RET instruction returns the number:

\[
\text{<RET>}
\text{<boolVal name="SUCCESS" val="true"/>}
\text{<intVal name="sub_count" val="1"/>}
\text{</RET>}
\]
end example]
Get a specific sub-object handle:

```
<GET handle="obj_handle_page01" usage="GET_SUB">
  <pos val="0"/>
</GET>
```

RET instruction returns the handle of the sub-object:

```
<RET>
  <boolVal name="SUCCESS" val="true"/>
  <stringVal name="handle" val="obj_handle_layer01"/>
</RET>
```

end example]

[Example:

Get specific property of the object

```
<GET handle="obj_handle_xxxxx" usage="GET_PROP">
  <property name="start"/>
</GET>
```

RET instruction returns the start property, which is a coordinate:

```
<RET>
  <boolVal name="SUCCESS" val="true"/>
  <stringVal name="start" val="200,300"/>
</RET>
```

end example]

[Example:

Get specific page's bitmap

```
<GET handle="page_obj_handle_xxx" usage="GET_PAGE_BMP">
  <disp_conf format="bmp" output="FILE" end_layer="1" resolution="600"
   path="/home/admin/output/page.bmp">
<clip>
```
<subpath data="s 0,0 l 3000,0 l 3000, 5000 l 0, 5000 l 0,0"/>
</clip>
</disp_conf>
</GET>

end example]

- When GET fails, the return value is defined by RET.

[Example:

<RET>
  <boolVal name="SUCCESS" val="false"/>
  <stringVal name="ERR_INFO" val="disk full"/>
</RET>

end example]

SET (proposed clause 3.5)

[Example:

Set specific object's angle property.
<SET handle="obj_handle_xxxxxx">
  <floatVal name="angle" val="0.1"/>
</SET>

end example]

INSERT (proposed clause 3.6)

[Example:

Insert text data

<INSERT pos="1"/>
  <xobj>
    <text origin="100, 200" encode="ASCII" text="UOML"
      spaces="20,20,20"/>
  </xobj>
</INSERT>

end example]
Example:

Insert a layer

```xml
<INSERT handle="page_obj_handle_xxxxx">
  <xobj>
    <layer/>
  </xobj>
</INSERT>
```

end example]

DELETE (proposed clause 3.7)

Example:

Delete an object

```xml
<DELETE handle="img_obj_handle_xxx"/>
```

end example]

SYSTEM (proposed clause 3.8)

Example:

Save the docbase example.sep

```xml
<SYSTEM>
  <flush handle="docbase_handle_xxxxx" path="/home/admin/storage/example.sep"/>
</SYSTEM>
```

end example]

RET (proposed clause 3.9)

Example:

Return two values.

```xml
<RET>
  <boolVal name="SUCCESS" val="false"/>
  <stringVal name="ERR_INFO" val="required resource not available"/>
</RET>
```

end example]

82. **Acknowledgments move from Annex A to Annex C.**

Before (current clause Annex A)
The following individuals have participated in the creation of this specification and are gratefully acknowledged:

**Participants:**
Alex Wang, Sursen Corporation
Xu Guo, Sursen Corporation
Allison Shi, Sursen Corporation
Liwei Wang, Sursen Corporation
Stephen Green, Individual
Charles H. Schulz, Ars Aperta
Pine Zhang, UOML Alliance
Mendy Liu, UOML Alliance
Andy Li, Changfeng Open Standards Platform Software Alliance
Lin Cheng, Beijing Redflag CH2000 Software Co. Ltd.

**After (proposed new clause Annex C), with additions**

This annex is informative.

The following individuals have participated in the creation of this specification and are gratefully acknowledged:

**Participants:**
Alex Wang, Sursen Corporation
Xu Guo, Sursen Corporation
Ningsheng Liu, Sursen Corporation
Allison Shi, Sursen Corporation
Stephen Green, Individual
Kaihong Zou, Sursen Corporation
Pine Zhang, UOML Alliance
Mendy Liu, UOML Alliance
Joel Marcey, Sursen Corporation
Andy Li, Changfeng Open Standards Platform Software Alliance
Charles H. Schulz, Ars Aperta
Lin Cheng, Beijing Redflag CH2000 Software Co. Ltd.
Liwei Wang, Sursen Corporation

**End of informative text.**
83. **Change normative schema to reflect informative schema in proposed Annex A**

Make two primary changes to the normative schema in order to make the schema implementable correctly. Add the base extension for EMBEDFONT and IMAGE to be xs:base64binary. Also explicitly call out that “path” is a ‘string’ and ‘optional’ for IMAGE – even though ‘optional’ is the default if not specified.

**Before (current normative schema is at: http://docs.oasis-open.org/uoml-x/v1.0/os/uoml-schema-os.xsd)**

```xml
<xs:complexType name="EMBEDFONT">
    <xs:annotation>
        <xs:documentation>embedded font</xs:documentation>
    </xs:annotation>
</xs:complexType>

<xs:complexType name="IMAGE">
    <xs:annotation>
        <xs:documentation>image</xs:documentation>
    </xs:annotation>
    <xs:simpleContent>
        <xs:extension base="xs:base64Binary">
            <xs:attribute name="tl" type="xs:string" use="required"/>
            <xs:attribute name="br" type="xs:string" use="required"/>
            <xs:attribute name="type" type="xs:string" use="required"/>
            <xs:attribute name="path" type="xs:string" use="optional"/>
        </xs:extension>
    </xs:simpleContent>
</xs:complexType>
```

**After (proposed normative schema will be at: http://docs.oasis-open.org/uoml-x/v1.0/errata/cd/uoml-part1-v1.0-schema-errata.xsd)**

```xml
<xs:complexType name="EMBEDFONT">
    <xs:annotation>
        <xs:documentation>embedded font</xs:documentation>
    </xs:annotation>
</xs:complexType>

<xs:complexType name="IMAGE">
    <xs:annotation>
        <xs:documentation>image</xs:documentation>
    </xs:annotation>
    <xs:simpleContent>
        <xs:extension base="xs:base64Binary">
            <xs:attribute name="tl" type="xs:string" use="required"/>
            <xs:attribute name="br" type="xs:string" use="required"/>
            <xs:attribute name="type" type="xs:string" use="required"/>
            <xs:attribute name="path" type="xs:string" use="optional"/>
        </xs:extension>
    </xs:simpleContent>
</xs:complexType>
```

**Comment [JM83]:** GB-08: Make proposed informative Annex A schema the actual normative schema.

GB-15: accepts GB-08

DE-24: data types in normative schema

NO-19: xml schema definition
84. **Add a copy of the UOML XML Schema as Annex A.**

This annex is informative.

The following is a copy of the XML Schema for UOML for ancillary purposes. It describes the types and elements, in XML format, for UOML. The normative schema is provided with the specification.

The normative XML schema definition is located at [UOMLSchema].

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:uoml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0"
    targetNamespace="urn:oasis:names:tc:uoml:xmlns:uoml:1.0" elementFormDefault="unqualified"
    attributeFormDefault="unqualified">

  <xs:complexType name="ARC">
      <xs:annotation>
          <xs:documentation>arc</xs:documentation>
      </xs:annotation>
      <xs:attribute name="clockwise" type="xs:boolean" use="required"/>
      <xs:attribute name="start" type="xs:string" use="required"/>
      <xs:attribute name="end" type="xs:string" use="required"/>
      <xs:attribute name="center" type="xs:string" use="required"/>
      <xs:attribute name="angle" type="xs:float" use="required"/>
  </xs:complexType>

  <xs:complexType name="BEZIER">
      <xs:annotation>
          <xs:documentation>bezier curve</xs:documentation>
      </xs:annotation>
      <xs:attribute name="start" type="xs:string" use="required"/>
      <xs:attribute name="ctrl" type="xs:string" use="required"/>
      <xs:attribute name="ctrl2" type="xs:string" use="optional"/>
      <xs:attribute name="end" type="xs:string" use="required"/>
  </xs:complexType>

  <xs:complexType name="CIRCLE">
      <xs:annotation>
          <xs:documentation>circle</xs:documentation>
      </xs:annotation>
      <xs:attribute name="radius" type="xs:int" use="required"/>
      <xs:attribute name="center" type="xs:string" use="required"/>
  </xs:complexType>

  <xs:complexType name="LINE">
      <xs:annotation>
          <xs:documentation>line</xs:documentation>
      </xs:annotation>
      <xs:attribute name="start" type="xs:string" use="required"/>
      <xs:attribute name="end" type="xs:string" use="required"/>
  </xs:complexType>

</xs:schema>
```

Comment [JM84]: GB-08: Add xs:base64binary to IMAGE and EMBEFONT. Fix xsd: errors in those locations. Make this informative annex the normative schema.

GB-15: Accepts GB-08

DE-24: data types in schema

GB-19: Annex A added for clarity and accepted GB-08 and GB-13

GB-20: show schema with minOccurs and maxOccurs. Also accepts GB-08

JP-07: show normative schema

NO-19: XML schema definition
<xs:element name="rgb" type="uoml:COLOR_RGB"/>
</xs:choice>
</xs:sequence>
<xs:attribute name="name" type="uoml:CMDNAME" use="required"/>
<xs:attribute name="v1" type="xs:anySimpleType"/>

End of informative text.

85. **Add Detailed UOML Examples as Annex B.**

This annex is informative.

The examples below demonstrate the usage of many of the UOML instructions. Each example is followed by a corresponding "RET " instruction.

The XML string of a UOML instruction may be preceded by a prolog to specify the character encoding of the XML string. If default encoding is UTF-8, the prolog, `<xml version="1.0" encoding="UTF-8"?>`, may be omitted. The default namespace for the XML string is: urn:oasis:names:tc:uoml:xmlns:uoml:1.0.

**Example 1: open a docbase**

*Instructions sent from application to DCMS*

```xml
<uoml:OPEN xmlns:uoml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0" create="false" del_exist="false" path="c:\test.sep"/>
```

*Instructions returned from DCMS to application*

```xml
<!-- the string value "docbase001" is the opened docbase’s handle for later use -->
```
Example 2 : get the root docset of the docbase (following example 1)

Instructions sent from application to DCMS

<!-- since each docbase has one and only one sub-object, to get the root docset is just to get the first sub-object of docbase whose handle is returned by example 1 -->

<uml:GET xmlns:uml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0" handle="docbase001" usage="GET_SUB">
  <pos val="0"/>
</uml:GET>

Instructions returned from DCMS to application

<uml:RET xmlns:uml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0">
  <boolVal name="SUCCESS" val="true"/>
  <stringVal name="handle" val="docset001"/>
</uml:RET>

Example 3: get the number of sub-objects of the root docset (following example 2)

Instructions sent from application to DCMS

<uml:GET xmlns:uml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0" handle="docset001" usage="GET_SUB_COUNT"/>

Instructions returned from DCMS to application

<!-- the return value of 3 indicates the root docset has 3 sub-objects -->

<uml:RET xmlns:uml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0">
  <boolVal name="SUCCESS" val="true"/>
  <intVal name="sub_count" val="3"/>
</uml:RET>

Example 4: get the third sub-object of the docset (following example 3)
Instructions sent from application to DCMS

<uoml:GET xmlns:uoml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0" handle="docset001" usage="GET_SUB">
  <pos val="2"/>
</uoml:GET>

Instructions returned from DCMS to application

<uoml:RET xmlns:uoml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0">
  <boolVal name="SUCCESS" val="true"/>
  <stringVal name="handle" val="doc001"/>
</uoml:RET>

Examples 5: get the type of a object using the empty string as the name of the property (following example 4)

Instructions sent from application to DCMS

<uoml:GET xmlns:uoml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0" usage="GET_PROP" handle="doc001">
  <property name=""/>
</uoml:GET>

Instructions returned from DCMS to application

<uoml:RET xmlns:uoml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0">
  <boolVal name="SUCCESS" val="true"/>
  <stringVal name="" val="DOC"/>
</uoml:RET>

Example 6: get the metadata of the document (following example 4)

Instructions sent from application to DCMS

<uoml:GET xmlns:uoml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0" usage="GET_PROP" handle="doc001">
  <property name="metainfo"/>
</uoml:GET>

Instructions returned from DCMS to application

<uoml:RET xmlns:uoml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0">
Example 7: get page bitmap of a page

Instructions sent from application to DCMS

<!-- the page object’s handle is supposed to have already obtained of value "page001" in prior instructions (using GET) -->

< uoml : GET xmlns:uoml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0" usage="GET_PAGE_BMP" handle="page001">
  <disp_conf addr="c:\test.bmp" end_layer="8" format="bmp" output="FILE"
resolution="640">
    <clip>
      <ellipse angle="45" center="10,20" xr="30" yr="40"/>
      <roundrect br="70,80" tl="50,60" xr="90" yr="100"/>
      <subpath data="s 214,193 l 368,193 l 368,298 l 214,298"/>
    </clip>
  </disp_conf>
</uoml:GET>

Instructions returned from DCMS to application

<!-- the bmp format of page bitmap data has been saved in the file c:\test.bmp as requested -->

< uoml : RET xmlns:uoml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0">
  <boolVal name="SUCCESS" val="true"/>
</uoml:RET>
Example 8: get first layer of a page

Instructions sent from application to DCMS

<!-- the page object’s handle is supposed to have already obtained of value "page001" in prior instructions(using GET) -->

<!-- since page has only layer objects as its sub-objects, get sub-objects is the same to get layer objects -->

<uoml:GET xmlns:uoml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0" handle="page001" usage="GET_SUB">
  <pos val="0"/>
</uoml:GET>

Instructions returned from DCMS to application

<uoml:RET xmlns:uoml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0">
  <boolVal name="SUCCESS" val="true"/>
  <stringVal name="handle" val="layer001"/>
</uoml:RET>

Example 9: set a text object as the current object

Instructions send from application to DCMS

<!-- the text object’s handle is supposed to have already obtained of value "text001" in prior instructions(using GET) -->

<uoml:USE xmlns:uoml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0" handle="text001"/>

Instructions returned from DCMS to application

<uoml:RET xmlns:uoml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0">
  <boolVal name="SUCCESS" val="true"/>
</uoml:RET>

Examples 10: get spaces property of a text object (following example 9)

Instructions send from application to DCMS

<uoml:GET xmlns:uoml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0" usage="GET_PROP">
  <property name="spaces"/>
</uoml:GET>
Example 11: insert a document into a docset (following example 2)

Instructions send from application to DCMS

```xml
<uoml:INSERT xmlns:uoml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0" handle="docset001">
  <xobj>
    <doc name="UOML part II">
      <metainfo>
        <meta key="author" val="alex"/>
      </metainfo>
    </doc>
  </xobj>
</uoml:INSERT>
```

Instructions returned from DCMS to application

```xml
<!---- the handle of the inserted document is returned for later use -->
<uoml:RET xmlns:uoml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0">
  <boolVal name="SUCCESS" val="true"/>
  <stringVal name="handle" val="doc002"/>
</uoml:RET>
```

Example 12: delete the document inserted in the example above

Instructions send from application to DCMS

```xml
```

Instructions returned from DCMS to application

```xml
<uoml:RET xmlns:uoml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0">
```

```xml
</uoml:RET>
```
Example 13: use SYSTEM to save a docbase

Instructions send from application to DCMS

```xml
<uoml:SYSTEM xmlns:uoml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0">
  <flush path="c:\test.sep"/>
</uoml:SYSTEM>
```

<!-- instructions returned from DCMS to application -->

```xml
<uoml:RET xmlns:uoml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0">
  <boolVal name="SUCCESS" val="true"/>
</uoml:RET>
```

Example 14: close the docbase (following example 1)

Instructions send from application to DCMS

```xml
<uoml:CLOSE xmlns:uoml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0" handle="docbase001"/>
```

Instructions returned from DCMS to application

```xml
<uoml:RET xmlns:uoml="urn:oasis:names:tc:uoml:xmlns:uoml:1.0">
  <boolVal name="SUCCESS" val="true"/>
</uoml:RET>
```

End of informative text.

86. **Add a RELAX NG Representation of the UOML XML Schema as an Annex C.**

This annex is informative.

The following is a compact RELAX NG representation of the normative UOML XML Schema.

```xml
default namespace = ""
namespace ns1 = "urn:oasis:names:tc:uoml:xmlns:uoml:1.0"
```

start =
  (notAllowed
