Abstract:

This document describes how to use ISO/IEC 21000-5 Rights Expressions with the Web Services Security (WSS) specification.

Status:

This document was last revised or approved by the [OASIS Web Services Security Maintenance \(WSS-M\) TC](#) on the above date. The level of approval is also listed above. Check the “Latest Version” location noted above for possible later revisions of this document.

Technical Committee members should send comments on this specification to the Technical Committee’s email list. Others should send comments to the Technical Committee by using the “[Send A Comment](#)” button on the Technical Committee’s web page at <http://www.oasis-open.org/committees/wss-m/>.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (<http://www.oasis-open.org/committees/wss-m/ipr.php>).

This document integrates specific error corrections or editorial changes to the preceding specification, within the scope of the Web Services Security and this TC.

This document introduces a third digit in the numbering convention where the third digit represents a consolidation of error corrections, bug fixes or editorial formatting changes (e.g., 1.1.1); it does not add any new features beyond those of the base specifications (e.g., 1.1).

1 Introduction (Informative)

The Web Services Security: SOAP Message Security [WS-Security] specification proposes a standard set of SOAP extensions that can be used when building secure Web services to implement message level integrity and confidentiality. This specification describes the use of ISO/IEC 21000-5 Rights Expressions with respect to the WS-Security specification.

2 Notations and Terminology (Normative)

2.1 Notational Conventions

The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [KEYWORDS].

Namespace URIs (of the general form "some-URI") represent some application-dependent or context-dependent URI as defined in [URI].

This specification is designed to work with the general SOAP message structure and message processing model, and should be applicable to any version of SOAP. The current SOAP 1.2 namespace URI is used herein to provide detailed examples, but there is no intention to limit the applicability of this specification to a single version of SOAP.

2.2 Namespaces

The following namespaces are used in this document:

Prefix	Namespace
S	http://www.w3.org/2003/05/soap-envelope
ds	http://www.w3.org/2000/09/xmldsig#
xenc	http://www.w3.org/2001/04/xmlenc#
wsse	http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-secext-1.0.xsd
wsse11	http://docs.oasis-open.org/wss/oasis-wss-wssecurity-secext-1.1.xsd
wsu	http://docs.oasis-open.org/wss/2004/01/oasis-200401-wss-wssecurity-utility-1.0.xsd
r	urn:mpeg:mpeg21:2003:01-REL-R-NS
sx	urn:mpeg:mpeg21:2003:01-REL-SX-NS

Table 1 Namespace Prefixes

21 **2.3 Terminology**

22 This specification employs the terminology defined in the Web Services Security: SOAP Message
23 Security [WS-Security] Specification.

24 Defined below are the basic definitions for additional terminology used in this specification.

25 **License** – ISO/IEC 21000-5 Rights Expression

26

27 3 Usage (Normative)

28 This section describes the syntax and processing rules for the use of licenses with the Web
29 Services Security: Soap Message Security specification [WS-Security].

30 3.1 Token Types

31 When a URI value is used to indicate a license according to this profile, its value MUST be
32 <http://docs.oasis-open.org/wss/oasis-wss-rel-token-profile-1.0.pdf#license>.

33 Note: This URI is for both the ValueType and TokenType attributes. It is also for use by any elements or
34 attributes that require a token type URI and are defined in another specification taking advantage of REL
35 Tokens.

36 3.2 Processing Model

37 The processing model for WS-Security with licenses is no different from that of WS-Security with other
38 token formats as described in Web Services Security: SOAP Message Security [WS-Security].

39 At the token level, a processor of licenses MUST conform to the required validation and processing rules
40 defined in ISO/IEC 21000-5 [REL].

41 3.3 Attaching Security Tokens

42 Licenses are attached to SOAP messages using WS-Security by placing the license element
43 inside the <wsse:Security> header. The following example illustrates a SOAP message
44 with a license.

```
45 <S:Envelope xmlns:S="...">  
46   <S:Header>  
47     <wsse:Security xmlns:wsse="...">  
48       <r:license xmlns:r="...">  
49         ...  
50       </r:license>  
51       ...  
52     </wsse:Security>  
53   </S:Header>  
54   <S:Body>  
55     ...  
56   </S:Body>  
57 </S:Envelope>
```

58 3.4 Identifying and Referencing Security Tokens

59 The Web Services Security: SOAP Message Security [WS-Security] specification defines the *wsu:id*
60 attribute as the common mechanism for identifying security tokens (the specification describes the
61 reasons for this). Licenses have an additional identification mechanism available: their *licenseId* attribute,
62 the value of which is a URI. The following example shows a license that uses both mechanisms:

```
63 <r:license xmlns:r="..." xmlns:wsu="...">  
64   licenseId="urn:foo:SecurityToken:ef375268"  
65   wsu:Id="SecurityToken-ef375268">  
66   ...  
67 </r:license>
```

68 Licenses can be referenced either according to their location or their *licenseId*. Location references are
69 dependent on location and can be either local or remote. *licenseId* references are not dependent on
70 location.

71 Local location references are RECOMMENDED when they can be used. Remote location references are
 72 OPTIONAL for cases where it is not feasible to transmit licenses with the SOAP message. licenseld
 73 references are OPTIONAL for cases where location is unknown or cannot be indicated.
 74 WS-Security specifies that tokens are referenced using the <wsse:SecurityTokenReference> element.
 75 Implementations compliant with this profile SHOULD set the
 76 /wsse:SecurityTokenReference/wsse:Reference/@ValueType attribute to http://docs.oasis-
 77 open.org/wss/oasis-wss-rel-token-profile-1.0.pdf#license when using wsse:SecurityTokenReference to
 78 refer to a license by licenseld. This is OPTIONAL when referring to a license by location.
 79 The following table demonstrates the use of the <wsse:SecurityTokenReference> element to refer to
 80 licenses.

By Location	Local	<pre><wsse:SecurityTokenReference> <wsse:Reference URI="#SecurityToken-ef375268" /> </wsse:SecurityTokenReference></pre>
	Remote	<pre><wsse:SecurityTokenReference> <wsse:Reference URI="http://www.foo.com/ef375268.xml" /> </wsse:SecurityTokenReference></pre>
By licenseld		<pre><wsse:SecurityTokenReference> <wsse:Reference URI="urn:foo:SecurityToken:ef375268" ValueType="http://docs.oasis- open.org/wss/oasis-wss-rel-token-profile- 1.0.pdf#license" /> </wsse:SecurityTokenReference></pre>

81 *Table 2. <wsse:SecurityTokenReference>*

82 The following example demonstrates how a <wsse:SecurityTokenReference> can be used to indicate that
 83 the message parts specified inside the <ds:SignedInfo> element were signed using a key from the license
 84 referenced by licenseld in the <ds:KeyInfo> element.

```
85 <S:Envelope xmlns:S="..." xmlns:ds="...">
86   <S:Header>
87     <wsse:Security xmlns:wsse="...">
88       <r:license xmlns:r="..." licenseId="urn:foo:SecurityToken:ef375268"
89       xmlns:wsu="..." wsu:Id="SecurityToken-ef375268">
90         ...
91       </r:license>
92       ...
93     <ds:Signature>
94       <ds:SignedInfo>
95         ...
96       </ds:SignedInfo>
97       <ds:SignatureValue>...</ds:SignatureValue>
98       <ds:KeyInfo>
99         <wsse:SecurityTokenReference>
100           <wsse:Reference
101             URI="#SecurityToken-ef375268"
102           />
103         </wsse:SecurityTokenReference>
104       </ds:KeyInfo>
105     </ds:Signature>
106   </wsse:Security>
107 </S:Header>
108 <S:Body>
109   ...
```

```
110 </S:Body>
111 </S:Envelope>
```

112 The following example shows a signature over a local license using a location reference to that license.
113 The example demonstrates how the integrity of an (unsigned) license can be preserved by signing it in
114 the <wsse:Security> header.

```
115 <S:Envelope xmlns:S="..." xmlns:wsu="..." >
116 <S:Header>
117 <wsse:Security xmlns:wsse="...">
118 <r:license xmlns:r="..." wsu:Id="SecurityToken-ef375268">
119 ...
120 </r:license>
121 ...
122 <wsse:SecurityTokenReference wsu:Id="Str1">
123 <wsse:Reference
124 URI="#SecurityToken-ef375268"
125 />
126 </wsse:SecurityTokenReference>
127 ...
128 <ds:Signature>
129 <ds:SignedInfo>
130 ...
131 <ds:Reference URI="#Str1">
132 <ds:Transforms>
133 <ds:Transform
134 Algorithm="http://schemas.xmlsoap.org/2003/06/STR-Transform">
135 <ds:CanonicalizationMethod
136 Algorithm="http://www.w3.org/TR/2001/REC-xml-c14n-
137 20010315"/>
138 </ds:Transform>
139 </ds:Transforms>
140 <ds:DigestMethod
141 Algorithm="http://www.w3.org/2000/09/xmldsig#sha1"
142 />
143 <ds:DigestValue>...</ds:DigestValue>
144 </ds:Reference>
145 </ds:SignedInfo>
146 <ds:SignatureValue>...</ds:SignatureValue>
147 <ds:KeyInfo>...</ds:KeyInfo>
148 </ds:Signature>
149 </wsse:Security>
150 </S:Header>
151 <S:Body>
152 ...
153 </S:Body>
154 </S:Envelope>
```

155 Note: since licenses allow the use of the wsu:Id attribute, it is usually not necessary to use the STR-
156 Transform because the license can be referred to directly in the ds:SignedInfo as shown in the following
157 example:

```
158 <S:Envelope xmlns:S="..." xmlns:ds="...">
159 <S:Header>
160 <wsse:Security xmlns:wsse="...">
161 <r:license xmlns:r="..." xmlns:wsu="..." wsu:Id="SecurityToken-
162 ef375268">
163 ...
164 </r:license>
165 ...
166 <ds:Signature>
167 <ds:SignedInfo>
168 ...
169 <ds:Reference URI="#SecurityToken-ef375268">
```

170
171
172
173
174
175
176
177
178
179
180
181
182
183
184

```
<ds:DigestMethod
  Algorithm="http://www.w3.org/2000/09/xmldsig#sha1"
/>
<ds:DigestValue>...</ds:DigestValue>
</ds:Reference>
</ds:SignedInfo>
<ds:SignatureValue>...</ds:SignatureValue>
<ds:KeyInfo>...</ds:KeyInfo>
</ds:Signature>
</wsse:Security>
</S:Header>
<S:Body>
  ...
</S:Body>
</S:Envelope>
```

185 3.5 Authentication

186 The Web Services Security: SOAP Message Security [WS-Security] specification does not dictate how
187 claim confirmation must be performed. As well, the REL allows for multiple types of confirmation. This
188 profile of WS-Security REQUIRES that message senders and receivers support claim confirmation for
189 <r:keyHolder> principals. It is RECOMMENDED that an XML Signature be used to establish the
190 relationship between the message sender and the claims. This is especially RECOMMENDED whenever
191 the SOAP message exchange is conducted over an unprotected transport.

192 The following table enumerates the mandatory principals to be supported by claim confirmation and
193 summarizes their associated processing models. It should be noted that this table is not all-
194 encompassing, and it is envisioned that future specifications may expand this table over time.

Principal	RECOMMENDED Processing Rules
<r:keyHolder>	The message sender adds (to the security header) an XML Signature that can be verified with the key information specified in the <r:keyHolder> of the referenced license.

195 *Table 3. Processing Rules for Claim Confirmation*

196 Note that the high-level processing model described in the following sections does not differentiate
197 between message author and message sender as would be necessary to guard against replay attacks.
198 The high-level processing model also does not take into account requirements for authentication of
199 receiver by sender or for message or token confidentiality. These concerns must be addressed by means
200 other than those described in the high-level processing model. If confidentiality of the token in the
201 message is important, then use the approach defined by [WS-Security] to encrypt the token.

202 3.5.1 <r:keyHolder> Principal

203 The following sections describe the <r:keyHolder> method of establishing the correspondence between a
204 SOAP message sender and the claims within a license.

205 Sender

206 The message sender MUST include within the <wsse:Security> header element a <r:license> containing
207 at least one <r:grant> to an <r:keyHolder> identifying the key to be used to confirm the claims. If the
208 message sender includes an <r:license> containing more than one <r:grant> to an <r:keyHolder>, then all
209 of those <r:keyHolder> elements MUST be equal.

210 In order for the receiver to perform claim confirmation, the sender MUST demonstrate knowledge of the
211 confirmation key. The sender MAY accomplish this by using the confirmation key to sign content from

212 within the message and by including the resulting <ds:Signature> element in the <wsse:Security> header
213 element. <ds:Signature> elements produced for this purpose MUST conform to the canonicalization and
214 token inclusion rules defined in the core WS-Security specification and this profile specification.

215 Licenses that contain at least one <r:grant> to an <r:keyHolder> SHOULD contain an <r:issuer> with a
216 <ds:Signature> element that identifies the license issuer to the relying party and protects the integrity of
217 the confirmation key established by the license issuer.

218 Receiver

219 If the receiver determines that the sender has demonstrated knowledge of a confirmation key as specified
220 in an <r:keyHolder>, then the claims (found in the licenses) pertaining to that <r:keyHolder> MAY be
221 attributed to the sender. If one of these claims is an identity and if the conditions of that claim are
222 satisfied, then any elements of the message whose integrity is protected by the confirmation key MAY be
223 considered to have been authored by that identity.

224 Example

225 The following example illustrates how a license security token having an <r:keyHolder> principal can be
226 used with a <ds:Signature> to establish that John Doe is requesting a stock report on FOO.

```
227 <S:Envelope xmlns:S="...">
228   <S:Header>
229     <wsse:Security xmlns:wsse="...">
230       <r:license xmlns:r="..." licenseId="urn:foo:SecurityToken:ef375268">
231         <r:grant>
232           <r:keyHolder>
233             <r:info>
234               <ds:KeyValue>...</ds:KeyValue>
235             </r:info>
236           </r:keyHolder>
237           <r:possessProperty/>
238           <sx:commonName xmlns:sx="...">John Doe</sx:commonName>
239         </r:grant>
240         <r:issuer>
241           <ds:Signature>...</ds:Signature>
242         </r:issuer>
243       </r:license>
244       <ds:Signature>
245         <ds:SignedInfo>
246           ...
247           <ds:Reference URI="#MsgBody">
248             <ds:DigestMethod
249               Algorithm="http://www.w3.org/2000/09/xmldsig#sha1"
250             />
251             <ds:DigestValue>...</ds:DigestValue>
252           </ds:Reference>
253         </ds:SignedInfo>
254         <ds:SignatureValue>...</ds:SignatureValue>
255         <ds:KeyInfo>
256           <wsse:SecurityTokenReference>
257             <wsse:Reference
258               URI="urn:foo:SecurityToken:ef375268"
259               ValueType="http://docs.oasis-open.org/wss/oasis-wss-rel-token-
260 profile-1.0.pdf#license"
261             />
262           </wsse:SecurityTokenReference>
263         </ds:KeyInfo>
264       </ds:Signature>
265     </S:Header>
266   </S:Envelope>
```

```

269     </wsse:Security>
270 </S:Header>
271
272     <S:Body wsu:Id="MsgBody" xmlns:wsu="...">

275       </ReportRequest>
276     </S:Body>
277
278 </S:Envelope>

```

279 3.6 Confidentiality

280 This section details how licenses may be used to protect the confidentiality of a SOAP message within
 281 WS-Security. The Web Services Security: SOAP Message Security [WS-Security] specification does not
 282 dictate how confidentiality must be performed. As well, the REL allows for multiple types of confidentiality.
 283 This profile of WS-Security REQUIRES that message senders and receivers support confidentiality for
 284 <r:keyHolder> principals. It is RECOMMENDED that XML Encryption be used to ensure confidentiality.
 285 This is especially RECOMMENDED whenever the SOAP message exchange is conducted over an
 286 unprotected transport.

287 The following table enumerates the mandatory principals to be supported for confidentiality and
 288 summarizes their associated processing models. It should be noted that this table is not all-
 289 encompassing, and it is envisioned that future specifications may expand this table over time.

Principal	RECOMMENDED Processing Rules
<r:keyHolder>	The message sender adds (to the security header) either 1) an <xenc:ReferenceList> that points to one or more <xenc:EncryptedData> elements that can be decrypted with a key which can be determined from information specified in the <r:keyHolder> of the referenced license or 2) an <xenc:EncryptedKey> that can be decrypted with a key determined from information specified in the <r:keyHolder> of the referenced license.

290 *Table 4. Processing Rules for Confidentiality*

291 Note that this section deals only with Confidentiality. Details of authentication of the sender by the
 292 receiver must be addressed by means other than those described in this section (see the previous
 293 section).

294 3.6.1 <r:keyHolder> Principal

295 The following sections describe the <r:keyHolder> method of establishing confidentiality using a license.

296 Sender

297 The message sender MUST include within the <wsse:Security> header element a <r:license> containing
 298 at least one <r:grant> to an <r:keyHolder> identifying the key used to encrypt some data or key. If the
 299 message sender includes an <r:license> containing more than one <r:grant> to an <r:keyHolder>, then all
 300 of those <r:keyHolder> elements MUST be equal.

301 In order for the receiver to know when to decrypt the data or key, the sender MUST indicate the
 302 encryption in the message. The sender MAY accomplish this by placing an <xenc:EncryptedData> or

303 <xenc:EncryptedKey> in the appropriate place in the message and by including the resulting
304 <xenc:ReferenceList> or <xenc:EncryptedKey> element in the <wsse:Security> header element.
305 <xenc:ReferenceList> or <xenc:EncryptedKey> elements produced for this purpose MUST conform to the
306 rules defined in the core WS-Security specification and this profile specification.

307 Receiver

308 If the receiver determines that he has knowledge of a decryption key as specified in an <r:keyHolder>,
309 then he MAY decrypt the associated data or key. In the case of decrypting a key, he may then
310 recursively decrypt any data or key that that key can decrypt.

311 Example

312 The following example illustrates how a license containing a <r:keyHolder> principal can be used with
313 XML encryption schema elements to protect the confidentiality of a message using a separate encryption
314 key given in the <xenc:EncryptedKey> in the security header.

315 In this example, the r:license element provides information about the recipient's RSA public key (i.e.,
316 KeyValue in keyHolder) used to encrypt the symmetric key carried in the EncryptedKey element. The
317 recipient uses this information to determine the correct private key to use in decrypting the symmetric key.
318 The symmetric key is then used to decrypt the EncryptedData child of the Body element.

367 **3.7 Error Codes**

368 It is RECOMMENDED that the error codes defined in the Web Services Security: SOAP
369 Message Security [WS-Security] specification are used. However, implementations MAY use
370 custom errors, defined in private namespaces if they desire. Care should be taken not to
371 introduce security vulnerabilities in the errors returned.

372

4 Types of Licenses (Informative)

373

4.1 Attribute Licenses

374

In addition to key information, licenses can carry information about attributes of those keys. Examples of such information on a client are e-mail address or common name. A service's key, on the other hand, might be associated with a DNS name and common name.

376

377

The following is an example client attribute license.

licenseId="urn:foo:SecurityToken:ef375268">
  <r:inventory>
    <r:keyHolder licensePartId="service">
      <r:info>
        <ds:KeyValue>FDFEWEFF...</ds:KeyValue>
      </r:info>
    </r:keyHolder>
  </r:inventory>
  <r:grant>
    <r:keyHolder licensePartIdRef="service"/>
    <r:possessProperty/>
    <sx:commonName>MyService Company</sx:commonName>
  </r:grant>
  <r:grant>
    <r:keyHolder licensePartIdRef="service"/>
    <r:possessProperty/>
    <sx:dnsName>www.myservice.com</sx:dnsName>
  </r:grant>
  <r:issuer>
    <ds:Signature>...</ds:Signature>
  </r:issuer>
</r:license>
```

425

Additional examples of and processing rules for the use of attribute licenses can be found in the above sections on Authentication and Confidentiality.

426

427

4.2 Sender Authorization

428

Licenses may be used by a sender as proof of authorization to perform a certain action on a particular resource. This WS-Security specification does not describe how authorization must be performed. In the

429

430 context of web services, a sender can send to a receiver an authorization license in the security header
431 as proof of authorization to call the sender. Typically, this authorization license is signed by a trusted
432 authority and conforms to the syntax pattern specified below.

```
433 <r:license xmlns:r="..." licenseId="urn:foo:SecurityToken:ef375268">  
434   <r:grant>  
435     <r:keyHolder>  
436       <r:info>  
437         <ds:KeyValue>FDFEWEFF...</ds:KeyValue>  
438       </r:info>  
439     </r:keyHolder>  
440     <sx:rightUri definition='...' />  
441     <x:someResource />  
442     <x:someCondition />  
443   </r:grant>  
444   <r:issuer>  
445     <ds:Signature>...</ds:Signature>  
446   </r:issuer>  
447 </r:license>
```

448 The above license contains an authorization grant authorizing the keyholder (sender's public key), the
449 right to exercise the right identified in the <sx:rightUri> element. The resource in the license typically
450 corresponds to the semantics of the URI given in the definition attribute of the <sx:rightUri> element. The
451 entire license along with the <ds:Signature> element in the <r:issuer> certifies the fact that the principal
452 (<keyholder>) is granted the authorization to exercise the right in the <sx:rightUri> element over the
453 specified resource. The integrity of the license is usually protected with a digital signature contained
454 within the <ds:Signature>.

455 4.3 Issuer Authorization

456 To enunciate that a particular issuer is allowed to issue particular types of licenses, one can use the kind
457 of license described here. Issuer authorization licenses can accompany other licenses in the security
458 header such as those used for authentication, sender authorization, or other issuer authorizations. These
459 issuer authorization licenses might help complete the authorization proof that is required for authorizing or
460 authenticating a particular sender.

461
462 The following license is an example issuer authorization license for authorizing an issuer to issue a simple
463 attribute license.

```
464 <r:license xmlns:r="..." licenseId="urn:foo:SecurityToken:ef375268">  
465   <r:grant>  
466     <r:forAll varName='K' />  
467     <r:forAll varName='P' />  
468     <r:keyHolder>  
469       <r:info>  
470         <ds:KeyValue>FDFEWEFF...</ds:KeyValue>  
471       </r:info>  
472     </r:keyHolder>  
473     <r:issue />  
474   </r:grant>  
475   <r:grant>  
476     <r:keyHolder varRef='K' />  
477     <r:possessProperty />  
478     <r:propertyAbstract varRef='P' />  
479   </r:grant>  
480 </r:grant>  
481 <r:issuer>  
482   <ds:Signature>...</ds:Signature>  
483 </r:issuer>  
</r:license>
```

484 The following license is an example issuer authorization license for authorizing an issuer to issue sender
485 authorization licenses.

```
486 <r:license xmlns:r="..." licenseId="urn:foo:SecurityToken:ef375268">  
487   <r:grant>  
488     <r:forAll varName='K' />  
489     <r:forAll varName='R' />  
490     <r:keyHolder>
```

```

491     <r:info>
492         <ds:KeyValue>FDFEWEFF...</ds:KeyValue>
493     </r:info>
494 </r:keyHolder>
495 <r:issue/>
496 <r:grant>
497     <r:keyHolder varRef='K' />
498     <sx:rightUri definition='...'/>
499     <r:resource varRef='R' />
500 </r:grant>
501 </r:grant>
502 <r:issuer>
503     <ds:Signature>...</ds:Signature>
504 </r:issuer>
505 </r:license>

```

506 The following license is an example issuer authorization license for authorizing an issuer to issue (to other
507 issuers) issuer authorization licenses allowing those other issuers to issue simple attribute licenses, such
508 as those that can be used for authentication or confidentiality.

```

509 <r:license xmlns:r="..." licenseId="urn:foo:SecurityToken:ef375268">
510   <r:grant>
511     <r:forAll varName='I' />
512     <r:keyHolder>
513       <r:info>
514         <ds:KeyValue>FDFEWEFF...</ds:KeyValue>
515       </r:info>
516     </r:keyHolder>
517     <r:issue/>
518     <r:grant>
519       <r:forAll varName='K' />
520       <r:forAll varName='P' />
521       <r:keyHolder varRef='I' />
522       <r:issue/>
523       <r:grant>
524         <r:keyHolder varRef='K' />
525         <r:possessProperty/>
526         <r:propertyAbstract varRef='P' />
527       </r:grant>
528     </r:grant>
529   </r:grant>
530   <r:issuer>
531     <ds:Signature>...</ds:Signature>
532   </r:issuer>
533 </r:license>

```

534

535 **5 Threat Model and Countermeasures (Informative)**

536 This section addresses the potential threats that a SOAP message may encounter and the
537 countermeasures that may be taken to thwart such threats. A SOAP message containing licenses may
538 face threats in various contexts. This includes the cases where the message is in transit, being routed
539 through a number of intermediaries, or during the period when the message is in storage.

540 The use of licenses with WS-Security introduces no new threats beyond those identified for the REL or
541 WS-Security with other types of security tokens. Message alteration and eavesdropping can be
542 addressed by using the integrity and confidentiality mechanisms described in WS-Security. Replay
543 attacks can be addressed by using of message timestamps and caching, as well as other application-
544 specific tracking mechanisms. For licenses, ownership is verified by the use of keys; man-in-the-middle
545 attacks are generally mitigated. It is strongly RECOMMENDED that all relevant and immutable message
546 data be signed. It should be noted that transport-level security MAY be used to protect the message and
547 the security token. In order to trust licenses, they SHOULD be signed natively and/or using the
548 mechanisms outlined in WS-Security. This allows readers of the licenses to be certain that the licenses
549 have not been forged or altered in any way. It is strongly RECOMMENDED that the <r:license> elements
550 be signed (either within the token, as part of the message, or both).

551 The following few sections elaborate on the afore-mentioned threats and suggest countermeasures.

552 **5.1 Eavesdropping**

553 Eavesdropping is a threat to the confidentiality of the message, and is common to all types of network
554 protocols. The routing of SOAP messages through intermediaries increases the potential incidences of
555 eavesdropping. Additional opportunities for eavesdropping exist when SOAP messages are persisted.

556 To provide maximum protection from eavesdropping, licenses, license references, and sensitive message
557 content SHOULD be encrypted such that only the intended audiences can view their content. This
558 removes threats of eavesdropping in transit, but does not remove risks associated with storage or poor
559 handling by the receiver.

560 Transport-layer security MAY be used to protect the message from eavesdropping while in transport, but
561 message content must be encrypted above the transport if it is to be protected from eavesdropping by
562 intermediaries.

563 **5.2 Replay**

564 The reliance on authority protected (e.g. signed) licenses to <r:keyHolder> principals precludes all but the
565 key holder from binding the licenses to a SOAP message. Although this mechanism effectively restricts
566 message authorship to the holder of the confirmation key, it does not preclude the capture and
567 resubmission of the message by other parties.

568 Replay attacks can be addressed by using message timestamps and caching, as well as other
569 application-specific tracking mechanisms.

570 **5.3 Message Insertion**

571 This profile of WS-Security is not vulnerable to message insertion attacks. Higher-level protocols built on
572 top of SOAP and WS-Security should avoid introducing message insertion threats and provide proper
573 countermeasures for any they do introduce.

574 **5.4 Message Deletion**

575 This profile of WS-Security is not vulnerable to message deletion attacks other than denial of service.
576 Higher-level protocols built on top of SOAP and WS-Security should avoid introducing message deletion
577 threats and provide proper countermeasures for any they do introduce.

578 **5.5 Message Modification**

579 Message Modification poses a threat to the integrity of a message. The threat of message modification
580 can be thwarted by signing the relevant and immutable content by the key holder. The receivers SHOULD
581 only trust the integrity of those segments of the message that are signed by the key holder.

582 To ensure that message receivers can have confidence that received licenses have not been forged or
583 altered since their issuance, licenses appearing in <wsse:Security> header elements SHOULD be
584 integrity protected (e.g. signed) by their issuing authority. It is strongly RECOMMENDED that a message
585 sender sign any <r:license> elements that it is confirming and that are not signed by their issuing
586 authority.

587 Transport-layer security MAY be used to protect the message and contained licenses and/or license
588 references from modification while in transport, but signatures are required to extend such protection
589 through intermediaries.

590 **5.6 Man-in-the-Middle**

591 This profile of WS-Security is not vulnerable to man-in-the-middle attacks. Higher-level protocols built on
592 top of SOAP and WS-Security should avoid introducing Man-in-the-Middle threats and provide proper
593 countermeasures for any they do introduce.
