#### **Technical Committee:**

OASIS Web Services Calendar (WS-Calendar) TC

#### Chair:

Toby Considine (toby.considine@unc.edu), University of North Carolina at Chapel Hill

#### **Editors:**

William Cox (wtcox@coxsoftwarearchitects.com), Individual

Toby Considine (toby.considine@unc.edu), University of North Carolina at Chapel Hill

#### **Additional artifacts:**

This prose specification is one component of a Work Product that also includes:

 XMI (UML in XML) documents representing the UML model described in the specification. XML is authoritative; EAP file is informative: http://docs.oasis-open.org/ws-calendar/wscalendar-pim/v1.0/csd02/xmi/

#### **Related work:**

This specification is related to:

• WS-Calendar Version 1.0. Edited by Toby Considine and Mike Douglass. Latest version. http://docs.oasis-open.org/ws-calendar/ws-calendar/v1.0/ws-calendar-1.0-spec.html

#### Abstract:

The Platform Independent Model is an abstract model that defines conformance and improves interoperation of calendar and schedule models with each other and with WS-Calendar and Xcal, which are in turn based on IETF RFCs.

This is a Platform Independent Model under the Object Management Group's Model-Driven Architecture. The Platform Dependent Model to which this specification relates is the full model for WS-Calendar as expressed in XML (xCal).

The focus of this Platform Independent Model is on describing and passing schedule and interval information with information attachments.

#### Status:

This document was last revised or approved by the OASIS Web Services Calendar (WS-Calendar) TC on the above date. The level of approval is also listed above. Check the "Latest version" location noted above for possible later revisions of this document.

Technical Committee members should send comments on this specification to the Technical Committee's email list. Others should send comments to the Technical Committee by using the "Send A Comment" button on the Technical Committee's web page at https://www.oasis-open.org/committees/ws-calendar/.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (https://www.oasis-open.org/committees/ws-calendar/ipr.php).

#### 1.4 Namespace 55

56 There are no XML namespaces defined in this specification.

#### 1.5 Naming Conventions 57

- 58 This specification follows a set of naming conventions for artifacts defined by the specification, as follows:
- 59 For the names of attributes in UML classes the names follow the lower camelCase convention, with all 60 names starting with a lower case letter. For example, an attribute name might be
- 61 durationShort
- 62 The names of UML classes follow the upper CamelCase convention with all names starting with an Upper 63 case letter followed by "Type".
- 64 ToleranceValueType
- 65 Some UML predefined types are used, e.g. string.

#### **1.6 Editing Conventions** 66

- 67 For readability, UML attribute names in tables appear as separate words. The actual names are
- lowerCamelCase, as specified above, and do not contain spaces. 68
- 69 All items in the tables not marked as "optional" are mandatory.
- 70 Information in the "Specification" column of the tables is normative. Information appearing in the "Note" 71
- column is explanatory and non-normative.
- 72 All sections explicitly noted as examples are informational and are not to be considered normative.

#### 1.7 Architectural References and Background 73

- 74 WS-Calendar and this WS-Calendar PIM assume incorporation into services. Accordingly it assumes a
- 75 certain background of definitions and discussion of roles, names, and interaction patterns. This document
- 76 relies heavily on roles and interactions as defined in the OASIS Standard Reference Model for Service 77 Oriented Architecture [SOA-RM].
- 78 Service-Oriented Architecture comprises not only the services and interaction patterns, but also the 79
- information models that support those services and make the actions meaningful. The WS-Calendar PIM 80 is such an information model for expressing schedule and time related information in a consistent manner
- and to permit easy transformation or adaptation into IETF iCalendar related specifications and among 81
- Platform-Specific Models based on this PIM. 82

# 83 **2 Architecture**

The Object Management Group's Model Driven Architecture **[MDA-Overview][MDA]** provides a framework to describe relationships between Unified Modeling Language **[UML]** models.1

- 86 An instance of MDA has two classes of models:
- A single *Platform-Independent Model*, abbreviated *PIM* (pronounced as though spelled pim)
- One or more *Platform-Specific Models*, abbreviated *PSM* (pronounced as though spelled *pism*)
- The PIM typically captures the more abstract relationships, clarifying the architecture. Each PSM is bound to a particular *platform*.
- 91 The art of establishing an MDA includes defining platforms and a PIM and PSMs, to solve interesting
- 92 important and useful problems. Artifacts expressed in different PSMs may more readily be exchanged
- and understood with reference to the related PIM, making interoperation simpler and semantics more free
   from irrelevant detail.

### 95 2.1 The PIM and the WS-Calendar PSM

- 96 In this specification we define a PIM or Platform-Independent Model for the **[WS-Calendar]** extensions to
- 97 IETF [iCalendar][xCal] and the relevant types included in [xCal]. We use "the PIM" to mean "the WS 98 Calendar PIM" in this specification.
- 99 **[iCalendar]** uses a set of definitions and a platform, developed over many years and much use, to
- express relationships, times, events, and availability. As such, the expression is very simple, but in the aggregate relatively complex and less suitable to UML expression—the several key types have sets of
- 102 values and attributes associated with them in a relatively flat hierarchy.
- 103 This PIM addresses the key abstractions as defined in **[WS-Calendar]** in a manner that allows for
- 104 understanding the nature and information model for those abstractions. In effect, we are creating a PIM
- 105 with respect to which the WS-Calendar specification is a PSM. Our purpose is to create a more abstract
- 106 model of the key concepts in WS-Calendar for easier use in application development, standardization, 107 and interoperation.
- 108 The MDA presumes transformations from UML models to UML models. The UML model for **[WS-**
- 109 **Calendar]** is structured differently than the PIM. We describe transformations in detail in Section 7.
- 110 This specification does not rely on any specific MDA tooling or environments to be useful.

#### 111 2.2 Key Abstractions

- 112 We define the following in order:
- Types for date, time, and duration
- 114 The Interval
- Payload attachment to an Interval
- Relations
- 117 The Gluon
- 118 Tolerance
- Availability

### 120 **2.3 Expression of the PIM**

121 The PIM is a **[UML]** model. We represent the PIM as a normative **[XMI]** serialization of the model. The

model is described using **[Enterprise Architect]**. The Enterprise Architect Project file is part of this work product but is non-normative.

#### 2.4 Structure of the PIM Model and Specification 124

- The PIM consists of a small number of key concepts and constructs as listed in Section 2.2. These are 125
- expressed in a largely flat structure, with a sub-package only for the Availability [Vavailability] 126
- abstractions.<sup>2</sup> We have not otherwise subdivided the core model, but expect (See Section 9) that 127 conforming specifications and implementations MAY claim conformance to sub-parts of the PIM, e.g. to 128
- 129 only the Interval.
- 130 We encourage consideration and use of the entire PIM, but understand that some aspects of the abstract
- 131 model may be more complex than needed to address specific problems. We consider such profiles of the
- 132 PIM to themselves be Platform-Specific Models.
- 133 We generally take the names for abstractions in the PIM from the names in [WS-Calendar] to simplify
- 134 implementations and mappings. We avoid multiple fully gualified terms of the same end component name. 135
- Many values in the XML Serialization [xCAL] of iCalendar are conformed strings, that is, strings with 136 certain defined patterns. We require similar standardized formats for conformed strings, and record the 137
- 138 type in this PIM as *string*, again to allow easy transformation between this PIM and the PSMs.
- 139 In a future version of this specification, the conformance rules will be included in the UML model; as of
- 140 this Working Draft they are of type string with references to the standards source for the patterns.

#### 2.5 Expression in UML 141

- 142 The terminology for attributes of an object, and how to describe an object or type differs between
- 143 [XMLSchema] and [UML]. Attributes of a class in UML are called either attributes (expressed in
- 144 name=value format in XML) or elements. Since this specification is based on UML, we use the term attribute throughout.<sup>3</sup> 145
- There are constraints and semantic rules and conformance that apply to a UML model defining the WS-146
- 147 Calendar PIM. The UML constraints allow for determining values in fully bound class instances that are 148 less succinct than the standardized expressions.
- 149 For example, an instance of Interval (see Figure 4-3 The PIM IntervalType) might have only duration; the
- 150 PIM, however, lists duration as optional (cardinality 0..1). Rules in this specification show how a specific
- representation is to be interpreted, typically by inheriting values from elsewhere. Conceptually, the actual 151 152 values depend on the context and applied rules.
- 153
- An Interval notionally has a start time, but that also is optional in the PIM. Finally, an Interval does not 154 have an end time (expressed in Figure 4-3 as dtEnd of cardinality 0. We keep the dtEnd attribute for ease 155 of use in PSMs and for intermediate stages of mapping into the canonical start and duration model, as
- 156 well as mapping into and from models that define intervals with all three of start, end, and duration.
- These characteristics are as defined in [WS-Calendar] and describe an abstract Interval with at most a 157
- start time and duration. This is in contrast to some historical models that require each interval to contain a 158
- start and end time, or occasionally start, end, and duration. The added flexibility of relocatable sets or 159
- 160 schedules comprised of Intervals and Gluons makes the expression of such a relocatable schedule easy
- and reusable, thus permitting a powerful abstraction to be applied to all sorts of scheduling expressions. 161
- 162 In addition the mapping capability to and from the PIM allows interoperation with systems with less
- 163 conveniently relocatable intervals.

<sup>&</sup>lt;sup>2</sup> The Vavailability definition is in process in the IETF.

<sup>&</sup>lt;sup>3</sup> There are UML stereotypes to express the nature of an XML Schema export, indicating whether a UML attribute should be represented as an XSDattribute or XSDelement.

# **3 WS-Calendar PIM Terminology and Semantics**

165 WS-Calendar PIM semantics are nearly identical to those defined in Section 1.9 of [WS-Calendar]. The

- 166 minor differences between the referenced section and those in Section Error! Reference source not 167 found. below are listed in Appendix C.
- 168 This specification and **[WS-Calendar]** share the same semantics and terminology, which allows easier 169 exchange of information across execution environments as well as consistency across Platform Specific 170 Models related to this specification. In addition, the definition of conformed strings for representation of
- 171 duration and date and time per **[ISO8601]** is identical.
- 172 [WS-Calendar] defines XML and XML Schema artifacts; the terminology differs from UML, most
- obviously in that XML distinguishes between elements and attributes within a type, while UML uniformly
   uses the term *attributes*.

# **3.1 Time Intervals and Collections of Time-Related Intervals**

- 176 Certain terms appear throughout this document and are defined in Table 3-1. Some terms are discussed177 in greater depth in later sections. In all cases, the normative definition is in this section.
- 178 WS-Calendar terminology begins with a specialized terminology for the segments of time, and for groups
- 179 of related segments of time. These terms are defined in Table 3-1 through Table 3-4 below, and are
- 180 quoted from **[WS-Calendar]**. The definitions are normative because this is a standalone specification.
- 181 Table 3-1: Semantics: Foundational Elements

Time Segment	Definition
Component	In iCalendar, the primary information structure is a Component. Intervals and Gluons are new Components defined in this specification.
Duration	Duration is the length of an event scheduled. The <b>[xCal]</b> and <b>[RFC5545]</b> duration is a data type using the string representation defined in the iCalendar duration. In the PIM the value set from <b>[ISO8601]</b> is used instead; informally there are several additional representations for duration in the PIM but all durations from <b>[xCal]</b> are included in the PIM. See Section 4.2.
Interval	The Interval is a single Duration derived from the common calendar Components as defined in iCalendar ( <b>[RFC5545]</b> ). An Interval is part of a Sequence. An entire Sequence can be scheduled by scheduling a single Interval in that sequence. For this reason, Intervals are defined through Duration rather than through dtStart or dtEnd.
Sequence	A Sequence is a set of Intervals with defined temporal relationships. Sequences may have gaps between Intervals, or even simultaneous activities. A Sequence is re-locatable, i.e., it does not have a specific date and time. A Sequence may consist of a single Interval. A Sequence may optionally include a Lineage.
	A Sequence can be scheduled multiple times through repeated reference by different Gluons. Intervals are defined through their Duration, and the schedule, dtEnd or dtStart, is applied to the Sequence as a whole.
Partition	A Partition is a set of consecutive Intervals. The Partition includes the trivial case of a single Interval. Partitions are used to define a single service or behavior that varies over time. Examples include energy prices over time and energy usage over time.

Time Segment	Definition
Gluon	A gluon influences the serialization of Intervals in a Sequence, though inheritance and through schedule setting. The Gluon is similar to the Interval, but has no service or schedule effects until applied to an Interval or Sequence.
Artifact	An Artifact is the information attached to, and presumably that occurs or is relevant to the time span described by an Interval. WS-Calendar uses the Artifact as a placeholder. The contents of the Artifact are not specified in WS-Calendar; rather the Artifact provides an extension base for the use of WS-Calendar in other specifications. Artifacts may inherit elements as do Intervals within a Sequence. A Conforming specification MUST describe where and why its inheritance rules differ from those in this specification.

182 WS-Calendar works with groups of Intervals that have relationships between them. These relations

183 constrain the final instantiation of a schedule-based service. Relations can control the ordering of

Intervals in a Sequence. They can describe when a service can be, or is prevented from, being invoked.
 They establish the parameters for how information will be shared between elements using Inheritance.

186 The terminology for these relationships is defined in Table 3-2.

#### 187 Table 3-2: Semantics: Relations, Limits, and Constraints

Term	Definition
Link	The Link is used by one PIM object to reference another. A link can reference either an internal object, within the same calendar, or an external object in a remote system.
Relationship	Relationships link between Components for Binding. ICalendar defines several relationships, but PIM uses only the CHILD relationship, and that only to bind Gluons to each other and to Intervals.
Temporal Relationship	Temporal Relationships extend the <b>[RFC5545]</b> Relationships to define how Intervals become a Sequence by creating an order between Intervals. The Predecessor Interval includes a Temporal Relation, which references the Successor Interval. When the start time and Duration of one Interval is known, the start time of the others can be computed through applying Temporal Relations.
Availability	Availability expresses the range of times in which an Interval or Sequence can be Scheduled. Availability often overlays or is overlaid by Busy. Availability can be Inherited.
Busy	Busy expresses the range of times in which an Interval or Sequence cannot be Scheduled. Busy often overlays Availability. Busy can be Inherited.
Child, Children	The CHILD relationship type ( <i>RelationshipType</i> ) defines a logical link (via URI or UID) from parent object to a child object. A Child object is the target of one or more CHILD relationships and may have one to many Parent objects.
Parent [Gluon]	A Gluon (in a Sequence) that includes a CHILD relationship parameter type ( <i>RelationshipType</i> ) defines a logical link (via URI or UID) from parent object to a child object. A Parent Component contains one or more CHILD Relationships.

188 WS-Calendar describes how to modify and complete the specification of Sequences. WS-Calendar calls

this process Inheritance and specifies a number of rules that govern inheritance. Table 3-3 defines the
 terms used to describe inheritance, with rewording to address this PIM.

191 Table 3-3: Semantics: Inheritance

Term	Definition
Lineage	The ordered set of Parents that results in a given inheritance or execution context for a Sequence.
Inheritance	Parents bequeath information to Children that inherit them. If a child does not already possess that information, then it accepts the inheritance. WS-Calendar specifies rules whereby information specified in one informational object is considered present in another that is itself lacking expression of that information. This information is termed the Inheritance of that object.
Bequeath	A Parent Bequeaths attributes (Inheritance) to its Children.
Inherit	A Child Inherits attributes (Inheritance) from its Parent.
Covarying Attributes	Some attributes are inherited as a group. If any member of that group is expressed in a Child, all members of that group are deemed expressed in that Child, albeit some may be default values. These characteristics are called covarying or covariant. A parent bequeaths covarying characteristics as a group and a child accepts or refuses them as a group.
Decouplable Attributes	Antonym for Covarying Attributes. Decouplable Attributes can be inherited separately.

As Intervals are processed, as Intervals are assembled, and as inheritance is processed, the information

193 conveyed about each element changes. When WS-Calendar is used to describe a business process or 194 service, it may pass through several stages in which the information is not yet complete or actionable, but

is still a conforming expression of time and Sequence. Table 3-4 defines the terms used when discussingthe processing or processability of Intervals and Sequences.

197 During the life cycle of communications concerning Intervals, different information may be available or

required. For service performance, Start Duration and the Attachment Payload must be complete. These

may not be available or required during service advertisement or other pre-execution processes. Table

3-4 defines the language used to discuss how the information in an Interval is completed.

201 Table 3-4: Semantics: Describing Intervals

Term	Definition
Designated Interval	An Interval that is referenced by a Gluon is the Designated Interval for a Series. An Interval can be Designated and still not Anchored.
Anchored	An Interval is Anchored when it includes a Start or End, either directly or through Binding. A Sequence is Anchored when its Designated Interval is Anchored.
Unanchored	An Interval is Unanchored when it includes neither a Start nor an End, either internally, or through Binding. A Sequence is Unanchored if its Designated Interval Unanchored. <i>Note: a Sequence that is re-used may be Unanchored in one context even while it is Anchored in another.</i>
Binding	Binding is the application of information to an Interval or Gluon, information derived through Inheritance or through Temporal Assignment.
Bound Element	A Bound Element refers to an Element and its Value after Binding, e.g., a Bound Duration.
Bound Interval	A Bound Interval refers to an Interval and the values of its Elements after Binding.

Term	Definition	
Bound Sequence	A Bound Sequence refers to a Sequence and the values of its Intervals after Binding.	
Partially Bound	Partially Bound refers to an Interval or a Sequence which is not yet complete following Binding, i.e., the processes cannot yet be executed.	
Fully Bound	Fully Bound refers to an Interval or Sequence that is complete after Binding, i.e., the process can be unambiguously executed when Anchored.	
Unbound	An Unbound Interval or Sequence is not itself complete, but must still receive inheritance to be fully specified. A Sequence or Partition is Unbound if it contains at least one Interval that is Unbound.	
Constrained	An Interval is Constrained if it is not Anchored and it is bound to one or more Availability or Free/Busy elements	
Temporal Assignment	Temporal Assignment determines the start times of Intervals in a Sequence through processing of their Durations and Temporal Relations.	
Scheduled	A Sequence or Partition is said to be Scheduled when it is Anchored, Fully Bound, and service performance has been requested.	
Unscheduled	An Interval is Unscheduled if it is not Anchored, nor is any Interval in its Sequence Anchored. A Sequence or Partition is Unscheduled if none of its Intervals, when Fully Bound, is Scheduled.	
Predecessor Interval	A Predecessor Interval includes a Temporal Relation that references a Successor Interval.	
Successor Interval	A Successor Interval is one referred to by a Temporal Relationship in a Predecessor Interval.	
Antecedent Interval(s)	Antecedents are an Interval or set of Intervals that precede a given Interval within the same Sequence	
Earliest Interval	The set of Intervals at the earliest time in a given Sequence	
Composed Interval	A Composed Interval is the virtual Interval specified by applying inheritance through the entire lineage and into the Sequence in accord with the inheritance rules. A Composed Interval may be Bound, Partially Bound, or Unbound.	
Composed Sequence	A Composed Sequence is the virtual Sequence specified by applying inheritance through the entire lineage and into the Sequence in accord with the inheritance rules. A Composed Sequence may be Bound, Partially Bound, or Unbound.	
Comparable Sequences	Two Sequences are Comparable if and only if the Composed version of each defines the same schedule.	

202

# **4 The Platform-Independent Model**

In this section we introduce the PIM, and treat in turn each component of the PIM. Each subsection has an introduction, a diagram, and discussion that may include the relationship of the respective components to the rest of the PIM.

This Platform-Independent Model (PIM) **[MDA]** describes an abstraction from which the Platform-Specific Model (PSM) of **[WS-Calendar]** can be derived. The intent is twofold:

- (1) To define an abstraction for calendar and schedule more in the style of web services descriptions, which may be used directly, and
- (2) To define the PIM as a model allowing easy transformation or adaptation between systems using the family of WS-Calendar specifications (such as [WS-Calendar], [xCal], [iCalendar]) as well as those addressing concepts of time intervals and Sequences (such as [IEC CIM],
   [EnergyInteroperation], and [EMIX].

### 215 **4.1 Introduction to the PIM**

In this section we present the entire PIM together with architectural discussion. The following sections
 begin with a description of the full model, and then address

- Types for Date and Time, Duration, and Tolerance
- The Interval

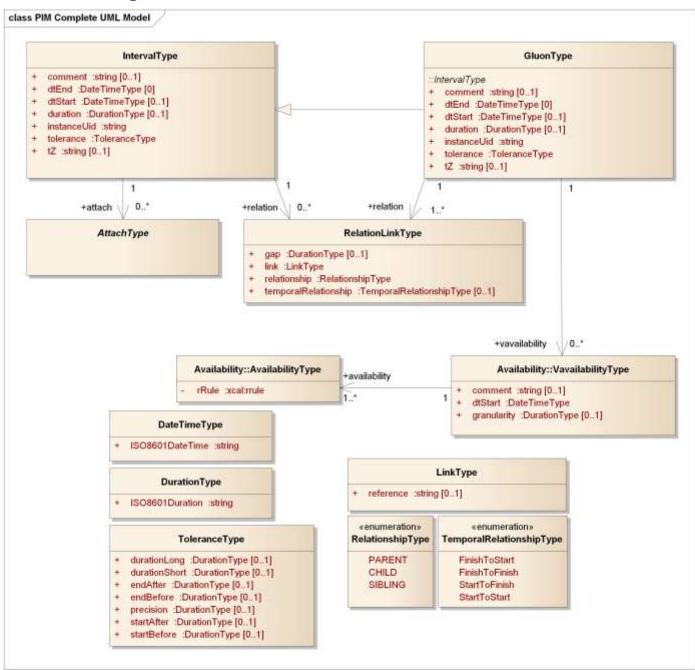

209

210

221

- Payload attachment an Interval
  - The Gluon
- Relations
- Tolerance
- Availability

### 225 4.1.1 Model Diagram of the PIM

226

227 Figure 4-1 The Complete WS-Calendar PIM UML Model

#### 228 4.1.2 Discussion

Primitive types express fundamental information related to date, time, and duration, and follow **[RFC5545] [ISO8601]** and are a superset of those expressed in **[iCalendar]**.<sup>4</sup>

<sup>&</sup>lt;sup>4</sup> See discussion in Section 4.2 that includes relationship to **[XMLSchema]** DateTime types.

- Associations in the PIM are directional, but profiles and PSMs derived or derivable from the PIM may
- have non-directional associations, vary the direction of associations to fit their particular platform(s) and purposes.<sup>5</sup>
- Attributes and associations' cardinality is defined in the PIM; profiles and PSMs derived or derivable from the PIM may have different cardinality.
- Attachments are made via the abstract class *AttachType* as described in Section 4.4.
- We have used the **[RFC5545] [ISO8601] [iCalendar]** attribute names wherever possible for ease of mapping to that common terminology. In particular, a fully bound Interval is defined by two of
- dtStart—the date & time for the start of the Interval
- dtEnd—the date & time for the end of the Interval
- duration—the duration (expressed as in **[ISO8601]**) for the Interval<sup>6</sup>
- For UML model purposes, the three key values for an interval, only two of which are required in fully
- bound Intervals, are each optional. This permits a conforming instantiation to have zero or more of the
- three key values; the semantics of Gluons and Intervals in Section Error! Reference source not found.
- describe how information for a bound interval is determined. Note also that *GluonType* while a subclass
   of *IntervalType* has a more restrictive cardinality for *dtEnd* and for *relation*.

# **4.2 Types for Date and Time, Duration, and Tolerance**

- 248 In this section we introduce key concepts and expressions for time including
- DateTime
- DurationType
- ToleranceValueType
- 252 Relationships are described in Section 4.5.

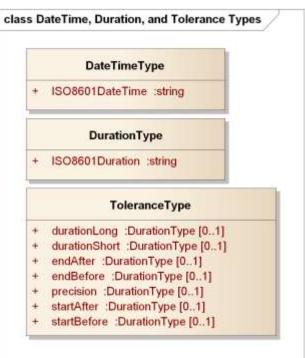

No timing of events, whether descriptive or prescriptive, can be perfectly accurate within the limits of measurement of real systems. Tolerance is an optional attribute that applies to the duration, allowing full flexibility in the description of permissible or expected variation in duration.

The containing Interval may start early or late, end early or late, or have a duration that may be short or long with respect to the nominal value. The *precision* used to describe tolerance is also included

<sup>&</sup>lt;sup>5</sup> Note that non-directional associations are a barrier to serializability in messages; hence all PSMs typically would use directional associations unless their purpose is to derive further PSMs.

<sup>&</sup>lt;sup>6</sup> But see discussion below related to **[ISO8601]** strings and those omitted by **[xCal]** and by **[XML Schema]**.

#### 258 4.2.1 Model Diagram

259

265

266

271

- 260 Figure 4-2 DateTimeType, DurationType, and ToleranceValueType
- All DateTime and duration values are expressed as conformed strings, that is, the type is *string* and the content of the string determines respectively the date, time, and the duration.
- The values of the following SHALL be expressed as conformed strings as described in the normative reference **[RFC5545]:** 
  - DateTime (See Section 3.3.5, Date-Time, in [RFC5545])
  - DurationValueType (See Section 3.3.6, Duration, in [RFC5545])
- Both DateTime and DurationValueType SHALL include [ISO8601] date & time and duration standard
   expression conformed strings, thus supporting a union of the [XMLSchema] and [iCalendar]
   expressions.
- 270 The class
  - ToleranceValueType
- is comprised of a set of optional attributes of DurationType. Tolerances can be expressed in any
- combination; however, the complexity of rules addressing the relationships of tolerances in start, end, and
   duration will likely lead to implementation-specific rules limiting the concurrent uses of tolerance
   attributes.
- It is expected that a PSM MAY include consistency requirements and limitations on the attributes of
   ToleranceValueType that might be used.
- 278 Tolerances can allow (e.g.) randomization of intervals to ensure that certain activities do not occur
- 279 "simultaneously." For example, a startBefore of 5s and startAfter of 10s indicates that the actual start time
- 280 may be in the range from 5s before to 10s after the indicated dtStart. Additional deployment semantics for
- 281 randomization may use this same expressed range. PSMs MAY include assumptions or explicit statement
- 282 of e.g. probability density functions or other indications of expected behavior.

#### 283 **4.2.2 Discussion**

These concepts are based on **[ISO8601]** and are as expressed in **[iCalendar]** as conformed strings. It is

- important to note that DurationType is identical to *neither* the XML Schema Specification **[XMLSchema]**
- 286 *Duration*<sup>7</sup> nor the **[xCal]** and **[iCalendar]** specification for duration.
- PSMs MAY express DurationType differently; if so the differences MUST be described in their
   conformance statement.

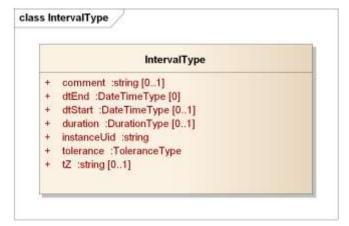

### 289 4.2.3 Relationship to other PIM Components

- 290 These concepts are pervasive in the WS-Calendar PIM. The fundamental understanding of time and
- duration must be consistent and identical to that in **[iCalendar]** for clean interoperation and
- transformation. Documentation of any differences in expression MUST be included in the conformance
- statement for any PSM claiming conformance to this PIM. Moreover, a mapping MUST be provided both
- directions between the types defined here and those in a PSM claiming conformance.

#### 295 **4.3 Interval**

- 296 The Interval is a fundamental notion—a bound interval starts at a particular time, runs for a specific
- duration, and ends at a particular time. This is reflected in Figure 4-3. But there are many possible
- 298 expressions of a time interval, and significant differences in relocatability of schedules including Intervals.

#### 299 **4.3.1 Model Diagram**

300

301 Figure 4-3 The PIM IntervalType

#### 302 **4.3.2 Discussion**

The IntervalType class is the fundamental unit for expressing a time interval; while logically any two or three of the set {dtStart, dtEnd, and duration} can express an interval, there are significant advantages to adopting a single canonical form, particularly one where the semantics are cleanly expressed. Intervals may be, and are, expressed many ways; the PIM requires a specific expression that includes start time and duration but not end time.<sup>8</sup>

308 This follows [WS-Calendar], the canonical PSM.

<sup>8</sup> See **[ISO8601]** section 4.4.

<sup>&</sup>lt;sup>7</sup> While **[iCalendar]**, **[WS-Calendar]**, and this PIM conform to **[ISO8601]**, none of them include all standard notations from 8601.Likewise **[XMLSchema]** does not include the full specification in **[ISO8601]**. In particular, there are duration strings included in **[XMLSchema]** that are not in **[iCalendar]** and *vice versa*.

- 309 Individual PSMs may use different expressions, but SHOULD recognize in their design that relocation and
- 310 scheduling of sets of intervals is a very common operation; as we will show later, an entire schedule of
- 311 Intervals in this WS-Calendar PIM can be scheduled with a single operation, whereas in other
- 312 representations each dtStart and dtEnd might have to be modified when scheduling. Individual PSMs
- 313 SHALL describe their requirements and restrictions on Interval descriptions in their conformance
- 314 statements.
- 315 See also Section 2.5.

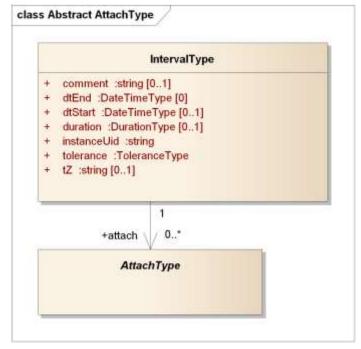

#### 316 4.3.3 Relationship to other PIM Components

- 317 The information in the IntervalType class is fundamental to expression of time interval. [ISO8601].
- 318 To maintain temporal structure while allowing correlated values, as in **[WS-Calendar]** Payload values are 319 attached to an Interval (or its subclass Gluon), as described in the next section.
- s rescribed in the next section.

### 320 **4.4 Payload Attachment to an Interval**

- A payload, which may be comprised of multiple subparts within a single class, or a reference, is attached to an Interval. This differs from other approaches that have been taken, such as
- (a) A class containing a value as well as a description of a relevant Interval (e.g. a measurement that applies to an included Interval)
- 325 (b) Associating a particular measurement to an interval (the association is the wrong direction)
- 326 The association is directional, and must be present for use of the Interval instance in a concrete way.

#### 327 **4.4.1 Model Diagram**

328

329 Figure 4-4 Attaching a Payload to an Interval

#### 330 **4.4.2 Discussion**

331 **[WS-Calendar]** (line 219) requires that the Attachment Payload and Start Duration must be complete for

332 service performance. For consistency with WS- we have defined the cardinality of *attach* to be 0..\* to

allow for abstract schedules, including those to which payloads are bound before service performance orconcrete use.

A PSM claiming conformance to this PIM SHALL document any changes in cardinality or of associations used for payload attachment in its conformance statement.

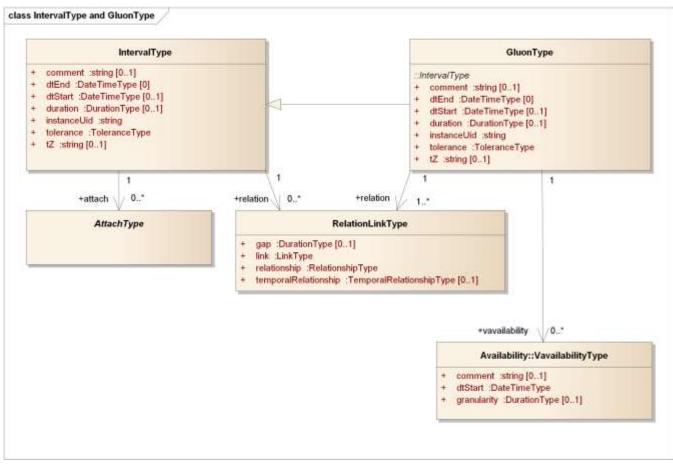

#### 337 **4.4.3 Relationship to other PIM Components**

- 338 The IntervalType is fundamental; application information is attached to instances of the IntervalType by a
- clear, directional association. This maintains the temporal structure of schedules with a variety of
   attachments of various types.

#### 341 **4.5 Gluons**

- The Gluon was defined in **[WS-Calendar]**. A Gluon may be thought of as a reference to a Sequence (a set of temporally-related intervals), with the same attributes as an Interval for simplicity of inheritance.
- 344 A sequence MAY be referenced by zero or more gluons; the view of a sequence and the indicated values
- are determined by the referencing gluon and values that may be inherited from the referencing gluonsuch as start time and duration. See Section 9.
- 347 More formally, a Gluon references schedules comprised of related Intervals and Gluons, while providing
- 348 that logical information such as the duration of Interval instances may be determined by inheritance from
- 349 other Interval instances. The structure permits directed graphs of instances with reuse of components.
- 350 Those sub graphs may therefore act as reusable sub-schedules, or considered as sub-routines.
- 351 The Gluon acts as a reference into a graph of time-related Intervals or Gluons, allowing differing schedule
- 352 views depending on the referenced Interval. For example, a room schedule that includes room
- preparation, meetings, and room cleanup could have a gluon pointing to the preparation Interval for those interested in the preparation starting point and associated actions, and another Gluon pointing to the start
- 355 of the meetings.
- 356 *GluonType* is a subclass of *IntervalType* with the added requirement that there be at least one
- 357 *RelationLink*; *IntervalType* has zero or more associated *RelationLinks*.
- 358 These relationships are capable of being used to compose arbitrarily complex graphs of instances of
- 359 Intervals and Gluons. See the examples in Section 5 and references.

#### 360 4.5.1 Model Diagram

361

362 Figure 4-5 Gluons, Intervals, and Relationship Links

Note in Figure 4-5 that the minimum number of relations for a Gluon is 1; Intervals need have no relationships. Only Gluons may have an associated Vavailability.

#### 365 **4.5.2 Discussion**

- Gluons are Intervals with at least one relation required. One could think of the Gluon as an optional
   container for values to "fill in" Interval attributes dynamically and depending on the relationships among
   the instances.
- This technique is used in **[EMIX]** and **[EnergyInteroperation]** to build energy schedules with varying values but consistent lengths.

#### 371 4.5.3 Relationship to other PIM Components

372 See the detailed discussion of Semantics in Section **Error! Reference source not found.** Gluons 373 contain values that may be inherited or overridden in its children in accordance with Section 9.2.

# **4.6 Relationships among Gluons and Intervals**

Relationships between instances of IntervalType are accomplished with RelationLinks. In **[WS-Calendar]** the LinkType is defined to be a UID (as defined in **[xCal]**), a URI **[RFC3986]**, or a reference string. This

377 supports both distributed schedules and local identifiers that need not be fully qualified as would be a UID

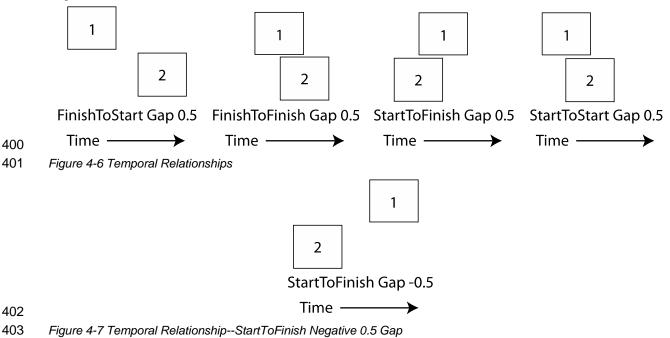

378 or a URI. In the PIM, we use a string, without defining the precise type or uses of that reference—that is

379 left to the PSMs.

- The Temporal Relationship and gap together determine the relationship of the referencing Interval andreferenced Interval instances.
- The gap SHALL be expressed as an ISO8601 duration, taken as a signed offset. For example, a gap of P-1H with Temporal Relationship StartToStart means that the referenced Interval starts one hour before
- 384 the referencing Interval.

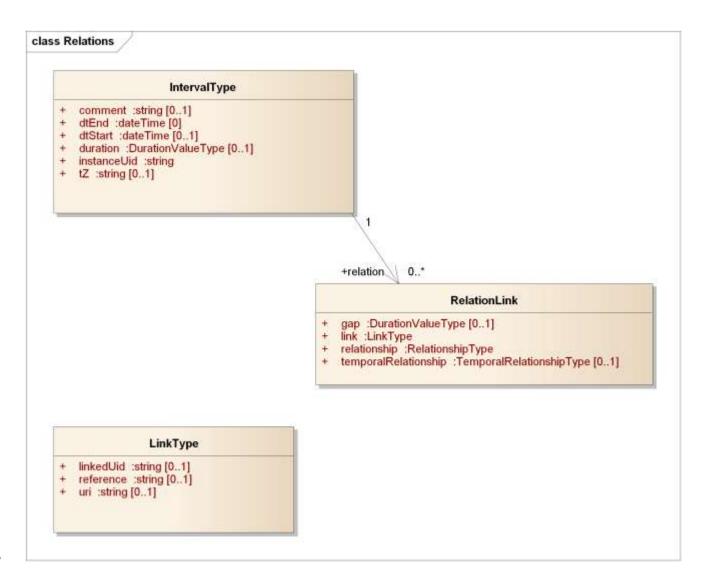

393

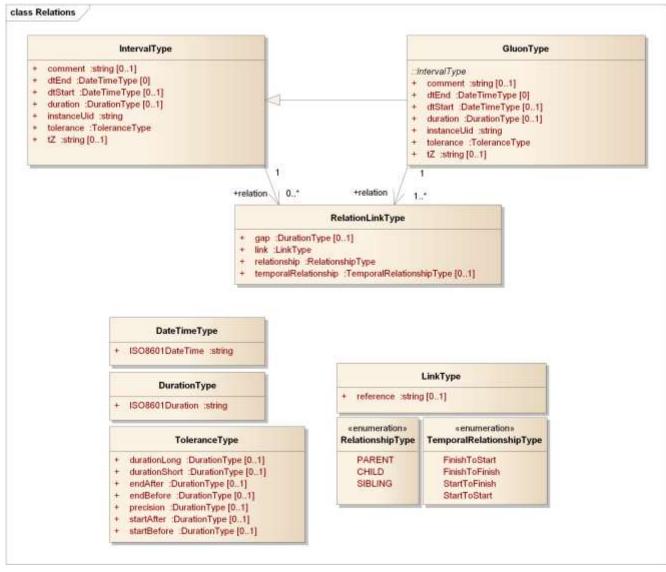

- 385 The absence of a gap attribute in a PIM object SHALL be the equivalent of a gap of zero duration.
- 386 The TemporalRelationshipType enumeration SHALL express the relationship with respect to the 387 referencing and referenced Interval:
- FinishToStart (the conventional, the referenced interval is after the Finish of the referencing Interval, with an optional gap)
   FinishToFinish (the end of the referencing Interval aligns with the end of the referenced Interval
- FinishToFinish (the end of the referencing Interval aligns with the end of the referenced Interval, with an optional gap)
   StartToFinish (the start of the referencing Interval aligns with the end of the referenced Interval,
  - StartToFinish (the start of the referencing Interval aligns with the end of the referenced Interval, with an optional gap)
- StartToStart (the start of the referencing Interval aligns with the start of the referenced Interval, with an optional gap.
- 396 RelationshipType SHALL express whether the linked Interval is a CHILD of the linking object.<sup>9</sup>
- 397 Note that the short forms for the temporal relationships listed in **[WS-Calendar]** are not used in the PIM.
- In Figure 4-6 we show two intervals with each of the temporal relationships. Figure 4-7 shows a gap of negative 0.5.

404 **4.6.1 Model Diagram** 

<sup>&</sup>lt;sup>9</sup> **[WS-Calendar]** and **[xCal]**, as with many other IETF RFCs,, also include as enumeration values an extension point (x-name) and an IANA-registered xCal token (iana-token) **[IANA]**. These are not part of the PIM. **[Relationships]**, an Internet Draft, adds an additional relationship type.

407 Figure 4-8 Relation Link Type and Relationship Types

#### 408 **4.6.2 Discussion**

406

409 The PIM and WS-Calendar both support the common relationships between time intervals, as expressed

# in facility, energy, and other schedules, project management tools, and business process definitions such as [BPEL] and [BPMN].

The relationships are expressed using the temporal relationship, the temporal gap between intervals, and the kind of relationship between Gluons and Intervals expressed as Parent, Child, and Sibling.

- The set is logically complete, and allows complex structures to be built from primitive relationships,passed in service invocations, and interpreted unambiguously.
- 416 In contrast with the WS-Calendar PSM, *LinkType* contains only a string. The broader range of links in the
- 417 WS-Calendar PSM includes a UID, a URI, or other kind of reference (implementation-defined). Since the
- 418 abstract link is conceptually a pointer in the PIM, we define a single kind of reference there. It is
- 419 maintained as a class to allow a diversity of PSM definitions including but not limited to [WS-Calendar].
- 420 A PSM claiming conformance to the PIM SHALL document how it manages and maintains links. In
- 421 particular, the conformance statement SHALL include a description of uniqueness of references in that 422 PSM.

### 423 **4.6.3 Relationship to other PIM Components**

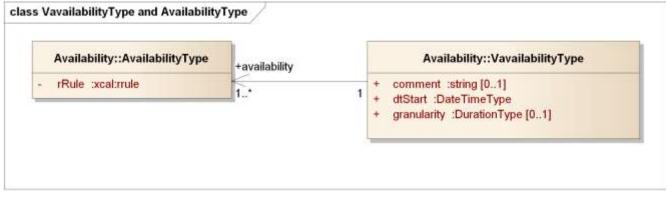

424 *Relation* allows the common and complete set of temporal relationships between time intervals to be

- 425 expressed with optional offsets (the optional Gap), while abstracting the details of the relationship into the
- 426 RelationLinkType class. The abstraction maps cleanly to (e.g.) project management schedules and
- 427 business process descriptions, excepting dependency-defined gaps.

### 428 **4.7 Availability**

- 429 Availability is a means for describing when an actor can be available, or its complement, not available.
- 430 This version of the WS-Calendar PIM includes the necessary classes to express Availability as in
- 431 **[Vavailability]** which is an Internet Draft as of this date.

#### 432 4.7.1 Model Diagram

434 Figure 4-9 Vavailability and Availability Recurrence Rules

### 435 **4.7.2 Discussion**

433

- 436 The *rrule* is an xCal recurrence rule as defined in section 8.6.5.3 of **[rfc6321]**. The recurrence might be
- (e.g.) Yearly. In its current form, the expression is in iCalendar syntax, and will need future adaptation tomatch the abstraction level of this PIM.

#### 439 **4.7.3 Relationship to other PIM Components**

440 Consumes recurrence relationships from **[Vavailability]**. Used in consumers of WS-Calendar to express

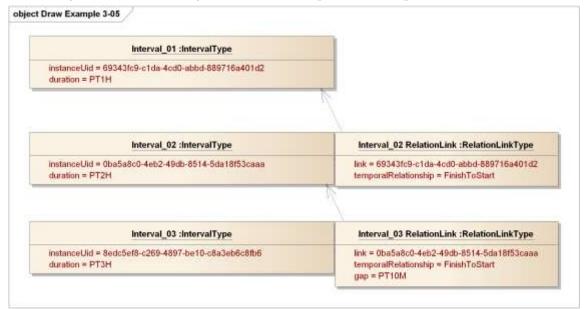

441 availability for (e.g.) Demand Response events in **[EnergyInteroperation]**. Not used by other parts of the 442 PIM.

# 443 5 Examples using the PIM (Non-Normative)

- 444 We include several examples drawn from a variety of sources. These examples were created to illustrate 445 facility scheduling, energy scheduling, and related topics.
- 446 A separate Committee Technical Note [PIM Examples] is in progress with examples including ones
- 447 drawn from those in **[WS-Calendar]** and other specifications.

#### 448 **5.1 Related Intervals**

This example is based on Example 3-05, line 483 in **[WS-Calendar]**.

450

451 Figure 5-1 PIM Expression of WS-Calendar Examples 3-05

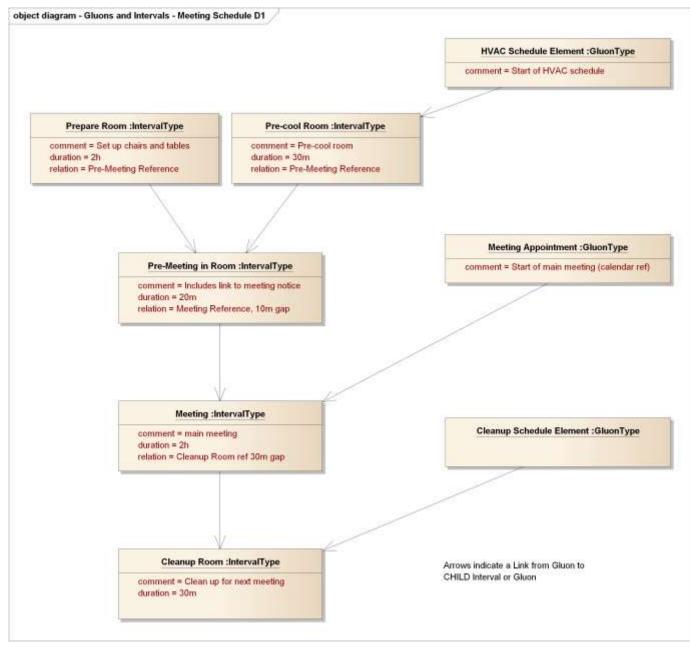

The dashed lines are not UML, but are a graphical annotation of the links, with the head of the arrow indicating the referenced (linked) Interval and the tail indicating the referencing (linking)

454 In this diagram, a gluon could refer to the Sequence with a reference to Interval\_03.

# 455 **5.2 A Meeting Schedule**

- 456 Consider a meeting scheduled for a specific time say 2pm and lasting two hours.
- The meeting itself can be represented (and scheduled with attendees) as a single interval with duration 2 hours.
- To carry out the meeting, there are other activities both before and after, and possibly during, the meeting time. See Figure 5-2 Simple Meeting Schedule below.
- 461 First, the room needs to be set up for the meeting. The Heating, Ventilating, and Air Conditioning system
- (HVAC) may need to pre-cool the room for the scheduled number of attendees. And the room needs tobe cleaned up before setup for the next meeting.
- 464 Each of these activities can be scheduled separately, and done by different actors. But they need to be 465 completed to set up and restore the room.
- Also consider a pre-meeting of the leaders in the room, starting 30 minutes before the main meeting, and lasting 20 minutes so the leaders can meet and greet attendees.
- 468 The gluons on the right are references into the sequence of intervals; the respective sequences are 469 CHILDren of the respective Gluons.

- 470 (1) The start of the HVAC pre-cooling is given to the HVAC control system
- 471 (2) The start of the main meeting gluon is given to the meeting attendees
- Additional gluons could be given to (e.g.) the room set-up team, pointing to the Prepare Room interval,and to the Pre-Meeting interval for the meeting leaders.
- 474 Additional elaboration might include the pre-purchase of energy for the pre-cooling (or committing in an
- 475 energy schedule, which the HVAC control system uses to balance energy use through the day to avoid476 demand charges.
- Finally, the actions are all based on where you reference the schedule—working back from the start time (inherited from the start of main meeting gluon) the pre-meeting is 30 minutes earlier, and the setup is 2
- 479 hours and 30 minutes earlier.
- The HVAC schedule gluon might be all that the control system needs, combined with the knowledge from
   the schedule that the meeting is over in 2 hours 30 minutes after the 30-minute pre-cool period, and that
   cleanup takes another 30 minutes.
- We have not tried to show all possible schedules and variations perhaps the setup takes longer but is finished earlier, using an endBefore tolerance (and a zero endAfter tolerance).
- 485 Note that this schedule may be used for any meeting the start time can be placed in a gluon that
- 486 references the Meeting interval. Likewise, the length could also be inherited from that same gluon. The
- 487 structure of the schedule would be determined by facility policy (e.g. "you must allow two hours for
  488 setup"), and the schedule itself is relocatable and reusable.
- 489 The figure is informal, and does not reflect all the details of relationships (the arrows indicate the
- 490 relationships which are not otherwise shown with relations and IDs).

# 493 6 Architectural Basis for the PIM (Non-Normative)

The PIM is defined as a more abstract model for describing and communicating schedules as defined in [WS-Calendar], [EMIX], [EnergyInteroperation], [OBIX], and [SPC201], among many others. This expression uses typical ways of expressing schedule, linked lists, directed graphs, and is consistent with algorithms for graph, list, and schedule management, e.g. those in [Aho] and [Knuth].

- 498 In summary, there are several anticipated architectural benefits of the PIM:
- 1. Expression of schedules in a common manner showing temporal structures and taking advantage
  - of differing views of a single schedule

500

501

502

503

504

505

- 2. Relocatable subroutines that may be used dynamically at run time
- 3. Automatable transformations between the abstract and concrete schedules in the PIM and WS-Calendar respectively
  - 4. Broader use of scheduling concepts in other domains and PSMs allowing automatable transformations across other domains
- 506 Schedule and values attached to time intervals in schedule are fundamental to planning and carrying out
- 507 operations is most domains. The WS-Calendar PIM provides a common model for expressing and 508 managing such schedules.

# **7 PIM to WS-Calendar PSM Transformation**

- 510 MDA instances include a Platform-Independent Model (PIM), defined in this specification, and a
- 511 transformation to one or more Platform-Dependent Model (PSM). In this section we briefly describe the 512 mapping from this PIM to **[WS-Calendar]** (considered as a PSM).
- 513 Largely the same data types and conformed strings for instance values are used in the PIM, to ensure 514 that the transformation is straightforward.
- 515 The UML model for WS-Calendar is of a different style from this PIM. WS-Calendar expresses the
- 516 information for Intervals, Gluons, and other classes in terms of collections of Parameters, Properties,
- and Value Types, held in those collections with others that may not reflect the abstractions of WS-
- 518 Calendar.

### 519 **7.1 General Transformation**

- 520 On inspection the transformations between the PIM model and the [XMLSchema] for [WS-Calendar] are
- 521 generally clear. The classes in the PIM are similar or identical to those in [WS-Calendar] including
- 522 attribute/element names, but are arranged as simple classes rather than collections of properties within a
- 523 potentially larger set of properties.

### 524 **7.2 Specific Transformations**

- 525 In the following subsections we describe transformations from the PIM to the WS-Calendar PSM. In WS-
- 526 Calendar an Interval or Gluon is a vcalendar component, expressed as a subclass of
- 527 ICalendar::VcalendarContainedComponentType.
- 528 That class informally contains sets of Properties, Values, and Parameters, based on the widely used
- 529 iCalendar definition. The PIM does not distinguish between parameters, values, and properties and the 530 differing types.
- 531 In the subsections below we describe the transformations for
  - DateTime and Duration Types, the fundamental types for talking about time and schedule
- ToleranceType

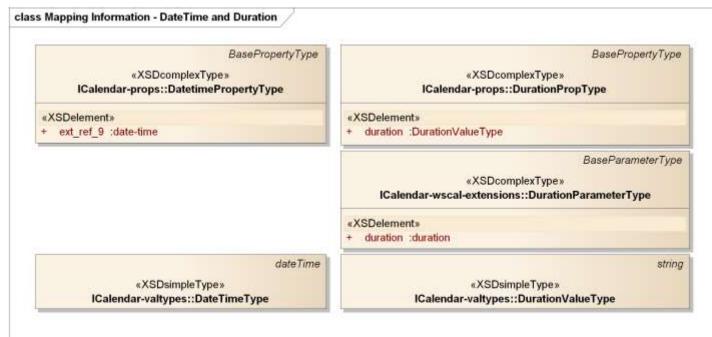

532

- Intervals and Gluons
- Relationships
- 536 Vavailability

### 537 **7.2.1 Transformation for DateTime and Duration Types**

- 538 DateTimeType and DurationType use **[ISO8601]** conformed strings. In transforming objects of these PIM 539 classes the values must be expressible in the target PSM. The following two figures show selected WS-540 Calendar classes and the PIM classes DateTimeType, DurationType, and ToleranceType.
- 541 There are different conformed strings for DurationType and DateTimeType. The PIM uses **[ISO8601]**
- 542 duration and date time semantics; these are isolated in the PIM classes DateTimeType and DurationType
- to facilitate mapping to classes in PSMs including those based on **[WS-Calendar]** and **[XMLSchema]**.

#### 544 Table 7-1 PIM to PSM DateTime and Duration Mappings

545

546 Figure 7-1 WS-Calendar Target Classes

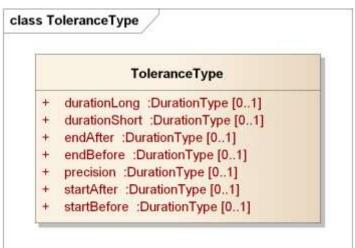

547 548

Figure 7-2 PIM Source Classes for DateTimeType and DurationType

#### 549 Table 7-2 PIM to PSM Mapping for DateTimeType and DurationType

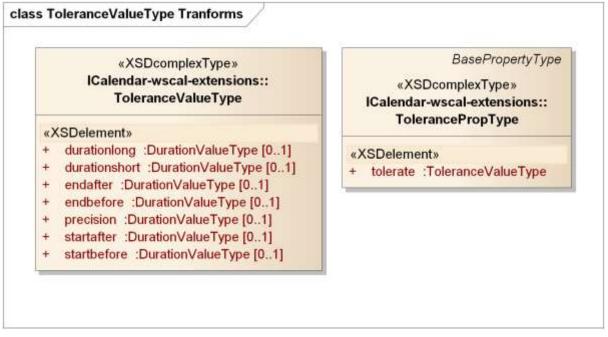

PIM Class Name	WS-Calendar Class Name	Notes
DateTimeType	ICalendar-valtypes::DateTimeType	Restrictions on ISO8601 strings when mapped to RFC5545 strings
DurationType	ICalendar-valtypes::DurationValueType	Restrictions on ISO8601 strings when mapped to RFC5545 strings

#### 550 7.2.2 Transformation for Tolerance Type

551

552 Figure 7-3 PIM Source Class for ToleranceType

553

554 Figure 7-4 WS-Calendar Target Classes for Tolerance Type

555 The PIM ToleranceType is identical in attribute names and types to the WS-Calendar class with the same

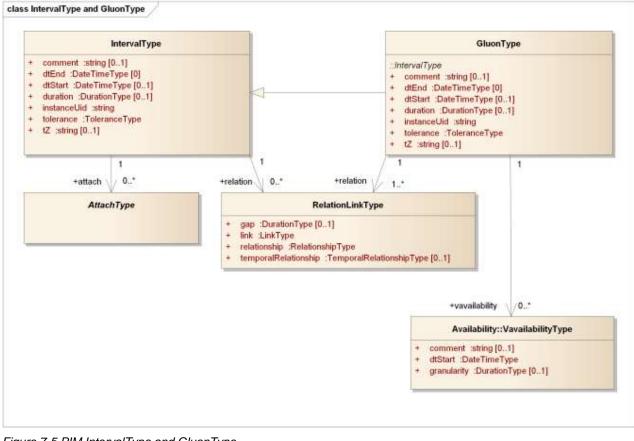

- 556 function, as shown in Figure 7-3 and Figure 7-4 above. The only differences are that PIM uses
- 557 *DurationType*, the WS-Calendar mapping is to WS-Calendar *ToleranceValueType*, and the PIM attribute 558 names are lowerCamelCase rather than lower case.

PIM Class Name	WS-Calendar Class Name	Notes
ToleranceType	ICalendar-wscal-extensions:: ToleranceValueType	Attributes map respectively to attributes of the same name; Types map per Section 7.2.1.

### 559 **7.2.3 Transformation for Interval and Gluon Types**

560 We treat the Gluon and Interval together; GluonType is a subclass of IntervalType, and extends 561 IntervalType as shown in Figure 7-5:

- Changing the cardinality of the attribute *relation* to require one or more *relation*s
- Optionally including Vavailability

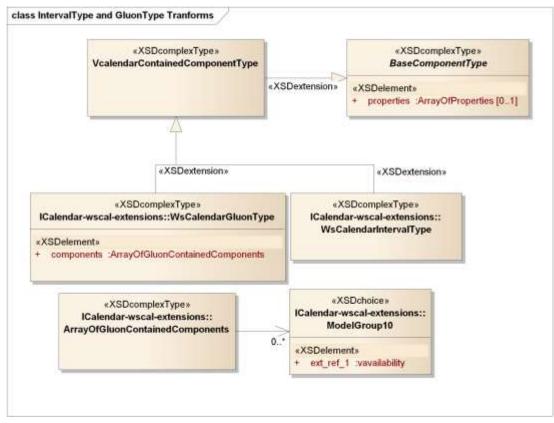

564

562

563

565 Figure 7-5 PIM IntervalType and GluonType

566

567 Figure 7-6 Target IntervalType and GluonType Transforms

A WS-Calendar Interval (and its subclass Gluon) is a Vcalendar object, with a set of properties, values,
 and parameters optionally included. Among those are the attributes of the PIM IntervalType, essentially
 the same set of attributes of GluonType, and the additional VavailabilityType in GluonType.

571 Properties with the same semantics and value types exist in WS-Calendar as well as the PIM; the name 572 and type transformations are described in the following table. RelationLinkType is addressed in the next 573 section.

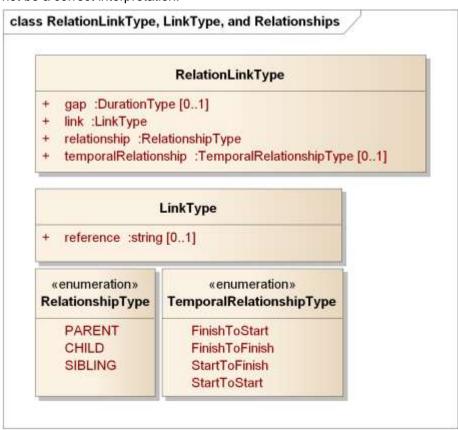

574 Table 7-3 PIM Classes IntervalType and GluonType Transforms

PIM Attribute and Type	WS-Calendar Target Type	Notes
comment: string	ICalendar-Props::CommentPropType	Target takes a text value.
dtEnd: DateTimeType	ICalendar-Props::DtendPropType	Constrained string per [RFC5545]
dtStart: DateTimeType	ICalendar-Props::DtstartPropType	Constrained string per [RFC5545]
duration: DurationType	ICalendar-wscal- extensions::DurationPropType	Constrained string per [RFC5545]
instanceUid: string	ICalendar-Props::UidPropType	
tolerance: ToleranceType	ICalendar-wscal- extensions::ToleranceValueType	Attribute of TolerancePropType is tolerate
Tz: string	ICalendar-Props::TzidPropType	Constrained string per [RFC5545]

PIM Attribute and Type	WS-Calendar Target Type	Notes
Relation: RelationLinkType	ICalendar-link-extension::LinkPropType	Target has possible UID, URI, Reference attributes

### 575 7.2.4 Transformation for Relationships

- 576 In this section we detail transformations for RelationLinkType and the types for its attributes: LinkType,
- 577 RelationshipType, and TemporalRelationshipType.
- 578 Both **[WS-Calendar]** and the current draft extending iCalendar **[Relationships]** have a single
- 579 *ReltypeParamType* which combines relationships (e.g. CHILD) and temporal relationships (e.g. 580 FinishToStart) in one.
- 581 In the PIM we maintain separate attributes of RelationLinkType for those two classes of relationship, and
- 582 separate enumerations, *RelationshipType* and *TemporalRelationshipType*, rather than multiple parameter 583 values. This mirrors current programming practices favoring explicit unitary value enumerations rather
- than logically combining a set of values. Moreover, the use of text *reltypes* adds brackets around every
- 585 string no matter how short. The implicit repetition of a parameter, each with its attendant brackets, may
- 586 not be a correct interpretation.

587

588 Figure 7-7 PIM RelationLinkType, LinkType, RelationshipType, and TemporalRelationshipType

589 The following table describes the transformation in detail for the classes and enumerations in Figure 7-7. 590 The *related-to* property in WS-Calendar may include a *reltype* parameter.

591 The "short form" in Temporal Relationships Table 3-2, line 423 in **[WS-Calendar]** is not used in the PIM;

transformation should be to the "long form" in **[WS-Calendar]**.

#### 593 Table 7-4 Attributes of PIM RelationLinkType and Transforms to WS-Calendar

594 The values for RelationshipType and TemporalRelationshipType map to the same names in WS-595 Calendar, excepting only that TemporalRelationshipType in WS-Calendar is all lower case rather than

PIM Attribute and Type	WS-Calendar Target Type	Notes	
gap: DurationType	ICalendar- Params::DurationParameterType	Duration is an <b>[ISO8601]</b> conformed string which maps to a constrained string per <b>[RFC5545]</b>	
Link: LinkType	ICalendar-props::RelatedToPropType	All of the RelatedToPropType extended choices are strings (uri, uid, and text). PIM LinkType is a string.	
Relationship: RelationshipType	iCalendar-params:: ReltypeParamType – iCalendar- props::related-to: RelatedToPropType	In the same set of RelatedToPropType as temporal relationships	
temporalRelationship: TemporalRelationshipType	iCalendar-params:: ReltypeParamType – iCalendar- props::related-to: RelatedToPropType	In the same set of RelatedToPropType as relationships	

#### 596 lowerCamelCase.

597 Table 7-5 PIM Enumeration Member Transforms to WS-Calendar

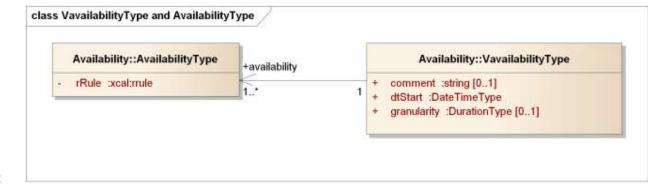

PIM Enumeration	WS-Calendar Target Type	Notes
RelationshipTypes:: PARENT, CHILD, SIBLING	ICalendar- props::RelatedToPropType	
TemporalRelationshipType:: FinishToStart, FinishToFinish, StartToFinish, StartToStart	ICalendar- props::RelatedToPropType	

#### 598 **7.2.5 Transformation for Vavailability**

599 Vavailability is described in a separate package in the PIM. A future Working Draft will disconnect

Vavailability from use of **[xCal]** types, so that the mapping is clearer and is disconnected from changes in

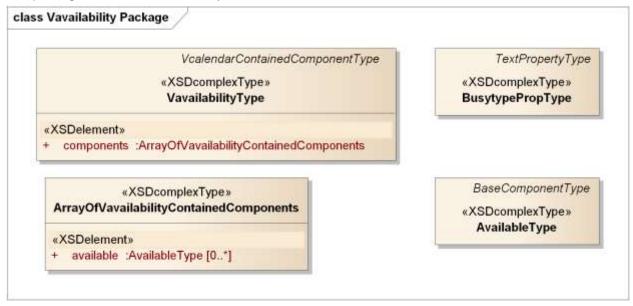

601 **[Vavailability]** as it completes the IETF process.

602

603 Figure 7-8 PIM Vavailability Package Classes

#### 604 The package in iCalendar-availability-extension.xsd is as follows:

- 606 Figure 7-9 Vavailability Package from iCalendar-availability-extension
- The VavailabilityType has zero or more AvailabilityType objects inside. The *rRules* matched a previous draft of **[Vavailability]** and is expected to work with the final standard version.

### **8 PIM to IEC TC57 CIM Intervals and Sequences**

The IEC TC57 Common Information Model [IEC CIM] uses time intervals in a variety of ways. A

- 611 transformation from a fully bound PIM interval (which uses dtStart and duration and time zone) to a CIM 612 interval (which uses dtStart and dtEnd in UTC) is straightforward:
- 613 (1) the CIM dtStart is the UTC equivalent of the (dtStart, time zone) pair in the PIM Interval
- 614 (2) the CIM dtEnd is the CIM dtStart plus the PIM Interval duration
- 615 In some cases intervals are contained in the related data; the sense of the inclusion needs to be reversed 616 with the class containing the CIM interval being referenced as an attachment by the PIM interval.
- Because of the interval information inserted in each data item, and including *dtStart* and *dtEnd*,
- 618 sequences of CIM intervals are not relocatable in the same way as PIM and **[WS-Calendar]** Intervals.
- 619 CIM intervals would each be modified with the new dtStart and dtEnd. Changing dtStart in the Designated
- 620 Interval or in a referencing Gluon relocates a PIM sequence.

# 9 Conformance and Rules for WS-Calendar PIM and Referencing Specifications

This Conformance section differs in minor detail from that in **[WS-Calendar]**. The conformance behavior is in general identical to that of WS-Calendar; see Appendix D for details. We do not describe changes in that Appendix that involve the use of the name "WS-Calendar PIM" rather than "WS-Calendar."

626 This section specifies conformance related to the information model contained in this specification.

627 If the implementer and/or implementation claiming conformance is using WS-Calendar PIM as part of a

628 larger business or service communication, they SHALL follow not only the semantic rules herein, but

629 SHALL also conform to the rules for specifying inheritance in referencing standards.

#### 630 9.1 Relationship to WS-Calendar [Non-Normative]

- This Platform-Independent Model for WS-Calendar shares all of the conformance statements from [WS Calendar] subject to
- Renaming of attributes (e.g., UID from [WS-Calendar] is named instanceID)
- Disambiguation of rules (e.g., "Intervals SHALL have a Duration AND (either a dtStart OR a dtEnd)" in 9.2.5.1)
- Simplification (e.g., the section 9.2.5.2)
- Rewording to define conformance to WS-Calendar PIM rather than [WS-Calendar].

#### 638 9.2 Conformance Rules for WS-Calendar PIM

There are five kinds of conformance that must be addressed for WS-Calendar and specifications that
 reference WS-Calendar. This PIM references WS-Calendar and requires the same conformance rules.

- Conformance to the *inheritance rules* in WS-Calendar, including the direction of inheritance
- **Specific attributes** for each type that MUST or MUST NOT be inherited
- **Conformance rules** that Referencing Specifications MUST follow
- Description of *Covarying attributes* with respect to the Reference Specification
- Semantic Conformance for the information within the artifacts exchanged
- 646 We address each of these in the following sections

#### 647 9.2.1 Inheritance in WS-Calendar

- 648 In this section we define rules that define inheritance including direction.
- 649 I1: Proximity Rule Within a given lineage, inheritance is evaluated though each Parent to the Child650 before what the Child bequeaths is evaluated.
- 651 **I2: Direction Rule** Intervals MAY inherit attributes from the nearest gluon subject to the Proximity Rule 652 and Override Rule, provided those attributes are defined as Inheritable.
- 653 **I3: Override Rule** If and only if there is no value for a given attribute of a Gluon or Interval, that Gluon or
   654 Interval SHALL inherit the value for that attribute from its nearest Ancestor in conformance to the
   655 Proximity Rule.
- 656 **I4: Comparison Rule** Two Sequences are equivalent if a comparison of the respective Intervals 657 succeeds as if each Sequence were fully Bound and redundant Gluons are removed.
- 658 **I5: Designated Interval Inheritance** [To facilitate composition of Sequences] the Designated Interval in
   659 the ultimate Ancestor of a Gluon is the Designated Interval of the composed Sequence. Special
   660 conformance rules for Designated Intervals apply only to the Interval linked from the Designator Gluon.

16: Start Time Inheritance When a start time is specified through inheritance, that start time is inherited
 only by the Designated Interval; the start time of all other Intervals are computed through the durations
 and temporal; relationships within the Sequence. The Designated Interval is the Interval whose parent is
 at the end of the lineage.

#### 665 9.2.2 Specific Attribute Inheritance

- 666 In WS-Calendar and this PIM the following attributes MUST be inherited in conformance to the Rules 667 (same for Gluons and Intervals):
- 668 dtStart
- 669 dtEnd
- Duration
- Designated Interval (Gluon, special upward inheritance rule)
- Tolerance
- 673 In WS-Calendar and this PIM the following attributes MUST NOT be inherited
- instanceUid (Gluons and Intervals)
- Temporal Relationships (between Intervals)
- Relationship Links

#### 677 9.2.3 General Conformance Issues

This specification is general purpose. Standards that claim conformance to this specification may need to restrict the variability inherent in the expressions of Date and Time to improve interoperation within their own interactions. Aspects of Date and Time that may reward attention and conformance statements include:

- Precision Does the conforming specification express time in Hours or in milliseconds. Consider
   a standard format recommendation.
- Time Zones and UTC Business interactions have a "natural" choice of local, time zone, or UTC based expression of time. Intents may be local, as they tie to the business processes that drive them. Tenders may be Time zone based, as they are driven by the local business process, but may require future action across changes in time and in time zone. Transaction recording may demand UTC, for complete unambiguity. The specification cannot require one or another, but particular business processes may require appropriate conformance statements.
- Business Purpose Because WS-Calendar is general purpose, it does not distinguish between different exchanges that may have different purposes. For example, a general indication of capability and/or timeliness may be appropriate for a market tender, and an unanchored Sequence may be appropriate. In the same specification, performance execution could require merely the Gluon to Anchor the Interval. If the distinction between Unanchored and Anchored Interval is critical for a set of interactions, the referencing specification SHALL indicate the proper form for a given exchange.

#### 697 9.2.4 Covarying Elements

Some elements of WS-Calendar and PIM objects may be **covarying**, meaning that they change together.
Such elements are treated as a single element for inheritance, they are either inherited together or the
child keeps its current values intact. This becomes important if one or more of a covarying set have
default values. In that case, if any are present, then inheritance should deem they are all present, albeit
some perhaps in their default values.

#### 703 9.2.5 Conformance of Intervals

#### 704 9.2.5.1 Intervals

- 705 WS-Calendar PIM Intervals SHALL have a Duration.
- 706 Intervals MAY have a Start Time.
- 707 Intervals SHALL have a Duration AND optionally dtStart. If a non-compliant Interval is received in a
- service operation with dtEnd, then the dtEnd SHALL be ignored.
- 709 Within a Sequence, a maximum of a single Interval MAY have a dtStart or a dtEnd.

#### 710 9.2.5.2 Other Elements

725

726

711 A Gluon may have a dtStart value.

#### 712 9.2.6 Conformance of Bound Intervals and Sequences

- Actionable services require Bound Intervals as part of a Bound Sequence. Services may include Intervals
   that are not bound for informational or negotiation purposes. Some of these are modeled and described
   as constraints in the UML models that have been produced separately.
- Intervals SHALL have values assigned for dtStart and duration, either explicitly or through inheritance
- Intervals SHALL have no value assigned for dtEnd
- Within a Sequence at most the Designated Interval may have dtStart and duration with a value specified or inherited.
- If Sequences are composed to create other Sequences, then the Designated Intervals within the composing Sequence are ignored.
- Any specification claiming conformance to the WS-Calendar PIM MUST satisfy all of the following conditions:
  - Follow the same style of inheritance (per the Rules)
  - Specify attribute inheritability in the specification claiming conformance
- Specify whether certain sets of elements must be inherited as a group or specify that all elements can be inherited or not on an individual basis

## 9.3 Conformance Rules for Specifications Claiming Conformance to WS-Calendar PIM

Specifications that claim conformance to the WS-Calendar PIM SHALL specify inheritance rules for use
 within their specification. These rules SHALL NOT modify the Proximity, Direction, or Override Rules. If
 the specification includes covariant elements, those elements SHALL be clearly designated in the
 specification.

Specifications that normatively reference and claim conformance with the WS-Calendar PIM SHALL
 define the business meaning of zero duration Intervals.

#### 737 9.4 Security Considerations

The WS-Calendar PIM describes an informational model. Specifications claiming conformance with the
 WS-Calendar PIM are likely to use the schedule and interval information as but a small part of their
 overall communications.

- 741 Specifications involving communication and messages that claim conformance to this specification should
- select the communication and select from well-known methods to secure that communication appropriate
- to the information exchanged, while paying heed to the costs of both communication failure and of
- inappropriate disclosure. To the extent that iCalendar schedule servers are used, the capabilities of

- security of those systems should be considered as well. Those concerns are out of scope for this
- 746 specification.

### 747 Appendix A. Acknowledgments

748 The following individuals have participated in the creation of this specification and are gratefully

749 acknowledged:

### 752 Appendix B. Revision History

Revision	Date	Editor	Changes Made
01	November 15 2012	William Cox	Initial Draft based on contributed models
02	December 20 2012	William Cox	First draft conformance section. Added explanatory text in individual model sections. GluonType is now a subclass of IntervalType, rather than GluonType having an association to IntervalType.
03	January 31, 2012	William Cox	Completed most sections; indicated questions for the TC as "EDITOR'S NOTE"s. Model is the same as for WD02. WD03 contains a quotation with modifications from the WS- Calendar conformance sections.
04	April 10, 2013	William Cox	Update with responses to questions from WD03; minor changes to the model and many clarifications based on meeting discussions. Included differences between the normative semantics and conformance sections and WS- Calendar 1.0 as non-normative Appendices.
05	April 24, 2013	William Cox	Addressed remaining Editor's Notes from previous Working Drafts. Changed cardinality for attachment from [11] to [01] in parallel with unbound attributes expressed in UML. Prepared text for public review.
06	16 January 2014	William Cox	Simplification of relations and LinkType. Addition of instance (object) diagrams to express examples. Includes PIM to WS- Calendar-as-PSM mapping.
07	17 January 2014	William Cox	Addresses comments from TC review of WD06. Eliminated unused DurationParameterEnum, corrected gap to DurationStringType (with no tolerance values), eliminated iana-token and x-name relationship types. Identified but did not correct the application of tolerance to dtStart, dtEnd, and duration. Clarified intended sources of examples. Eliminated unused classes and objects in the model.
08	13 March 2014	William Cox	Simplifies the DurationType, moves tolerance to IntervalType instead of the former DurationValueType. Completed PIM-PSM mapping, updated references, other editorial and technical clarity change. Updated diagrams to express updated model.

Revision	Date	Editor	Changes Made
09	21 April 2014	William Cox	First inclusion of mapping descriptions. Clarified DateTimeType and DurationType relationship to ISO 8601. Many minor edits; minor model changes.
10	08 May 2014	William Cox	Edits throughout based on meeting discussion. lowerCamelCase for ToleranceType, textual changes, and updated diagrams.

# Appendix C. PIM and WS-Calendar Semantics Differences

The following is a non-normative list of changes required to convert the **[WS-Calendar]** Section 1.9
 Semantics section to the Semantics section of the PIM.

We have excluded changes to table numbering, page footers, and purely typographic changes such asdeletion of extra spaces.

Line numbers are with respect to **[WS-Calendar]** in PDF form.

Line Number	Change to [WS-Calendar] to PIM
200-201	Added references to WS-Calendar and PIM tables
202 Table 1-3, Gluon Entry	Changed "gluon is influences" to "gluon influences" (typographic)
202 Table 1-3, Artifact Entry	Changed first sentence to "An Artifact is the information attached to, and presumably that occurs or is relevant to the time span described by an Interval."
208, Table 1-4, Busy Entry	Changed "Busy often overlays is overlaid by Availability" to "Busy often overlays Availability."

# Appendix D. PIM and WS-Calendar Conformance Differences

The following is a non-normative list of changes required to convert the **[WS-Calendar]** Section 4 Conformance and Rules for WS-Calendar and Referencing Specification to Section 5 of the PIM.

We have excluded changes to table numbering, page footers, and purely typographic changes such as
deletion of extra spaces. Text was reworded to refer to the PIM rather than WS-Calendar as needed;
such changes are not captured here.

T70 Line numbers are with respect to **[WS-Calendar]** in PDF form.

Line Number	Change to [WS-Calendar] to PIM
1450-1453 Introduction	Modified Introduction to apply to the WS-Calendar PIM.
1490	Changed "UID (Gluons and Intervals)" to "instanceUid (Gluons and Intervals)"
1491	Added "Relationship Links" to list.
1522-1523	Changed "Duration AND a dtStart OR a dtEnd" to "Duration AND optionally dtStart." Changed "received with both a dtStart and a dtEnd then the dtEnd SHALL be ignored" to" "received in a service operation with dtEnd then the dtEnd SHALL be ignored."
1525-1529	Replaced with "A Gluon may have a dtStart value>" Other conditions are excluded by the UML in PIM.
1550	Change "override" to "modify" [the Proximity, Direction, or Override Rules.]

771

NOTE: This table was current as of PIM WD05; needs to be updated.
