Related work:
This specification replaces or supercedes:

- Core and hierarchical role based access control (RBAC) profile of XACML v2.0

This specification is related to:

- eXtensible Access Control Markup Language (XACML) Version 3.0, WD 11

Declared XML Namespace(s):
None

Abstract:
This specification defines a profile for the use of XACML in expressing policies that use role based access control (RBAC). It extends the XACML Profile for RBAC Version 1.0 to include a recommended AttributeId for roles, but reduces the scope to address only “core” and “hierarchical” RBAC. This specification has also been updated to apply to XACML 3.0.

Status:
This document was last revised or approved by the eXtensible Access Control Markup Language (XACML) TC on the above date. The level of approval is also listed above. Check the “Latest

Version" or "Latest Approved Version" location noted above for possible later revisions of this document.

Technical Committee members should send comments on this specification to the Technical Committee's email list. Others should send comments to the Technical Committee by using the "Send A Comment" button on the Technical Committee's web page at http://www.oasis-open.org/committees/xacml/.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page http://www.oasis-open.org/committees/xacml/ipr.php.

The non-normative errata page for this specification is located at http://www.oasis-open.org/committees/xacml/.

Notices

All capitalized terms in the following text have the meanings assigned to them in the OASIS Intellectual Property Rights Policy (the "OASIS IPR Policy"). The full Policy may be found at the OASIS website.

This document and translations of it may be copied and furnished to others, and derivative works that comment on or otherwise explain it or assist in its implementation may be prepared, copied, published, and distributed, in whole or in part, without restriction of any kind, provided that the above copyright notice and this section are included on all such copies and derivative works. However, this document itself may not be modified in any way, including by removing the copyright notice or references to OASIS, except as needed for the purpose of developing any document or deliverable produced by an OASIS Technical Committee (in which case the rules applicable to copyrights, as set forth in the OASIS IPR Policy, must be followed) or as required to translate it into languages other than English.

The limited permissions granted above are perpetual and will not be revoked by OASIS or its successors or assigns.

This document and the information contained herein is provided on an "AS IS" basis and OASIS DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY OWNERSHIP RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

OASIS requests that any OASIS Party or any other party that believes it has patent claims that would necessarily be infringed by implementations of this OASIS Committee Specification or OASIS Standard, to notify OASIS TC Administrator and provide an indication of its willingness to grant patent licenses to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification.

OASIS invites any party to contact the OASIS TC Administrator if it is aware of a claim of ownership of any patent claims that would necessarily be infringed by implementations of this specification by a patent holder that is not willing to provide a license to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification. OASIS may include such claims on its website, but disclaims any obligation to do so.

OASIS takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on OASIS' procedures with respect to rights in any document or deliverable produced by an OASIS Technical Committee can be found on the OASIS website. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this OASIS Committee Specification or OASIS Standard, can be obtained from the OASIS TC Administrator. OASIS makes no representation that any information or list of intellectual property rights will at any time be complete, or that any claims in such list are, in fact, Essential Claims.

The names "OASIS" and “XACML” are trademarks of OASIS, the owner and developer of this specification, and should be used only to refer to the organization and its official outputs. OASIS welcomes reference to, and implementation and use of, specifications, while reserving the right to enforce its marks against misleading uses. Table of Contents

1 Introduction

{non-normative}

This specification defines a profile for the use of the OASIS eXtensible Access Control Markup Language (XACML) **[XACML]** to meet the requirements for "core" and "hierarchical" ***role*** based access control (RBAC) as specified in **[ANSI-RBAC]**. Use of this profile requires no changes or extensions to standard XACML Version 3.0. Compared to the Core and hierarchical ***role*** based access control (RBAC) profile of XACML v2.0 **[RBAC-V2]** there are is no new functionality, rather the specification has just been updated for XACML 3.0.

This specification begins with a non-normative explanation of the building blocks from which the ***RBAC*** solution is constructed. A full example illustrates these building blocks. The specification then discusses how these building blocks may be used to implement the various elements of the ***RBAC*** model presented in **[ANSI-RBAC]**. Finally, the normative section of the specification describes compliant uses of the building blocks in implementing an ***RBAC*** solution.

This specification assumes the reader is somewhat familiar with XACML. A brief overview sufficient to understand these examples is available in **[XACMLIntro]**. An introduction to the ***RBAC*** model is available in **[RBACIntro]**.

1.1 Glossary

HasPrivilegesOfRole policy

An optional type of `<Policy>` that can be included in a Permission `<PolicySet>` to allow support queries asking if a subject "has the privileges of" a specific ***role***. See Section 2.5: HasPrivilegesOfRole Policies and Requests.

Junior role

In a ***role*** hierarchy, Role A is junior to Role B if Role B inherits all the ***permissions*** associated with Role A.

Multi-role permissions

A set of ***permissions*** for which a user must hold more than one ***role*** simultaneously in order to gain access.

Permission

The ability or right to perform some action on some resource, possibly only under certain specified conditions.

PPS

Permission `<PolicySet>`. See Section 1.8: Policies.

RBAC

Role based access control. A model for controlling access to resources where permitted actions on resources are identified with ***roles*** rather than with individual subject identities.

Role Enablement Authority

An entity that assigns ***role*** attributes and values to users or enables ***role*** attributes and values during a user's session.

RPS

Role `<PolicySet>`. See Section 1.8: Policies.

Role

A job function within the context of an organization that has associated semantics regarding the authority and responsibility conferred on the user assigned to the ***role*** **[ANSI-RBAC]**.

Senior role

In a ***role*** hierarchy, Role A is senior to Role B if Role A inherits all the ***permissions*** associated with Role B.

1.2 XML Entity Declarations

In order to improve readability, the examples in this specification assume use of the following XML Internal Entity declarations:

```
<!ENTITY xml "http://www.w3.org/2001/XMLSchema#">
<!ENTITY rule-combine "urn:oasis:names:tc:xacml:1.0:rule-combining-algorithm:">
<!ENTITY policy-combine "urn:oasis:names:tc:xacml:1.0:policy-combining-algorithm:">
<!ENTITY function "urn:oasis:names:tc:xacml:1.0:function:">
<!ENTITY subject-category "urn:oasis:names:tc:xacml:1.0:subject-category:">
<!ENTITY subject "urn:oasis:names:tc:xacml:1.0:subject:">
<!ENTITY role "urn:oasis:names:tc:xacml:2.0:subject:role">
<!ENTITY roles "urn:example:role-values:">
<!ENTITY resource "urn:oasis:names:tc:xacml:1.0:resource:">
<!ENTITY action "urn:oasis:names:tc:xacml:1.0:action:">
<!ENTITY actions "urn:oasis:names:tc:xacml:2.0:actions:">
<!ENTITY environment "urn:oasis:names:tc:xacml:1.0:environment:">
<!ENTITY category " urn:oasis:names:tc:xacml:3.0:attribute-category:">
```

For example, “&xml;string” is equivalent to “http://www.w3.org/2001/XMLSchema#string”.

1.3 Terminology

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in **[RFC2119]**.

1.6 Scope

Role based access control allows policies to be specified in terms of subject ***roles*** rather than strictly in terms of individual subject identities. This is important for scalability and manageability of access control systems.

The policies specified in this profile can answer three types of questions:

1. If a subject has ***roles*** R_1 , R_2, ... R_n enabled, can subject X access a given resource using a given action?
2. Is subject X allowed to have ***role*** R_i enabled?
3. If a subject has ***roles*** R_1 , R_2, ... R_n enabled, does that mean the subject will have ***permissions*** associated with a given ***role*** R'? That is, is ***role*** R' either equal to or junior to any of ***roles*** R_1 , R_2, ... R_n?

The policies specified in this profile do not answer the question "What set of ***roles*** does subject X have?" That question must be handled by a ***Role Enablement Authority***, and not directly by an XACML PDP. Such an entity may make use of XACML policies, but will need additional information. See Section 3: Assigning and Enabling Role Attributes for more information about ***Role Enablement Authorities***.

The policies specified in this profile assume all the ***roles*** for a given subject have already been enabled at the time an authorization decision is requested. They do not deal with an environment in which ***roles*** must be enabled dynamically based on the resource or actions a subject is attempting to perform. For this reason, the policies specified in this profile also do not deal with static or dynamic "Separation of Duty" (see **[ANSI-RBAC]**). A future profile may address the requirements of this type of environment.

1.7 Role

In this profile, ***roles*** are expressed as XACML Subject Attributes. There are two exceptions: in a Role Assignment `<PolicySet>` or `<Policy>` and in a HasPrivilegesOfRole `<Policy>`, the ***role*** appears as a Resource Attribute. See Section 2.5: HasPrivilegesOfRole Policies and Requests and Section 3: Assigning and Enabling Role Attributes for more information.

Role attributes may be expressed in either of two ways, depending on the requirements of the application environment. In some environments there may be a small number of "***role*** attributes", where the name of each such attribute is some name indicating "***role***", and where the value of each such attribute indicates the name of the ***role*** held. For example, in this first type of environment, there may be one "***role*** attribute" having the `AttributeId` "&role;" (this profile recommends use of this identifier). The possible ***roles*** are values for this one attribute, and might be "&roles;officer", "&roles;manager", and "&roles;employee". This way of expressing ***roles*** works best with the XACML way of expressing policies. This method of identifying ***roles*** is also most conducive to interoperability.

Alternatively, in other application environments, there may be a number of different attribute identifiers, each indicating a different ***role***. For example, in this second type of environment, there might be three attribute identifiers: "urn:someapp:attributes:officer-role", "urn:someapp:attributes:manager-role", and "urn:someapp:attributes:employee-role". In this case the value of the attribute may be empty or it may contain various parameters associated with the ***role***. XACML policies can handle ***roles*** expressed in this way, but not as naturally as in the first way.

XACML supports multiple subjects per access request, indicating various entities that may be involved in making the request. For example, there is usually a human user who initiates the request, at least indirectly. There are usually one or more applications or code bases that generate the actual low-level access request on behalf of the user. There is some computing device on which the application or code base is executing, and this device may have an identity such an IP address. XACML identifies each such Subject with a `Category` xml attribute in the `<Attributes>` element that indicates the type of subject being described. For example, the human user has a `Category` of &subject-category;access-subject; the application that generates the access request has a `Category` of &subject-category;codebase and so on. In this profile, a ***role*** attribute may be associated with any of the categories of subjects involved in making an access request.

1.8 Policies

In this profile, four types of policies are specified.

1. **Role `<PolicySet>`** or **RPS** : a `<PolicySet>` that associates holders of a given ***role*** attribute and value with a Permission `<PolicySet>` that contains the actual ***permissions*** associated with

the given ***role***. The <Target> element of a Role <PolicySet> limits the applicability of the <PolicySet> to subjects holding the associated ***role*** attribute and value. Each Role <PolicySet> references a single corresponding Permission <PolicySet> but does not contain or reference any other <Policy> or <PolicySet> elements.

2. **Permission <PolicySet> or PPS**: a <PolicySet> that contains the actual ***permissions*** associated with a given ***role***. It contains <Policy> elements and <Rules> that describe the resources and actions that subjects are permitted to access, along with any further conditions on that access, such as time of day. A given Permission <PolicySet> may also contain references to Permission <PolicySet>s associated with other ***roles*** that are junior to the given ***role***, thereby allowing the given Permission <PolicySet> to inherit all ***permissions*** associated with the ***role*** of the referenced Permission <PolicySet>. The <Target> element of a Permission <PolicySet>, if present, must not limit the subjects to which the <PolicySet> is applicable.

3. **Role Assignment <Policy> or <PolicySet>**: a <Policy> or <PolicySet> that defines which ***roles*** can be enabled or assigned to which subjects. It may also specify restrictions on combinations of ***roles*** or total number of ***roles*** assigned to or enabled for a given subject. This type of policy is used by a ***Role Enablement Authority***. Use of a Role Assignment <Policy> or <PolicySet> is optional.

4. **HasPrivilegesOfRole <Policy>**: a <Policy> in a Permission <PolicySet> that supports requests asking whether a subject has the privileges associated with a given ***role***. If this type of request is to be supported, then a HasPrivilegesOfRole <Policy> must be included in each Permission <PolicySet>. Support for this type of <Policy>, and thus for requests asking whether a subject has the privileges associated with a given ***role***, is optional.

Permission <PolicySet> instances must be stored in the policy repository in such a way that they can never be used as the initial policy for an XACML PDP; Permission <PolicySet> instances must be reachable only through the corresponding Role <PolicySet>. This is because, in order to support hierarchical ***roles***, a Permission <PolicySet> must be applicable to every subject. The Permission <PolicySet> depends on its corresponding Role <PolicySet> to ensure that only subjects holding the corresponding ***role*** attribute will gain access to the ***permissions*** in the given Permission <PolicySet>.

Use of separate Role <PolicySet> and Permission <PolicySet> instances allows support for Hierarchical ***RBAC***, where a more *senior* ***role*** can acquire the ***permissions*** of a more *junior* ***role***. A Permission <PolicySet> that does not reference other Permission <PolicySet> elements could actually be an XACML <Policy> rather than a <PolicySet>. Requiring it to be a <PolicySet>, however, allows its associated ***role*** to become part of a ***role*** hierarchy at a later time without requiring any change to other policies.

1.9 Multi-Role Permissions

In this profile, it is possible to express policies where a user must hold several ***roles*** simultaneously in order to gain access to certain ***permissions***. For example, changing the care instructions for a hospital patient may require that the Subject performing the action have both the physician ***role*** and the staff ***role***.

These policies may be expressed using a Role <PolicySet> where the <Target> element requires the <Attributes> element with the subject attribute category to have all necessary ***role*** attributes. This is done by using a single <AllOf> element containing multiple <Match> elements. The associated Permission <PolicySet> should specify the ***permissions*** associated with Subjects who simultaneously have all the specified ***roles*** enabled.

The Permission <PolicySet> associated with a multi-***role*** policy may reference the Permission <PolicySet> instances associated with other ***roles***, and thus may inherit ***permissions*** from other ***roles***. The ***permissions*** associated with a given multi-***role*** <PolicySet> may also be inherited by another ***role*** if the other ***role*** includes a reference to the Permission <PolicySet> associated with the multi-***role*** policy in its own Permission <PolicySet>.

2 Example

{non-normative}

This section presents a complete example of the types of policies associated with ***role*** based access control.

Assume an organization uses two ***roles***, manager and employee. In this example, they are expressed as two separate values for a single XACML Attribute with `AttributeId` "&role;". The &role; Attribute values corresponding to the two ***roles*** are "&roles;employee" and "&roles;manager". An employee has ***permission*** to create a purchase order. A manager has ***permission*** to sign a purchase order, plus any ***permissions*** associated with the employee ***role***. The manager ***role*** therefore is senior to the employee ***role***, and the employee ***role*** is junior to the manager ***role***.

According to this profile, there will be two Permission `<PolicySet>` instances: one for the manager ***role*** and one for the employee ***role***. The manager Permission `<PolicySet>` will give any Subject the specific ***permission*** to sign a purchase order and will reference the employee Permission `<PolicySet>` in order to inherit its ***permissions***. The employee Permission `<PolicySet>` will give any Subject the ***permission*** to create a purchase order.

According to this profile, there will also be two Role `<PolicySet>` instances: one for the manager ***role*** and one for the employee ***role***. The manager Role `<PolicySet>` will contain a `<Target>` requiring that the Subject hold a &role; Attribute with a value of "&roles;manager". It will reference the manager Permission `<PolicySet>`. The employee Role `<PolicySet>` will contain a `<Target>` requiring that the Subject hold a &role; Attribute with a value of "&roles;employee". It will reference the employee Permission `<PolicySet>`.

The actual XACML policies implementing this example follow. An example of a Role Assignment Policy is included in Section 3: Assigning and Enabling Role Attributes.

2.1 Permission <PolicySet> for the manager role

The following Permission `<PolicySet>` contains the ***permissions*** associated with the manager ***role***. The PDP's policy retrieval must be set up such that access to this `<PolicySet>` is gained only by reference from the manager Role `<PolicySet>`.

```
<PolicySet xmlns="urn:oasis:names:tc:xacml:3.0:core:schema:wd-05"
  PolicySetId="PPS:manager:role"
  PolicyCombiningAlgId="&policy-combine;permit-overrides">

  <!-- Permissions specifically for the manager role -->
  <Policy PolicyId="Permissions:specifically:for:the:manager:role"
    RuleCombiningAlgId="&rule-combine;permit-overrides">

    <!-- Permission to sign a purchase order -->
    <Rule RuleId="Permission:to:sign:a:purchase:order" Effect="Permit">
      <Target>
        <AnyOf>
          <AllOf>
            <Match MatchId="&function;string-equal">
              <AttributeValue
                DataType="&xml;string">purchase order</AttributeValue>
              <AttributeDesignator
                Category="&category;resource"
                AttributeId="&resource;resource-id"
                DataType="&xml;string"/>
            </Match>
          </AllOf>
        </AnyOf>
```

```
        <AnyOf>
          <AllOf>
            <Match MatchId="&function;string-equal">
              <AttributeValue
                DataType="&xml;string">sign</AttributeValue>
              <AttributeDesignator
                Category="&category;action"
                AttributeId="&action;action-id"
                DataType="&xml;string"/>
            </Match>
          </AllOf>
        </AnyOf>
      </Target>
    </Rule>
  </Policy>

  <!-- Include permissions associated with employee role -->
  <PolicySetIdReference>PPS:employee:role</PolicySetIdReference>
</PolicySet>
```

Listing 1 Permission <PolicySet> for managers

2.2 Permission <PolicySet> for employee role

The following Permission `<PolicySet>` contains the ***permissions*** associated with the employee ***role***. The PDP's policy retrieval must be set up such that access to this `<PolicySet>` is gained only by reference from the employee Role `<PolicySet>` or by reference from the more senior manager Role `<PolicySet>` via the manager Permission `<PolicySet>`.

```
<PolicySet xmlns="urn:oasis:names:tc:xacml:3.0:core:schema:wd-05"
  PolicySetId="PPS:employee:role"
  PolicyCombiningAlgId="&policy-combine;permit-overrides">

  <!-- Permissions specifically for the employee role -->
  <Policy PolicyId="Permissions:specifically:for:the:employee:role"
    RuleCombiningAlgId="&rule-combine;permit-overrides">

    <!-- Permission to create a purchase order -->
    <Rule RuleId="Permission:to:create:a:purchase:order" Effect="Permit">
      <Target>
        <AnyOf>
          <AllOf>
            <Match MatchId="&function;string-equal">
              <AttributeValue
                DataType="&xml;string">purchase order</AttributeValue>
              <AttributeDesignator
                Category="&category;resource"
                AttributeId="&resource;resource-id"
                DataType="&xml;string"/>
            </Match>
          </AllOf>
        </AnyOf>
        <AnyOf>
          <AllOf>
            <Match MatchId="&function;string-equal">
              <AttributeValue
                DataType="&xml;string">create</AttributeValue>
              <AttributeDesignator
                Category="&category;action"
                AttributeId="&action;action-id"
                DataType="&xml;string"/>
            </Match>
          </AllOf>
```

```
        </AnyOf>
      </Target>
    </Rule>
  </Policy>
</PolicySet>
```

Listing 2 Permission <PolicySet> for employees

2.3 Role <PolicySet> for the manager role

The following Role `<PolicySet>` is applicable, according to its `<Target>`, only to Subjects who hold a &role; Attribute with a value of "&roles;manager". The `<PolicySetIdReference>` points to the Permission `<PolicySet>` associated with the manager ***role***. That Permission `<PolicySet>` may be viewed in Section 2.1: Permission `<PolicySet>` for the manager ***role*** above.

```
<PolicySet xmlns="urn:oasis:names:tc:xacml:3.0:core:schema:wd-05"
  PolicySetId="RPS:manager:role"
  PolicyCombiningAlgId="&policy-combine;permit-overrides">
  <Target>
    <AnyOf>
      <AllOf>
        <Match MatchId="&function;anyURI-equal">
          <AttributeValue
            DataType="&xml;anyURI">&roles;manager</AttributeValue>
          <AttributeDesignator
            Category="&subject-category;access-subject"
            AttributeId="&role;"
            DataType="&xml;anyURI"/>
        </Match>
      </AllOf>
    </AnyOf>
  </Target>

  <!-- Use permissions associated with the manager role -->
  <PolicySetIdReference>PPS:manager:role</PolicySetIdReference>
</PolicySet>
```

Listing 3 Role <PolicySet> for managers

2.4 Role <PolicySet> for employee role

The following Role `<PolicySet>` is applicable, according to its `<Target>`, only to Subjects who hold a &role; Attribute with a value of "&roles;employee". The `<PolicySetIdReference>` points to the Permission `<PolicySet>` associated with the employee ***role***. That Permission `<PolicySet>` may be viewed in Section 2.2: Permission `<PolicySet>` for employee ***role*** above.

```
<PolicySet xmlns="urn:oasis:names:tc:xacml:3.0:core:schema:wd-05"
  PolicySetId="RPS:employee:role"
  PolicyCombiningAlgId="&policy-combine;permit-overrides">
  <Target>
    <AnyOf>
      <AllOf>
        <Match MatchId="&function;anyURI-equal">
          <AttributeValue
            DataType="&xml;anyURI">&roles;employee</AttributeValue>
          <AttributeDesignator
            Category="&subject-category;access-subject"
            AttributeId="&role;"
            DataType="&xml;anyURI"/>
        </Match>
      </AllOf>
```

```
    </AnyOf>
  </Target>

  <!-- Use permissions associated with the employee role -->
  <PolicySetIdReference>PPS:employee:role</PolicySetIdReference>
</PolicySet>
```

Listing 4 Role <PolicySet> for employees

2.5 HasPrivilegesOfRole Policies and Requests

An XACML ***RBAC*** system MAY choose to support queries of the form "Does this subject have the privileges of ***role*** X?" If so, each Permission `<PolicySet>` MUST contain a HasPrivilegesOfRole `<Policy>`.

For the Permission `<PolicySet>` for managers, the HasPrivilegesOfRole `<Policy>` would look as follows:

```
<!-- HasPrivilegesOfRole Policy for manager role -->

Listing 5 HasPrivilegesOfRole <Policy> for manager role

For the Permission `<PolicySet>` for employees, the HasPrivilegesOfRole `<Policy>` would look as follows:

```
<!-- HasPrivilegesOfRole Policy for employee role -->
<Policy PolicyId="Permission:to:have:employee:role:permissions"
  RuleCombiningAlgId="&rule-combine;permit-overrides">

  <!-- Permission to have employee role permissions -->
  <Rule RuleId="Permission:to:have:employee:permissions" Effect="Permit">
    <Condition>
      <Apply FunctionId="&function;and">
        <Apply FunctionId="&function;anyURI-is-in">
```

```
          <AttributeValue
            DataType=”&xml;anyURI”>&roles;employee</AttributeValue>
          <AttributeDesignator
            Category="&category;resource"
            AttributeId="&role;"
            DataType="&xml;anyURI"/>
        </Apply>
        <Apply FunctionId=”&function;anyURI-is-in”>
          <AttributeValue
          DataType=”&xml;anyURI”>&actions;hasPrivilegesofRole</AttributeValue>
          <AttributeDesignator
            Category="&category;action"
            AttributeId=”&action;action-id”
            DataType=”&xml;anyURI”/>
        </Apply>
      </Apply>
    </Condition>
  </Rule>
</Policy>
```

Listing 6 HasPrivilegesOfRole <Policy> for employee role

A Request asking whether subject Anne has the privileges associated with &roles;manager would look as follows.

```
<Request>
  <Attributes Category="&subject-category;access-subject">
    <Attribute AttributeId=”&subject;subject-id”>
      <AttributeValue DataType=”&xml;string”>Anne</AttributeValue>
    </Attribute>
  </Attributes>
  <Attributes Category="&category;resource">
    <Attribute AttributeId=”&role;”>
      <AttributeValue DataType=”&xml;anyURI”>&roles;manager</AttributeValue>
    </Attribute>
  </Attributes>
  <Attributes Category="&category;action">
    <Attribute AttributeId=”&action;action-id”>
      <AttributeValue
        DataType="&xml;anyURI">&actions;hasPrivilegesOfRole</AttributeValue>
    </Attribute>
  </Attributes>
</Request>
```

Listing 7 Example of HasPrivilegesOfRole Request

Either the `<Request>` must contain Anne's direct ***roles*** (in this case, &roles;employee), or else the PDP's Context Handler must be able to discover them. ***HasPrivilegesOfRole policies*** do not do the job of associating ***roles*** with subjects. See Section 3: Assigning and Enabling Role Attributes for more information on how ***roles*** are associated with subjects.

3 Assigning and Enabling Role Attributes

{non-normative}

The assignment of various ***role*** attributes to users and the enabling of those attributes within a session are outside the scope of the XACML PDP. There must be one or more separate entities, referred to a ***Role Enablement Authorities***, implemented to perform these functions. This profile assumes that the presence in the XACML Request Context of a ***role*** attribute for a given user (Subject) is a valid assignment at the time the access decision is requested

So where do a subject's ***role*** attributes come from? What does one of these ***Role Enablement Authorities*** look like? The answer is implementation dependent, but some possibilities can be suggested.

In some cases, ***role*** attributes might come from an identity management service that maintains information about a user, including the subject's assigned or allowed ***roles***; the identity management service acts as the ***Role Enablement Authority***. This service might store static ***role*** attributes in an LDAP directory, and a PDP's Context Handler might retrieve them from there. Or this service might respond to requests for a subject's ***role*** attributes from a PDP's Context Handler, where the requests are in the form of SAML Attribute Queries.

Role Enablement Authorities MAY use an XACML Role Assignment `<Policy>` or `<PolicySet>` to determine whether a subject is allowed to have a particular ***role*** attribute and value enabled. A Role Assignment `<Policy>` or `<PolicySet>` answers the question "Is subject X allowed to have ***role*** R_i enabled?" It does not answer the question "Which set of ***roles*** is subject X allowed to have enabled?" The ***Role Enablement Authority*** must have some way of knowing which ***role*** or ***roles*** to submit a request for. For example, the ***Role Enablement Authority*** might maintain a list of all possible ***roles***, and, when asked for the ***roles*** associated with a given subject, make a request against the Role Assignment policies for each candidate ***role***.

In this profile, Role Assignment policies are a different set from the Role `<PolicySet>` and Permission `<PolicySet>` instances used to determine the access ***permissions*** associated with each ***role***. ***Role*** Assignment policies are to be used only when the XACML Request comes from a ***Role Enablement Authority***. This separation may be managed in various ways, such as by using different PDPs with different policy stores or requiring `<Request>` elements for ***role*** enablement queries to include an `<Attributes>` element with a `Category` of "&subject-category;role-enablement-authority".

There is no fixed form for a ***Role*** Assignment `<Policy>`. The following example illustrates one possible form. It contains two XACML `<Rule>` elements. The first `<Rule>` states that Anne and Seth and Yassir are allowed to have the "&roles;employee" ***role*** enabled between the hours of 9am and 5pm. The second `<Rule>` states that Steve is allowed to have the "&roles;manager" ***role*** enabled, with no restrictions on time of day.

Listing 8 Role Assignment <Policy> Example

4 Implementing the RBAC Model

{non-normative}

The following sections describe how to use XACML policies to implement various components of the ***RBAC*** model as described in **[ANSI-RBAC]**.

4.1 1.1 Core RBAC

{non-normative}

Core ***RBAC***, as defined in **[ANSI-RBAC]**, includes the following five basic data elements:

1. Users
2. Roles
3. Objects
4. Operations
5. Permissions

Users are implemented using XACML Subjects. Any of the XACML attribute `Category` values which are semantically associated with subjects may be used, as appropriate.

Roles are expressed using one or more XACML Subject Attributes. The set of ***roles*** is very application- and policy domain-specific, and it is very important that different uses of ***roles*** not be confused. For these reasons, this profile does not attempt to define any standard set of ***role*** values, although this profile does recommend use of a common `AttributeId` value of "urn:oasis:names:tc:xacml:2.0:subject:role". It is recommended that each application or policy domain agree on and publish a unique set of `AttributeId` values, `DataType` values, and `<AttributeValue>` values that will be used for the various ***roles*** relevant to that domain.

Objects are expressed using XACML Resources.

Operations are expressed using XACML Actions.

Permissions are expressed using XACML Role `<PolicySet>` and Permission `<PolicySet>` instances as described in previous sections.

Core ***RBAC*** requires support for multiple users per ***role***, multiple ***roles*** per user, multiple ***permissions*** per ***role***, and multiple ***roles*** per ***permission***. Each of these requirements can be satisfied by XACML policies based on this profile as follows. Note, however, that the actual assignment of ***roles*** to users is outside the scope of the XACML PDP. For more information see Section 3: Assigning and Enabling Role Attributes.

XACML allows multiple Subjects to be associated with a given ***role*** attribute. XACML Role `<PolicySet>`s defined in terms of possession of a particular ***role*** `<Attribute>` and `<AttributeValue>` will apply to any requesting user for which that ***role*** `<Attribute>` and `<AttributeValue>` are in the XACML Request Context.

XACML allows multiple ***role*** attributes or ***role*** attribute values to be associated with a given Subject. If a Subject has multiple ***roles*** enabled, then any Role `<PolicySet>` instance applying to any of those ***roles*** may be evaluated, and the ***permissions*** in the corresponding Permission `<PolicySet>` will be permitted. As described in Section 1.9: Multi-Role Permissions, it is even possible to define policies that require a given Subject to have multiple ***role*** attributes or values enabled at the same time. In this case, the ***permissions*** associated with the multiple-***role*** requirement will apply only to a Subject having all the necessary ***role*** attributes and values at the time an XACML Request Context is presented to the PDP for evaluation.

The Permission `<PolicySet>` associated with a given ***role*** may allow access to multiple resources using multiple actions. XACML has a rich set of constructs for composing ***permissions***, so there are multiple ways in which multi-***permission roles*** may be expressed. Any Role A may be associated with a

Permission <PolicySet> B by including a <PolicySetIdReference> to Permission <PolicySet> B in the Permission <PolicySet> associated with the Role A. In this way, the same set of ***permissions*** may be associated with more than one ***role***.

In addition to the basic Core ***RBAC*** requirements, XACML policies using this profile can also express arbitrary conditions on the application of particular ***permissions*** associated with a ***role***. Such conditions might include limiting the ***permissions*** to a given time period during the day, or limiting the ***permissions*** to ***role*** holders who also possess some other attribute, whether it is a ***role*** attribute or not.

4.2 1.2 Hierarchical RBAC

{non-normative}

Hierarchical ***RBAC***, as defined in **[ANSI-RBAC]**, expands Core ***RBAC*** with the ability to define inheritance relations between ***roles***. For example, Role A may be defined to inherit all ***permissions*** associated with Role B. In this case, Role A is considered to be senior to Role B in the ***role*** hierarchy. If Role B in turn inherits ***permissions*** associated with Role C, then Role A will also inherit those ***permissions*** by virtue of being senior to Role B.

XACML policies using this profile can implement ***role*** inheritance by including a <PolicySetIdReference> to the Permission <PolicySet> associated with one ***role*** inside the Permission <PolicySet> associated with another ***role***. The ***role*** that includes the <PolicySetIdReference> will then inherit the ***permissions*** associated with the referenced ***role***.

This profile structures policies in such a way that inheritance properties may be added to a ***role*** at any time without requiring changes to <PolicySet> instances associated with any other ***roles***. An organization may not initially use ***role*** hierarchies, but may later decide to make use of this functionality without having to rewrite existing policies.

5 Profile

5.1 Roles and Role Attributes

Roles SHALL be expressed using one or more XACML Attributes. Each application domain using this profile for ***role*** based access control SHALL define or agree upon one or more `AttributeId` values to be used for ***role*** attributes. Each such `AttributeId` value SHALL be associated with a set of permitted values and their `DataTypes`. Each permitted value for such an `AttributeId` SHALL have well-defined semantics for the use of the corresponding value in policies.

This profile RECOMMENDS use of the "urn:oasis:names:tc:xacml:2.0:subject:role" `AttributeId` value for all ***role*** attributes. Instances of this Attribute SHOULD have a `DataType` of "http://www.w3.org/2001/XMLSchema#anyURI".

5.2 Role Assignment or Enablement

A ***Role Enablement Authority***, responsible for assigning ***roles*** to users and for enabling ***roles*** for use within a user's session, MAY use an XACML Role Assignment `<Policy>` or `<PolicySet>` to determine which users are allowed to enable which ***roles*** and under which conditions. There is no prescribed form for a Role Assignment `<Policy>` or `<PolicySet>`. It is RECOMMENDED that ***roles*** in a Role Assignment `<Policy>` or `<PolicySet>` be expressed as Resource Attributes, where the `AttributeId` is &role; and the `<AttributeValue>` is the URI for the relevant ***role*** value. It is RECOMMENDED that the action of assigning or enabling a ***role*** be expressed as an Action Attribute, where the `AttributeId` is &action;action-id, the `DataType` is &xml;anyURI, and the `<AttributeValue>` is &actions;enableRole.

5.3 Access Control

Role based access control SHALL be implemented using two types of `<PolicySet>`s: Role `<PolicySet>`, Permission `<PolicySet>`. The specific functions and requirements of these two types of `<PolicySet>`s are as follows.

For each ***role***, one Role `<PolicySet>` SHALL be defined. Such a `<PolicySet>` SHALL contain a `<Target>` element that makes the `<PolicySet>` applicable only to Subjects having the XACML Attribute associated with the given ***role***; the `<Target>` element SHALL NOT restrict the Resource, Action, or Environment. Each Role `<PolicySet>` SHALL contain a single `<PolicySetIdReference>` element that references the unique Permission `<PolicySet>` associated with the ***role***. The Role `<PolicySet>` SHALL NOT contain any other `<Policy>`, `<PolicySet>`, `<PolicyIdReference>`, or `<PolicySetIdReference>` elements.

For each ***role***, one Permission `<PolicySet>` SHALL be defined. Such a `<PolicySet>` SHALL contain `<Policy>` and `<Rule>` elements that specify the types of access permitted to Subjects having the given ***role***. The `<Target>` of the `<PolicySet>` and its included or referenced `<PolicySet>`, `<Policy>`, and `<Rule>` elements SHALL NOT limit the Subjects to which the Permission `<PolicySet>` is applicable.

If a given ***role*** inherits ***permissions*** from one or more ***junior roles***, then the Permission `<PolicySet>` for the given (senior) ***role*** SHALL include a `<PolicySetIdReference>` element for each ***junior role***. Each such `<PolicySetIdReference>` shall reference the Permission `<PolicySet>` associated with the ***junior role*** from which the ***senior role*** inherits.

A Permission `<PolicySet>` MAY include a HasPrivilegesOfRole `<Policy>`. Such a `<Policy>` SHALL have a `<Rule>` element with an effect of "Permit". This Rule SHALL permit any Subject to perform an Action with an Attribute having an `AttributeId` of &action;action-id, a `DataType` of &xml;anyURI, and an `<AttributeValue>` having a value of &actions;hasPrivilegesOfRole on a Resource having an

730 Attribute that is the ***role*** to which the Permission <PolicySet> applies (for example, an AttributeId
731 of &role;, a DataType of &xml;anyURI, and an <AttributeValue> whose value is the URI of the
732 specific ***role*** value). Note that the ***role*** Attribute, which is a Subject Attribute in a Role <PolicySet>
733 <Target>, is treated as a Resource Attribute in a HasPrivilegesOfRole <Policy>.

734 The organization of any repository used for policies and the configuration of the PDP SHALL ensure that
735 the PDP can never use a Permission <PolicySet> as the PDP's initial policy.

6 Identifiers

This profile defines the following URN identifiers.

6.1 Profile Identifier

The following identifier SHALL be used as the identifier for this profile when an identifier in the form of a URI is required.

urn:oasis:names:tc:xacml:3.0:profiles:rbac:core-hierarchical

6.2 Role Attribute

The following identifier MAY be used as the `AttributeId` for ***role*** Attributes.

urn:oasis:names:tc:xacml:2.0:subject:role

6.3 SubjectCategory

The following identifier MAY be used as the `Category` for Subject Attributes identifying that a Request is coming from a ***Role Enablement Authority***.

urn:oasis:names:tc:xacml:2.0:subject-category:role-enablement-authority

6.4 Action Attribute Values

The following identifier MAY be used as the `<AttributeValue>` of the &action;action-id Attribute in a HasPrivilegesOfRole `<Policy>`.

urn:oasis:names:tc:xacml:2.0:actions:hasPrivilegesOfRole

The following identifier MAY be used as the `<AttributeValue>` of the &action;action-id Attribute in a Role Assignment `<Policy>`.

urn:oasis:names:tc:xacml:2.0:actions:enableRole

7 Conformance

An implementation may conform to this profile in one or more of the following ways.

7.1 As a policy processor

An implementation conforms to this specification as a policy processor if it makes use of XACML policies in the manner described in sections 5 and 6.

7.2 As an XACML request generator

An implementation conforms to this specification as an XACML request generator if it produces XACML requets in the manner described in sections 5 and 6.
