Technical Committee:
OASIS Web Services Calendar (WS-Calendar) TC

Chair:
Toby Considine (toby.considine@unc.edu), University of North Carolina at Chapel Hill

Editor:
Michael Douglass (douglm@rpi.edu), Rensselaer Polytechnic Institute

Related work:
This specification is related to:
• RFC 6321 – xCal: iCalendar in XML. http://www.ietf.org/rfc/rfc6321.txt
• WS-Calendar Version 1.0. Latest version.
  http://docs.oasis-open.org/ws-calendar/ws-calendar/v1.0/ws-calendar-1.0-spec.html

Abstract:
This document describes standard messages and interactions for service interactions with a
system that hosts calendar-based information using SOAP. Hosted information can be either
traditional personal and enterprise calendar information or services that support XML payloads
developed in conformance with the WS-Calendar specification.

Status:
This document was last revised or approved by the OASIS Web Services Calendar (WS-
Calendar) TC on the above date. The level of approval is also listed above. Check the “Latest
version” location noted above for possible later revisions of this document.
Technical Committee members should send comments on this Work Product to the Technical Committee’s email list. Others should send comments to the Technical Committee by using the "Send A Comment" button on the Technical Committee’s web page at http://www.oasis-open.org/committees/ws-calendar/.

For information on whether any patents have been disclosed that may be essential to implementing this Work Product, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (http://www.oasis-open.org/committees/ws-calendar/ipr.php).

1 Introduction

The CalWS SOAP protocol is built upon and makes the same assumptions about structure as the CalDAV protocol defined in [RFC 4791] and related specifications. It does NOT require nor assume the WebDAV nor CalDAV protocol.

Calendar resources, for example events and tasks are stored as named resources (files) inside special collections (folders) known as "Calendar Collections".

This specification can be looked upon as a layer built on top of CalDAV and defines the basic operations which allow creation, retrieval, update and deletion. In addition, query and freebusy operations are defined to allow efficient, partial retrieval of calendar data.

This does not mean that a CalWS service must be built on CalDAV, merely that a degree of conformity is established such that services built in that manner do not have a significant mismatch. It is assumed that some CalWS services will be built without any CalDAV support.

1.1 Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].

1.2 Normative References

1.3 Non-Normative References

http://www.w3.org/2002/ws/addr/

[WT-I-Basic] Basic Profile Version 1.1, 10 April 2006
http://www.ws-i.org/Profiles/BasicProfile-1.1-2006-04-10.html

http://www.ws-i.org/Profiles/SimpleSoapBindingProfile-1.0-2004-08-24.html

1.4 Namespace

XML namespaces and prefixes used in this standard:

<table>
<thead>
<tr>
<th>Prefix</th>
<th>Namespace</th>
</tr>
</thead>
<tbody>
<tr>
<td>xcal</td>
<td>urn:ietf:params:xml:ns:icalendar-2.0</td>
</tr>
<tr>
<td>CalWS</td>
<td><a href="http://docs.oasis-open.org/ws-calendar/ns/soap">http://docs.oasis-open.org/ws-calendar/ns/soap</a></td>
</tr>
</tbody>
</table>
2 Issues not addressed by this specification.

A number of issues are not addressed by this version of the specification, either because they should be addressed elsewhere or will be addressed at some later date.

2.1 Access Control

It is assumed that the targeted server will set an appropriate level of access based on authentication. This specification will not attempt to address the issues of sharing or ACLs.

2.2 Provisioning

The protocol will not provide any explicit provisioning operations. If it is possible to authenticate or address a principal's calendar resources then they MUST be automatically created if necessary or appropriate.

2.3 Copy/Move

These operations are not yet defined for this version of the CalWS protocol. Both operations raise a number of issues. In particular implementing a move operation through a series of retrievals, insertions and deletions may cause undesirable side-effects. Both these operations will be defined in a later version of this specification.

2.4 Creating Collections

We will not address the issue of creating collections within the address space. The initial set is created by provisioning.

2.5 Retrieving collections

This operation is currently undefined.

2.6 Setting service and resource properties.

These operations are not defined in this version of the specification. In the future it will be possible to define or set the properties for the service or resources within the service.
3 CalWS Glossary

3.1 Calendar Object Resource
A calendar object resource is an event, meeting or a task. Attachments are resources but NOT calendar
object resources. An event or task with overrides is a single calendar resource entity.

3.2Uid
The UID of an event is defined in [RFC 5545] as a "persistent, globally unique identifier for the calendar
component". It is in fact, slightly more complicated in that all overrides to a recurring event have the same
UID as the master event. Copies of a meeting invitation sent to attendees must also have the same UID.
In this protocol the UID is the key by which we locate calendar object resources (see above) and any as-
sociated overrides within a calendar collection (see below).

3.3Collections
A collection is a set of resources which may be entities or other collections. In file systems a collection is
commonly referred to as a folder. Collections are referred to by a collection id which is specific to a ser-
vie and may take any form. For many systems they will be path-like.

3.4Calendar Collection
A collection only allowed to contain calendar object resources. The UIDs for components within a calen-
dar collection must be unique. The combination of a calendar collection id and the UID MUST be a unique
key within a set of resources made available through this service.

3.5Scheduling Calendar Collection
A folder only allowed to contain calendar resources which is also used for scheduling operations.
Scheduling events placed in such a collection will trigger implicit scheduling activity on the server.

3.6Principal Home
The collection under which all the resources for a given principal are stored. For example, for principal
"fred" the principal home might be "/user/fred/"

3.7Change token
This is an opaque token returned to identify the current change status of an entity. Whenever an entity is
changed the token will take on a new value. An unchanged token value DOES NOT imply byte-for-byte
equality with the stored entity. The service may choose to modify properties under its control, for example
last-modification times. However, an entity with an unchanged token can be safely updated by a client
holding that token.
Overview of the CalWS protocol

CalWS operations and data elements are defined in this specification. Many of the operations result in the transmission of data as defined in [RFC 5545]. SOAP 1.1 messages consist of three elements: an envelope, header data, and a message body. CalWS request-response elements MUST be enclosed within the SOAP message body. CalWS SOAP messages MUST conform to [WT-I-Basic] and [WS-I-Bind]. A single CalWS SOAP message MUST contain only one service request or a single service response.

The basic process for using SOAP for CalWS operations is:

A system entity acting as a CalWS requester transmits a CalWS request element within the body of a SOAP message to a system entity acting as a CalWS responder. The CalWS requester MUST NOT include more than one CalWS request per SOAP message or include any additional XML elements in the SOAP body (though see Section 14 for multiple messages packaged in one request).

The CalWS responder MUST return either a CalWS response element within the body of another SOAP message or generate a SOAP fault. The CalWS responder MUST NOT include more than one CalWS response per SOAP message or include any additional XML elements in the SOAP body. If a CalWS responder cannot, for some reason, process a CalWS request, it MUST generate a SOAP fault. (SOAP 1.1 faults and fault codes are discussed in [SOAP11] section 5.1.)

4.1 Discovery

CalWS implementers (service providers) MUST provide a WSDL WSDL11 to describe their implementations. This WSDL MAY or may not be made public via a standard discovery mechanism (such as UDDI) or other method.

In addition, it is REQUIRED that the CalWS implementation include the Properties operation to provide dynamic information regarding CalWS capabilities, options, etc. that are supported.

4.2 Properties

A service or resource will have a number of properties which describe the current state of that service or resource. These properties are accessed through the execution of a properties operation specifying the target resource. See Retrieving Collection and Service Properties below.

4.3 Operations

The following operations are defined by this specification:

- Retrieval and update of service and resource properties
- Creation of a calendar object
- Retrieval of a single calendar object
- Multiget of one or more calendar objects
- Update of a calendar object
- Deletion of a calendar object
- Query
- Free-busy query
- Multiple operations

4.4 Calendar Object Resources

The same restrictions apply to Calendar Object Resources as specified in CalDAV [RFC 4791] section 4.2. An additional constraint for CalWS is that no timezone specifications are transferred with the data.

4.5 Timezone information

It is assumed that the client and server each have access to a full set of up to date timezone information. Timezones will be referenced by a timezone identifier from the full set of Olson data together with a set of well-known aliases. CalWS services may advertise a timezone service (which may be the same service
acting as a timezone server) through the server properties object. The timezone service operations are defined in [draft-timezones]. The service can provide a list of timezone identifiers and aliases.

4.6 Error conditions

Each operation on the calendar system has a number of pre-conditions and post-conditions that apply. If any of these are violated the response message will have a status code indicating an error occurred and will contain an error response element providing details.

A "precondition" for a method describes the state of the server that must be true for that method to be performed. A "postcondition" of a method describes the state of the server that must be true after that method has been completed. Any violation of these conditions will result in an error response in the message.

Each method specification defines the preconditions that must be satisfied before the method can succeed. A number of postconditions are generally specified which define the state that must exist after the execution of the operation. Preconditions and postconditions are defined as error elements in the CalWS-SOAP XML namespace, "http://docs.oasis-open.org/ws-calendar/ns/soap".

4.6.1 Example: error with error condition

```xml
<?xml version="1.0" encoding="utf-8" 
xmlns:CW="http://docs.oasis-open.org/ws-calendar/ns/soap" ?>
<CW:error>
  <CW:uidConflict>
    <CW:href>/user/mike/calendar/abcd-0123456789.ics</CW:href>
  </CW:uidConflict>
  <CW:description>Unknown property</CW:description>
</CW:error>
```
5 CalWs-SOAP Messages.

This section describes the common elements and structure of CalWs-SOAP messages. The conventions followed are shown in Table 1.

<table>

</tbody>
</table>

Table 1: Field column descriptions

5.1 Common Elements and types

The following tables define the base types for requests and responses. All CalWs-SOAP messages and responses are based on these types.

All requests must include an href which specifies the target for the request. There is also an id attribute which will be copied into the response to help identify it.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>href</td>
<td>string</td>
<td>1</td>
<td>Y</td>
<td>Required in each request to identify the target of the message.</td>
</tr>
<tr>
<td>#id</td>
<td>int</td>
<td>1</td>
<td>N</td>
<td>Useful for tying responses to requests.</td>
</tr>
</tbody>
</table>

Table 2: BaseRequestType elements

A response may include an error response element of type ErrorResponseType. This element will be returned in response messages when some form of processing error occurs and provides further information on the error beyond the basic status code.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>?</td>
<td>ErrorCodeType</td>
<td>1</td>

Table 5: BaseResponseType elements
6 Properties

The getPropertiesResponse message contains 0 or more properties defined below. Some properties apply to the service as a whole while others apply only to the targeted resource. The targeted resource may have property values which override those for the service. For example, the timezone identifier for a particular collection may differ from the default timezone identifier for the system.

Each property is an XML complex type based on the GetPropertiesBasePropertyType.

6.1 childCollection

Provides information about a child collections for the target.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

Table 22:SupportedFeaturesType fields

### 6.16 supportedFeatures

This property SHOULD be returned for the service and MAY be returned for any targeted collection resource. The property shows what protocol features are supported by the server.

### 6.17 timezoneServer

This property SHOULD be returned for the service and MAY be returned for any targeted collection resource.

### 6.18 CalWS:privilege-set XML element

Appears within a link relation describing collections or entities and specifies the set of privileges allowed to the current authenticated principal for that collection or entity.

```
<!ELEMENT calws:privilege-set (calws:privilege*)>
<!ELEMENT calws:privilege ANY>
```

Each privilege element defines a privilege or access right. The following set is currently defined

- CalWS: Read - current principal has read access
- CalWS: Write - current principal has write access

```
<calWS:privilege-set>
  <calWS:privilege><calWS:read/></calWS:privilege>
  <calWS:privilege><calWS:write/></calWS:privilege>
</calWS:privilege-set>
```
Retrieving Collection and Service Properties

The CalWs-SOAP `getProperties` request is used to fetch properties. The `href` can target the service with a path of "/" or any entity within the service.

The service properties define the global limits and defaults. Any properties defined on collections within the service hierarchy override those service defaults. The service may choose to prevent such overriding of defaults and limits when appropriate. The tables below show the fields for request and response.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>href</td>
<td>string</td>
<td>1</td>
<td>Y</td>
<td>Identify the target of the request. &quot;/&quot; for the service.</td>
</tr>
</tbody>
</table>

Table 24: `GetPropertiesType` fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>href</td>
<td>string</td>
<td>1</td>
<td>Y</td>
<td>Identify the target of the request. &quot;/&quot; for the service.</td>
</tr>
<tr>
<td>?</td>
<td>GetPropertiesBasePropertyType</td>
<td>0..n</td>
<td>C</td>
<td>0 or more properties of the targeted resource</td>
</tr>
</tbody>
</table>

Table 25: `GetPropertiesResponseType` fields

Example - retrieving server properties:

```xml
<?xml version="1.0" encoding="UTF-8"?>
    xmlns:ns2="http://docs.oasis-open.org/ws-calendar/ns/soap"
    xmlns:ns3="urn:ietf:params:xml:ns:icalendar-2.0" >
    <ns2:href>/</ns2:href>
</SOAP-ENV:Envelope>
```

```xml
<?xml version="1.0" encoding="UTF-8"?>
    xmlns:ns2="http://docs.oasis-open.org/ws-calendar/ns/soap"
    xmlns:ns4="urn:ietf:params:xml:ns:icalendar-2.0" id="0" >
    <ns2:href>/</ns2:href>
    <ns2:lastModifiedDateTime>
        <ns2:dateTime>2012-01-04T18:21:14Z</ns2:dateTime>
    </ns2:lastModifiedDateTime>
    <ns2:supportedCalendarComponentSet>
        <ns4:vevent />
        <ns4:vtodo />
        <ns4:vavailability />
    </ns2:supportedCalendarComponentSet>
    <ns2:resourceType>
        <ns2:collection />
    </ns2:resourceType>
    <ns2:resourceType>
        <ns2:calendarAccessFeature />
    </ns2:resourceType>
    <ns2:resourceType>
        <ns2:calendarAccessFeature />
    </ns2:resourceType>
    <ns2:maxInstances>
        <ns2:integer>1000</ns2:integer>
    </ns2:maxInstances>
</SOAP-ENV:ENV:Body>
```
<ns2:maxInstances>
  <ns2:maxResourceSize>
    <ns2:integer>100000</ns2:integer>
  </ns2:maxResourceSize>
</ns2:getPropertiesResponse>
</SOAP-ENV:Body>
</SOAP-ENV:Envelope>
8 Creating Calendar Object Resources

Creating calendar object resources is carried out by using a CalWs-SOAP addItem request targeted at the parent collection and containing the resource to be created. The response will contain the href of the newly created object.

The icalendar entity in the request MUST contain only a single calendaring entity with any related overrides.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>href</td>
<td>string</td>
<td>1</td>
<td>Y</td>
<td>Identify the target of the request.</td>
</tr>
<tr>
<td>icalendar</td>
<td>xcal:IcalendarType</td>
<td>1</td>
<td>Y</td>
<td>The entity to be created</td>
</tr>
</tbody>
</table>

Table 26: AddItemType fields

The service will respond with an AddItemResponseType giving either the href and change token of the new entity or an error response.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>href</td>
<td>string</td>
<td>0..1</td>
<td>N</td>
<td>Href of the new entity for a successful request.</td>
</tr>
<tr>
<td>changeToken</td>
<td>string</td>
<td>0..1</td>
<td>N</td>
<td>Change token for the new entity</td>
</tr>
</tbody>
</table>

Table 27: AddItemResponseType additional fields

8.1 Preconditions for Calendar Object Creation

- CalWS:target-exists: The entity already exists.
- CalWS:not-calendar-data: The resource submitted MUST be a supported media type (i.e., iCalendar) for calendar object resources;
- CalWS:invalid-calendar-data: The resource submitted MUST be valid data for the media type being specified (i.e., MUST contain valid iCalendar data);
- CalWS:invalid-calendar-object-resource: The resource submitted in the request MUST obey all restrictions specified in Calendar Object Resources (e.g., calendar object resources MUST NOT contain more than one type of calendar component, calendar object resources MUST NOT specify the iCalendar METHOD property, etc.);
- CalWS:unsupported-calendar-component: The resource submitted in the request MUST contain a type of calendar component that is supported in the targeted calendar collection;
- CalWS:uid-conflict: The resource submitted in the request MUST NOT specify an iCalendar UID property value already in use in the targeted calendar collection or overwrite an existing calendar object resource with one that has a different UID property value. Servers SHOULD report the URL of the resource that is already making use of the same UID property value in the CalWS:href element
  <!ELEMENT uid-conflict (CalWS:href)>|
- CalWS:exceeds-max-resource-size: The resource submitted in the request MUST have an octet size less than or equal to the value of the CalDAV:max-resource-size property value on the calendar collection where the resource will be stored;
- CalWS:before-min-date-time: The resource submitted in the request MUST have all of its iCalendar DATE or DATE-TIME property values (for each recurring instance) greater than or equal to the value of the CalDAV:min-date-time property value on the calendar collection where the resource will be stored;
- CalWS:after-max-date-time: The resource submitted in the request MUST have all of its iCalendar DATE or DATE-TIME property values (for each recurring instance) less than the value of the CalDAV:max-date-time property value on the calendar collection where the resource will be stored;
- CalWS:too-many-instances: The resource submitted in the request MUST generate a number of recurring instances less than or equal to the value of the CalDAV:max-instances property value on the calendar collection where the resource will be stored;
• **CalWS:too-many-attendees-per-instance:** The resource submitted in the request MUST have a number of ATTENDEE properties on any one instance less than or equal to the value of the Cal-DAV:max-attendees-per-instance property value on the calendar collection where the resource will be stored;

### 8.2 Example - successful addItem:

```xml
Request

<?xml version="1.0" encoding="UTF-8"?>
  <SOAP-ENV:Header/>
  <SOAP-ENV:Body>
    <ns2:addItem xmlns:ns2="http://docs.oasis-open.org/ws-calendar/ns/soap"
                 xmlns:ns3="urn:ietf:params:xml:ns:icalendar-2.0">
      <ns2:href>/user/douglm/calendar</ns2:href>
      <ns3:icalendar>
        <ns3:components>
          <ns3:vevent>
            <ns3:properties>
              <ns3:uid>
                <ns3:text>1302064354993</ns3:text>
              </ns3:uid>
              <ns3:summary>
                <ns3:text>try this</ns3:text>
              </ns3:summary>
              <ns3:dtstart>
                <ns3:date-time>20110406T150000Z</ns3:date-time>
              </ns3:dtstart>
              <ns3:dtend>
                <ns3:date-time>20110406T160000Z</ns3:date-time>
              </ns3:dtend>
            </ns3:properties>
          </ns3:vevent>
        </ns3:components>
      </ns3:icalendar>
    </ns2:addItem>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>

Response

<?xml version="1.0" encoding="UTF-8"?>
  <SOAP-ENV:Header/>
  <SOAP-ENV:Body>
    <ns2:addItemResponse xmlns:ns2="http://docs.oasis-open.org/ws-calendar/ns/soap"
                          xmlns:ns3="urn:ietf:params:xml:ns:icalendar-2.0">
      <ns2:status>OK</ns2:status>
      <ns2:href>/user/douglm/calendar/1302064354993.ics</ns2:href>
      <ns2:changeToken>20110406T155741Z-0</ns2:changeToken>
    </ns2:addItemResponse>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```
9 Retrieving resources

Fetching calendar object resources is carried out by using a CalWs-SOAP fetchItem request with an href specifying the entity to be fetched. The response will contain the calendaring entity with any related over-rides.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>href</td>
<td>string</td>
<td>1</td>
<td>Y</td>
<td>Identify the target of the request.</td>
</tr>
</tbody>
</table>

Table 28: FetchItemType fields

The service will respond with a FetchItemResponseType containing either the change token, its href and the entity or an error response.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>changeToken</td>
<td>string</td>
<td>0..1</td>
<td>N</td>
<td>The change token for the fetched entity</td>
</tr>
<tr>
<td>href</td>
<td>string</td>
<td>1</td>
<td>Y</td>
<td>Identify the entity.</td>
</tr>
<tr>
<td>icalendar</td>
<td>xcal:IcalendarType</td>
<td>0..1</td>
<td>N</td>
<td>The fetched entity</td>
</tr>
</tbody>
</table>

Table 29: FetchItemResponseType additional fields

9.1 Example - successful fetchItem:

Request

```xml
<?xml version="1.0" encoding="UTF-8"?>
<SOAP-ENV:Header/>
<SOAP-ENV:Body>
<ns2:fetchItem xmlns:ns2="http://docs.oasis-open.org/ws-calendar/ns/soap"
xmns3="urn:ietf:params:xml:ns:icalendar-2.0">
<ns2:href>/user/douglm/calendar/1302105461170.ics</ns2:href>
</ns2:fetchItem>
</SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

Response

```xml
<?xml version="1.0" encoding="UTF-8"?>
<SOAP-ENV:Header/>
<SOAP-ENV:Body>
<ns2:fetchItemResponse xmlns:ns2="http://docs.oasis-open.org/ws-calendar/ns/soap"
xmns3="urn:ietf:params:xml:ns:icalendar-2.0">
<ns2:status>OK</ns2:status>
<ns2:changeToken>20110406T155741Z-0</ns2:changeToken>
<ns2:href>/user/douglm/calendar/1302105461170.ics</ns2:href>
<ns3:icalendar>
<ns3:vcalendar>
<ns3:properties>
<ns3:prodid>
<ns3:text>/Bedework.org//Bedework V3.7//EN</ns3:text>
</ns3:prodid>
<ns3:version>
<ns3:text>2.0</ns3:text>
</ns3:version>
</ns3:properties>
<ns3:components>
<ns3:vevent>
<ns3:properties>
<ns3:created>20110406T155741Z</ns3:created>
</ns3:properties>
</ns3:vevent>
```

9.2 Example - unsuccessful fetchItem:

>>Request

<?xml version="1.0" encoding="UTF-8"?>
  <SOAP-ENV:Header/>
  <SOAP-ENV:Body>
    <ns2:fetchItem xmlns:ns2="http://docs.oasis-open.org/ws-calendar/nssoap"
                   xmlns:ns3="urn:ietf:params:xml:ns:icalendar-2.0">
      <ns2:href>/user/douglm/calendar/nosuchevent.ics</ns2:href>
    </ns2:fetchItem>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>

>>Response

<?xml version="1.0" encoding="UTF-8"?>
  <SOAP-ENV:Header/>
  <SOAP-ENV:Body>
    <ns2:fetchItemResponse xmlns:ns2="http://docs.oasis-open.org/ws-calendar/nssoap"
                            xmlns:ns3="urn:ietf:params:xml:ns:icalendar-2.0">
      <ns2:status>Error</ns2:status>
      <ns2:errorResponse>
        <ns2:targetDoesNotExist/>
      </ns2:errorResponse>
    </ns2:fetchItemResponse>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
10 Updating resources

Calendar entity updates apply changes to a data model which has the form:

- An iCalendar element contains...
- A single vCalendar element which contains...
- One or more calendaring components, event, task etc each of which contain...
- Zero or more components, alarms etc or one or more properties each of which contains...
- Zero or more parameters and one or more values.

Thus we have a nested structure which does recurse to a limited extent and looks like

```xml
<icalendar>
  <vcalendar>
    <components>
      <vevent>
        <properties>
          <uid>
            <text>1302064354993-a</text>
          </uid>
          <summary>
            <text>try this</text>
          </summary>
          <dtstart>
            <date-time>2011-07-18T15:00:00Z</date-time>
          </dtstart>
          <dtend>
            <date-time>2011-07-18T16:00:00Z</date-time>
          </dtend>
        </properties>
      </vevent>
    </components>
  </vcalendar>
</icalendar>
```

The update approach described here only allows for updating a single calendar entity, though that entity may consist of more than one component, for example an override to a repeating event.

Resources are updated with the CalWs-SOAP updateItem request. The request contains the href of the entity to be updated, the current change token for that entity and the updates. The updates take the form of nested selections of an element from the current level in the data. The outermost selection is always for a vcalendar element - we ignore the icalendar element. Nested within that outer selection is one for the components element followed by selections on the entity, event, task etc and so on.

Only 3 kinds of update may be applied at any point:

- Remove - components, properties or parameters
- Add - components, properties or parameters
- Change - property or parameter values

Removals MUST be processed ahead of additions

Preconditions as specified in Preconditions for Calendar Object Creation are applicable. The response will indicate success or failure of the update. If the change token value does not match that held by the service a mismatchedChangeToken error status will be returned. The client should re-fetch the entity to refresh its cache and then retry the update based on the new entity values and change token.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>href</td>
<td>string</td>
<td>1</td>
<td>Y</td>
<td>Identify the target of the request.</td>
</tr>
<tr>
<td>changeToken</td>
<td>string</td>
<td>1</td>
<td>Y</td>
<td>The change token held by the client for that entity</td>
</tr>
<tr>
<td>select</td>
<td>ComponentSelection-</td>
<td>1..*</td>
<td>Y</td>
<td>Must select vcalendar</td>
</tr>
</tbody>
</table>

Table 30: UpdateItemType fields
The `ComponentsSelectionType` contains three repeating child elements. The first allows for selection of nested components which can then be updated. The next allows addition of entire components and the last allows for the removal of components.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>component</td>
<td>ComponentSelectionType</td>
<td>0..1</td>
<td>N</td>
<td>Used to match against a component in the target</td>
</tr>
<tr>
<td>remove</td>
<td>ComponentReferenceType</td>
<td>0..1</td>
<td>N</td>
<td>Supplies components to remove</td>
</tr>
<tr>
<td>add</td>
<td>ComponentReferenceType</td>
<td>0..1</td>
<td>N</td>
<td>Species components to add</td>
</tr>
</tbody>
</table>

*Table 31: ComponentsSelectionType fields*

The `PropertiesSelectionType` follows the same pattern, selecting properties to update, add or remove.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>property</td>
<td>PropertySelectionType</td>
<td>0..1</td>
<td>N</td>
<td>Used to match against a property in the target</td>
</tr>
<tr>
<td>remove</td>
<td>PropertyReferenceType</td>
<td>0..1</td>
<td>N</td>
<td>Supplies properties to remove</td>
</tr>
<tr>
<td>add</td>
<td>PropertyReferenceType</td>
<td>0..1</td>
<td>N</td>
<td>Species properties to add</td>
</tr>
</tbody>
</table>

*Table 32: PropertiesSelectionType fields*

To complete that pattern there is also a `ParametersSelectionType` used to select property parameters for update or removal and to supply new parameters.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter</td>
<td>ParameterSelectionType</td>
<td>0..1</td>
<td>N</td>
<td>Used to match against a parameter in the target</td>
</tr>
<tr>
<td>remove</td>
<td>ParameterReferenceType</td>
<td>0..1</td>
<td>N</td>
<td>Supplies parameters to remove</td>
</tr>
<tr>
<td>add</td>
<td>ParameterReferenceType</td>
<td>0..1</td>
<td>N</td>
<td>Species parameters to add</td>
</tr>
</tbody>
</table>

*Table 33: ParametersSelectionType fields*

Each of these refers to a reference type. These either provide a complete entity for addition or identify the entity for removal. The three reference types are:

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any valid iCalendar component name</td>
<td>xcal:BaseComponentType</td>
<td>1</td>
<td>Y</td>
<td>Either a complete component or sufficient to identify it.</td>
</tr>
</tbody>
</table>

*Table 34: ComponentReferenceType fields*

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any valid iCalendar property name</td>
<td>xcal:BasePropertyType</td>
<td>1</td>
<td>Y</td>
<td>Either a complete property or sufficient to identify it or provide a new value, depending on usage.</td>
</tr>
</tbody>
</table>

*Table 35: PropertyReferenceType fields*
To complete the picture we have three selection types for component, property and parameter. Each of these identifies the entity to be updated, possible selections of the sub-elements and a possible change to values.

ComponentSelectionType contains three child elements. The first is any valid icalendar component element which is to be matched at the current level.

The optional properties selection allows selection and possible updates to the properties of the component. An iCalendar properties element cannot take a value so the only updates possible are addition and removal of properties. Nested properties may be selected for updates.

The optional components selection allows selection and possible updates to the nested icalendar components element of the component. An iCalendar components element cannot take a value so the only updates possible are addition and removal of components. Nested components may be selected for updates.

PropertySelectionType contains three child elements. The first is any valid icalendar property element which is to be matched at the current level.

The optional parameters selection allows selection and possible updates to the parameters of the property.

The optional change element allows a change to the value of the property. The new value is specified by supplying an iCalendar property with the desired value(s). Any parameters will be ignored.

Lastly, there is the ParameterSelectionType which contains two child elements. The first is any valid icalendar parameter element which is to be matched at the current level.

The optional change element allows a change to the value of the parameter. The new value is specified by supplying an iCalendar parameter with the desired value(s).
### Table 39: ParameterSelectionType fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any valid iCalendar parameter name</td>
<td>xcal:BaseParameter Type</td>
<td>1</td>
<td>Y</td>
<td>Used to match against an element in the target change</td>
</tr>
<tr>
<td>change</td>
<td>ParameterReference-Type</td>
<td>0..1</td>
<td>N</td>
<td>To provide a new value</td>
</tr>
</tbody>
</table>

For a successful update the service will respond with a UpdateItemResponseType containing the status and the new change token.

### Table 40: UpdateItemResponseType additional fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>changeToken</td>
<td>string</td>
<td>0..1</td>
<td>N</td>
<td>The new change token for the updated entity</td>
</tr>
</tbody>
</table>

The change token value should be used to replace the value held by the client.

## 10.1 Change tokens and concurrent updates

The change token is used to allow a service to determine whether or not it is safe to carry out an update requested by the client. The change token should be opaque to the client but will probably in fact be a structured value. Calendaring transactions have some special characteristics which make it desirable to allow certain non-conflicting updates to take place while other changes are taking place. For example, meeting requests with a large number of attendees can be frequently updated by the server as a result of attendee participation status changes. If we use an unstructured change token to represent all changes this can make it very difficult to update an event while those participation status changes are being made. If, on the other hand, the token has a section indicating that only participation status changes have been made, then other changes can take place. For a reference on implementing such a token see "Avoiding Conflicts when Updating Scheduling Object Resources" in [draft caldav-sched]. This describes the use of a schedule-tag.

## 10.2 Example - successful update:

The event to be updated is represented by the following XML.

```xml
<ns3:icalendar>
  <ns3:vcalendar>
    <ns3:components>
      <ns3:vevent>
        <ns3:properties>
          <ns3:uid>
            <ns3:text>1302064354993-a</ns3:text>
          </ns3:uid>
          <ns3:summary>
            <ns3:text>try this</ns3:text>
          </ns3:summary>
          <ns3:dtstart>
            <ns3:date-time>2011-07-18T15:00:00Z</ns3:date-time>
          </ns3:dtstart>
          <ns3:dtend>
            <ns3:date-time>2011-07-18T16:00:00Z</ns3:date-time>
          </ns3:dtend>
        </ns3:properties>
      </ns3:vevent>
    </ns3:components>
  </ns3:vcalendar>
</ns3:icalendar>
```

In the following example we make the following changes to the above event:

- Change the summary
- Change the dtstart - add a tzid and change the value to local time
- Add some categories

We first select an event by specifying the uid value and then, from that event, we select the properties, then select and change the appropriate properties.

```xml
<?xml version="1.0" encoding="UTF-8"?>
```
10.3 Other updates:

Based on the example above we present some XML fragments for different kinds of update. These include:

- Addition of properties
- Removal of properties
- Addition of parameters to properties
- Removal of parameters from properties
- Changing parameter values.

The examples all start with the selection of the vevent properties element. First we have the XML for the addition of a tzid to the start date/time. Here we select the dtstart, then the parameters element then add a tzid parameter and change the value of the date and time.

```
<ns2:properties>
  <ns2:property>
    <ns3:dtstart>
      <ns3:date-time>2011-07-18T15:00:00Z</ns3:date-time>
    </ns3:dtstart>
    <ns2:parameters>
      <ns2:add>
        <ns3:tzid>
          <ns3:text>America/New_York</ns3:text>
        </ns3:tzid>
      </ns2:add>
    </ns2:parameters>
    <ns2:change>
      <ns3:dtstart>
        <ns3:date-time>2011-07-18T11:00:00</ns3:date-time>
      </ns3:dtstart>
    </ns2:change>
  </ns2:property>
</ns2:properties>
```

In this example we add two categories to the event.

```
<ns2:properties>
  <ns2:add>
    <ns3:categories>
      <ns3:text>paper</ns3:text>
    </ns3:categories>
  </ns2:add>
  <ns2:add>
    <ns3:categories>
      <ns3:text>resources</ns3:text>
    </ns3:categories>
  </ns2:add>
</ns2:properties>
```

In this example we add a duration and remove the dtend.

```
<ns2:properties>
  <ns2:remove>
    <ns3:dtend>
      <ns3:date-time>2011-07-18T16:00:00Z</ns3:date-time>
    </ns3:dtend>
  </ns2:remove>
  <ns2:add>
    <ns3:duration>
      <ns3:duration>PT1H</ns3:duration>
    </ns3:duration>
  </ns2:add>
</ns2:properties>
```

In this example we change the dtstart timezone identifier.

```
<ns2:properties>
  <ns2:property>
    <ns3:dtstart>
      <ns3:parameters>
        <ns3:tzid>
          <ns3:text>America/New_York</ns3:text>
        </ns3:tzid>
      </ns3:parameters>
      <ns3:date-time>2011-07-18T11:00:00</ns3:date-time>
    </ns3:dtstart>
    <ns2:parameters>
      <ns2:parameter>

10.4 Creating an update message.

The update can be created in many ways but the most common approach is to build the update while modifications take place or to create one as the result of comparing old and new versions. It appears that comparing XML for differences is difficult. However, we can take advantage of the structure of calendar- ing entities to simplify the process. There are implementations available which take the diff approach to producing an update stream.

There are some special cases to consider when comparing. Some properties are multi-valued and may themselves appear more than once. There is no semantic information implied by any grouping though parameters may need to be taken into account. These properties need to be normalized before comparison and when updating them we produce a change which treats each value as a single property.

These properties are:

- categories
- exdate
- freebusy
- rdate

This normalization can take place before comparison.

Some properties are multi-valued and may only appear once. At the moment the only standard property is resource which may take a comma separated list. This should be treated as a single multi-valued property when comparing. The order is unimportant. Sorting the values may help.

Some properties may appear multiple times, for example comment. Comparison should take account of parameters. Ordering all properties appropriately allows for relatively simple comparison.
11 Deletion of resources

Deletion of calendar object resources is carried out by using a CalWs-SOAP deleteItem request with an href specifying the entity to be deleted. The deleteItem request is not valid when the href specifies a collection.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>href</td>
<td>string</td>
<td>1</td>
<td>Y</td>
<td>Identify the target of the request.</td>
</tr>
</tbody>
</table>

Table 41: DeleteItemType fields

The service will respond with a DeleteItemResponseType containing the status and a possible error response. There are no additional elements.

11.1 Example - successful deleteItem:

```
>>Request
<?xml version="1.0" encoding="UTF-8"?>
  <SOAP-ENV:Header/>
  <SOAP-ENV:Body>
    <ns2:deleteItem xmlns:ns2="http://docs.oasis-open.org/ws-calendar/ns/soap"
                    xmlns:ns3="urn:ietf:params:xml:ns:icalendar-2.0">  
      <ns2:href>/user/douglm/calendar/1302620814655.ics</ns2:href>
    </ns2:deleteItem>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

```
>>Response
<?xml version="1.0" encoding="UTF-8"?>
  <SOAP-ENV:Header/>
  <SOAP-ENV:Body>
    <ns2:deleteItemResponse xmlns:ns2="http://docs.oasis-open.org/ws-calendar/ns/soap"
                            xmlns:ns3="urn:ietf:params:xml:ns:icalendar-2.0">
      <ns2:status>OK</ns2:status>
    </ns2:deleteItemResponse>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

11.2 Example - unsuccessful deleteItem:

```
>>Request
<?xml version="1.0" encoding="UTF-8"?>
  <SOAP-ENV:Header/>
  <SOAP-ENV:Body>
    <ns2:deleteItem xmlns:ns2="http://docs.oasis-open.org/ws-calendar/ns/soap"
                    xmlns:ns3="urn:ietf:params:xml:ns:icalendar-2.0">  
      <ns2:href>/user/douglm/calendar/nosuchevent.ics</ns2:href>
    </ns2:deleteItem>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

```
>>Response
<?xml version="1.0" encoding="UTF-8"?>
  <SOAP-ENV:Header/>
  <SOAP-ENV:Body>
    <ns2:deleteItemResponse xmlns:ns2="http://docs.oasis-open.org/ws-calendar/ns/soap"
                            xmlns:ns3="urn:ietf:params:xml:ns:icalendar-2.0">
      <ns2:status>Error</ns2:status>
      <ns2:errorMessage>ws-calendar-soap-v1.0-csprd01</ns2:errorMessage>
    </ns2:deleteItemResponse>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```
<ns2:targetDoesNotExist/>
</ns2:.errorResponse>
</ns2:deleteItemResponse>
</SOAP-ENV:Body>
</SOAP-ENV:Envelope>
12 Querying calendar resources

Querying provides a mechanism by which information can be obtained from the service through possibly complex queries. A skeleton icalendar entity can be provided to limit the amount of information returned to the client. A query takes the parts

- Limitations on the data returned
- Selection of the data
- Optional timezone id for floating time calculations.

12.1 Calendar Query common types

The UTCTimeRangeType is used in a number of places to define a time range within which components must appear or property values must lie. The values are UTC time-date, the start is inclusive and the end is exclusive.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start</td>
<td>UTC date-time</td>
<td>1</td>
<td>Y</td>
<td>UTC inclusive start</td>
</tr>
<tr>
<td>end</td>
<td>UTC date-time</td>
<td>1</td>
<td>Y</td>
<td>UTC exclusive end</td>
</tr>
</tbody>
</table>

Table 42: UTCTimeRangeType elements

The TextMatchType is used to match text values in properties and parameters. The collation attribute species a collation as defined in Error: Reference source not found.

Servers are REQUIRED to support the "i;ascii-casemap" and "i;octet" collations which provide a basic case insensitive and case sensitive match respectively.

Elements of this type take a string value which is matched according to the attributes.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>#collation</td>
<td>String</td>
<td>0..1</td>
<td>N</td>
<td>Collation name from Error: Reference source not found.</td>
</tr>
<tr>
<td>#negate-condition</td>
<td>boolean</td>
<td>0..1</td>
<td>N</td>
<td>if &quot;true&quot; negates the condition</td>
</tr>
</tbody>
</table>

Table 43: TextMatchType attributes

12.2 CompFilterType

This type defines a search query for the calendar query operation. It specifies the component types to return, absence tests or basic matching operations on properties and time ranges.

The top level comp-filter element (which must match a vcalendar component) may contain zero or more comp-filter elements to match events, tasks or other contained components. These in turn may contain further nested comp-filter elements to match further levels of nested components.

Each may also contain prop-filter elements to test for the absence of properties or to match values.

Only logical conjunctions are supported, that is, all elements of a comp-filter must match for the expression to match.
<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>anyComp</td>
<td>AnyCompType</td>
<td>0..1</td>
<td>C</td>
<td>One of anyComp, vcalendar or a BaseComponentType must be supplied. anyComp indicates that any component will match.</td>
</tr>
<tr>
<td>xcal:vcalendar</td>
<td>xcal:VcalendarType</td>
<td>0..1</td>
<td>C</td>
<td>Matches vcalendar at the top level. Must be provided</td>
</tr>
<tr>
<td>xcal:baseComponent</td>
<td>xcal:BaseComponentType</td>
<td>0..1</td>
<td>C</td>
<td>May be vevent or vtodo for example.</td>
</tr>
<tr>
<td>#test</td>
<td>String</td>
<td>0..1</td>
<td>N</td>
<td>&quot;anyof&quot; is a logical OR of the child elements. &quot;allof&quot; is a logical AND of the child elements.</td>
</tr>
<tr>
<td>is-not-defined</td>
<td>empty</td>
<td>0..1</td>
<td>N</td>
<td>Only this element or one or more of time-range, prop-filter or comp-filter may be present</td>
</tr>
<tr>
<td>time-range</td>
<td>UTCTimeRangeType</td>
<td>0..1</td>
<td>N</td>
<td></td>
</tr>
<tr>
<td>comp-filter</td>
<td>CompFilterType</td>
<td>1</td>
<td>Y</td>
<td>Match against contained components</td>
</tr>
<tr>
<td>prop-filter</td>
<td>PropFilterType</td>
<td>0..n</td>
<td>N</td>
<td>Match against component properties</td>
</tr>
</tbody>
</table>

**Table 44: CompFilterType elements**

### 12.3 PropFilterType

The prop-filter element may test for the absence of a property or match values or specify zero or more ParamFilterType elements to match against parameters. Only logical conjunctions are supported, that is, all elements must match for the full expression to match.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xcal:baseProperty</td>
<td>xcal:BasePropertyType</td>
<td>1</td>
<td>Y</td>
<td>Specifies the property to be matched.</td>
</tr>
<tr>
<td>#test</td>
<td>String</td>
<td>0..1</td>
<td>N</td>
<td>&quot;anyof&quot; is a logical OR of the child elements. &quot;allof&quot; is a logical AND of the child elements.</td>
</tr>
<tr>
<td>is-not-defined</td>
<td>empty</td>
<td>0..1</td>
<td>N</td>
<td>Only this element or optionally one of time-range or text-match followed by param-filter</td>
</tr>
<tr>
<td>time-range</td>
<td>UTCTimeRangeType</td>
<td>0..1</td>
<td>N</td>
<td></td>
</tr>
<tr>
<td>text-match</td>
<td>TextMatchtype</td>
<td>0..1</td>
<td>N</td>
<td></td>
</tr>
<tr>
<td>param-filter</td>
<td>ParamFilterType</td>
<td>0..n</td>
<td>N</td>
<td>Match against property parameters</td>
</tr>
</tbody>
</table>

**Table 45: PropFilterType elements**

### 12.4 ParamFilterType

The ParamFilterType element may test for the absence of a parameter or match a value.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xcal:baseParameter</td>
<td>xcal:BaseParameterType</td>
<td>1</td>
<td>Y</td>
<td>Specifies the parameter to be matched.</td>
</tr>
<tr>
<td>is-not-defined</td>
<td>empty</td>
<td>0..1</td>
<td>N</td>
<td>Only this element or text-match</td>
</tr>
<tr>
<td>text-match</td>
<td>TextMatchtype</td>
<td>0..1</td>
<td>N</td>
<td></td>
</tr>
</tbody>
</table>

**Table 46: ParamFilterType elements**
12.5 CalendarQueryType elements

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>href</td>
<td>string</td>
<td>1</td>
<td>Y</td>
<td>Identify the target of the request. &quot;/&quot; for the service.</td>
</tr>
<tr>
<td>allprop</td>
<td>empty</td>
<td>0..1</td>
<td>N</td>
<td>If present specifies all properties should be returned. One or none of allprop or icalendar</td>
</tr>
<tr>
<td>xcal:icalendar</td>
<td>xcal:IcalendarType</td>
<td>0..1</td>
<td>N</td>
<td>If present is a valueless icalendar skeleton entity defining which components and properties should be returned. If present allprop must NOT be present.</td>
</tr>
<tr>
<td>expand</td>
<td>ExpandType</td>
<td>0..1</td>
<td>N</td>
<td>A subclass of UTCTimeRangeType. Either expand or limitRecurrenceSet may be specified but not both. If specified recurring events are expanded and limited to the supplied time-range. All events times are converted to UTC. This option allows for simplified event handling for certain classes of client.</td>
</tr>
<tr>
<td>limitRecurrenceSet</td>
<td>LimitRecurrenceSetType</td>
<td>0..1</td>
<td>N</td>
<td>A subclass of UTCTimeRangeType. Either expand or limitRecurrenceSet may be specified but not both. If specified only overrides that fall within the specified time-range are returned. This helps to limit the size of the result-set when there are many overrides.</td>
</tr>
<tr>
<td>depth</td>
<td>String</td>
<td>0..1</td>
<td>N</td>
<td>Species depth for query. &quot;1&quot; =&gt; just targeted collection, &quot;infinity&quot; =&gt; query targeted and all sub-collections.</td>
</tr>
<tr>
<td>filter</td>
<td>FilterType</td>
<td>1</td>
<td>Y</td>
<td>Defines the search filter</td>
</tr>
<tr>
<td>/comp-filter</td>
<td>CompFilterType</td>
<td>1</td>
<td>Y</td>
<td>Defines the top-level component</td>
</tr>
</tbody>
</table>

Table 47: CalendarQueryType elements

12.6 Specifying data to be returned

This is achieved by specifying one of the following

- allprop: return all properties and calendar data. (some properties are specified as not being part of the allprop set so are not returned)
- Set the icalendar element. This is an icalendar valueless pattern entity which provides a map of the components and properties to be returned. Neither the pattern nor the returned result need to be valid icalendar entities in that required properties may be absent if unselected.

12.7 Pre/postconditions for calendar queries

The preconditions as defined in [RFC 4791] Section 7.8 apply here. CalWS errors may be reported by the service when preconditions or postconditions are violated.

12.8 Time range limited queries.

Time-range limited retrieval has some special characteristics. The simplest case is a single event or task which overlaps the requested time-period. Recurring items and other components such as alarms complicate the picture.
12.9 Example: time range limited retrieval

This example shows the time-range limited retrieval from a calendar which results in 2 events, one a recurring event and one a simple non-recurring event.

13 Free-busy queries

Free-busy queries are used to obtain freebusy information for a principal. The result contains information only for events to which the current principal has sufficient access and may be affected by components and rules available only to the server (for instance office hours availability).

These queries are carried out by using a CalWs-SOAP freebusyReport request with an href specifying a principal. The freebusyReport request is not valid when the href specifies any entity other than a principal. The query follows the specification defined in [FreeBusy Read URL] with certain limitations. As an unauthenticated user to the CalWS service scheduling read-freebusy privileges must have been granted. As an unauthenticated user equivalent access must have been granted to unauthenticated users.

Freebusy information is returned by default as xcalendar vfreebusy components, as defined by [RFC 6321]. Such a component is not meant to conform to the requirements of VFREEBUSY components in Error: Reference source not found. The VFREEBUSY component SHOULD conform to section "4.6.4 Free/Busy Component" of [RFC 5545]. A client SHOULD ignore the ORGANIZER field.

Since a Freebusy query can only refer to a single user, a client will already know how to match the result component to a user. A server MUST only return a single vfreebusy component.

13.1 Element values

Three values are provided: href; start; end. Only the href is required. The start and end are in XML UTC date/time format and are interpreted as follows:

13.1.1 start

Default: If omitted the default value is left up to the server. It may be the current day, start of the current month, etc.

Description: Specifies the start date for the Freebusy data. The server is free to ignore this value and return data in any time range. The client must check the data for the returned time range.

Format: An XML UTC date-time

Example:

2011-12-01T10:15:00Z

Notes: Specifying only a start date/time without specifying an end-date/time or period should be interpreted as in [RFC 5545]. The effective period should cover the remainder of that day.

13.1.2 end

Default: Same as start

Description: Specifies the end date for the Freebusy data. The server is free to ignore this value.

Format: Same as start

Example: Same as start

The server is free to ignore the start, end and period parameters. It is recommended that the server return at least 6 weeks of data from the current day.

A client MUST check the time range in the response as a server may return a different time range than the requested range.

13.2 Examples

The following is an unsuccessful request targeting an invalid resource.

>> Request <<

<?xml version="1.0" encoding="UTF-8"?>
  <SOAP-ENV:Header/>
  <SOAP-ENV:Body>
    <ns2:freebusyReport
      xmlns:ns2="http://docs.oasis-open.org/ws-calendar/ns/soap"
      xmlns:ns3="urn:ietf:params:xml:ns:xmldb" xmlns:ns:calendar="2.0">
      <ns2:href>/user/douglm/calendar</ns2:href>
      <ns2:start>2011-04-01T04:00:00Z</ns2:start>
    </ns2:freebusyReport>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
The following is an example of a request to retrieve Freebusy data for a user:

```
>> Request <<

  <SOAP-ENV:Header/>
  <SOAP-ENV:Body>
    <ns2:freebusyReport xmlns:ns2="http://docs.oasis-open.org/ws-calendar/ns/soap"
      xmlns:ns3="urn:ietf:params:xml:ns:icalendar-2.0">
      <ns2:href>/principals/users/douglm</ns2:href>
      <ns2:time-range>
        <ns2:start>2011-04-01T04:00:00Z</ns2:start>
        <ns2:end>2011-04-30T04:00:00Z</ns2:end>
      </ns2:time-range>
    </ns2:freebusyReport>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```

>> Response <<

```
<?xml version="1.0" encoding="UTF-8"?>
  <SOAP-ENV:Header/>
  <SOAP-ENV:Body>
    <ns2:freebusyReportResponse xmlns:ns2="http://docs.oasis-open.org/ws-calendar/ns/soap"
      xmlns:ns3="urn:ietf:params:xml:ns:icalendar-2.0">
      <ns2:status>Error</ns2:status>
      <ns2:message>Only principal href supported</ns2:message>
    </ns2:freebusyReportResponse>
  </SOAP-ENV:Body>
</SOAP-ENV:Envelope>
```
14 Multiple operations

Each of the previously described operations acts upon a single entity or resource only. Frequently we have the need to update an interconnected set of entities so that we maintain the consistency of the structure. This requires an atomic operation which can successfully update all the entities or roll back the operation on failure.

The MultiOpType operation provides such a feature. It is essentially a wrapper around any of the other operations which guarantees the success of the entire set or a roll back. Using the id attribute for requests, each individual response can be located in the result.

The MultiOpType request takes the following elements:

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>operations</td>
<td>Sequence of BaseOperationType</td>
<td>1</td>
<td>Y</td>
<td>Contains one or more operations</td>
</tr>
</tbody>
</table>

Table 48: MultiOpType elements

The response type is also simple containing a single element containing all the responses:

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>#</th>
<th>?</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>responses</td>
<td>Sequence of BaseResponseType</td>
<td>1</td>
<td>Y</td>
<td>Contains zero or more responses</td>
</tr>
</tbody>
</table>

Table 49: MultiOpResponseType elements
15  Conformance

The last numbered section in the specification must be the Conformance section. Conformance Statements/Clauses go here. [Remove the "#" marker and the text in the two sentences before this bracketed material, and the brackets, and the text inside the brackets.]
Appendix A  Acknowledgments

The following individuals have participated in the creation of this specification and are gratefully acknowledged:

Participants:
- Bruce Bartell, Southern California Edison
- Brad Benson, Trane
- Edward Cazalet, Individual
- Toby Considine, University of North Carolina at Chapel Hill
- William Cox, Individual
- Sharon Dinges, Trane
- Mike Douglass, Rensselaer Polytechnic Institute
- Craig Gemmill, Tridium, Inc.
- Girish Ghatikar, Lawrence Berkeley National Laboratory
- Gerald Gray, Southern California Edison
- David Hardin, ENERNOC
- Gale Horst, Electric Power Research Institute (EPRI)
- Gershon Janssen, Individual
- Ed Koch, Akuacom Inc.
- Benoit Lepeuple, LonMark International*
- Carl Mattocks, CheckMi*
- Robert Old, Siemens AG
- Alexander Papaspyrou, Technische Universitat Dortmund
- Joshua Phillips, ISO/RTO Council (IRC)
- Jeremy J. Roberts, LonMark International
- David Thewlis, CalConnect

The Calendaring and Scheduling Consortium (CalConnect) TC-XML committee worked closely with WS-Calendar Technical Committee, bridging to developing IETF standards and contributing the services definitions that make up Services in Section 4. The Technical Committee gratefully acknowledges their assistance and cooperation as well. Contributors to TC XML include:

- Cyrus Daboo, Apple
- Mike Douglass, Rensselaer Polytechnic Institute
- Steven Lees, Microsoft
- Tong Li, IBM
# Appendix B  Revision History
