### Technical Committee:

OASIS Web Services Calendar (WS-Calendar) TC

### Chair:

Toby Considine

### Editor(s):

Toby Considine  
Mike Douglass

### Related work:

[XML Schemas for WS-Calendar Version 1.0](#)

This specification is related to:

- [IETF RFC5545](#), ICalendar
- [IETF RFC5546](#), ICalendar Transport
- [IETF RFC2447](#), ICalendar Message Based Interoperability
- IETF XCAL specification in progress
- IETF / CalConnect Calendar Resource Schema specification in progress

### Declared XML Namespace(s):

<http://docs.oasis-open.org/ns/ws-calendar>  
<http://docs.oasis-open.org/ns/ws-calendar/timestamp>

### Abstract:

WS-Calendar describes a limited set of message components and interactions providing a common basis for specifying schedules and intervals to coordinate activities between services. The specification includes service definitions consistent with the OASIS SOA Reference Model and XML vocabularies for the interoperable and standard exchange of:

- Schedules, including sequences of schedules
- Intervals, including sequences of Intervals

These message components describe schedules and Intervals future, present, or past (historical). The definition of the services performed to meet a schedule or Interval depends on the market context in which that service exists. It is not in scope for this TC to define those markets or services.

**Status:**

*This version of the specification has known deficiencies. The examples have not been re-written since the schema changes. The Graphics, too, are out of date. The entire sections on SOAP-based calendar services remain to be written. The TC feels that the prose and the schemas are essentially complete.*

This document was last revised or approved by the OASIS Web Services Calendar (WS-Calendar) TC on the above date. The level of approval is also listed above. Check the "Latest Version" location noted above for possible later revisions of this document.

Technical Committee members should send comments on this specification to the Technical Committee's [email list](#). Others should send comments to the Technical Committee by using the "Send A Comment" button on the Technical Committee's web page at <http://www.oasis-open.org/committees/ws-calendar/>.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (<http://www.oasis-open.org/committees/ws-calendar/ipr.php>).

# 1 Introduction

*This version of the specification has known deficiencies. The examples have not been re-written since the schema changes. The Graphics, too, are out of date. The entire sections on SOAP-based calendar services remain to be written. The TC feels that the prose and the schemas are essentially complete.*

One of the most fundamental components of negotiating services is agreeing when something should occur, and in auditing when they did occur. Short running services traditionally have been handled as if they were instantaneous, and have handled scheduling through just-in-time requests. Longer running processes, including physical processes, may require significant lead times. When multiple long-running services participate in the same business process, it may be more important to negotiate a common completion time than a common start time. Pre-existing approaches that rely on direct control of such services by a central system increases integration costs and reduce interoperability as they require the controlling agent to know and manage multiple lead times.

Not all services are requested one time as needed. Processes may have multiple and periodic occurrences. An agent may need to request identical processes on multiple schedules. An agent may request services to coincide with or to avoid human interactions. Service performance be required on the first Tuesday of every month, or in weeks in which there is no payroll, to coordinate with existing business processes. Service performance requirements may vary by local time zone. A common schedule communication must support diverse requirements.

Physical processes are already being coordinated by web services. Building systems and industrial processes are operated using **[oBIX]**, BACnet/WS, LON-WS, OPC XML, and a number of proprietary specifications including TAC-WS, Johnson Controls EnNet™, and MODBUS.NET. In particular, if building systems coordinate with the schedules of the building's occupants, they can reduce energy use while improving performance.

An increasing number of specifications envision synchronization of processes through mechanisms including broadcast scheduling. Efforts to build an intelligent power grid (or smart grid) rely on coordinating processes in homes, offices, and industry with projected and actual power availability; mechanisms proposed include communicating different prices at different times. Several active OASIS Technical Committees require a common means to specify schedule and interval: Energy Interoperation **[EITC]** and Energy Market Information Exchange **[EMIX]**. Emergency management coordinators wish to inform geographic regions of future events, such as a projected tornado touchdown, using **[EDXL]**. The open Building Information Exchange specification **[oBIX]** lacks a common schedule communications for interaction with enterprise activities. These and other efforts would benefit from a common cross-domain, cross specification standard for communicating schedule and interval.

For human interactions and human scheduling, the well-known iCalendar format is used to address these problems. Prior to WS-Calendar, there has been no comparable standard for web services. As an increasing number of physical processes become managed by web services, the lack of a similar standard for scheduling and coordination of services becomes critical.

The intent of the WS-Calendar technical committee was to adapt the existing specifications for calendaring and apply them to develop a standard for how schedule and event information is passed between and within services. The standard adopts the semantics and vocabulary of iCalendar for application to the completion of web service contracts. WS Calendar builds on work done and ongoing in The Calendaring and Scheduling Consortium (CalConnect), which works to increase interoperation between calendaring systems.

Everything with the exception of all examples, all appendices, and the introduction is normative unless otherwise specifically noted.

## 46 1.1 Terminology

47 The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD  
48 NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described  
49 in [RFC2119]

122 **1.4 Namespace**

123 The XML namespace [XML-ns] URI that MUST be used by implementations of this specification is:

124 `http://docs.oasis-open.org/ns/ws-calendar/icalendar`

125 Dereferencing the above URI will produce the Resource Directory Description Language [RDDL 2.0]  
126 document that describes this namespace.

127 Table 1-1Table 1 lists the XML schemas that are used in this specification. The choice of any namespace  
128 prefix is arbitrary and not semantically significant.

129 *Table 1-1: Namespaces Used in this Specification*

Prefix	Namespace
Xs	<a href="http://www.w3.org/2001/XMLSchema">http://www.w3.org/2001/XMLSchema</a>
Xcal	<a href="http://docs.oasis-open.org/ns/ws-calendar/i">http://docs.oasis-open.org/ns/ws-calendar/i</a>

130 The normative schemas for EMIX can be found linked from the namespace document that is located at  
131 the namespace URI specified above.

132 *Table 1-2: Schemas and Extensions Used in this Specification*

Schema	Description
iCalendar.xsd	Base Schema expressing core iCalendar information

<b>iCalendar-params.xsd</b>	Parameters used in iCalendar objects
<b>iCalendar-props.xsd</b>	Properties of iCalendar objects
<b>iCalendar-valtypes.xsd</b>	Values used by iCalendar
<b>iCalendar-link-extension.xsd</b>	Link extensions based on <b>[web linking]</b> to define relationships between components.
<b>iCalendar-wscal-extensions.xsd</b>	Extensions to iCalendar to support service functionality
<b>iCalendar-bw-extensions.xsd</b>	Extensions to support integration with Bedeworks server.
<b>iCalendar-ms-extensions.xsd</b>	Extensions to support integration with MS Exchange Server

133 Reviewers can find the schemas at <http://docs.oasis-open.org/ws-calendar/ws-calendar-spec/v1.0/csd02/xsd/>.

## 135 1.5 Naming Conventions

136 This specification follows some naming conventions for artifacts defined by the specification, as follows:  
 137 For the names of elements and the names of attributes within XSD files, the names follow the lower  
 138 camelCase convention, with all names starting with a lower case letter. For example,

```
139 <element name="componentType" type="energyinterop:ComponentType" />
```

140 For the names of types within XSD files, the names follow the lower CamelCase convention with all  
 141 names starting with a lower case letter prefixed by "type-". For example,

```
142 <complexType name="type-componentService">
```

143 For the names of intents, the names follow the lower camelCase convention, with all names starting with  
 144 a lower case letter, EXCEPT for cases where the intent represents an established acronym, in which  
 145 case the entire name is in upper case.

146 An example of an intent that is an acronym is the "SOAP" intent.

## 147 1.6 Editing Conventions

148 For readability, element names in tables appear as separate words. The actual names are  
 149 lowerCamelCase, as specified above, and as they appear in the XML schemas.

150 All elements in the tables not marked as "optional" are mandatory.

151 Information in the "Specification" column of the tables is normative. Information appearing in the note  
 152 column is explanatory and non-normative.

153 All sections explicitly noted as examples are informational and are not to be considered normative.

## 154 1.7 Architectural References

155 WS-Calendar assumes incorporation into services. Accordingly it assumes a certain amount of definitions  
 156 of roles, names, and interaction patterns. This document relies heavily on roles and interactions as  
 157 defined in the OASIS Standard *Reference Model for Service Oriented Architecture [SOA-RM]*.

## 158 1.8 Terminology

159 Certain terms appear throughout this document, some with extensive definitions. The table provides  
 160 summary definitions for the convenience of the reader and reviewer. When full definitions of the terms  
 161 below appear in later sections of this document, with the exception of in the appendices, then that later  
 162 definition is normative.

163 WS-Calendar terminology begins with a specialized terminology for the segments of time, and for groups  
 164 of related segments of time. These terms are defined in Table 1-3, below.

165 *Table 1-3: Terminology – Foundational Elements*

Time Segment	Definition
<b>Duration</b>	Well-known element from iCalendar and [XCAL], Duration is the length of an event scheduled using iCalendar or any of its derivatives. The [XCAL] duration is a data type using the string representation defined in the iCalendar duration. The Duration is the sole descriptive element of the VTOD object that is mandatory in the Interval.
<b>Interval</b>	The Interval is a single duration derived from the common calendar components as defined in iCalendar ([RFC5545]) and refined in [XCAL]. In Calendar systems, it is processed as a vtodo, but the constraints and conformance are different.
<b>Sequence</b>	A Sequence is a set of Intervals with defined temporal relationships. Sequences may have gaps between Intervals, or even simultaneous activities. A Sequence is re-locatable, i.e., it does not have a specific date and time. A Sequence may consist of a single Interval. A Sequence may optionally include a Lineage.
<b>Partition</b>	A Partition is a set of consecutive Intervals. The Partition includes the trivial case of a single Interval. Partitions are used to define a single service or behavior which varies over time. Examples include energy prices over time and energy usage over time.
<b>Gluon</b>	A gluon influences the serialization of Intervals in a Sequence, though inheritance and through schedule setting. The Gluon is similar to the Interval, but has no service or schedule effects until applied to an Interval or Sequence.
<b>Artifact</b>	An Artifact is the thing that occurs during an Interval. WS-Calendar extends the [XCAL] attach object to contain this placeholder. The contents of the Artifact are not specified in WS-Calendar, rather the Artifact provides an extension base for the use of WS-Calendar in other specifications. Artifacts may inherit elements as do Intervals within a Sequence.

166 WS-Calendar works with groups of Intervals that have relationships between them. These relations  
 167 constrain the final instantiation of a schedule-based service. Relations can control the ordering of  
 168 Intervals in a Sequence. They can describe when a service can be, or is prevented from, being invoked.  
 169 They establish the parameters for how information will be shared between elements using Inheritance.  
 170 The terminology for these relationships is defined in Table 1-4.

171 *Table 1-4: Terminology – Relations, Limits, and Constraints*

Term	Definition
<b>Link</b>	The Link is used by one WS-Calendar object to reference another. A link can reference either an internal object, within the same calendar, or an external object in a remote system.
<b>Relationship</b>	Relationships are incorporated into links and define how Intervals are connected for Binding. iCalendar defines several relationships, but WS-Calendar uses only the Parent relationship, and that only to bind Gluons to each other and to Intervals.

Term	Definition
<b>Temporal Relationship</b>	Temporal Relationships are incorporated into Links and define how Intervals become a Sequence by creating an order between Intervals. The Predecessor Interval includes a Temporal Relation which references the Successor Interval. When the start time and duration of one Interval is known, the start time of the others can be computed through applying Temporal Relations.
<b>Availability</b>	Availability expresses the range of times in which an Interval or Sequence can be Scheduled. Availability is often used to overlay or be overlaid by Busy. a Availability can be Inherited
<b>Busy</b>	Busy expresses the range of times in which an Interval or Sequence cannot be Scheduled. Busy is often used to overlay or be overlaid by Availability. Busy can be Inherited
<b>Child, Children</b>	The PARENT relationship type (rel_type) defines a logical link (via URI or UID) from parent object to a child object. A Child object is the target of one or more PARENT links and may have zero to many Parent objects.
<b>Parent [Gluon]</b>	A Gluon that (in a Sequence) that includes a PARENT relationship to object. type (rel_type) defines a logical link (via URI or UID) from parent object to a child object. A Parent object is the contains one or more PARENT links
<b>Lineage</b>	The ordered set of Parents that results in a given inheritance or execution context for a Sequence.

172 WS-Calendar describes how to modify and complete the specification of Sequences. WS-Calendar calls  
173 this process Inheritance and specifies a number of rules that govern inheritance. Table 1-5 defines the  
174 terms used to describe inheritance.

175 *Table 1-5: Terminology – Sequence State and Completeness*

Term	Definition
<b>Lineage</b>	The ordered set of Parents that results in a given inheritance or execution context for a Sequence.
<b>Inheritance</b>	Parents bequeath information to Children that inherit them. If a child does not already possess that information, then it accepts the inheritance. WS-Calendar specifies rules whereby information specified in one informational object is considered present in another that is itself lacking expression of that information. This information is termed the Inheritance of that object.
<b>Bequeath</b>	A Parent Bequeaths attributes (Inheritance) to its Children
<b>Inherit</b>	A Child Inherits attributes (Inheritance) from its Parent
<b>Covarying Attributes</b>	Some attributes are inherited as a group. If any member of that group is expressed in a Child, all members of that group are deemed expressed in that Child, albeit some may be default values. These characteristics are called covarying or covariant. A parent bequeaths covarying characteristics as a group and a child accepts or refuses them as a group.
<b>Decouplable Attributes</b>	Antonym for Covarying Attributes. Decouplable Attributes can be inherited separately.

176 As Intervals are processed, as Intervals are assembled, and as inheritance is processed, the information  
177 conveyed about each element changes. When WS-Calendar is used to describe a business process or

178 service, it may pass through several stages in which the information is not yet complete or actionable, but  
 179 is still a conforming expression of time and Sequence. Table 1-6 defines the terms used when discussing  
 180 the processing or processability of Intervals and Sequences.

181 *Table 1-6: Terminology – Describing Intervals*

<b>Term</b>	<b>Definition</b>
<b>Anchored</b>	An Interval is Anchored [in time] if it is Bound to a full date and time. A Sequence or Partition is Anchored if it contains an Anchored Interval, and when Fully Bound, the specific date, time, and duration of all Intervals can be determined unambiguously. Specific performance of a Service Contract always occurs in an Anchored Sequence.,
<b>Partially Anchored</b>	An Interval is Partially Anchored if EITHER its Date OR its Time is Bound. A Sequence or Partition is Partially Anchored if its Designated Interval is Partially Anchored.
<b>Unanchored</b>	An Interval is Unanchored if NEITHER its Begin Date nor its Begin Time are known.
<b>Bound</b>	As in mathematical logic where a metasyntactic variable is called "bound", an Interval, Sequence, or Partition is said to be Bound when the values necessary to execute it (as a service) are completely filled in.
<b>Partially Bound</b>	A Partially Bound Interval is one that is still not Bound after receiving its Inheritance. A Sequences or Partitions is Partially Bound if it contains at least one Interval that is Partially Bound.
<b>Unbound</b>	An Unbound Interval or Sequence is not itself complete, but must still receive inheritance to be fully specified. A Sequences or Partitions is Unbound if it contains at least one Interval that is Unbound.
<b>Fully Bound</b>	A synonym for Bound
<b>Constrained</b>	An Interval is Constrained if it is not Anchored and it is bound to one or more Availability or Free/Busy elements
<b>Scheduled</b>	A Sequence or Partition is said to be Scheduled when it is Anchored, Fully Bound, and service performance has been requested.
<b>Unscheduled</b>	An Interval is Unscheduled if its neither its begin date and time nor its end date and time have been set. A Sequence or Partition is Unscheduled if none of its Intervals, after when Fully Bound, is Scheduled.
<b>Designated Interval</b>	In a Sequence the Designated Interval is either (a) (if there are no Gluons related to the Sequence) one of the Earliest Interval(s), or (b) (if there is at least one Gluon related to the Sequence) the single Interval referenced by a Gluon as Parent.
<b>Predecessor Interval</b>	A Predecessor Interval includes a Temporal Relation which references a Successor Interval.
<b>Successor Interval</b>	A Successor Interval is one referred to by a Temporal Relationship in a Predecessor Interval.
<b>Antecedent Interval(s)</b>	An Interval or set of Intervals that precede a given Interval within the same Sequence

Term	Definition
<b>Earliest Interval</b>	The set of Intervals at the earliest time in a given Sequence
<b>Composed Interval</b>	A Composed Interval is the virtual Interval specified by applying inheritance through the entire lineage and into the Sequence in accord with the inheritance rules. A Composed Interval may be Bound or Unbound.
<b>Composed Sequence</b>	A Composed Sequence is the virtual Sequence specified by applying inheritance through the entire lineage and into the Sequence in accord with the inheritance rules. A Composed Sequence may be Bound or Unbound.
<b>Comparable Sequences</b>	Two Sequences are Comparable if and only if there exists a Composed version of each that defines the same schedule.

182

---

## 2 Overview of WS-Calendar

183 A calendar communication without a real world effect<sup>1</sup> is of little interest. That real world effect is the result  
184 of a service execution context within a policy context. Practitioners can use WS-Calendar to add  
185 communication of schedule and Interval to the execution context of a service. Use of WS-Calendar will  
186 align the performance expectations between execution contexts in different domains. The Technical  
187 Committee intends for other specifications and standards to incorporate WS-Calendar, bringing a  
188 common scheduling context to diverse interactions in different domains

189

### 2.1 Approach taken by the WS-Calendar Technical Committee

190 The Technical Committee (TC) based its work upon the iCalendar specification as updated in 2009 (IETF  
191 **[RFC5545]** and its the XML serialization **[XCAL]**, currently (2010-07) on a standards track in the IETF.  
192 Members of the Calendaring and Scheduling Consortium (CalConnect.org) developed both updates to  
193 IETF specifications and provided advice to this TC. This work provides the vocabulary for use in this  
194 specification.

195 This committee developed the normative schema (XSD) for iCalendar. This schema, including the  
196 schema extensions necessary for the services defined herein, is part of the WS-Calendar specification.

197 The committee solicited requirements from a range of interests, notably the NIST Smart Grid Roadmap  
198 and the requirements of the Smart Grid Interoperability Panel (SGIP) as developed by the North  
199 American Energy Standards Board (NAESB). Others submitting requirements included members of the  
200 oBIX technical committee and representative of the FIX Protocol Association. These requirements are  
201 reflected in the semantic elements described in Chapters 3 and 4.

202 In a parallel effort, the CalConnect TC-XML committee developed a number of schedule and calendar-  
203 related services. CalConnect drew on its experience in interoperability between enterprise calendaring  
204 systems as well as interactions with web-based calendars and personal digital assistants (PDAs). These  
205 services were developed as RESTfull (using **[REST]**) services by CalConnect and contributed to the WS-  
206 Calendar TC. CalConnect also developed and contributed **[SOAP]** and **[WSDL]** definitions to this TC.

207

### 2.2 Scheduling Service Performance

208 Time semantics are critical to WS-Calendar. Services requested differently can have different effects on  
209 performance even though they appear to request the same time interval. This is inherent in the concept of  
210 a service-oriented architecture.

211 As defined in the OASIS Reference Model for Service Oriented Architecture 1.0<sup>2</sup>, service requests access  
212 the capability of a remote system.

---

<sup>1</sup> This paragraph includes a number of terms of art used in service oriented architecture (SOA). In all cases, the terms are as defined in the *Reference Model for Service Oriented Architecture*, found in the normative references.

<sup>2</sup> See normative references in section 1.2

213 *The purpose of using a capability is to realize one or more real world effects. At its core, an*  
214 *interaction is “an act” as opposed to “an object” and the result of an interaction is an effect (or a*  
215 *set/series of effects). This effect may be the return of information or the change in the state of*  
216 *entities (known or unknown) that are involved in the interaction.*

217 *We are careful to distinguish between public actions and private actions; private actions are*  
218 *inherently unknowable by other parties. On the other hand, public actions result in changes to the*  
219 *state that is shared between at least those involved in the current execution context and possibly*  
220 *shared by others. Real world effects are, then, couched in terms of changes to this shared state*

221 A request for remote service performance is a request for specific real world effects. For WS-Calendar,  
222 these effects are expected to occur during a given period. Consider two service providers that offer the  
223 same service. One must start planning an hour or more in advance. The second may be able to achieve  
224 the service in five minutes. The service start time is the time when that service becomes fully available;  
225 that is the time specified in service interactions. Because this service start time and service period are all  
226 that matters, the same service can be offered by different providers using quite different technologies.

227 The complement of this is the scheduled end time. The party offering the service may need to ramp down  
228 long running processes. Using for example energy demand response, if a system contracts to end energy  
229 use by 3:00, it assumes the onus of turning everything off before 3:00.

230 Duration is how long a behavior is continued. If a service contracts to provide shed load for an hour, it is  
231 not necessary for it to stop shedding load 65 minutes later (which may be the end of the work day). It  
232 must, however, shed the agreed upon load during all of the 60 minutes.

233 In this way, the service scheduled to shed load from 4:00 ending at 5:00 may be quite different than the  
234 one scheduled to shed load for an hour beginning at 4:00.

## 235 **2.2.1 Which Time? UTC vs. Local Time**

236 When 2 or more parties attempt to agree on a time, e.g., for a meeting, or when to provide a service, they  
237 agree to start at a particular instant of time UTC. They agree on that instant in time by converting from  
238 local time, e.g., they want a meeting to start at 13:00 Eastern, 18:00 UK. Our lives and the use of services  
239 are bound by local time not by UTC. To humans local time is the invariant and UTC is mapped on to it. If  
240 a government modifies the rules we adjust the mappings and we shift the UTC time. We still want to meet  
241 at 13:00 local or have the heating start at 07:00.

242 As long as the rules never change this causes no confusion—but they do. Recent experience has  
243 included considerable efforts when the rules for the start of Daylight Savings Time (DST) have changed.  
244 If all information is in UTC, and no record of the events basis in the local time and time zone remains,  
245 there is no way to re-compute existing contracts. We don't know if that UTC was calculated based on an  
246 old or new rule.

247 A triplet of Local time + timezoneid + (UTC or offset) always allows you to determine if the time is valid. If  
248 a recalculation of UTC for that local time + tzid results in a different value from that stored then  
249 presumably the DST rules have changed since the data was stored. If you can detect that the scheduled  
250 time is no longer valid you can take corrective action.

251 For simplicity, all examples and discussion in this document are based on Greenwich Mean Time also  
252 known as Coordinated Universal Time (UTC). The Technical Committee makes no representation as

253 whether UTC or local time are more appropriate for a given interaction. Because WS-Calendar is based  
254 on **[iCalendar]**, business practices built upon WS-Calendar can support either.  
255 Practitioners should consult **[Time Service Recommendations]** and **[Time Zone Service]** in the non-  
256 normative references.

## 257 **2.3 Overview of This Document**

258 The specification consists of a standard schema and semantics for schedule and interval information.  
259 Often the most important service schedule communications involve series of related services over time,  
260 which WS-Calendar defines as a Sequence. These semantic elements are defined and discussed in  
261 Section 3.

262 Section 4 introduces notions of performance, i.e. what does it mean to be “on time”. This section also  
263 describes the different ways to associate a service request with each Interval in a Sequence.

264 Managing information exchanges about a Sequence of events can easily become cumbersome, or prone  
265 to error. WS-Calendar defines the Calendar Gluon, a mechanism for making assertions about all or most  
266 of the Intervals in a Sequence. Intervals can inherit from a Calendar Gluon, or they can override locally  
267 assertions inherited from the Calendar Gluon. Section 5 discusses inheritance and parsimony of  
268 communication and introduces contract scheduling.

269 In Sections 8-16, this document describes **[REST]**-based, (RESTfull) web services for interacting with  
270 remote calendars. These interactions are derived from the well-known interactions defined in **[CalDAV]**,  
271 although they do not specify any interaction with **[CalDAV]** servers. This specification defines services for  
272 calendar inquiries, event scheduling, event updating, and event cancelation.

273 In Sections n-n, this document describes **[SOAP]**-based interactions for Calendar services. As with  
274 REST, the specification defines services for calendar inquiries, event scheduling, event updating, and  
275 event cancelation using the iCalendar schema.

276 With incompatible communications defined (REST, SOAP), the specification is not prescriptive of the  
277 communications used. The practitioner must decide whether to use either of these communication  
278 protocols, or whether WS-Calendar artifacts are better used when embedded within other messages.  
279 These decisions, along with decisions about the specific security needed by the communication must be  
280 based upon the specific application and message content.

---

## 3 Intervals, Temporal Relations, and Sequences

281

282 WS-Calendar Elements are semantic elements derived from the [XCAL] specification. These elements  
283 are smaller than a full schedule interaction, and describe the intervals, durations, and time-related events  
284 that are relevant to service interactions. The elements are used to build a precise vocabulary of time,  
285 duration, Sequence, and schedule.

286 WS-Calendar elements adapt the iCalendar objects to make interaction requirements explicit. For  
287 example, in human schedule interactions, different organizations have their own expectations. Meetings  
288 may start on the hour or within 5 minutes of the hour. As agents scheduled in those organizations, people  
289 learn the expected precision. In WS-Calendar, that precision must be explicit to prevent interoperability  
290 problems. WS-Calendar defines a performance element to elaborate the simple specification of [XCAL] to  
291 make explicit the performance expectations within a scheduled event.

292 WS-Calendar defines common semantics for recording and exchanging event information.

### 3.1 Core Semantics derived from [XCAL]

293

294 The iCalendar data format [RFC5545] is a widely deployed interchange format for calendaring and  
295 scheduling data. The [XCAL] specification (in process) standardizes the XML representation of iCalendar  
296 information. WS-Calendar relies on [XCAL] standards and data representation to develop its semantic  
297 components.

#### 3.1.1 Time

298

299 Time is an ISO 8601 compliant time string with the optional accompaniment of a duration interval to  
300 define times of less than 1 second. Examples of date and time representations from the ISO 8601  
301 standard include:

```
302 Year:  
303   YYYY (eg 1997)  
304 Year and month:  
305   YYYY-MM (eg 1997-07)  
306 Complete date:  
307   YYYY-MM-DD (eg 1997-07-16)  
308 Complete date plus hours and minutes:  
309   YYYY-MM-DDThh:mmTZD (eg 1997-07-16T19:20+01:00)  
310 Complete date plus hours, minutes and seconds:  
311   YYYY-MM-DDThh:mm:ssTZD (eg 1997-07-16T19:20:30+01:00)  
312 Complete date plus hours, minutes, seconds and a decimal fraction of a second  
313   YYYY-MM-DDThh:mm:ss.sTZD (eg 1997-07-16T19:20:30.45+01:00)
```

314 Normative information on [ISO 8601] is found in section 1.2.

#### 3.1.2 The iCalendar Components (VComponents)

315

316 iCalendar and [XCAL] have a number of long defined component objects that comprise the payload  
317 inside of an iCalendar message. These include the VTODO, the VALARM, the VEVENT. (The “v” that  
318 begins each element name is there for historic purposes.) The definitions and use of each of the vObjects  
319 can be found in [RFC5545].

320 The vObjects share the same parameters and properties. The distinctions between these informational  
321 objects is in which are permitted, and which are required. Because of its flexibility, the VTODO object is  
322 the basis for WS-Calendar objects for service performance. Because WS-Calendar services support all  
323 traditional iCalendar-based interactions (CalDAV, et al.), all VComponents SHALL be supported.

324 The Interval and Gluon are new vObjects, and each is derived from vtodo.

325 **3.2 Intervals**

326 Time Segments, i.e., increments of continuous passage of time, are a critical component of service  
 327 alignment using WS-Calendar. There are many overloaded uses of terms about time, and within a  
 328 particular time segment, there may be many of them. Within this document, we use the term Time  
 329 Segments to encompass all the items defined in *Table 1-3: Terminology – Foundational Elements*.

330 The building block for the WS-Calendar information model is the Interval. The Interval is a time segment  
 331 whose length is specified by the Duration. The Duration is represented by a string as defined in the  
 332 iCalendar specification [RFC5545]. The Committee listened to arguments that we should redefine the use  
 333 and meaning of Duration. Whatever their merit, the iCalendar Duration has a pre-existing meaning of the  
 334 length of time of scheduled within an event.

335 An Interval is a unit of service delivery, bindable to time. An Unscheduled Interval is not linked to a  
 336 specific date and time. A Scheduled Interval has a known start date and time. Intervals can legally  
 337 complain all elements of the VTODO as defined in [RFC5545]. For convenience, the elements essential  
 338 to Intervals are listed in Table 3-1.

339 Nothing in this section supersedes [RFC5545]. Implementers SHALL refer to those respective  
 340 specifications [RFC5545] and the [XCAL] specifications for the normative description of each element.

341 *Table 3-1: Properties of Intervals*

Elements	Use	Use in WS-Calendar
<b>Dtstamp</b>	xcal:dtstamp Mandatory	Identifies when Interval object was created
<b>Uid</b>	Mandatory	Used to enable unambiguous referencing by other components
<b>Duration</b>	xcal:Duration Optional	Identifies length of time for Interval
<b>DtStart</b>	Xcal:dateTime Optional	Scheduled start date and time for Interval
<b>attach</b>	Mandatory	In [xCal], any attachment. In WS-Calendar, the Attach contains the informational payload used by incorporating specifications. Defined in section 4.
<b>link</b>	As defined in [RFC5998] Optional	Links contain the temporal relations between Intervals that create Sequences. Section 3.3. describes Temporal Relations and their use.

342 An Interval specifies how long an activity lasts. An Unanchored Interval is not linked to a specific date and  
 343 time. The example below shows the components section of a WS-Calendar message containing a single  
 344 Interval

345 *Example 3-2: An Unanchored Interval*

```

346 <components>
347 <vtodo>
348   <properties>
349     <x-wscalendartype>Interval</x-wscalendartype>
350     <uid>
351       <text>00959BC664CA650E933C892C@example.com</text>
352     </uid>
353     <description>
354       <text>Sample Contract</text>
355     </description>
356     <duration>
357       <duration>
358         <duration>T10H</duration>
  
```

359  
360  
361  
362  
363

```
        </duration>
    </duration>
</properties>
</vtodo>
<components>
```

364 Note that no start time is specified, and no relationship. Relationships are not needed until an Interval is  
365 incorporated into a Sequence.

### 366 3.3 Connecting the Intervals

367 Many iCalendar communications involve more than one Interval. Classic iCalendar [RFC5545] defines  
368 relationships internally. WS-Calendar instead uses the Web Link [RFC5998], both for the traditional  
369 Relationships (parent, child, sibling) and for the Temporal Relationships. Links include a reference, a  
370 relation, and optional business parameters.

371 Temporal Relationships, new in WS-Calendar, use Web Linking [RFC5998] in an Interval (the  
372 Predecessor) to reference another Interval (the Successor). Temporal Relationships optionally include a  
373 Gap that specifies any lag between Predecessor and Successor.

374 *Table 3-3: Temporal Relationships*

Temporal Relationship	Short Form	Definition	Example
<b>finishToStart</b>	FS	As soon as the predecessor Interval finishes, the successor Interval starts.	When sanding is complete, painting begins.
<b>finishToFinish</b>	FF	The successor Interval continues as long as the predecessor Interval.	The concession stand stops serving 20 minutes after the end of the game.
<b>startToFinish</b>	SF	The start of the predecessor controls the finish of the successor.	The start of Attendee Check-in controls the end of the Interval "Set up registration booth."
<b>startToStart</b>	SS	The Predecessor Interval triggers the start of the second task. The Gap indicates the lag time	20 minutes after the caterer begins work, the dining lines are open.
<b>Gap</b>		Duration indicating the time between the predecessor and the successor. Optional, where missing, Gap is treated as a zero duration	Gap may be positive or negative.

375 While simple relationships may be ordered based on which task occurs first (finishToStart), if a later  
376 Interval is controlling, other choices may make more useful. For example, if ramp-up time must be  
377 completed before run-time, and run-time start is indicated in a contract, it may be useful to specify that the  
378 Ramp Interval (Successor) must complete before (startToFinish) the Designated Interval's (Predecessor)  
379 scheduled start time. Referencing specifications should consider conformance around Temporal  
380 Relationships.

381 The relationship below indicates that this Interval is to start ten minutes following the finish of the Interval  
382 specified.

383 *Example 3—1: Temporal Relationship*

384  
385  
386  
387

```
<x-wscalendarrelation>
<temporalrelationshiptype>finishtostart</temporalrelationshiptype>
<gap>
    <duration>
```

```

388         <xcal:duration>T00:10</xcal:duration>
389     </duration>
390 </gap>
391 <relatedto>
392     <uid>00959BC664CA650E933C892C@example.com</uid>
393 </relatedto>
394 </x-wscalendarrelation>

```

395 If there is no temporal separation between Intervals, the gap element is optional. The following examples  
396 are equivalent expressions to express a relationship wherein both Intervals must start at the same  
397 moment.

398 *Example 3—2: Temporal Relationship with Gap*

```

399 <x-wscalendarrelation>
400 <temporalrelationshipstype>starttostart</temporalrelationshipstype>
401 <gap>
402     <duration>
403         <xcal:duration>T00:10</xcal:duration>
404     </duration>
405 </gap>
406 <relatedto>
407     <uid>00959BC664CA650E933C892C@example.com</uid>
408 </relatedto>
409 </x-wscalendarrelation>

```

410 Leaving out the optional Gap element, we have:

411 *Example 3—3: Temporal Relationship without Gap*

```

412 <x-wscalendarrelation>
413 <temporalrelationshipstype>starttostart</temporalrelationshipstype>
414 <relatedto>
415     <uid>00959BC664CA650E933C892C@example.com</uid>
416 </relatedto>
417 </x-wscalendarrelation>

```

418 The two expressions of a Temporal Relationship above are equivalent.

419 Intervals with Temporal Relationships enable the message to express complex temporal relations to form  
420 a Sequence, as well as express the simple consecutive Intervals named a Partition

421 A Sequence describes a coherent set of Intervals that can be assembled from a collection of Intervals. As  
422 the rules for parsing XML do not mandate preservation of order within a sub-set, we cannot assume that  
423 order is preserved when parsing a set of Components. For Sequences in WS-Calendar, then, mere order  
424 is not enough—a Sequences is a collection of Intervals each of which Interval either refers to or ir referred  
425 by at least one Interval. Using the references, expressed as Temporal Relations, WS-Calendar describes  
426 a single coherent Sequence that is assembled from a set of Intervals in a collection.

## 427 **3.4 Sequences: Combining Intervals**

428 A Sequences is a collection of Intervals with a coherent set of Temporal Relationships. Temporal  
429 Relationships are transitive, so that if Interval A is related to Interval B, and Interval B is related to Interval  
430 C, then Interval A is related to Interval C. Sequences can also include Gluons (*see section 5.1,*  
431 *References and Inheritance.*, but for this section, we will discuss Sequences only as a set of Intervals.

432 *Table 3-4: Introducing the Sequence*

485         <x-wscalendarrelation>
486
487         <temporalrelationshipi>finishtostart</temporalrelationshipi>
488         <relatedto>
489             <uid>20959BC664CA650E933C892C@example.com</uid>
490         </relatedto>
491         <gap>
492             <xcal:duration>
493                 <xcal:duration>T10M</xcal:duration>
494             </xcal:duration>
495         </gap>
496     </x-wscalendarrelation>
497 </properties>
498 </vtodo>

```

499

```
</components>
```

500 In this example, the Intervals are one hour, 15 minutes, and 30 minutes long. There is a ten minute period  
501 between the second and third periods.

### 502 3.4.1 Anchoring a Sequence

503 A Sequence becomes an Anchored Sequence whenever a single Interval within the Sequence is  
504 Anchored. An Interval is Anchored when it has a specific starting date and time (dtstart).

505 *Example 3—4: A Scheduled Sequence*

```
506 <components>
507 <vtodo>
508   <properties>
509     <x-wscalendartype>Interval</x-wscalendartype>
510     <xcal:uid>
511       <xcal:text>10959BC664CA650E933C892C@example.com</xcal:text>
512     </xcal:uid>
513     <xcal:description>
514       <xcal:text>First Interval in Sequence</xcal:text>
515     </xcal:description>
516     <dtstart>2010-09-11T13:00</dtstart>
517     <xcal:duration>
518       <xcal:duration>T1H</xcal:duration>
519     </xcal:duration>
520   </properties>
521 </vtodo>
522 <vtodo>
523   <properties>
524     <x-wscalendartype>Interval</x-wscalendartype>
525     <xcal:uid>
526       <xcal:text>20959BC664CA650E933C892C@example.com</xcal:text>
527     </xcal:uid>
528     <xcal:description>
529       <xcal:text>Second Interval in Sequence</xcal:text>
530     </xcal:description>
531     <xcal:duration>
532       <xcal:duration>T15M</xcal:duration>
533     </xcal:duration>
534     <x-wscalendarrelation>
535
536     <temporalrelationshiptype>finishtostart</temporalrelationshiptype>
537     <relatedto>
538       <uid>10959BC664CA650E933C892C@example.com</uid>
539     </relatedto>
540   </x-wscalendarrelation>
541 </properties>
542 </vtodo>
543 </components>
```

544 Note that the entire Sequence is Anchored when a single Interval within the Sequence is Anchored.

### 545 3.5 State Changes

546 A common service interaction is to request that, at a certain time, a discrete state change will occur. It  
547 could be that the price will rise. It could be that a report will be run. Such a communication has no logical  
548 Duration. WS-Calendar communicates state changes through use of an Interval with the Duration  
549 explicitly set to zero time. Because the Duration is explicit, it will not be over-ridden through inheritance.

550 Specifications that incorporate WS-Calendar SHALL defined the business meaning of zero duration  
551 Intervals.

## 4 Service Characteristics: Payloads & Performance

552

553 While iCalendar expresses time and intervals, WS-Calendar associates those intervals with specific  
554 services and service performance characteristics. In iCalendar components, the ATTACH component is  
555 used to include information outside the scope of traditional Calendar services. WS-Calendar extends the  
556 ATTACH element to support payloads developed in other specifications. WS-Calendar also defines a new  
557 class of parameters for iCalendar components that specify the temporal performance requirements of the  
558 service.

### 4.1 Attachment and the Artifact

560 The WS-Calendar ATTACH component supports including or referencing an informational payload. This  
561 payload is something that is or can be provided over an Interval, or whose service qualities vary over  
562 several intervals. As the Technical Committee cannot know all the specifications that may incorporate  
563 WS-Calendar, this specification cannot discuss the contents of this payload. WS-Calendar does expect,  
564 however, that these payloads will respect and extend the inheritance and conformance rules herein  
565 specified.

566 The payload may be in-line, i.e., contained within the ATTACH element, object, or it may be found in  
567 another section of the same XML object, sharing the same message as WS-Calendar element, or it may  
568 be discovered by external reference. ATTACH, then, are used to request “perform as described here”, or  
569 “perform as described below”, or “perform as described elsewhere.”

570 The ATTACH element in WS-Calendar has three elements as below.

571 *Table 4-1: Elements of a WS-Calendar Attachment*

Attachment Element	Use	Discussion
<b>artifact</b>	any in-line XML (xs:any) <i>Optional</i> . An attachment must have at least one artifact or reference	Unevaluated container for payload describing service.
<b>reference</b>	[XPOINTER] <i>Optional</i> An attachment must have at least one of artifact or reference	Points to external XML, or XML located elsewhere in document

572 When a WS-Calendar reference uses an external reference to specify a service, that reference is an  
573 object of the type [XPOINTER] (see section 1.2)..[XPOINTER] is a general purpose URI and XML  
574 traversal standard. This [XPOINTER] object is in the named data element “Reference.”

575 *Example 4—1: Use of an Attachment with inline XML artifact*

```
576 <vtodo>  
577   <properties>  
578     <x-wscalendartype>Interval</x-wscalendartype>  
579     <xcal:uid>  
580       <xcal:text>00959BC664CA650E933C892C@example.com</xcal:text>  
581     </xcal:uid>  
582     <xcal:description>  
583     <xcal:text>Sample Contract</xcal:text></xcal:description>  
584     <attach>  
585       <artifact>  
586         <emix-wip>  
587           <price>8.45</price>  
588           <quantity>8.45</quantity>  
589         </emix-wip>  
590       </artifact/>
```

```

591     </attach>
592   </properties>
593 </vtodo>

```

594 The Artifact is of type xs:any, allowing compliant XML from any namespace to be submitted as a payload.  
 595 Per the conformance rules, the payload should be Fully Bound before evaluation.

596 *Example 4—2: Use of an Attachment with external reference*

```

597 <vtodo>
598   <properties>
599     <x-wscalendartype>Interval</x-wscalendartype>
600     <xcal:uid>
601       <xcal:text>00959BC664CA650E933C892C@example.com</xcal:text>
602     </xcal:uid>
603     <xcal:description>
604       <xcal:text>Sample Contract</xcal:text></xcal:description>
605     <attach>
606       <reference>http://scheduled.ws-calendar-
607         service.com/contract1</reference>
608     </attach>
609   </properties>
610 </vtodo>

```

611

## 612 4.2 Specifying Timely Performance

613 WS-Calendar elements adapt the iCalendar objects to make interaction requirements explicit. For  
 614 example, in human schedule interactions, different organizations have their own expectations. Meetings  
 615 may start on the hour or within 5 minutes of the hour. As agents scheduled in those organizations, people  
 616 learn the expected precision. In WS-Calendar, that precision must be explicit to prevent interoperation  
 617 problems.

618 Service coordination between systems requires precise communication about expectation for the  
 619 timeliness of performance. WS-Calendar defines performance parameters that can be added to any  
 620 iCalendar component to make explicit the performance expectations within a scheduled event.  
 621 Performance expectations can be set for each Interval or for an entire Sequence.

622 The Performance component refines the meaning of time-related service communication. All elements of  
 623 the Performance object use the Duration element as defined in [RFC5545].

624 *Table 4-2: Performance Characteristics*

Performance Characteristic	Definition	Discussion
<b>startBeforeTolerance</b>	A Duration enumerating how far before the requested start time the requested service may commence.	Indicates if a service that begins at 1:57 is compliant with a request to start at 2:00
<b>startAfterTolerance</b>	A Duration enumerating how far after the requested start time the requested service may commence.	Indicates if a service that begins at 2:01 is compliant with a request to start at 2:00
<b>endBeforeTolerance</b>	A Duration enumerating how far before scheduled end time may end.	Indicates if a service that ends at 1:57 is compliant with a request to end at 2:00

Performance Characteristic	Definition	Discussion
<b>endAfterTolerance</b>	A Duration enumerating how far after the scheduled end time the requested service may commence.	Indicates if a service that ends at 2:01 is compliant with a request to end at 2:00
<b>durationLongTolerance</b>	A Duration indicating by how much the performance Duration may exceed the Duration specified in the Interval . It may be 0.	Used when run time is more important than start and stop time. DurationLongTolerance SHALL NOT be used when Start and End Tolerances are both specified.
<b>durationShortTolerance</b>	A Duration indicating by how much the performance Duration may fall short of Duration specified in the Interval . It may be 0.	Used when run time is more important than start and stop time. DurationShortTolerance SHALL NOT be used when Start and End Tolerances are both specified.
<b>granularity</b>	A Duration enumerating the smallest unit of time measured or tracked	Whatever the time tolerance above, there is some minimum time that is considered insignificant. A Granularity of 1 second defines the tracking and reporting requirements for a service.

625 Performance is part of the core WS-Calendar service definition. Similar prodUTCs or services, identical  
626 except for different Performance characteristics may appear in different markets. Performance  
627 characteristics influence the price offered and the service selected.

628 Note that Performance object does not indicate time, but only Duration. A performance object associated  
629 with an unscheduled Interval does not change when that Interval is scheduled.

630 The Performance object is an optional component of each WS-Calendar attachment.

631 *Example 4—3: Performance Component*

```

632 <attach>
633   <uri>http://scheduled.ws-calendar-service.com/contract1</uri>
634   <performance>
635     <properties>
636       <startbeforetolerance>
637         <duration>
638           <duration>T10M</duration>
639         </duration>
640       </startbeforetolerance>
641       <startaftertolerance>
642         <duration>
643           <duration>T0M</duration>
644         </duration>
645       </startaftertolerance>
646       <durationlongtolerance>
647         <duration>
648           <duration>T0M</duration>
649         </duration>
650       </durationlongtolerance>
651       <durationshorttolerance>
652         <duration>
653           <duration>T0M</duration>
654         </duration>
655       </durationshorttolerance>
656     </properties>

```

```
657     </performance>
658 </attach>
```

659 In the example, the service can start as much as 10 minutes earlier than the scheduled time, and must  
660 start no later than the scheduled time. Whenever the service starts, the service must execute for exactly  
661 the Duration indicated.

662 Generally, the implementer should refrain from expressing unnecessary or redundant performance  
663 characteristics.

### 664 4.3 Expressing Service and Performance

665 Services, references and performance each appear in the examples below

666 *Example 4—4: Interval with inline XML artifact and optional specified Performance*

```
667 <vtodo>
668   <properties>
669     <x-wscaledartype>Interval</x-wscaledartype>
670     <xcal:uid>
671       <xcal:text>00959BC664CA650E933C892C@example.com</xcal:text>
672     </xcal:uid>
673     <xcal:description>
674       <xcal:text>Sample Contract</xcal:text></xcal:description>
675     <attach>
676       <artifact>
677         <emix-wip>
678           <price>8.45</price>
679           <quantity>8.45</quantity>
680         </emix-wip>
681       </artifact/>
682       <performance>
683         <properties>
684           <startbeforetolerance>
685             <duration>
686               <duration>T10M</duration>
687             </duration>
688           </startbeforetolerance>
689           <startaftertolerance>
690             <duration>
691               <duration>T0M</duration>
692             </duration>
693           </startaftertolerance>
694         </properties>
695       </performance>
696     </attach>
697   </properties>
698 </vtodo>
```

699 *Example 4—5: Interval with external reference and optional specified performance*

```
700 <vtodo>
701   <properties>
702     <x-wscaledartype>Interval</x-wscaledartype>
703     <xcal:uid>
704       <xcal:text>00959BC664CA650E933C892C@example.com</xcal:text>
705     </xcal:uid>
706     <xcal:description>
707       <xcal:text>Sample Contract</xcal:text></xcal:description>
708     <attach>
709       <reference>http://scheduled.ws-calendar-
710         <reference>service.com/contract1</reference>
```

```
711         <performance>
712             <properties>
713                 <startbeforetolerance>
714                     <duration>
715                         <duration>T10M</duration>
716                     </duration>
717                 </startbeforetolerance>
718                 <startaftertolerance>
719                     <duration>
720                         <duration>T0M</duration>
721                     </duration>
722                 </startaftertolerance>
723             </properties>
724         </performance>
725     </attach>
726 </properties>
727 </vtodo>
```

---

## 5 Using Sequences: referencing, modifying, and remote access

728

729

730 Sequences can define specific progressions of performance or state within a wide range of services and  
731 specifications. They become more useful as they can be re-used or modified. A Sequence that is not fully  
732 specified can be adapted and re-used without re-statement. An abstract Sequence can become a service  
733 through iterative referencing.

734 As a Sequence is reified through reference, WS-Calendar specifies how additional information is applied  
735 or not applied to each Interval through a chain of references. We refer to this process as inheritance.  
736 Derivative specification can take advantage of inheritance by defining specific rules that conform to the  
737 WS-Calendar inheritance pattern.

738 This section describes how to create references to Sequences, including remote references, the rules  
739 that allow schedule-related information to become more complete through those references, and how to  
740 specify conforming rules in derivative specifications.

### 741 5.1 References and Inheritance.

742 Sequences are composed of Intervals for which a set of temporal relations have been defined.  
743 **[RFC5545]** also defines the “parent”, “child” and “sibling” relationships, in which one component  
744 references another by UID. In WS-Calendar, we reference a Sequence by creating a relationship with any  
745 single Interval in the Sequence. We refer to the Interval within a Sequence that has this relationship as  
746 the Designated Interval.

747 Wherever there is “missing” information in the Designated Interval, it can be inherited is inherited from the  
748 referring component; we use the “parent” relationship to reference the designated Interval. These  
749 references may be local or remote. Some, but not all, of the information can be inherited by the other  
750 Intervals in the Sequence. Adding additional references can further specify information in the Sequence  
751 through inheritance; these additional references created by specifying an additional component that has a  
752 parent relation to the previous referring component. In this way, we can create a grand-parent and a great  
753 grand-parent.

754 Each parent bequeaths information to its child. A child inherits this information in accord with the  
755 inheritance rules. If the child is itself a parent, it bequeaths its information, the bound result of its internal  
756 information and its inheritance, to its child. Information to complete the specification of a Sequence flows  
757 in this way from parent to child, from the outer reference to the inner Sequence.

758 Inheritance by the designated Interval is governed by slightly different inheritance rules than the other  
759 Intervals in the Sequence. In particular, only the designated Interval can inherit the start date and time  
760 from its parent. The starting date and times if other Intervals in a Sequence are computed using the  
761 temporal relationships within the Sequence. Other information can be inherited by all Intervals in a  
762 Sequence. Full inheritance rules are specified at [reference].

763 The referring components are named Gluons. In physics, gluons are particles that affect the exchanges of  
764 force between quarks, but are not themselves quarks. By analogy, WS-Calendar Gluons affect the  
765 referencing and binding of Intervals in a Sequence, but are not themselves Intervals or part of  
766 Sequences. Because Intervals can inherit almost any property from a Gluon, Gluons must contain most of  
767 the same information elements as Intervals. Because Intervals can contain information payloads for  
768 specifications that use WS-Calendar, and these payloads can inherit information from gluons in the same  
769 way Intervals do, Gluons must be able to contain information payloads from those specifications as well.  
770 Gluons are described in the next section.

771 **5.1.1 Introducing the Gluon**

772 WS-Calendar Gluons are used to referencing and bind the Intervals in a Sequence, but are not  
 773 themselves Intervals or part of Sequences. Gluons must contain most of the same information elements  
 774 as Intervals, because Intervals can inherit almost any property from a Gluon. When Intervals are used in  
 775 other specifications, they contain payloads for that are not defined in WS-Calendar. Gluons can also hold  
 776 the same payloads, and conforming specifications MUST define inheritance rules that govern inheritance  
 777 within these payloads. Conformance rules, including those for inheritance conformance, are discussed in  
 778 section 17 *Conformance and Rules for WS-Calendar and Referencing Specifications*.

779 The WS-Calendar Gluon is in essence an the Interval component profiled down to minimal elements for  
 780 which inheritance rules defined, and able to carry a conforming informational payload. (See Appendix  
 781 *Overview of WS-Calendar, its Antecedents and its Use*) Calendar Gluons use iCalendar relations to apply  
 782 service information to Sequences.

783 *Table 5-1: Calendar Gluon elements in WS-Calendar*

Calendar Gluon Element	Use	Discussion
<b>dtStamp</b>	[XCAL]:dtstamp <i>Mandatory</i>	Time and date that Calendar Gluon object was created
<b>Uid</b>	<i>Mandatory</i>	Used to enable unambiguous referencing of each VTODO object
<b>Summary</b>	Text <i>Optional</i>	Text describing the Calendar Gluon
<b>child</b>	As defined in <b>[RFC5998]</b> Parent	A Calendar Gluon must have a link to at least one child.
<b>dtStart</b>	dateTime Start time for the related Interval of the Sequence. <i>Optional</i>	An Calendar Gluon may either have a dtStart or a dtEnd, but may not have both.
<b>dtEnd</b>	DateTime. Scheduled completion time for the related Interval of the Sequence. <i>Optional</i>	An Calendar Gluon may either have a dtStart or a dtEnd, but may not have both.
<b>duration</b>	Duration <i>Optional</i>	If specified, a Duration is inherited by all Intervals in the referred-to Sequence,
<b>attach</b>	WSCalendar:Attachment <i>Optional</i>	The Attach contains the informational payload used by incorporating specifications. Defined in section 4..
<b>Availability</b>	Vavailability, <i>Optional</i>	Provides information as to when information the service can or cannot be offered.

784 Because the properties of the Calendar Gluon are bequeathed to the child Sequence, they can stand for  
 785 the elements in any Interval in the Sequence, as defined in the Conformance Section. An inherited

786 element can even serve as a substitute for an Interval mandatory element. For example, Duration is  
787 mandatory for all Intervals. Intervals are able to inherit Duration from a parent. A single Duration in the  
788 Parent can be inherited by each Interval in a Sequence. In this way, a Sequence in which every Interval  
789 does not have a Duration, could be made complete through inheritance. If one of those Intervals does  
790 include a Duration, the Bound Duration would be its own, rather than that it inherited from a Parent of the  
791 Sequence.

## 792 5.1.2 Availability

793 One use for gluons is to expose a Sequence for remote invocation. The service offered may be  
794 sometimes unavailable. WS-Calendar incorporates the iCalendar extension **[Vavailability]**.

795 It is likely that the service requester is aware only of when he wants the service and for how long. These  
796 are properties of the Designated Interval. Availability will be interpreted as a filter on the Designated  
797 Interval, but on no others.

## 798 5.1.3 Calendar Gluons and Sequences

799 Calendar Gluons express common service requirements for an entire Sequence. If a Gluon is parent to  
800 an Interval in a Sequence, then the Gluon's Attachment expresses service attributes inheritable by all  
801 Intervals in the Sequence.

802 In this example, the Sequence in the previous example is expressed using a Calendar Gluon.

803 *Example 5—1: Sequence with Performance defined in the Calendar Gluon*

```
804 <components>

944 </vtodo>
945 </components>

```

946 Note that the performance expectations, identical for each Interval, have moved into the Calendar Gluon.  
947 Not also that while the duration for all Intervals in the partition is set in the Calendar Gluon, Interval 3  
948 overrides that with a half hour duration assigned locally. This Calendar Gluon happens to be related to  
949 the first Interval in the Sequence; there are specific use cases (discussed below) which require it to be  
950 linked to other Intervals.

## 951 5.2 Inheritance rules for Calendar Gluons

952 In general, the rules that anything specified in the Parent Calendar Gluon applies to each Child. The  
953 Parent of an Interval in a Sequence is parent to all Intervals in the Sequence. As a Sequence creates  
954 single temporal relationship, assigning a start time (dtstart) to any Interval allows computation of the  
955 starting time for any of them.

956 *Table 5-2 Gluon Inheritance rules*

Attribute	Inheritance Rules
<b>General</b>	A Interval or Calendar Gluon inherits its attributes through it's the parent. Local specification of an attributes overrides any inheritance.
<b>Duration</b>	Follows general rules
<b>Temporal Relation</b>	Relationship Type and Gap only are inherited. Either may be overridden locally. To specify no gap when a parent specifies a gap, an explicit zero duration gap must be specified. Related-to is not inherited.
<b>Performance</b>	Performance is either inherited intact or overridden completely. There are no rules for recombining partial Performance objects through inheritance.
<b>Artifacts</b>	Artifacts hold payload from other specifications. Elements within Artifacts are inherited in accord with the rules in those specifications, which must be consistent the inheritance rules in WS-Calendar. Artifacts are evaluated for completeness and conformance only after processing inheritance.
<b>Schedules</b>	Schedules, i.e., the start date and time, are inherited only by the designated Interval. The start date and times of other Intervals are computed by reference to the designated Interval. Between the Gluon bequeathing a schedule and the Designated Interval, an intervening Gluon may set availability. It is up to the application or to the specification incorporating WS-Calendar to assert whether an Interval that is outside the availability is conforming or not.
<b>Availability</b>	Availability communicates restrictions on when a service is offered. Service availability is interpreted for the Designated Interval only. If there are two availability objects, they are evaluated for the union of the two availabilities. For example, if I am available all week from 2:00 to 6:00 in one, and available all day Tuesday in the other, then after inheritance, there remains only 2:00 to 6:00 on Tuesday,

### 957 5.3 Optimizing the expression of a Partition

958 Partitions are Sequences composed of consecutive Intervals. A Partition can be further optimized by  
959 bringing the relationship into the Gluon. Notice that while the type of the relationship is defined in the  
960 Calendar Gluon, the Temporal Relation for each Interval must still be expressed within the Interval.

961 *Example 5—2: Partition with Duration and Performance defined in the Calendar Gluon*

```

962 <components>

```

1093 This Partition shows a school schedule in which classes start one hour apart. Each class is for 50  
1094 minutes, and there is a 10 minute gap between each as students move between classes. Classes may  
1095 not begin before the schedule, but they may start up to five minutes late.

1096 Stripped of all annotations, this can be expressed as follows:

1097 *Example 5—3: Partition without annotations*

```

## 1240 5.4 Mixed Inheritance of Start Time

1241 A Sequence has not been scheduled until it has both a start time and a start date. Start time and date  
1242 SHALL be expressed together when all components are in a single communication. Time and Date MAY  
1243 be separated when the full Sequence and schedule are created by reference.

1244 To illustrate this, here is the classroom scheduling Partition from Example 5—3, updated to include each  
1245 day's school opening.

1246 *Example 5—5: Partition with Duration and Performance defined in the Calendar Gluon*

```

1247 <components>
1248 <x- calendargluon>
1249     <properties>
1250         <x-wscalendartype>CalendarGluon</x-wscalendartype>
1251         <xcal:uid>
1252             <xcal:text>
1253                 90959BC664CA650E933C892C@invokingexample.com
1254             </xcal:text>
1255         </xcal:uid>

1360 <components>
1361

```

1362 In the example above, a general purpose classroom calendar has been created and advertised with an  
1363 URL. The class day always starts at 9:00. The referring Calendar Gluon scheduled a particular instance  
1364 of this Sequence for Monday, September 13.

1365 This double inheritance, in which a Sequence inherits from a Calendar Gluon which inherits from a  
1366 Calendar Gluon is a useful pattern for scheduling an advertised service.

## 1367 5.5 Other Scheduling Scenarios

1368 Sometimes, the invoker of a service is interested only in single Interval of the Sequence, but the entire  
1369 Sequence is required. In the example below, the second Interval is advertised, i.e., the Calendar Gluon  
1370 points to the second Interval. The first Interval might be a required ramp-period, during which the  
1371 underlying process is “warming up”, and which may bring some lesser service to market during that ramp  
1372 time. The ramp-down time at the end is similarly fixed. The entire Service offering is represented by the  
1373 exposed (it has a public URI) Calendar Gluon.

1374 *Example 5—6: Standard Sequence with Ramp-Up and Ramp Down*

```

1375 <components>
1376 <x-calendargluon>
1377     <properties>
1378         <x-wscalendarartype>CalendarGluon</x-wscalendarartype>

1538

1539

## 7 Time Stamps

1540 Time stamps are used everywhere in inter-domain service performance analysis and have particular use  
1541 in smart grids to support event forensics. Time stamps are often assembled and collated from events  
1542 across multiple time zones and from multiple systems.

1543 Different systems may track time and therefore record events with different levels of Tolerance. It is not  
1544 unusual for a time stamp from a domain with a low Tolerance to appear to have occurred after events  
1545 from a domain with high-Tolerance time-stamps that it caused. A fully qualified time-stamp includes the  
1546 granularity measure.

1547 *Table 7-1: Aspects of Time Stamps*

Time Stamp Element	Definition (Normative)	Note (Non-Normative)
<b>timestamp</b>	WS-Calendar:time A fully qualified date and time of event. Mandatory.	May include two objects as defined above.
<b>precision</b>	A Duration defining the accuracy of the TimeStamp value. Mandatory.	Identifies whether one hour Interval is indeed one hour or plus or minus some number of milliseconds, seconds and minutes.
<b>timeStampRealm</b>	Of type Uri, shall identify the system where the TimeStamp value originated. The value of this element shall be set by: <ul style="list-style-type: none"> <li>• The component at the realm border in a particular inter-domain interaction or,</li> <li>• By any component able to accurately set it within a system or sub-system.</li> </ul> In the latter case, nothing prevents the component at the realm border to overwrite it without any notice. Optional.	A set of points originating from the same realm are reasonably synchronized. Within a realm, one can assume that time-stamped objects sorted by time are in the order of their occurrence. Between realms, this assumption is rebuttable.  A system border is crossed in an interaction when the 2 communication partners are not synchronized based on the same time source.  See the example below for more information.
<b>leapSecondsKnown</b>	Xs:bool If True, shall indicate that the TimeStamp value takes into account all leap seconds occurred. Otherwise False. Optional.	Indicates that the time source of the sending device support leap seconds adjustments.

Time Stamp Element	Definition (Normative)	Note (Non-Normative)
<b>clockFailure</b>	xs:boolean If True, shall indicate a failure on the time source preventing the TimeStamp value issuer from setting accurate timestamps. Otherwise False. Mandatory.	Indicates that the time source of the sending device is unreliable. The timestamp should be ignored.
<b>clockNotSynchronized</b>	xs:boolean If True, shall indicate the time source of the TimeStamp value issuer is not synchronized correctly, putting in doubt the accuracy of the timestamp. Mandatory.	Indicates that the time source of the sending device is not synchronized with the external UTC time source.
<b>timeSourceAccuracy</b>	A Duration defining the accuracy of the time source used in the TimeStampRealm system. Optional.	Represents the time accuracy class of the time source of the sending device relative to the external UTC time source.

### 1548 7.1.1 Time Stamp Realm Discussion

1549 Within a single system, or synchronized system of systems, one can sort the temporal order of event by  
1550 sorting them by TimeStamp. Determining the order of events is the first step of event forensics. This  
1551 assumption does not apply when events are gathered across systems.

1552 Different systems may not have synchronized time, or may synchronize time against different sources.  
1553 This means different system clocks may drift apart. It may be that a later timestamp from one system  
1554 occurred before an earlier timestamp in another. As this drift is unknown, it cannot be automatically  
1555 corrected for without additional information.

1556 The TimeStampRealm element identifies which system created an event time-stamp. The  
1557 TimeStampRealm identifies a source system in inter-domain interactions (a system of systems). For  
1558 example: <http://SystemA.com> and <http://SystemB.com> identify 2 systems. This example assumes  
1559 SystemA and SystemB do not have a common time source.

1560 The TimeStampRealm can also be used to identify sub-systems in intra-domain interactions (sub-systems  
1561 of a system). For example: <http://SystemA.com/SubSystem1> and <http://SystemA.com/SubSystem2>  
1562 identify 2 subsystems of the same higher level system. In case the upper level SystemA does not have a  
1563 global time source for synchronizing all of its sub-system, it can be useful to identify sub-systems in such  
1564 a way.

1565

---

## 8 Calendar Services

1566

1567 The Service interactions are built upon and make the same assumptions about strUTCure as the CalDAV  
1568 protocol defined in [RFC4791] and related specifications. It does NOT require nor assume the WebDAV  
1569 nor CalDAV protocol but does make use of some of the same elements and strUTCures in the CalDAV  
1570 XML namespace.

1571 Calendar resources, for example events and tasks are stored as named resources (files) inside special  
1572 collections (folders) known as "**Calendar Collections**".

1573 These services can be looked upon as a layer built on top of CalDAV and defines the basic operations  
1574 which allow creation, retrieval, update and deletion. In addition, query, and free-busy operations are  
1575 defined to allow efficient, partial retrieval of calendar data.

1576 These services assume a degree of conformity with CalDAV is established such that services built in that  
1577 manner do not have a significant mismatch. It is assumed that some WS-Calendar services will be built  
1578 without any CalDAV support.

### 1579 8.1 Overview of the protocol

1580 The protocol is an HTTP based RESTfull protocol using a limited set of methods. Each request may be  
1581 followed by a response containing status information.

1582 The following methods are specified in the protocol description, PUT, POST, GET, DELETE. To avoid  
1583 various issues with certain methods being blocked clients may use the X-HTTP-Method-Override: header  
1584 to specify the intended operation. Servers SHOULD behave as if the named method was used.

```
1585     POST /user/fred/calendar/ HTTP/1.1  
1586     ...  
1587     X-HTTP-Method-Override: PUT  
1588     Properties
```

1589 A service or resource will have a number of properties which describe the current state of that service or  
1590 resource. These properties are accessed through a GET on the target resource or service with an  
1591 ACCEPT header specifying application/xrd+xml. See Section 8.1.3.6

1592 The following operations are defined by this specification:

- 1593 • Retrieval and update of service and resource properties
- 1594 • Creation of a calendar object
- 1595 • Retrieval of a calendar object
- 1596 • Update of a calendar object
- 1597 • Deletion of a calendar object
- 1598 • Query
- 1599 • Free-busy query

#### 1600 8.1.1 Calendar Object Resources

1601 The same restrictions apply to Calendar Object Resources as specified in CalDAV [RFC4791] section  
1602 4.2. An additional constraint for CalWS is that no timezone specifications are transferred.

#### 1603 8.1.2 Timezone information

1604 It is assumed that the client and server each have access to a full set of up to date timezone information.  
1605 Timezones will be referenced by a timezone identifier from the full set of Olson data together with a set of

1606 well-known aliases defined [TZDB]. CalWS services may advertise themselves as timezone servers  
1607 through the server properties object.

### 1608 **8.1.3 Issues not addressed by this specification.**

1609 A number of issues are not addressed by this version of the specification, either because they should be  
1610 addressed elsewhere or will be addressed at some later date.

#### 1611 **8.1.3.1 Access Control**

1612 It is assumed that the targeted server will set an appropriate level of access based on authentication. This  
1613 specification will not attempt to address the issues of sharing or Access Control Lists (ACLs).

#### 1614 **8.1.3.2 Provisioning**

1615 The protocol will not provide any explicit provisioning operations. If it is possible to authenticate or  
1616 address a principal's calendar resources then they MUST be automatically created if necessary or  
1617 appropriate

#### 1618 **8.1.3.3 Copy/Move**

1619 These operations are not yet defined for this version of the CalWS protocol. Both operations raise a  
1620 number of issues. In particular implementing a move operation through a series of retrievals, insertions  
1621 and deletions may cause undesirable side-effects. Both these operations will be defined in a later version  
1622 of this specification.

#### 1623 **8.1.3.4 Creating Collections**

1624 We will not address the issue of creating collections within the address space. The initial set is created by  
1625 provisioning.

#### 1626 **8.1.3.5 Retrieving collections**

1627 This operation is currently undefined. A GET on a collection may fail or return a complete calendar object  
1628 representing the collection.

#### 1629 **8.1.3.6 Setting service and resource properties.**

1630 These operations are not defined in this version of the specification. In the future it will be possible to  
1631 define or set the properties for the service or resources within the service.

### 1632 **8.1.4 CalWS Glossary**

#### 1633 **8.1.4.1 Hrefs**

1634 An href is a URI reference to a resource, for example

1635 `"http://example.org/user/fred/calendar/event1.ics".`

1636 The URL above reflects a possible strUTCure for a calendar server. All URLs should be absolute or path-  
1637 absolute following the rules defined in RFC4918 Section 8.3.

#### 1638 **8.1.4.2 Calendar Object Resource**

1639 A calendar object resource is an event, meeting or a task. Attachments are resources but NOT calendar  
1640 object resources. An event or task with overrides is a single calendar resource entity.

1641 **8.1.4.3 Calendar Collection**

1642 A folder only allowed to contain calendar object resources.

1643 **8.1.4.4 Scheduling Calendar Collection**

1644 A folder only allowed to contain calendar resources which is also used for scheduling operations.  
1645 Scheduling events placed in such a collection will trigger implicit scheduling activity on the server.

1646 **8.1.4.5 Principal Home**

1647 The collection under which all the resources for a given principal are stored. For example, for principal  
1648 "fred" the principal home might be "/user/fred/"

1649 **8.2 Error conditions**

1650 Each operation on the calendar system has a number of pre-conditions and post-conditions that apply.  
1651 A "precondition" for a method describes the state of the server that must be true for that method to be  
1652 performed. A "post-condition" of a method describes the state of the server that must be true after that  
1653 method has been completed. Any violation of these conditions will result in an error response in the form  
1654 of a CalWS XML error element containing the violated condition and an optional description. \  
1655 Each method specification defines the preconditions that must be satisfied before the method can  
1656 succeed. A number of post-conditions are generally specified which define the state that must exist after  
1657 the execution of the operation. Preconditions and post-conditions are defined as error elements in the  
1658 CalWS XML namespace.

1659 **8.2.1 Example: error with CalDAV error condition**

```
1660 <?xml version="1.0" encoding="utf-8"  
1661     xmlns:CW="Error! Reference source not found."  
1662     xmlns:C="urn:ietf:params:xml:ns:caldav" ?>  
1663 <CW:error>  
1664   <C:supported-filter>  
1665     <C:prop-filter name="X-ABC-GUID"/>  
1666   </C:supported-filter>  
1667   <CW:description>Unknown property </CW:description>  
1668 </CW:error>
```

1669

## 9 Properties and link relations

1670

### 9.1 Property and relation-type URIs

1671 In the XRD entity returned properties and related services and entities are defined by absolute URIs  
1672 which correspond to the extended relation type defined in **[web linking]** Section 4.2. These URIs do NOT  
1673 correspond to any real entity on the server and clients should not attempt to retrieve any data at that  
1674 target.

1675 Certain of these property URIs correspond to CalDAV preconditions. Each URL is prefixed by the CalWS  
1676 relations and properties namespace `http://docs.oasis-open.org/ns/wscal/calws`. Those properties which  
1677 correspond to CalDAV properties have the additional path element "caldav/", for example

1678 `http://docs.oasis-open.org/ns/wscal/calws/caldav/supported-calendar-data`

1679 corresponds to

1680 `CalDAV:supported-calendar-data`

1681 In addition to those CalDAV properties, the CalWS specification defines a number of other properties and  
1682 link relations with the URI prefix of `http://docs.oasis-open.org/ns/wscal/calws`.

1683

### 9.2 supported-features property.

1684

`http://docs.oasis-open.org/ns/wscal/calws/supported-features`

1685 This property defines the features supported by the target. All resources contained and managed by the  
1686 service should return this property. The value is a comma separated list containing one or more of the  
1687 following

- 1688 • calendar-access - the service supports all MUST requirements in this specification

1689 `<Property type="http://docs.oasis-open.org/ns/wscal/calws/supported-features"`  
1690 `>calendar-access</Property>`

1691

### 9.3 max-attendees-per-instance

1692

`http://docs.oasis-open.org/ns/wscal/calws/max-attendees-per-instance`

1693

Defines the maximum number of attendees allowed per event or task.

1694

### 9.4 max-date-time

1695

`http://docs.oasis-open.org/ns/wscal/calws/max-date-time`

1696

Defines the maximum date/time allowed on an event or task

1697

### 9.5 max-instances

1698

`http://docs.oasis-open.org/ns/wscal/calws/max-instances`

1699

Defines the maximum number of instances allowed per event or task

1700

### 9.6 max-resource-size

1701

`http://docs.oasis-open.org/ns/wscal/calws/max-resource-size`

1702

Provides a numeric value indicating the maximum size of a resource in octets that the server is willing to  
1703 accept when a calendar object resource is stored in a calendar collection.

## 1704 9.7 min-date-time

1705 <http://docs.oasis-open.org/ns/wscal/calws/min-date-time>

1706 Provides a DATE-TIME value indicating the earliest date and time (in UTC) that the server is willing to  
1707 accept for any DATE or DATE-TIME value in a calendar object resource stored in a calendar collection.

## 1708 9.8 description

1709 <http://docs.oasis-open.org/ns/wscal/calws/description>

1710 Provides some descriptive text for the targeted collection.

## 1711 9.9 timezone-service relation.

1712 <http://docs.oasis-open.org/ns/wscal/calws/timezone-service>

1713 The location of a timezone service used to retrieve timezone information and specifications. This may be  
1714 an absolute URL referencing some other service or a relative URL if the current server also provides a  
1715 timezone service.

```
1716 <Link rel="http://docs.oasis-open.org/ns/wscal/calws/calws/timezone-service"  
1717 href="http://example.com/tz" />
```

## 1718 9.10 principal-home relation.

1719 <http://docs.oasis-open.org/ns/wscal/calws/principal-home>

1720 Provides the URL to the user home for the currently authenticated principal.

```
1721 <Link rel="http://docs.oasis-open.org/ns/wscal/calws/principal-home"  
1722 href="http://example.com/user/fred" />
```

## 1723 9.11 current-principal-freebusy relation.

1724 <http://docs.oasis-open.org/ns/wscal/calws/current-principal-freebusy>

1725 Provides the URL to use as a target for freebusy requests for the current authenticated principal.

```
1726 <Link rel="http://docs.oasis-open.org/ns/wscal/calws/current-principal-freebusy"  
1727 href="http://example.com/freebusy/user/fred" />
```

## 1728 9.12 principal-freebusy relation.

1729 <http://docs.oasis-open.org/ns/wscal/calws/principal-freebusy>

1730 Provides the URL to use as a target for freebusy requests for a different principal.

```
1731 <Link rel="http://docs.oasis-open.org/ns/wscal/calws/principal-freebusy"  
1732 href="http://example.com/freebusy" />
```

## 1733 9.13 child-collection relation.

1734 <http://docs.oasis-open.org/ns/wscal/calws/child-collection>

1735 Provides information about a child collections for the target. The href attribute gives the URI of the  
1736 collection. The element should only have CalWS child elements giving the type of the collection, that is  
1737 the CalWS:collection link property and the CalWS-calendar-collection link property. This allows clients to  
1738 determine the strUTCure of a hierarchical system by targeting each of the child collections in turn.

1739 The xrd:title child element of the link element provides a description for the child-collection.

```
1740 <Link rel="http://http://docs.oasis-open.org/ns/wscal/calws/child-collection"  
1741 href="http://example.com/calws/user/fred/calendar">  
1742 <Title xml:lang="en">Calendar</Title>
```

1743  
1744  
1745  
1746  
1747  
1748

```
<Property type="http://docs.oasis-open.org/ns/wscal/calws/collection"
  xsi:nil="true" />
<Property type="http://docs.oasis-open.org/ns/wscal/calws/calendar-
collection"
  xsi:nil="true" />
</Link>
```

## 1749 9.14 created link property

1750

<http://docs.oasis-open.org/ns/wscal/calws/created>

1751 Appears within a link relation describing collections or entities. The value is a date-time as defined in  
1752 **RFC3339** Section 5.6

1753  
1754

```
<Property type="http://docs.oasis-open.org/ns/wscal/calws/created"
  >1985-04-12T23:20:50.52Z</Property>
```

## 1755 9.15 last-modified property

1756

<http://docs.oasis-open.org/ns/wscal/calws/last-modified>

1757 Appears within an xrd object describing collections or entities. The value is the same format as would  
1758 appear in the Last-Modified header and is defined in **[RFC2616]**, Section 3.3.1

1759  
1760

```
<Property type="http://docs.oasis-open.org/ns/wscal/calws/last-modified"
  >Mon, 12 Jan 1998 09:25:56 GMT</Property>
```

## 1761 9.16 displayname property

1762

<http://docs.oasis-open.org/ns/wscal/calws/displayname>

1763 Appears within an xrd object describing collections or entities. The value is a localized name for the entity  
1764 or collection.

1765  
1766

```
<Property type="http://docs.oasis-open.org/ns/wscal/calws/displayname "
  >My Calendar</Property>
```

## 1767 9.17 timezone property

1768

<http://docs.oasis-open.org/ns/wscal/calws/timezone>

1769 Appears within an xrd object describing collections. The value is a text timezone identifier.

1770  
1771

```
<Property type="http://docs.oasis-open.org/ns/wscal/calws/timezone"
  >America/New_York</Property>
```

## 1772 9.18 owner property

1773

<http://docs.oasis-open.org/ns/wscal/calws/owner>

1774 Appears within an xrd object describing collections or entities. The value is a server specific uri.

1775  
1776

```
<Property type="http://docs.oasis-open.org/ns/wscal/calws/owner "
  >/principals/users/mike</Property>
```

## 1777 9.19 collection link property

1778

<http://docs.oasis-open.org/ns/wscal/calws/collection>

1779 Appears within a link relation describing collections or entities. The property takes no value and indicates  
1780 that this child element is a collection.

1781  
1782

```
<Property type="http://docs.oasis-open.org/ns/wscal/calws/collection"
  xsi:nil="true" />
```

1783 **9.20 calendar-collection link property**

1784 <http://docs.oasis-open.org/ns/wscal/calws/calendar-collection>

1785 Appears within a link relation describing collections or entities. The property takes no value and indicates  
1786 that this child element is a calendar collection.

1787 `<Property type="http://docs.oasis-open.org/ns/wscal/calws/calendar-collection"  
1788 xsi:nil="true" />`

1789 **9.21 CalWS:privilege-set XML element**

1790 <http://docs.oasis-open.org/ns/wscal/calws:privilege-set>

1791 Appears within a link relation describing collections or entities and specifies the set of privileges allowed  
1792 to the current authenticated principal for that collection or entity.

1793 `<!ELEMENT calws:privilege-set (calws:privilege*)>  
1794 <!ELEMENT calws:privilege ANY>`

1795 Each privilege element defines a privilege or access right. The following set is currently defined

- 1796
- CalWS: Read - current principal has read access
  - CalWS: Write - current principal has write access
- 1797

1798 `<calWS:privilege-set>  
1799 <calWS:privilege><calWS:read></calWS:privilege>  
1800 <calWS:privilege><calWS:write></calWS:privilege>  
1801 </calWS:privilege-set>`

---

## 10 Retrieving Collection and Service Properties

1802

1803 Properties, related services and locations are obtained from the service or from service resources in the  
1804 form of an XRD document as defined by [XRD-1.0].

1805 Given the URL of a CalWS service a client retrieves the service XRD document through a GET on the  
1806 service URL with an ACCEPT header specifying application/xrd+xml.

1807 Retrieving resource properties is identical to obtaining service properties, that is, execute a GET on the  
1808 target URL with an ACCEPT header specifying application/xrd+xml.

1809 The service properties define the global limits and defaults. Any properties defined on collections within  
1810 the service hierarchy override those service defaults. The service may choose to prevent such overriding  
1811 of defaults and limits when appropriate.

### 1812 10.1 Request parameters

- 1813 • None

### 1814 10.2 Responses:

- 1815 • 200: OK
- 1816 • 403: Forbidden
- 1817 • 404: Not found

### 1818 10.3 Example - retrieving server properties:

```
1819 >>Request
1820 GET / HTTP/1.1
1821 Host: example.com
1822 ACCEPT:application/xrd+xml
1823
1824 >>Response
1825 <XRD xmlns="http://docs.oasis-open.org/ns/xri/xrd-1.0"
1826     xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
1827     <Expires>1970-01-01T00:00:00Z</Expires>
1828     <Subject>http://example.com/calws</Subject>
1829     <Property type="http://docs.oasis-open.org/ns/wscal/calws/created"
1830         >1970-01-01</Property>
1831
1832     <Link rel="http://docs.oasis-open.org/ns/wscal/calws/timezone-service"
1833         href="http://example.com/tz" />
1834
1835     <calWS:privilege-set>
1836     <calWS:privilege><calWS:read></calWS:privilege>
1837     </calWS:privilege-set>
1838
1839     <Link rel="http://docs.oasis-open.org/ns/wscal/calws/principal-home"
1840         type="collection"
1841         href="http://example.com/calws/user/fred">
1842     <Title xml:lang="en">Fred's calendar home</Title>
1843     </Link>
1844
1845     <Link rel="http://docs.oasis-open.org/ns/wscal/calws/child-collection"
1846         type="calendar,scheduling"
1847         href="http://example.com/calws/user/fred/calendar">
```

```
1849 <Title xml:lang="en">Calendar</Title>
1850 </Link>
1851
1852 <Property type="http://docs.oasis-open.org/ns/wscal/calws/max-instances"
1853 >1000</Property>
1854
1855 <Property type="http://docs.oasis-open.org/ns/wscal/calws/max-attendees-
1856 per-instance"
1857 >100</Property>
1858
1859 </XRD>
1860
```

---

## 11 Creating Calendar Object Resources

1861

1862 Creating calendar object resources is carried out by a POST on the parent collection. The body of the  
1863 request will contain the resource being created. The request parameter "action=create" indicates this  
1864 POST is a create. The location header of the response gives the URL of the newly created object.

### 11.1 Request parameters

1865

- 1866 • action=create

### 11.2 Responses:

1867

- 1868 • 201: created
- 1869 • 403: Forbidden - no access

### 11.3 Preconditions for Calendar Object Creation

1870

- 1871 • **CalWS:target-exists:** The target of a PUT must exist. Use POST to create entities and PUT to  
1872 update them.
- 1873 • **CalWS:not-calendar-data:** The resource submitted in the PUT request, or targeted by a COPY or  
1874 MOVE request, MUST be a supported media type (i.e., iCalendar) for calendar object resources;
- 1875 • **CalWS:invalid-calendar-data:** The resource submitted in the PUT request, or targeted by a COPY  
1876 or MOVE request, MUST be valid data for the media type being specified (i.e., MUST contain valid  
1877 iCalendar data);
- 1878 • **CalWS:invalid-calendar-object-resource:** The resource submitted in the PUT request, or targeted  
1879 by a COPY or MOVE request, MUST obey all restrictions specified in Calendar Object Resources  
1880 (e.g., calendar object resources MUST NOT contain more than one type of calendar component,  
1881 calendar object resources MUST NOT specify the iCalendar METHOD property, etc.);
- 1882 • **CalWS:unsupported-calendar-component:** The resource submitted in the PUT request, or  
1883 targeted by a COPY or MOVE request, MUST contain a type of calendar component that is  
1884 supported in the targeted calendar collection;
- 1885 • **CalWS:uid-conflict:** The resource submitted in the PUT request, or targeted by a COPY or MOVE  
1886 request, MUST NOT specify an iCalendar UID property value already in use in the targeted  
1887 calendar collection or overwrite an existing calendar object resource with one that has a different  
1888 UID property value. Servers SHOULD report the URL of the resource that is already making use of  
1889 the same UID property value in the CalWS:href element  
1890 <!ELEMENT uid-conflict (CalWS:href)>
- 1891 • **CalWS:invalid-calendar-collection-location:** In a COPY or MOVE request, when the Request-  
1892 URI is a calendar collection, the Destination-URI MUST identify a location where a calendar  
1893 collection can be created;
- 1894 • **CalWS:exceeds-max-resource-size:** The resource submitted in the PUT request, or targeted by a  
1895 COPY or MOVE request, MUST have an octet size less than or equal to the value of the  
1896 CalDAV:max-resource-size property value on the calendar collection where the resource will be  
1897 stored;
- 1898 • **CalWS:before-min-date-time:** The resource submitted in the PUT request, or targeted by a COPY  
1899 or MOVE request, MUST have all of its iCalendar DATE or DATE-TIME property values (for each

- 1900 recurring instance) greater than or equal to the value of the CalDAV:min- date-time property value  
 1901 on the calendar collection where the resource will be stored;
- 1902 • **CalWS:after-max-date-time:** The resource submitted in the PUT request, or targeted by a COPY  
 1903 or MOVE request, MUST have all of its iCalendar DATE or DATE-TIME property values (for each  
 1904 recurring instance) less than the value of the CalDAV:max-date-time property value on the calendar  
 1905 collection where the resource will be stored;
  - 1906 • **CalWS:too-many-instances:** The resource submitted in the PUT request, or targeted by a COPY  
 1907 or MOVE request, MUST generate a number of recurring instances less than or equal to the value  
 1908 of the CalDAV: max-instances property value on the calendar collection where the resource will be  
 1909 stored;
  - 1910 • **CalWS:too-many-attendees-per-instance:** The resource submitted in the PUT request, or  
 1911 targeted by a COPY or MOVE request, MUST have a number of ATTENDEE properties on any one  
 1912 instance less than or equal to the value of the CalDAV:max-attendees-per-instance property value  
 1913 on the calendar collection where the resource will be stored;

## 1914 11.4 Example - successful POST:

```

1915 >>Request
1916
1917 POST /user/fred/calendar/?action=create HTTP/1.1
1918 Host: example.com
1919 Content-Type: application/xml+calendar; charset="utf-8"
1920 Content-Length: ?
1921
1922 <?xml version="1.0" encoding="utf-8" ?>
1923 <icalendar xmlns="urn:iETF:params:xml:ns:icalendar-2.0">
1924   <vcalendar>
1925     ...
1926   </vcalendar>
1927 </icalendar>
1928
1929 >>Response
1930
1931 HTTP/1.1 201 Created
1932 Location: http://example.com/user/fred/calendar/event1.ics

```

## 1933 11.5 Example - unsuccessful POST:

```

1934 >>Request
1935
1936 POST /user/fred/readcalendar/?action=create HTTP/1.1
1937 Host: example.com
1938 Content-Type: text/text; charset="utf-8"
1939 Content-Length: ?
1940
1941 This is not an xml calendar object
1942
1943 >>Response
1944
1945 HTTP/1.1 403 Forbidden
1946 <?xml version="1.0" encoding="utf-8"
1947     xmlns:D="DAV:"
1948     xmlns:C="urn:iETF:params:xml:ns:caldav" ?>
1949 <D:error>
1950   <C:supported-calendar-data/>
1951   <D:description>Not an icalendar object</D:description>
1952 </D:error>

```

1953

## 12 Retrieving resources

1954 A simple GET on the href will return a named resource. If that resource is a recurring event or task with  
1955 overrides, the entire set will be returned. The desired format is specified in the ACCEPT header. The  
1956 default form is application/xml+calendar

### 12.1 Request parameters

- none

### 12.2 Responses:

- 200: OK
- 403: Forbidden - no access
- 406 The requested format specified in the accept header is not supported.

### 12.3 Example - successful fetch:

```
1964 >>Request
1965
1966 GET /user/fred/calendar/event1.ics HTTP/1.1
1967 Host: example.com
1968
1969 >>Response
1970
1971 HTTP/1.1 200 OK
1972 Content-Type: application/xml+calendar; charset="utf-8"
1973 Content-Length: ?
1974
1975 <?xml version="1.0" encoding="utf-8" ?>
1976 <icalendar xmlns="urn:ietf:params:xml:ns:icalendar-2.0">
1977   <vcalendar>
1978     ...
1979   </vcalendar>
1980 </icalendar>
```

### 12.4 Example - unsuccessful fetch:

```
1982 >>Request
1983
1984 PUT /user/fred/calendar/noevent1.ics HTTP/1.1
1985 Host: example.com
1986
1987 >>Response
1988
1989 HTTP/1.1 404 Not found
```

---

## 13 Updating resources

- 1990
- 1991 Resources are updated with the PUT method targeted at the resource href. The body of the request
- 1992 contains a complete new resource which effectively replaces the targeted resource. To allow for optimistic
- 1993 locking of the resource use the if-match header.
- 1994 When updating a recurring event all overrides and master must be supplied as part of the content.
- 1995 Preconditions as specified in Section 11.3 are applicable.

### 13.1 Responses:

- 1996
- 1997
- 200: OK
- 1998
- 304: Not modified - entity was modified by some other request
- 1999
- 403: Forbidden - no access, does not exist etc. See error response

2000

#### 2001 *Example 13—1: Successful Update*

```
2002 >>Request
2003
2004 PUT /user/fred/calendar/event1.ics HTTP/1.1
2005 Host: example.com
2006 Content-Type: application/xml+calendar; charset="utf-8"
2007 Content-Length: ?
2008
2009 <?xml version="1.0" encoding="utf-8" ?>
2010 <icalendar xmlns="urn:iETF:params:xml:ns:icalendar-2.0">
2011   <vcalendar>
2012     ...
2013   </vcalendar>
2014 </icalendar>
2015
2016 >>Response
2017
2018 HTTP/1.1 200 OK
```

#### 2019 *Example 13—2: Unsuccessful Update*

```
2020 >>Request
2021
2022 PUT /user/fred/readcalendar/event1.ics HTTP/1.1
2023 Host: example.com
2024 Content-Type: application/xml+calendar; charset="utf-8"
2025 Content-Length: ?
2026
2027 <?xml version="1.0" encoding="utf-8" ?>
2028 <icalendar xmlns="urn:iETF:params:xml:ns:icalendar-2.0">
2029   <vcalendar>
2030     ...
2031   </vcalendar>
2032 </icalendar>
2033
2034 >>Response
2035
2036 HTTP/1.1 403 Forbidden
2037 Content-Type: application/xml; charset="utf-8"
2038 Content-Length: xxxx
```

2039  
2040 <?xml version="1.0" encoding="utf-8"  
2041     xmlns:D="DAV:"  
2042     xmlns:CW=" http://docs.oasis-open.org/ws-calendar/CalWS" ?>  
2043 <CW:error>  
2044     <CW:target-exists/>  
2045     <CW:description>Target of update must exist</C:description>  
2046 </CW:error>

2047

---

## 14 Deletion of resources

2048 Delete is defined in [RFC 2616] Section 9.7. In addition to conditions defined in that specification, servers  
2049 must remove any references from the deleted resource to other resources. Resources are deleted with  
2050 the DELETE method targeted at the resource URL. After a successful completion of a deletion a GET on  
2051 that URL must result in a 404 - Not Found status.

2052

### 14.1 Delete for Collections

2053 Delete for collections may or may not be supported by the server. Certain collections are considered  
2054 undeletable. On a successful deletion of a collection all contained resources to any depth must also be  
2055 deleted.

2056

### 14.2 Responses:

2057

- 200: OK

2058

- 403: Forbidden - no access

2059

- 404: Not Found

2060

## 15 Querying calendar resources

2061 Querying provides a mechanism by which information can be obtained from the service through possibly  
2062 complex queries. A list of icalendar properties can be specified to limit the amount of information returned  
2063 to the client. A query takes the parts

- 2064 • Limitations on the data returned
- 2065 • Selection of the data
- 2066 • Optional timezone id for floating time calculations.

2067 The current specification uses CalDAV multiget and calendar-query XML bodies as specified in [RFC  
2068 4791] with certain limitations and differences.

- 2069 1. The POST method is used for all requests, the action being identified by the outer element.
- 2070 2. While CalDAV servers generally only support [RFC 5545] and assume that as the default, the  
2071 delivery format for CalWS will, by default, be [draft-xcal].
- 2072 3. The CalDAV query allows the specification of a number of DAV properties. Specification of these  
2073 properties, with the exception of DAV:getetag, is considered an error in CalWS.
- 2074 4. The CalDAV:propnames element is invalid

2075 With those differences, the CalDAV specification is the normative reference for this operation.

### 2076 15.1 Limiting data returned

2077 This is achieved by specifying one of the following

- 2078 • CalDAV:allprop return all properties (some properties are specified as not being part of the allprop  
2079 set so are not returned)
- 2080 • CalDAV:prop An element which contains a list of properties to be returned . May only contain  
2081 DAV:getetag and CalDAV:calendar-data

2082 Of particular interest, and complexity, is the calendar-data property which can contain a time range to limit  
2083 the range of recurrences returned and/or a list of calendar properties to return.

### 2084 15.2 Pre/postconditions for calendar queries

2085 The preconditions as defined in in [RFC 4791] Section 7.8 apply here. CalDav errors may be reported by  
2086 the service when preconditions or postconditions are violated.

### 2087 15.3 Example: time range limited retrieval

2088 This example shows the time-range limited retrieval from a calendar which results in 2 events, one a  
2089 recurring event and one a simple non-recurring event.

```
2090 >> Request <<
2091
2092 POST /user/fred/calendar/ HTTP/1.1
2093 Host: calws.example.com
2094 Depth: 1
2095 Content-Type: application/xml; charset="utf-8"
2096 Content-Length: xxxx
2097
2098 <?xml version="1.0" encoding="utf-8" ?>
2099 <C:calendar-query xmlns:D="DAV:"
2100                 xmlns:C="urn:ietf:params:xml:ns:caldav">

## 16 Free-busy queries

2299 Free-busy queries are used to obtain free-busy information for a calendar-collection or principals. The  
2300 result contains information only for events to which the current principal has sufficient access.

2301 When targeted at a calendar collection the result is based only on the calendaring entities contained in  
2302 that collection. When targeted at a principal free-busy URL the result will be based on all information  
2303 which affect the principals free-busy status, for example availability.

2304 The possible targets are:

- 2305 • A calendar collection URL
- 2306 • The XRD link with relation CalWS/current-principal-freebusy
- 2307 • The XRD link with relation CalWS/principal-freebusy with a principal given in the request.

2308 The query follows the specification defined in **[FreeBusy Read URL]** with certain limitations. As an  
2309 authenticated user to the CalWS service scheduling read-freebusy privileges must have been granted. As  
2310 an unauthenticated user equivalent access must have been granted to unauthenticated access.

2311 Freebusy information is returned by default as xcalendar vfreebusy components, as defined by **[draft-  
2312 xcal]**. Such a component is not meant to conform to the requirements of VFREEBUSY components in  
2313 **[RFC 5546]**. The VFREEBUSY component SHOULD conform to section "4.6.4 Free/Busy Component" of  
2314 **[RFC 5545]**. A client SHOULD ignore the ORGANIZER field..

2315 Since a Freebusy query can only refer to a single user, a client will already know how to match the result  
2316 component to a user. A server MUST only return a single vfreebusy component.

### 2317 16.1 ACCEPT header

2318 The Accept header is used to specify the format for the returned data. In the absence of a header the  
2319 data should be returned as specified in **[draft-xcal]**, that is, as if the following had been specified

2320 `ACCEPT: application/xml+calendar`

### 2321 16.2 URL Query Parameters

2322 None of these parameters are required except for the conditions noted below. Appropriate defaults will be  
2323 supplied by the server.

#### 2324 16.2.1 start

2325 **Default:** The default value is left up to the server. It may be the current day, start of the current  
2326 month, etc.

2327 **Description:** Specifies the start date for the Freebusy data. The server is free to ignore this value and  
2328 return data in any time range. The client must check the data for the returned time range.

2329 **Format:** A profile of an **[RFC3339]** Date/Time. Fractional time is not supported. The server MUST  
2330 support the expanded version e.g.

2331 `2007-01-02T13:00:00-08:00`

2332 It is up to the server to interpret local date/times.

2333 **Example:**

2334 `2007-02-03T15:30:00-0800`

2335 `2007-12-01T10:15:00Z`

2336 **Notes:** Specifying only a start date/time without specifying an end-date/time or period should be  
2337 interpreted as in **[RFC 5545]**. The effective period should cover the remainder of that day.

2338 Date-only values are disallowed as the server cannot determine the correct start of the day. Only  
2339 UTC or date/time with offset values are permitted.

## 2340 16.2.2 end

2341 **Default:** Same as start

2342 **Description:** Specifies the end date for the Freebusy data. The server is free to ignore this value.

2343 **Format:** Same as start

2344 **Example:** Same as start

## 2345 16.2.3 period

2346 **Default:** The default value is left up to the server. The recommended value is "P42D".

2347 **Description:** Specifies the amount of Freebusy data to return. A client cannot specify both a period  
2348 and an end date. Period is relative to the start parameter.

2349 **Format:** A duration as defined in section 4.3.6 of [RFC 5545]

2350 **Example:**

2351 `P42D`

## 2352 16.2.4 account

2353 **Default:** none

2354 **Description:** Specifies the principal when the request is targeted at the XRD CalWS/principal-  
2355 freebusy. Specification of this parameter is an error otherwise.

2356 **Format:** Server specific

2357 **Example:**

2358 `fred`  
2359 `/principals/users/jim`  
2360 `user1@example.com`

## 2361 16.3 URL parameters - notes

2362 The server is free to ignore the start, end and period parameters. It is recommended that the server return  
2363 at least 6 weeks of data from the current day.

2364 A client MUST check the time range in the VFREEBUSY response as a server may return a different time  
2365 range than the requested range.

## 2366 16.4 HTTP Operations

2367 The server SHOULD return an Etag response header for a successful GET request targeting a Freebusy  
2368 read URL. Clients MAY use the Etag response header value to do subsequent "conditional" GET  
2369 requests that will avoid re-sending the Freebusy data again if it has not changed.

## 2370 16.5 Response Codes

2371 Below are the typical status codes returned by a GET request targeting a Free-busy URL. Note that other  
2372 HTTP status codes not listed here might also be returned by a server.

2373 • 200 OK

2374 • 302 Found

2375 • 400 Start parameter could not be understood / End parameter could not be understood / Period  
2376 parameter could not be understood

- 2377 • 401 Unauthorized
- 2378 • 403 Forbidden
- 2379 • 404 The data for the requested principal is not currently available, but may be available later.
- 2380 • 406 The requested format in the accept header is not supported.
- 2381 • 410 The data for the requested principal is no longer available
- 2382 • 500 General server error

## 2383 16.6 Examples

2384 The following are examples of URLs used to retrieve Free-busy data for a user:

```
2385 http://www.example.com/freebusy/user1@example.com?
2386 start=2007-09-01T00:00:00-08:00&end=2007-09-31T00:00:00-08:00
2387
2388 http://www.example.com/freebusy/user1@example.com?
2389 start=2007-09-01T00:00:00-08:00&end=2007-09-31T00:00:00-08:00
2390
2391 http://www.example.com/freebusy/user1@example.com
2392
2393 http://www.example.com/freebusy?user=user%201@example.com&
2394 start=2008-01-01T00:00:00Z&end=2008-12-31T00:00:00Z
```

2395 Some Request/Response Examples:

2396 A URL with no query parameters:

```
2397 >> Request <<
2398 GET /freebusy/bernard/ HTTP/1.1
2399 Host: www.example.com
2400
2401 >> Response <<
2402 HTTP/1.1 200 OK
2403 Content-Type: application/xml+calendar; charset="utf-8"
2404 Content-Length: xxx
2405
2406 <xc:icalendar xmlns:xc="urn:ietf:params:xml:ns:icalendar-2.0">

2508 **17 Conformance and Rules for WS-Calendar and**  
2509 **Referencing Specifications**

2510 **17.1 Introduction**

2511 This section specifies conformance related to the semantic model, REST Web Services, and to SOAP  
2512 Web Services While the semantic model applies to all WS-Calendar implementations; the other  
2513 conformance statements are relevant only to those using those services.

2514 If the implementer is merely using WS-Calendar as part of a larger business or service communication,  
2515 they SHALL follow not only the semantic rules herein, but SHALL also conform to the rules for specifying  
2516 inheritance in referencing standards.

2517 **17.2 Semantic Conformance Rules for WS-Calendar**

2518 There are five kinds of conformance that must be addressed for WS-Calendar and specifications that  
2519 reference WS-Calendar.

- 2520 • Conformance to the **inheritance rules** in WS-Calendar, including the direction of inheritance
- 2521 • **Specific attributes** for each type that MUST or MUST NOT be inherited.
- 2522 • **Conformance rules** that Referencing Specifications MUST follow
- 2523 • Description of **Covarying attributes** with respect to the Reference Specification
- 2524 • **Semantic Conformance** for the information within the artifacts exchanged.

2525 We address each of these in the following sections.

2526 **17.2.1 Inheritance in WS-Calendar**

2527 In this section we define rules that define inheritance including direction.

2528 **I1: Proximity Rule** Within a given lineage, inheritance is evaluated though each Parent to the Child  
2529 before what the Child bequeaths is evaluated.

2530 **I2: Direction Rule** Intervals MAY inherit attributes from the nearest gluon subject to the Proximity Rule  
2531 and Override Rule, provided those attributes are defined as Inheritable.

2532 **I3: Override Rule** If and only if there is no value for a given attribute of a Gluon or Interval, that Gluon or  
2533 Interval SHALL inherit the value for that attribute from its nearest Ancestor in conformance to the  
2534 Proximity Rule

2535 **I4: Comparison Rule** Two Sequences are equivalent if a comparison of the respective Intervals  
2536 succeeds as if each Sequence were fully Bound and redundant Gluons are removed.

2537 **I5: Designated Interval Inheritance** [To facilitate composition of Sequences] the Designated Interval in  
2538 the ultimate Ancestor of a Gluon is the Designated Interval of the composed Sequence.<sup>5</sup> Special  
2539 conformance rules for Designated Intervals apply only to the Interval linked from the Designator Gluon.

2540 **I6: Start Time Inheritance** When a start time is specified through inheritance, that start time is inherited  
2541 only by the Designated Interval; the start time of all other Intervals are computed through the durations  
2542 and temporal; relationships within the Sequence. The designated Interval is the Interval whose parent is  
2543 at the end of the lineage.

## 2544 17.2.2 Specific Attribute Inheritance in WS-Calendar

2545 In WS-Calendar the following attributes **MUST** be inherited in conformance to the Rules (same for Gluons  
2546 and Intervals):

- 2547 • dtStart
- 2548 • dtEnd
- 2549 • duration
- 2550 • designatedInterval (Gluon, special upward inheritance rule)
- 2551 • performance
- 2552 • performanceInterval

2553 In WS-Calendar the following attributes **MUST NOT** be inherited

- 2554 • UID (Gluons and Intervals)
- 2555 • Temporal Relationships (Intervals)

2556 Some elements of WS-Calendar objects may be **covarying**, meaning that they change together. Such  
2557 elements are treated as a single element for inheritance, they are either inherited together or the child  
2558 keeps its current values intact. This becomes important if one or more of a covarying set have default  
2559 values. In that case, if any are present, then inheritance should deem they are all present, albeit some  
2560 perhaps in their default values.

## 2561 17.2.3 Conformance of Intervals in WS-Calendar

### 2562 17.2.3.1 Intervals

2563 WS-Calendar Intervals **SHALL** have a Duration.

2564 Intervals **MAY** have a StartTime.

2565 Intervals **SHALL NOT** include an END time. If a non-compliant Interval is received with an END time, it  
2566 may be ignored.

---

<sup>5</sup> We are assuming here that Sequences can be composed to form new Sequences. This needs detailed discussion as the rules for Designated Intervals cannot easily be applied to a Sequence of Sequences.

2567 **17.2.3.2 Other Elements**

2568 A performance component SHALL not include Start, Stop, and Duration elements. Two out of the three  
2569 elements is acceptable, but not three.

2570 In Partitions, the Description, Summary and Priority of each Interval SHALL be excluded.

2571 A Calendar Gluon may have either a dtStart or a dtEnd, but may not have both.

2572 **17.2.4 Conformance of Bound Intervals and Sequences in WS-Calendar**

2573 Actionable services require Bound Intervals as part of a Bound Sequence. Services may Intervals that  
2574 arenot bound for informational or negotiation purposes. Some of these are modeled and described as  
2575 constraints in the UML models that have been produced separately.

- 2576 • Intervals SHALL have values assigned for dtStart and duration
- 2577 • Intervals SHALL have no value assigned for dtEnd<sup>6</sup>
- 2578 • Within a Sequence at most the Designated Interval may have dtStart and duration with a value  
2579 specified or inherited.<sup>7</sup>
- 2580 • Any specification claiming conformance to WS-Calendar MUST satisfy all of the following  
2581 conditions:
  - 2582 ○ Follow the same style of inheritance (per the Rules)
  - 2583 ○ Specify attribute inheritability in the specification claiming conformance
  - 2584 ○ Specify whether certain sets of elements must be inherited as a group or specify that all  
2585 elements can be inherited or not on an individual basis

2586 **17.3 Conformance Rules for REST Web Services**

2587 Still to come

2588

2589 **17.4 Conformance Rules for SOAP Services**

2590 Still to Come

---

<sup>6</sup> While VTODD objects allow for all three of dtStart, dtEnd, and duration, the scheduling use for automation is simpler if only dtStart and duration are used.

<sup>7</sup> Note that composition of Sequences to create other Sequences raises issues both of inheritance direction and the meaning of subSequences. We suggest an approach of ignoring Designated Intervals with respect to the composed Sequence as simpler than having the new subSequences change form and not be reusable.

2591 **17.5 Conformance Rules for Specifications incorporating WS-**  
2592 **Calendar**

2593 Specifications that incorporate WS-Calendar SHALL specify inheritance rules for use within their  
2594 specification. These rules SHALL NOT violate override the Proximity, Direction, or Override Rules. If the  
2595 specification includes covariant elements, those elements SHALL be clearly designated in the  
2596 specification.

2597

---

## A. Acknowledgements

2598 The following individuals have participated in the creation of this specification and are gratefully  
2599 acknowledged:

## B. An Introduction to Internet Calendaring

2631 *The WS-Calendar Technical Committee thanks CalConnect for contributing this overview of iCalendar*  
2632 *and its use.*

### 2633 B.1 icalendar

#### 2634 B.1.1 History

2635 The iCalendar specification was first produced by the IETF in 1998 as RFC 2445 [1]. Since then it has  
2636 become the dominant standard for calendar data interchange on the internet and between devices  
2637 (desktop computers, mobile phones etc.). The specification was revised in 2009 as RFC 5545 [4].

2638 Alongside iCalendar is the iTIP specification (RFC 2446 [2] and revised as RFC 5546[5]) that defines how  
2639 iCalendar is used to carry out scheduling operations (for example, how an organizer can invite attendees  
2640 to a meeting and receive their replies). This forms the basis for email-based scheduling using iMIP (the  
2641 specification that describes how to use iTIP with email - RFC 2447 [3]).

2642 iCalendar itself is a text-based data format. However, an XML format is also available, providing a one-to-  
2643 one mapping to the text format (draft [7]).

2644 iCalendar data files typically have a .ics file name extension. Most desktop calendar clients can import or  
2645 export iCalendar data, or directly access such data over the Internet using a variety of protocols.

#### 2646 B.1.2 Data model

2647 The iCalendar data format has a well defined data model. "iCalendar objects" encompass a set of  
2648 "iCalendar components" each of which contains a set of "iCalendar properties" and possibly other sub-  
2649 components. An iCalendar property consists of a name, a set of optional parameters (specified as "key-  
2650 value" pairs) and a value.

2651 iCalendar components include:

2652 "VEVENT" which represents an event

2653 "VTODO" which represents a task or to-do

2654 "VJOURNAL" which represents a journal entry

2655 "VFREEBUSY" which represents periods of free or busy time information

2656 "VTIMEZONE" which represents a timezone definition (timezone offset and daylight saving rules)

2657 "VALARM" is currently the only defined sub-component and is used to set alarms or reminders on events  
2658 or tasks.

2659 Properties include:

2660 "DTSTART" which represents a start time for a component

2661 "DTEND" which represents an end time for a component

2662 "SUMMARY" which represents a title or summary for a component

2663 "RRULE" which can specify rules for repeating events or tasks (for example, every day, every week on  
2664 Tuesdays, etc.)

2665 "ORGANIZER" which represents the calendar user who is organizing an event or assigning a task

2666 "ATTENDEE" which represents calendar users attending an event or assigned a task

2667 In addition to this data model and the pre-defined properties, the specification defines how all those are  
2668 used together to define the semantics of calendar objects and scheduling. The semantics are basically a  
2669 set of rules stating how all the components and properties are used together to ensure that all iCalendar

2670 prodUTCs can work together to achieve good interoperability. For example, a rule requires that all events  
2671 must have one and only one "DTSTART" property. The most important part of the iCalendar specification  
2672 is the semantics of the calendaring model that it represents. The use of text or XML to encode those is  
2673 secondary.

### 2674 **B.1.3 Scheduling**

2675 The iTIP specification defines how iCalendar objects are exchanged in order to accomplish the key task  
2676 needed to schedule events or tasks. An example of a simple workflow is as follows:

- 2677 1. To schedule an event, an organizer creates the iCalendar object representing the event and adds  
2678 calendar users as attendees.
- 2679 2. The organizer then sends an iTIP "REQUEST" message to all the attendees.
- 2680 3. Upon receipt of the scheduling message, each attendee can decide whether they want to attend  
2681 the meeting or not.
- 2682 4. Each attendee can then respond back to the organizer using an iTIP "REPLY" message  
2683 indicating their own attendance status.

2684 iTIP supports other types of scheduling messages, for example, to cancel meetings, add new instances to  
2685 a repeating meeting, etc.

### 2686 **B.1.4 Extensibility**

2687 iCalendar was designed to be extensible, allowing for new components, properties and parameters to be  
2688 defined as needed. A registry exists to maintain the list of standard extensions with references to their  
2689 definitions to ensure anyone can use them and work well with others.

## 2690 **B.2 Calendar data access and exchange protocols**

### 2691 **B.2.1 Internet Calendar Subscriptions**

2692 An Internet calendar subscription is simply an iCalendar data file made available on a web server. Users  
2693 can use this data in two ways:

- 2694 – The data can be downloaded from the web server and then imported directly into an iCalendar  
2695 aware client. This solution works well for calendar data that is not likely to change over time (for  
2696 example the list of national holidays for the next year).
- 2697 – Calendar clients that support "direct" subscriptions can use the URL to the calendar data on the  
2698 web server to download the calendar data themselves. Additionally, the clients can check the web  
2699 server on a regular basis for updates to the calendar data, and then update their own cached  
2700 copy of it. This allows calendar data that changes over time to be kept synchronized.

### 2701 **B.2.2 CalDAV**

2702 CalDAV is a calendar access protocol and is defined in RFC 4791 [6]. The protocol is based on WebDAV  
2703 which is an extension to HTTP that provides enhanced capabilities for document management on web  
2704 servers.

2705 CalDAV is used in a variety of different environments, ranging from very large internet service providers,  
2706 to large and small corporations or institutions, and to small businesses and individuals.

2707 CalDAV clients include desktop applications, mobile devices and browser-based solutions. It can also be  
2708 used by "applets", for example, a web page panel that displays a user's upcoming events.

2709 One of the key aspects of CalDAV is its data model. Simply put, it defines a "calendar home" for each  
2710 calendar user, within which any number of "calendars" can be created. Each "calendar" can contain any  
2711 number of iCalendar objects representing individual events, tasks or journal entries. This data model  
2712 ensures that clients and servers can interoperate well.

2713 In addition to providing simple operations to read, write and delete calendar data, CalDAV provides a  
2714 querying mechanism to allow clients to fetch calendar data matching specific criteria. This is commonly  
2715 used by clients to do "time-range" queries, i.e., find the set of events that occur within a given start/end  
2716 time period.

2717 CalDAV also supports access control allowing for features such as delegated calendars and calendar  
2718 sharing.

2719 CalDAV also specifies how scheduling operations can be done using the protocol. Whilst it uses the  
2720 semantics of the iTIP protocol, it simplifies the process by allowing simple calendar data write operations  
2721 to trigger the sending of scheduling messages, and it has the server automatically process the receipt of  
2722 scheduling messages. Scheduling can be done with other users on the CalDAV server or with calendar  
2723 users on other systems (via some form of "gateway").

### 2724 **B.2.3 ActiveSync/SyncML**

2725 ActiveSync and SyncML are technologies that allow multiple devices to synchronize data with a server,  
2726 with calendar data being one of the classes of data supported. These have typically been used for low-  
2727 end and high-end mobile devices.

### 2728 **B.2.4 CalWS**

2729 CalWS is a web services calendar access API developed by The Calendaring and Scheduling  
2730 Consortium and the OASIS organization, to be used as part of the Oasis WS-Calendar standard. It  
2731 provides an API to access and manipulate calendar data stored on a server. It follows a similar data  
2732 model to CalDAV and has been designed to co-exist with a CalDAV service offering the same data.

### 2733 **B.2.5 iSchedule**

2734 iSchedule is a protocol to allow scheduling between users on different calendaring systems and across  
2735 different internet domains. It transports iTIP scheduling messages using HTTP between servers. Servers  
2736 use DNS and various security mechanisms to determine the authenticity of messages received.

2737 It has been specifically designed to be independent of any calendar system in use at the endpoints, so  
2738 that it is compatible with many different systems. This allows organizations with different calendar  
2739 systems to exchange scheduling messages with each other, and also allows a single organization with  
2740 multiple calendar systems (for example due to mergers, or different departmental requirements) to  
2741 exchange scheduling messages between users of each system.

## C. Overview of WS-Calendar, its Antecedents and its Use

2756 iCalendar has long been the predominant message format for an Internet user to send meeting requests  
2757 and tasks to other Internet users by email. The recipient can respond to the sender easily or counter  
2758 propose another meeting date/time. iCalendar support is built into all major email systems and email  
2759 clients. While SMTP is the predominant means to transport iCalendar messages, protocols including  
2760 WebDAV and SyncML are used to transport collections of iCalendar information. No similar standard for  
2761 service interactions has achieved similar widespread use.

2762 The Calendar and Scheduling Consortium (CalConnect), working within the IETF, updated the iCalendar  
2763 standard in the summer of 2009 to support extension ([RFC5545]). In 2010, the same group defined  
2764 [XCAL], a canonical XML serialization for iCalendar, currently (08/21/2008) on the recommended  
2765 standards track within the IETF. This specification supports extensions, including handling non-standard,  
2766 i.e., non-iCalendar, data during message storage and retrieval.

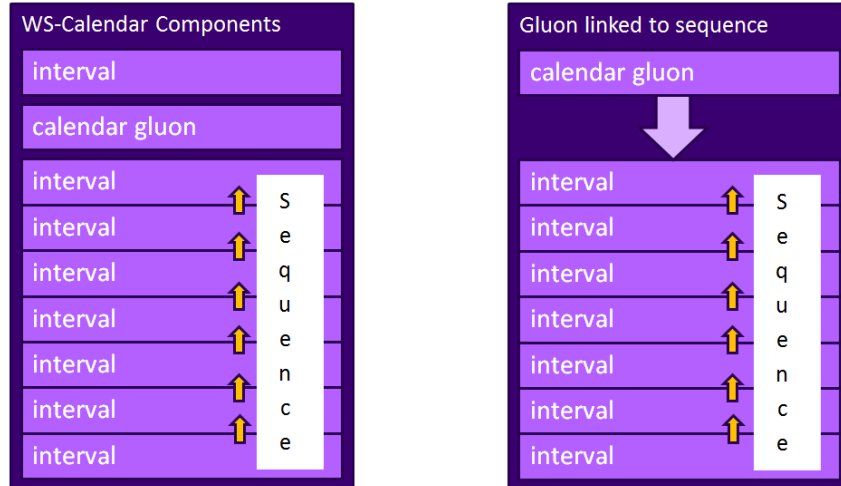

2767 WS-Calendar builds on this work, and consists of extensions to the vocabulary of iCalendar, along with  
2768 standard services to extend calendaring and scheduling into service interactions. iCalendar consists of a  
2769 number of fields that support the delivery, update, and synchronization of if calendar messages and a list  
2770 of components. The components can specify defined relationships between each other.

2771  
2772

Figure 3: iCalendar overview

2773 WS-Calendar defines the Interval, a profile of the vtodo component requiring only a duration and an  
2774 artifact to define service delivery and performance. WS-Calendar also defines the CalendarGluon  
2775 component, a container for holding only a service delivery and performance artifact, to associate with a  
2776 component or group of components.

2777

2778 *Figure 4: WS-Calendar and EMIX*

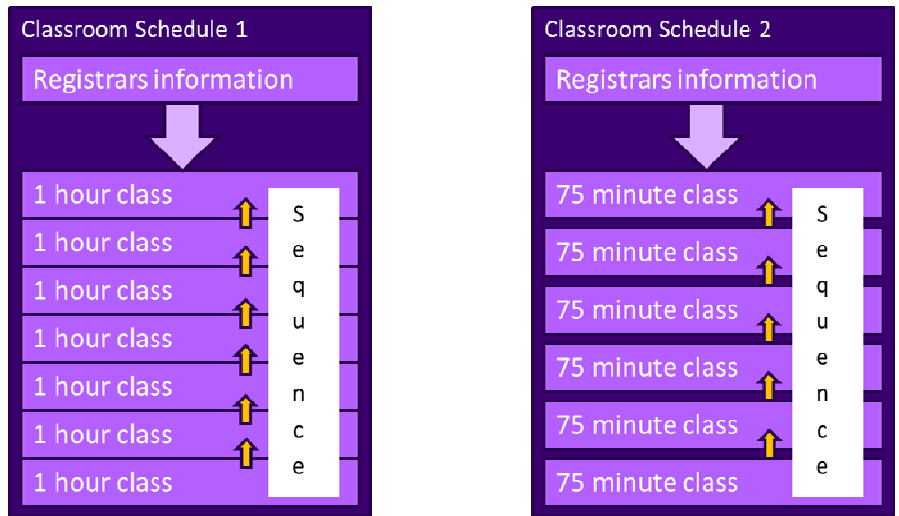

2779 A set of Intervals that have defined temporal relationships is a Sequence. Temporal relationships express  
 2780 how the occurrence of one Interval is related to another. For example, Interval B may begin 10 minutes  
 2781 after Interval A completes, or Interval D may start 5 minutes after Interval C starts. An Calendar Gluon  
 2782 linked to a Sequence defines service performance for all Intervals in the Sequence. Because each  
 2783 Interval has its own service performance contract, specifications built on WS-Calendar can define rules  
 2784 for inheritance and over-rides with a Sequence.

2785 The Partition is a sub-class of a Sequence in which all Intervals follow consecutively with no lag time.  
 2786 Intervals in a Partition normally have the same Duration, but WS-Calendar does support overriding the  
 2787 duration on an individual basis.

## 2788 **C.1 Scheduling Sequences**

2789 A Sequence is a general pattern of behaviors and results that does not require a specific schedule. A  
 2790 publishing service may advertise a Sequence with no schedule, i.e., no specific time for performance.  
 2791 When the Sequence is invoked or contracted, a specific performance time is added. In the original  
 2792 iCalendar components, this would add the starting date and time (dtStart) to the component. In WS-  
 2793 Calendar, we add the starting date and time only to the first Interval of a Sequence; the performance  
 2794 times for all other Intervals in the Sequence are derived from that one start time.

2795 **C.1.1 Academic Scheduling example**

2796  
2797 *Figure 5: Classroom Scheduling Example*

2798 A college campus uses two schedules to schedule its buildings. In Schedule 1, classes start on the hour,  
2799 and follow one after another; each class starts on the hour. In the second schedule, each class lasts an  
2800 hour and a quarter, and there is a fifteen minute gap between classes; classes start on the half hour. On  
2801 many campuses, the Sequence in Schedule 1 may describe classes taught on Monday, Wednesday, and  
2802 Friday. Schedule 2 may describe classes taught on Tuesday and Thursday.

2803 The registrar's office knows some key facts about each classroom, including whether it hosts a class  
2804 during a particular period, and the number of students that will be in that class. The college wishes to  
2805 optimize the provision of building services for each class. Such services may include adequate ventilation  
2806 and comfortable temperatures to assure alert students. Other services may ensure that the classroom  
2807 projection systems and A/V support services are warmed up in advance of a class, or powered off when a  
2808 classroom is vacant.

2809 Although most classes meet over typical schedule for the week (M-W-F or Tu-Th), some classes may not  
2810 meet on Friday, or may have a tutorial section one day a week. The registrar's system, ever mindful of  
2811 student privacy, shares only minimal information with the building systems such as how many students  
2812 will be supported.

2813 The Registrar's system schedule building systems using the Calendar Gluon (registrar's information) and  
2814 the student counts for each Interval, and schedules the Sequence in classroom schedule 1 three days a  
2815 week for the next 10 weeks. The Registrar's system also schedules the Sequence in classroom schedule  
2816 2 two days a week, also for 10 weeks.

2817 This example demonstrates a system (A) that offers services using either of two Sequences. Another  
2818 business system (B) with minimal knowledge of how (A) works determines the performance requirements  
2819 for (A). The business system (B) communicates what these expectations are by scheduling the  
2820 Sequences offered by (A).

2821 **C.1.2 Market Performance schedule**

2822 A factory relies on an energy-intensive process which is performs twice a year for eight weeks. The  
2823 factory has some flexibility about scheduling the process; it can perform the work in either the early  
2824 morning or the early evening; it avoids the afternoon when energy costs are highest. The factory works up  
2825 a detailed profile of when it will need energy to support this process.

2826

2827 *Figure 6: Daily Load Profile for Market Operations Example*

2828 Factory management has decided that they want to use only renewable energy prodUTCs for this  
 2829 process. They approach two regional wind farms with the intent of making committed purchases of wind  
 2830 energy. The wind farms consider their proposals taking into account the seasonal weather forecasts they  
 2831 use to project their weather capacity, and considering the costs that may be required to buy additional  
 2832 wind energy on the spot market to make up any shortfalls.

2833 Each energy supplier submits of the same Sequence, a schedule, i.e. a daily starting time, and a price for  
 2834 the season's prodUTCion. After considering the bids, and other internal costs of each proposal, the  
 2835 factory opts to accept a contract for the purchase of a fixed load profile (Partition), using the evening wind  
 2836 generation from one of the suppliers. This contract specifies Schedules of load purchases (starting data  
 2837 and time for the Sequence) for each day.

## D. Revision History

Revision	Date	Editor	Changes Made
1.0 WD 01	2010-03-11	Toby Considine	Initial document, largely derived from Charter
1.0 WD 02	2010-03-30	Toby Considine	Straw-man assertion of elements, components to push conversation
1.0 WD 03	2010-04-27	Toby Considine	Cleaned up Elements, added [XPOINTER] use, xs:duration elements
1.0 WD 04	2010-05-09	Toby Considine	Aligned Chapter 4 with the vAlarm and vToDo objects.
1.0 WD 05	2010-05-18	Toby Considine	Responded to comments, added references, made references to [XCAL] more consistent,
1.0 WD 06	2010-05-10	Toby Considine	Responded to comments from CalConnect, mostly constancy of explanations
1.0 WD 07	2010-07-28	Toby Considine	Incorporated input from informal public review, esp. SGIP PAP04. Firmed up relationships between scheduled objects
1.0 WD 08	2010-08-07	Toby Considine	Aligned with Interval / Partition / Sequence language. Reduced performance characteristics to before / after durations.
1.0 WD 09	2010-08-15	Toby Considine	Formalized Attachment section and rolled Performance into the Attachment. Created RelatedComponent object. Added CalWS Outline to specification. Removed SOOP section
1.0 WD 10	2010-08-28	Toby Considine, Benoit Lepeuple	Updated Time Stamp section Added background Appendices Incorporated Association language to replace RelatedComponent Recast examples to show inheritance, remove inconsistencies
1.0 WD 11	2010-09-11	Toby Considine	Traceability Release in support of a re-shuffling of the document. Sections 3, 4 were re-shuffled to create: 3: Interval / Relationships / Time Stamps 4: Performance / Attachments 5: Associations & Inheritance Also, changed all associations to Gluons. No paragraphs have been changed, just shuffled, changes accepted, to create clean base for editing
1.0 WD 12	2010-09-14	Toby Considine Dave Thewlis	Edits for clarity and flow following changes in WD11, updated examples based upon XSD artifacts. Adding final contribution from

			CalConnect for Services.
1.0 WD 13		Toby Considine	Mechanistic processing of trivial comments for grammar, spelling, etc.
1.0 WD 14	2011-01-17	Toby Considine	Added Conformance rules, redefined inheritance, added terminology section in Section 1, added language on separability of information model, REST, and SOAP sections
1.0 WD 15	2011-01-27	Toby Considine	Pulled more definitions into Terminology Section, re-factored into multiple tables, Added Availability. Have not updated examples.
1.0 WD 15	2011-01-29	Toby Considine	Re-added footers to document (?!?) Added disclaimers on completeness prior to committee spec draft.
