Abstract:

While ebMS 3.0 represents a leap forward in reducing the complexity of Web Services B2B messaging, the specification still contains numerous options and comprehensive alternatives for addressing a variety of scenarios for exchanging data over a Web Services platform. The AS4 profile of the ebMS 3.0 specification has been developed in order to bring continuity to the principles and simplicity that made AS2 successful, while adding better compliance to Web [Services standards, and features such as message pulling capability and a built-in Receipt mechanism. Using ebMS 3.0 as a base, a subset of functionality is defined along with implementation guidelines adopted based on the "just-enough" design principles and AS2 functional requirements to trim down ebMS 3.0 into a more simplified and AS2-like specification for Web Services B2B messaging. This document defines the AS4 profile as a combination of a conformance profile that concerns an implementation capability, and of a usage profile that concerns how to use this implementation. A couple of variants are defined for the AS4 conformance profile - the AS4 ebHandler profile and the AS4 Light Client profile - that reflect different endpoint capabilities.](#) ~~services standards, and features such as message pulling capability and a built-in Receipt mechanism. Using ebMS 3.0 as a base, a subset of functionality is defined along with implementation guidelines adopted based on the "just-enough" design principles and AS2 functional requirements to trim down ebMS 3.0 into a more simplified and AS2-like specification for Web Services B2B messaging. This document defines the AS4 profile as a combination of a conformance profile that concerns an implementation capability, and of a usage profile that concerns how to use this implementation. A couple of variants are defined for the AS4 conformance profile - the AS4 ebHandler profile and the AS4 Light Client profile - that reflect different endpoint capabilities.~~

1 Introduction

1.1 Rationale and Context

Historically, the platform for mission-critical business-to-business (B2B) transactions has steadily moved from proprietary value-added networks (VANs) to Internet-based protocols free from the data transfer fees imposed by the VAN operators. This trend has been accelerated by lower costs and product ownership, a maturing of technology, internationalization, widespread interoperability, and marketplace momentum. The exchange of EDI business documents over the Internet has substantially increased along with a growing presence of XML and other document types such as binary and text files.

The Internet messaging services standards that have emerged provide a variety of options for end users to consider when deciding which standard to adopt. These include pre-Internet protocols, the EDIINT series of AS1 [RFC3335] AS2 [RFC4130] and AS3 [RFC4823], simple XML over HTTP, government specific frameworks, ebMS 2.0 [ebMS2], and Web Services variants. As Internet messaging services standards have matured, new standards are emerging that leverage prior B2B messaging services knowledge for applicability to Web Services messaging.

The emergence of the OASIS ebMS 3.0 Standard [ebMS3CORE] represents a leap forward in Web Services B2B messaging services by meeting the challenge of composing many Web Services standards into a single comprehensive specification for defining the secure and reliable exchange of documents using Web Services. The ebMS 3.0 standard composes fundamental Web Services standards SOAP 1.1 [SOAP11], SOAP 1.2 [SOAP12], SOAP with Attachments [SOAPATTACH], WS-Security 1.0 [WSS10], WS-Security 1.1 [WSS11], WS-Addressing [WSADDRCORE], and reliable messaging (WS-Reliability 1.1 [WSR11] or WS-ReliableMessaging - currently at version 1.2 [WSRM12]) together with guidance for the packaging of messages and receipts along with definitions of messaging choreographies for orchestrating document exchanges.

Historically, the platform for mission-critical business-to-business (B2B) transactions have steadily moved from proprietary networks (VANs) to Internet-based protocols free from the data transfer fees imposed by the VAN operators. This trend has been accelerated by lower costs and product ownership, a maturing of technology, internationalization, widespread interoperability, and marketplace momentum. The exchange of EDI business documents over the Internet has substantially increased along with a growing presence of XML and other document types such as binary and text files.

The Internet messaging services standards that have emerged provide a variety of options for end users to consider when deciding which standard to adopt. These include pre-Internet protocols, the EDIINT series of AS1/AS2/AS3, simple XML over HTTP, government specific frameworks, ebMS 2.0, and Web Services variants. As Internet messaging services standards have matured, new standards are emerging that leverages prior B2B messaging services knowledge for applicability to Web Services messaging.

The emergence of the ebMS 3.0 specification represents a leap forward in Web Services B2B messaging services by meeting the challenge of composing many Web Services standards into a single comprehensive specification for defining the secure and reliable exchange of documents using Web Services. ebMS 3.0 composes the fundamental Web Services standards like SOAP 1.1/1.2, SOAP with Attachments and MTOM, WS-Security 1.0/1.1, and WS-Reliability 1.1/WS-ReliableMessaging 1.1 together with guidance for the packaging of messages and receipts along with definitions of messaging choreographies for orchestrating document exchanges.

Like AS2, ebMS 3.0 brings together many existing standards that govern the packaging, security, and transport of electronic data under the umbrella of a single specification document. While ebMS 3.0 represents a leap forward in reducing the complexity of Web Services B2B messaging, the specification still contains numerous options and comprehensive alternatives for addressing a variety of scenarios for exchanging data over a Web Services platform.

In order to fully take advantage of the AS2 success story, this profile of the ebMS 3.0 specification has been developed. Using ebMS 3.0 as a base, a subset of functionality has been defined along with

51 implementation guidelines adopted based on the “just-enough” design principles and AS2 functional
52 requirements to trim down ebMS 3.0 into a more simplified and AS2-like specification for Web Services
53 B2B messaging. The main benefits of AS4 compared to ~~AS2 are: its previous version are compatibility with~~
54 ~~Web services standards, message pulling capability, and a built-in Receipt mechanism.~~

- 55 ● Compatibility with Web services standards.
- 56 ● Message pulling capability.
- 57 ● A built-in Receipt mechanism

58 Profiling ebMS V3 means:

- 59 ● Defining a subset of ebMS V3 options to be supported by the AS4 handler.
- 60 ● Deciding which types of message exchanges must be supported, and how these exchanges
61 should be conducted (level of security, binding to HTTP, etc.).
- 62 ● Deciding of AS4-specific message contents and practices (how to make use of the ebMS
63 message header fields, in an AS4 context).
- 64 ● Deciding of some operational best practices, for the end-user.
- 65 ● ~~defining of a subset of ebMS V3 options to be supported by the AS4 handler,~~
- 66 ● ~~deciding which types of message exchanges must be supported, and how these exchanges~~
67 ~~should be conducted (level of security, binding to HTTP, etc.)-~~
- 68 ● ~~deciding of AS4 specific message contents and practices (how to make use of the ebMS-~~
69 ~~message header fields, in an AS4 context)-~~
- 70 ● ~~deciding of some operational best practices, for the end-user.-~~
- 71 ● The overall goal of a profile for a standard is to ensure interoperability by:
- 72 ● Establishing particular usage and practices of the standard within a community of users.⁵⁷
- 73 ● Defining the subset of features in this standard that needs to be supported by an implementation.

74 Two kinds of profiles are usually to be considered when profiling an existing standard:

- 75 1. **Conformance Profiles.** These define the different ways a product can conform to a standard,
76 based on specific ways to implement use this standard. A conformance profile is usually
77 associated with a specific conformance clause. Conformance profiles are of prime interest for
78 product managers and developers: they define a precise subset of features to be supported.
- 79 2. **Usage Profiles** (also called Deployment Profiles). These define how a standard should be used
80 by a community of users, in order to ensure best compatibility with business practices and
81 interoperability. Usage profiles are of prime interest for IT end-users: they define how to configure
82 the use of a standard (and related product) as well as how to bind this standard to business
83 applications. A usage profile usually points at required or compatible conformance profile(s).

84 AS4 is defined as a combination of:

- 85 ● Two primary AS4 conformance profiles (see section 2) that define two subsets of ebMS V3
86 features, one of which is a couple of AS4 Conformance Profiles (see section 2), that define the
87 subset of ebMS V3 features to be supported by an AS4 implementation.
- 88 ● An optional complementary conformance profile (see section 5) that specifies how to use AS4
89 endpoints with ebMS 3.0 intermediaries. This is based on a simplified subset of the multi-hop
90 messaging feature defined in ebMS 3.0 Part 2, Advanced Features specification [ebMS3ADV].
91 AS4 Usage Profile (section 4) that defines how to use an AS4 compliant implementation in order
92 to achieve similar functions as specified in AS2.

- An AS4 Usage Profile (see section 6) that defines how to use an AS4-compliant implementation in order to achieve similar functions as specified in AS2.

The two primary AS4 conformance profiles (CP) are defined below:

(1) The AS4 ebHandler CP. This conformance profile supports both Sending and Receiving roles, and for each role both message pushing and message pulling.

(2) The AS4 Light Client CP. This conformance profile supports both Sending and Receiving roles, but only message pushing for Sending and message pulling for Receiving. In other words, it does not support incoming HTTP requests, and may have no fixed IP address.

~~Two AS4 conformance profiles (CP) are defined below:-~~

~~(1) the AS4 ebHandler CP. This conformance profile supports both Sending and Receiving roles, and for each role both message pushing and message pulling.~~

~~(2) the AS4 light Client CP. This conformance profile supports both Sending and Receiving roles, but only message pushing for Sending and message pulling for Receiving. In other words, it does not support incoming HTTP requests, and may have no IP address.~~

Compatible existing conformance profiles for ebMS V3 are:

- Gateway RM V3 or Gateway RX V3: a Message Service Handler (MSH)~~n MSH product~~ implementing any of these profiles will also be conforming to the AS4 ebHandler CP (the reverse is not true).

NOTE: Full compliance to AS4 actually requires and/or authorizes a message handler to implement a few additional features beyond the above CPs, as described in the Conformance section 6. These additional-
~~These~~ features are described in Section 3.

1.2 Terminology

The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this specification are to be interpreted as described in IETF RFC 2119.

2 AS4 Conformance Profiles for ebMS V3 Core Specification

NOTE: AS4 is more than a conformance profile, in the sense given in [ebMS3-CP]. It is a combination of a conformance profile and a usage profile, as explained in the introduction section. Consequently, only this section (section 2) is conforming to the format recommended in [ebMS3-CP] for describing conformance profiles. The usage profile part (section 6) is following a format based on tables similar to those found in [IIC-DP].

[IIC-DP] OASIS Committee Draft 01, *ebXML Deployment Profiles Templates*, 2006. http://www.oasis-open.org/committees/te_home.php?wg_abbrev=ebcore

[ebGPPA] OASIS, *Collaboration Protocol Profile and Agreement Specification Version 2.0*, http://www.oasis-open.org/committees/ebxml-eppa/documents/ebCPP-2_0.pdf, September 23, 2002.

[ebDGT] OASIS, *ebXML Deployment Guide Template Specification Version 1.0* (ebXML-IIC) http://www.oasis-open.org/committees/download.php/1713/ebMS_Deployment_Guide_Template_10.doc, April 7, 2003.

3 AS4 Conformance Profiles for ebMS V3

NOTE: AS4 is more than a Conformance Profile, in the sense given in [ebMS3-CP]. It is a combination of a Conformance Profile and of an Usage Profile, as explained in the introduction section. Consequently, only this section (section 2) is conforming to the format recommended in [ebMS3-CP] for describing conformance profiles. The usage profile part (section 4) is following a format based on tables similar to those found in [IG-DP].

The AS4 ebHandler Conformance Profile

The AS4 ebHandler is identified by the URI:

http://docs.oasis-open.org/ebxml-msg/ebms/v3.0/ns/cprofiles/200809/as4ebhandler_

(Note: this URI is only an identifier, not a document address.)

3.0.1 Features Set

The AS4 CP is defined as follows, using the table template and terminology provided in Appendix A (“Conformance”) of the core ebXML Messaging Services V3.0 Conformance Profiles specification [ebMS3-CP].

Conformance Profile: <u>AS4 ebHandler</u>	Profile summary: <“Sending+Receiving” / “AS4 eb Handler” / Level 1 / HTTP1.1 + SOAP 1.2 + WSS1.1 >
Functional Aspects	Profile Feature Set
<u>ebMS MEP</u>	<p>Both Sender and Receiver MUST support the following ebMS simple Message Exchange Patterns (MEPs):</p> <ul style="list-style-type: none"> ● <u>One-way / Push</u> ● <u>One-way / Pull</u> <p>Regardless of which MEP is used, the sending of an eb:Receipt message MUST be supported:</p> <ul style="list-style-type: none"> ● <u>For the One-way / Push, both “response” and “callback” reply patterns MUST be supported.</u> ● <u>For the One-way / Pull, the “callback” pattern is the only viable option, and the User message sender MUST be ready to accept an eb:Receipt either piggybacked on (or bundled with) a PullRequest, or piggybacked on another User Message, or sent separately.</u> <p><u>In all MEPs, the User message receiver MUST be able to send an eb:Receipt as a separate message (i.e. not piggybacked on a PullRequest message or on another User message). An MSH conforming to this profile is therefore NOT required to bundle an eb:Receipt with any other ebMS header or message body.</u></p> <p><u>Use of the ebbpsig:NonRepudiationInformation element (as defined in [ebBP-SIG]) is REQUIRED as content for the eb:Receipt message, i.e. when conforming to this profile a Sending MSH must be able to create a Receipt with such a content, and a Receiving MSH must be able to process it.</u></p>

<u>Reliability</u>	<p><u>Reception Awareness, defined as the ability for a Sending ebHandler to notify its application (message Producer) of lack of reception of an eb:Receipt related to a sent message, MUST be supported. This implies support for:</u></p> <ul style="list-style-type: none"> ● <u>Correlating eb:Receipts with previously sent User messages, based on the ebMS message ID</u> ● <u>Detection of a missing eb:Receipt for a sent message</u> ● <u>Ability to report an error to the message Producer in case no eb:Receipt has been received for a sent message.</u> <p><u>The semantics for sending back an eb:Receipt message is as follows: a well-formed ebMS user message has been received and the MSH is taking responsibility for its processing (additional application-level delivery semantics, and payload validation semantics are not relevant).</u></p> <p><u>Support for a WS reliable messaging specification is optional .</u></p>
<u>Security</u>	<p><u>The following security features MUST be supported:</u></p> <ul style="list-style-type: none"> ● <u>Support for username / password token, digital signatures and encryption.</u> ● <u>Support for content-only transforms.</u> ● <u>Support for security of attachments.</u> ● <u>Support for message authorization at P-Mode level (see 7.10 in [ebMS3CORE]) Authorization of the Pull signal , for a particular MPC , must be supported at minimum.</u> <p><u>Two authorization options MUST be supported by an MSH in the Receiving role, and at least one of them in the Sending role:</u></p> <ul style="list-style-type: none"> ● <u>Authorization Option 1:</u> <u>Use of the WSS security header targeted to the “ebms” actor, as specified in section 7.10 of ebMS V3, with the wsse:UsernameToken profile. This header may either come in addition to the regular wsse security header (XMLDsig for authentication), or may be the sole wsse header, if a transport-level secure protocol such as SSL or TLS is used.</u> ● <u>Authorization Option 2:</u> <u>Use of a regular wsse security header (XMLDsig for authentication, use of X509), and no additional wsse security header targeted to “ebms”. In that case, the MSH must be able to use the credential present in this security header for Pull authorization, i.e. to associate these with a specific MPC.</u> <p><u>NOTE on XMLDsig: XMLDsig allows arbitrary XSLT transformations when constructing the plaintext over which a signature or reference is created. Conforming applications that allow use of XSLT transformations when verifying either signatures or references are encouraged to maintain lists of “safe” transformations for a given partner, service, action and role combination. Static analysis of XSLT expressions with a human user audit is encouraged for trusting a given expression as “safe” .</u></p>
<u>Error generation and reporting</u>	<p><u>The following error processing capabilities MUST be supported:</u></p> <ul style="list-style-type: none"> ● <u>Capability of the Receiving MSH to report errors from message</u>

	<p><u>processing, either as ebMS error messages or as SOAP Faults to the Sending MSH. The following modes of reporting to a Sending MSH are supported:</u></p> <ul style="list-style-type: none"> ● <u>Sending error as a separate request (ErrorHandling.Report.ReceiverErrorsTo=<URL of Sending MSH>)</u> ● <u>Sending error on the back channel of the underlying protocol (ErrorHandling.Report.AsResponse="true").</u> ● <u>Capability to report to a third-party address (ErrorHandling.Report.ReceiverErrorsTo=<other address>).</u> ● <u>Capability of Sending MSH to report generated errors as notifications to the message producer (support for Report.ProcessErrorNotifyProducer="true")(e.g. delivery failure).</u> ● <u>Generated errors: All specified errors in [ebMS3CORE] must be generated when applicable, except for EBMS:0010: On a Receiving MSH, there is no requirement to generate error EBMS:0010 for discrepancies between message header and the P-Mode.reliability and P-Mode.security features. It is required to generate such errors, on a Receiving MSH, for other discrepancies</u>
<u>Message Partition Channels</u>	<u>Message partition channels (MPC) MUST be supported in addition to the default channel, so that selective pulling by a partner MSH is possible. This means AS4 handlers MUST be able to use the @mpc attribute and to process it as expected.</u>
<u>Message packaging</u>	<p><u>The following features MUST be supported both on sending and receiving sides:</u></p> <ul style="list-style-type: none"> ● <u>Support for attachments.</u> ● <u>Support for MessageProperties.</u> ● <u>Support for processing messages that contain both a signal message unit (eb:SignalMessage) and a user message unit (eb:UserMessage).</u>
<u>Interoperability Parameters</u>	<p><u>The following interoperability parameters values MUST be supported for this conformance profile:</u></p> <ul style="list-style-type: none"> ● <u>Transport: HTTP 1.1</u> ● <u>SOAP version: 1.2</u> ● <u>Reliability Specification: none.</u> ● <u>Security Specification: WSS 1.1.</u>

259 AS4-CP is defined as follows, using the table template and terminology provided in Appendix F
260 (“Conformance”) of the core ebXML Messaging Services V3.0 specification [ebMS3].

261

Conformance Profile:	Profile summary: <“Sending+Receiving” / “AS4 eb Handler” / Level 1 / HTTP1.1 + SOAP 1.2 + WSS1.1 >
-----------------------------	---

AS4 ebHandler	
Functional Aspects	Profile Feature Set
ebMS MEP	<p>Both Sender and Receiver MUST support all ebMS simple MEPs:</p> <ul style="list-style-type: none"> ● One-way / Push, ● One-way / Pull, <p>Regardless of which MEP is used, the sending of an eb:Receipt message MUST be supported:</p> <ul style="list-style-type: none"> ● For the One-way / Push, both “response” and “callback” reply patterns MUST be supported. ● For the One-way / Pull, the “callback” pattern is the only viable option, and the User message sender MUST be ready to accept an eb:Receipt either piggybacked on (or bundled with) a PullRequest, or piggybacked on another User Message, or sent separately. In all MEPs, the User message receiver MUST be able to send an eb:Receipt as a separate message (i.e. not piggybacked on a PullRequest message or on another User message). An MSH conforming to this profile is therefore NOT required to bundle an eb:Receipt with any other ebMS header or message body. <p>Use of the ebbpsig:NonRepudiationInformation element (as defined in [ebBP-SIG]) MUST be supported as content for the eb:Receipt message, i.e. when conforming to this profile a Sending MSH must be able to create a Receipt with such a content, and a Receiving MSH must be able to process it.</p>
Reliability	<p>Reception Awareness, defined as the ability for a Sending ebHandler to notify its application (message Producer) of lack of reception of an eb:Receipt related to a sent message, MUST be supported. This implies support for: (a) correlating eb:Receipts with previously sent User messages, based on the ebMS message ID, (b) detection of a missing eb:Receipt for a sent message, (c) ability to report an error to the message Producer in case no eb:Receipt has been received for a sent message.</p> <p>The semantics of sending back an eb:Receipt message is: a well-formed ebMS user message has been received and the MSH is taking responsibility for its processing, (no additional application-level delivery semantics, and no payload-validation semantics).</p> <p>No support for a WS reliable messaging specification is required although that is an option.</p>
Security	<p>The following security features MUST be supported:</p> <ul style="list-style-type: none"> ● Support for username / password token, digital signatures and encryption. ● Support for content-only transforms. ● Support for security of attachments. ● Support for message authorization at P-Mode level (see 7.10 in [ebMS3]). Authorization of the Pull signal for a particular MPC must be supported at minimum. <p>Two authorization options MUST be supported by an MSH in the Receiving role, and at least one of them in the Sending role:</p>

	<ul style="list-style-type: none"> ● Authorization Option 1: Use of the WSS security header targeted to the “ebms” actor, as specified in section 7.10 of ebMS V3, with the wsse:UsernameToken profile. This header may either come in addition to the regular wsse security header (XMLDsig for authentication), or may be the sole wsse header, if a transport level secure protocol such as SSL or TLS is used. An example of message is given in Appendix ... ● Authorization Option 2: Use of a regular wsse security header (XMLDsig for authentication, use of X509), and no additional wsse security header targeted to “ebms”. In that case, the MSH must be able to use the credential present in this security header for Pull authorization, i.e. to associate these with a specific MPC. <p>NOTE on XMLDsig: XMLDsig allows arbitrary XSLT Transformations when constructing the plaintext over which a signature or reference is created. Conforming applications that allow use of XSLT transformations when verifying either signatures or references are encouraged to maintain lists of “safe” transformations for a given partner, service, action and role combination. Static analysis of XSLT expressions with a human user audit is encouraged for trusting a given expression as “safe”.</p>
Error generation and reporting	<p>The following error processing capabilities MUST be supported:</p> <ul style="list-style-type: none"> ● Capability of the Receiving MSH to report errors from message processing, either as ebMS error messages or as Faults to the Sending MSH. The following modes of reporting to Sending MSH are supported: (a) sending error as a separate request (ErrorHandling.Report.ReceiverErrorsTo=<URL of Sending MSH>), (b) sending error on the back channel of underlying protocol (ErrorHandling.Report.AsResponse="true"). ● Capability to report to a third party address (ErrorHandling.Report.ReceiverErrorsTo=<other address>). ● Capability of Sending MSH to report generated errors as notifications to the message producer (support for Report.ProcessErrorNotifyProducer="true") (e.g. delivery failure). ● Generated errors: All specified errors in [ebMS3] are to be generated when applicable, except for EBMS:0010: On Receiving MSH, no requirement to generate error EBMS:0010 for discrepancies between message header and the following P-Mode features: P-Mode.reliability and P-Mode.security, but requirement to generate such error for other discrepancies.
Message Partition Channels	<p>Message partition channels (MPC) MUST be supported in addition to the default channel, so that selective pulling by a partner MSH is possible. This means AS4 handlers MUST be able to use the @mpc attribute and to process it as expected.</p>
Message packaging	<p>The following features MUST be supported both on sending and receiving sides:</p> <ul style="list-style-type: none"> ● Support for attachments.

	<ul style="list-style-type: none"> ● Support for MessageProperties. ● Support for processing messages that contain both a signal message unit (eb:SignalMessage) and a user message unit (eb:UserMessage).
Interoperability Parameters	<p>The following interoperability parameters values MUST be supported for this conformance profile:</p> <p>Transport: HTTP 1.1</p> <p>SOAP version: 1.2</p> <p>Reliability Specification: none.</p> <p>Security Specification: WSS 1.1. When using the One-way / Pull MEP, the response message must use by default the same WSS version as the request message. Otherwise, the version to be applied to a message is specified in the P-Mode.security</p>

262

263

264

WS-I Conformance Profiles

265

266

267

268

269

The Web-Services Interoperability consortium has defined guidelines for interoperability of SOAP messaging implementations. In order to ensure maximal interoperability across different SOAP stacks, eg. SOAP messaging implementations. In order to ensure maximal interoperability across different SOAP stacks, MIME and HTTP implementations, compliance with the following WS-I profiles is REQUIRED whenever related features are used:

270

- Basic Security Profile (BSP) 1.1 [WSIBSP11]. [WSIBSP11]

271

- Attachment Profile (AP) 1.0 [WSIAP10] with regard to the use of MIME and SOAP with Attachments, [WSIAP10] with regard to the use of MIME and SwA.

272

273

Notes:

274

275

276

277

278

279

280

- Compliance with AP1.0 would normally require compliance with BP1.1, which in turn requires the absence of a SOAP Envelope in the HTTP response of a One-Way MEP (R2714). However, recent BP versions such as BP1.2 [WSIBP12] and BP2.0 [WSIBP20] SOAP Envelope in the HTTP response of a One-Way (R2714). However, recent BP versions such as BP1.2 [WSIBP12] override this requirement. Consequently, the AS4 ebHandler conformance profile does not require conformance to these deprecated requirements inherited from BP1.1 (R2714, R1143) regarding the use of HTTP.

281

282

283

284

285

286

287

- WS-I compliance is here understood as requiring that the features exhibited by an AS4 ebHandler MUST comply with the above WS-I profiles. For example, since only SOAP 1.2 is required by the above WS-I profiles must be complied with within the scope of features exhibited by the AS4 ebHandler conformance profile. For example, since only SOAP 1.2 is required by AS4 ebHandler, the requirements from BSP 1.1 that depend on SOAP 1.1 would not apply. Similarly, none of the requirements for DESCRIPTION (WSDL) or REGDATA (UDDI) apply here, as these are not used.

288 | This conformance profile also requires conformance to the following WS-I profiles, may be refined in a
289 | future version to require conformance to the following WS-I profiles, once approved and published by WS-
290 | I:

- 291 | ● Basic Profile 2.0 (BP2.0) [\[WSIBP20\]](#).

292 |

293 | Processing Mode

294 | Parameters

295 | This section contains a summary of P-Mode parameters relevant to AS4 features for this conformance
296 | profile. An AS4 handler MUST support and understand those that are mentioned as "required". For each
297 | parameter, either:

- 298 | ● Full support is required: An implementation MUST ~~full support is required: an implementation is~~
299 | ~~supposed to~~ support the possible options for this parameter.
- 300 | ● Partial support is required: Support for a subset of values is required.
- 301 | ● No support is required: An implementation is not required to support the features controlled by this
302 | parameter, and therefore is an implementation is not required to support the features controlled by
303 | this parameter, and therefore not required to understand this parameter.

304 | An AS4 handler is expected to support the P-Mode set below both as a Sender (of the user message) and
305 | as a Receiver.

306 | **3.0.1.1 General P-Mode parameters**

- 307 | ● PMode.ID: support required.
- 308 | ● PMode.Agreement: support required.

309 | ~~0. General PMode parameters:~~

336 | **3. PMode[1].ErrorHandling:**

337 | (**PMode[1].ErrorHandling.Report.SenderErrorsTo**: support not required)

- 338 | ● **PMode[1].ErrorHandling.Report.ReceiverErrorsTo**: support required (for address of the MSH
- 339 | sending the message in error or for third-party).
- 340 | ● **PMode[1].ErrorHandling.Report.AsResponse**: support required (true/false).
- 341 | ● (**PMode[1].ErrorHandling.Report.ProcessErrorNotifyConsumer** support not required)
- 342 | ● **PMode[1].ErrorHandling.Report.ProcessErrorNotifyProducer**: support required (true/false)
- 343 | ● **PMode[1].ErrorHandling.Report.DeliveryFailuresNotifyProducer**: support required (true/false)

344 | **3.0.1.5 PMode[1].Reliability**

345 | Support not required.

346 | **3.0.1.6 PMode[1].Security**

- 347 | ● **PMode[1].Security.WSSVersion:** support required for: 1.1

348 | **4. PMode[1].Reliability:**

349 | none.

350 |

351 | **5. PMode[1].Security:**

- 352 | ● **PMode[1].Security.WSSVersion:** support required for: {1.1 }

353 | **PMode[1].Security.X509.Sign:** support required.

- 354 | ● **PMode[1].Security.X509.Signature.Certificate:** support required.
- 355 | ● **PMode[1].Security.X509.Signature.HashFunction:** support required.
- 356 | ● **PMode[1].Security.X509.Signature.Algorithm:** support required.
- 357 | ● **PMode[1].Security.X509.Encryption.Encrypt:** support required.
- 358 | ● **PMode[1].Security.X509.Encryption.Certificate:** support required.
- 359 | ● **PMode[1].Security.X509.Encryption.Algorithm:** support required.
- 360 | ● **(PMode[1].Security.X509.Encryption.MinimumStrength:** support not required)
- 361 | ● **PMode[1].Security.UsernameToken.username:** support required.
- 362 | ● **PMode[1].Security.UsernameToken.password:** support required.
- 363 | ● **PMode[1].Security.UsernameToken.Digest:** support required (true/false)
- 364 | ● **(PMode[1].Security.UsernameToken.Nonce:** support not required)
- 365 | ● **PMode[1].Security.UsernameToken.Created:** support required.
- 366 | ● **PMode[1].Security.PModeAuthorize:** support required (true/false)
- 367 | ● **PMode[1].Security.SendReceipt:** support required (true/false)
- 368 | ● **Pmode[1].Security.SendReceipt.ReplyPattern:** support required (both “response” and
- 369 | “callback”))

370 | **3.1 The AS4 Light Client Conformance Profile**

371 | The AS4 light Client is identified by the URI:

372 | http://docs.oasis-open.org/ebxml-msg/ebms/v3.0/ns/cprofiles/200809/as4lightclient_

373 | (Note: this URI is only an identifier, not a document address.)

374 | **3.1.1 Feature Set**

Conformance Profile:	Profile summary: <“Sending+Receiving” / “lighthandler-rm” / Level 1 / HTTP1.1 + SOAP 1.1>
-----------------------------	--

AS4-LightClient	
Functional Aspects	Profile Feature Set
ebMS MEP	<p>The following Message Exchange Patterns (MEPs) MUST be supported:</p> <ul style="list-style-type: none"> ● <u>One-way / Push (as initiator).</u> ● <u>One-way / Pull (as initiator).</u> <p>Regardless of which MEP is used, the sending of an eb:Receipt message MUST be supported:</p> <ul style="list-style-type: none"> ● <u>For the One-way / Push, the “response” reply pattern MUST be supported.</u> ● <u>For the One-way / Pull, the “callback” pattern is the only viable option, and the User message sender MUST be ready to accept an eb:Receipt either piggybacked on a PullRequest, or sent separately. The User message receiver MUST be able to send an eb:Receipt separately from the PullRequest.</u> <p>In all MEPs, the User message receiver MUST be able to send an eb:Receipt as a separate message (i.e. not piggybacked on a PullRequest message or on another User message). An MSH conforming to this profile is therefore NOT REQUIRED to bundle an eb:Receipt with any other ebMS header or message body. However, when receiving a Receipt, an MSH conforming to this profile MUST be able to process an eb:Receipt bundled with an other ebMS message header or body.</p> <p>Use of the ebbpsig:NonRepudiationInformation element (as defined in [ebBP-SIG]) is REQUIRED as content for the eb:Receipt message, i.e. when conforming to this profile a Sending MSH must be able to create a Receipt with such a content, and a Receiving MSH must be able to process it.</p>
Reliability	<p>Reception Awareness, defined as the ability for a Sending light Client to notify its application (message Producer) of lack of reception of an eb:Receipt related to a sent message, MUST be supported. This implies support for:</p> <ul style="list-style-type: none"> ● <u>Correlating eb:Receipts with previously sent User messages, based on the ebMS message ID.</u> ● <u>Detection of a missing eb:Receipt for a sent message.</u> ● <u>Ability to report an error to the message Producer in case no eb:Receipt has been received for a sent message.</u> <p>The semantics for sending back an eb:Receipt message is as follows: a well-formed ebMS user message has been received and the MSH is taking responsibility for it's processing, (additional application-level delivery semantics, and payload validation semantics are not relevant).</p> <p>Support for a WS reliable messaging specification is optional.</p>
Security	<p>Both authorization options for message pulling (authorizing a PullRequest for a particular MPC) described in the ebHandler conformance profile MUST be supported:</p> <ol style="list-style-type: none"> 1. <u>Support for username / password token: minimal support for wss:UsernameToken profile in the Pull signal - for authorizing a particular</u>

	<p>MPC. Support for adding a WSS security header targeted to the “ebms” actor, as specified in section 7.10 of ebMS V3, with the wsse:UsernameToken profile. The use of transport-level secure protocol such as SSL or TLS is recommended.</p> <p>2. Support for a regular wsse security header (XMLDsig for authentication, use of X509), and no additional wsse security header targeted to “ebms”.</p>
<u>Error generation and reporting</u>	<p>Error notification to the local message producer MUST be supported (e.g. reported failure to deliver pushed messages).</p> <p>The reporting of message processing errors for pulled messages to the remote party MUST be supported via Error messages (errors may be bundled with another pushed message or a Pull Request signal message.).</p>
<u>Message Partition Channels</u>	<p>Sending on the default message partition channel is sufficient (support for additional message partitions is NOT REQUIRED.)</p>
<u>Message packaging</u>	<p>Support for attachments is NOT REQUIRED – i.e. any XML message payload will use the SOAP body.</p> <p>Support for MessageProperties is NOT REQUIRED.</p>
<u>Interoperability Parameters</u>	<p>The following interoperability parameters values MUST be supported for this conformance profile:</p> <ul style="list-style-type: none"> ● Transport: HTTP 1.1 ● SOAP version: 1.2 ● Reliability Specification: none. ● Security Specification: WSS 1.1.

375

Conformance Profile: -AS4-LightClient	Profile summary: <“Sending+Receiving” / “lighthandler-rm” / Level 1 / HTTP1.1 + SOAP 1.1>
Functional Aspects	Profile Feature Set
ebMS-MEP	<p>The following MEPs MUST be supported: One-way / Push (as initiator), and One-way / Pull (as initiator).</p> <p>Regardless of which MEP is used, the sending of an eb:Receipt message MUST be supported:</p> <ul style="list-style-type: none"> ● For the One-way / Push, the “response” reply pattern MUST be supported. ● For the One-way / Pull, the “callback” pattern is the only viable option, and the User message sender MUST be ready to accept an eb:Receipt either piggybacked on a PullRequest, or sent separately. The User message-receiver MUST be able to send an eb:Receipt separately from the-

	<p style="text-align: center;">PullRequest:</p> <p>In all MEPs, the User message receiver MUST be able to send an eb:Receipt as a separate message (i.e. not piggybacked on a PullRequest message or on another User message). An MSH conforming to this profile is therefore NOT REQUIRED to bundle an eb:Receipt with any other ebMS header or message body. However, when receiving a Receipt, an MSH conforming to this profile MUST be able to process an eb:Receipt bundled with an other ebMS message header or body.</p> <p>Use of the ebbpsig:NonRepudiationInformation element (as defined in [ebBP-SIG]) MUST be supported as content for the eb:Receipt message, i.e. when conforming to this profile a Sending MSH must be able to create a Receipt with such a content, and a Receiving MSH must be able to process it.</p>
<p>Reliability</p>	<p>Reception Awareness, defined as the ability for a Sending light Client to notify its application (message Producer) of lack of reception of an eb:Receipt related to a sent message, MUST be supported. This implies support for:</p> <ul style="list-style-type: none"> (a) correlating eb:Receipts with previously sent User messages, based on the ebMS message ID, (b) detection of a missing eb:Receipt for a sent message, (c) ability to report an error to the message Producer in case no eb:Receipt has been received for a sent message. <p>The semantics of sending back an eb:Receipt message is: a well formed ebMS user message has been received and the MSH is taking responsibility for its processing, (no additional application-level delivery semantics, and no payload-validation semantics).</p> <p>Support for a WS reliable messaging specification is NOT REQUIRED although that is an option.</p>
<p>Security</p>	<p>Both authorization options for message pulling (authorizing PullRequest for a particular MPC) described in the ebHandler conformance profile MUST be supported:</p> <ol style="list-style-type: none"> 1. Support for username / password token: minimal support for wss:UsernameToken profile in the Pull signal for authorizing a particular MPC. Support for adding a WSS security header targeted to the "ebms" actor, as specified in section 7.10 of ebMS V3, with the wsse:UsernameToken profile. The use of transport-level secure protocol such as SSL or TLS is recommended. 2. Support for a regular wsse security header (XMLDsig for authentication, use of X509), and no additional wsse security header targeted to "ebms",
<p>Error generation and reporting</p>	<p>Error notification to the local message producer MUST be supported (e.g. reported failure to deliver pushed messages).</p> <p>The reporting of message processing errors for pulled messages to the remote party MUST be supported via Error messages (such an error may be bundled with another pushed message or a Pull signal).</p>

Message-Partition-Channels	Sending on the default message partition channel is sufficient (support for additional message partitions is NOT REQUIRED.)
Message-packaging	Support for attachments is NOT REQUIRED — i.e. the message payload will use the SOAP body —, Support for MessageProperties is NOT REQUIRED.
Interoperability-Parameters	<p>The following interoperability parameters values MUST be supported for this conformance profile:</p> <p>Transport: HTTP-1.1</p> <p>SOAP version: 1.2</p> <p>Reliability Specification: none.</p> <p>Security Specification: WSS 1.1.</p>

376

377 WS-I Conformance Requirements

378 This conformance profile will require compliance with the following WS-I profile :

- 379 ● Basic Profile 2.0 (BP2.0) [WSIBP20].

380 Note: this must be interpreted as requiring that the features exhibited by an AS4 Light Client ebMS
 381 conformance profile MUST comply with the above WS-I profile.

382 **3.1.2 Processing Mode Parameters**

383 This section contains a summary of P-Mode parameters relevant to AS4 features for this conformance
 384 profile. An AS4 Light client MUST support and understand those that are mentioned as "required". For
 385 each parameter, either:

- 386 ● Full support is required: An implementation is supposed to support the possible options for this
 387 parameter.
- 388 ● Partial support is required: Support for a subset of values is required.
- 389 ● No support is required: An implementation is not required to support the features controlled by this
 390 parameter, and therefore not required to understand this parameter.

391

392 An AS4 Light client is expected to support the P-Mode set below both as a Sender (of the user message,
 393 in case of a one-way / push) and as a Receiver (in case of a one-way / pull).

394 **3.1.2.1 General P-Mode parameters**

- 395 ● PMode.ID: support required.
- 396 ● PMode.Agreement: support required.
- 397 ● PMode.MEP: support required for: <http://www.oasis-open.org/committees/ebxml-msg/one-way>

- 398 | ● **PMode.MEPbinding**: support required for: [http://www.oasis-open.org/committees/ebxml-](http://www.oasis-open.org/committees/ebxml-msg/push)
399 | [msg/push](http://www.oasis-open.org/committees/ebxml-msg/pull) and <http://www.oasis-open.org/committees/ebxml-msg/pull>.
- 400 | ● **PMode.Initiator.Party**: support required.
- 401 | ● **PMode.Initiator.Role**: support required.
- 402 | ● **PMode.Initiator.Authorization.username and PMode.Initiator.Authorization.password**:
403 | support required for: [wsse:UsernameToken](#). (as initiator of the one-way / pull)
- 404 | ● **PMode.Responder.Party**: support required.
- 405 | ● **PMode.Responder.Role**: support required.
- 406 | ● **PMode.Responder.Authorization.username and**
407 | **PMode.Responder.Authorization.password**: support not required.
- 408 | **3.1.2.2 PMode[1].Protocol**
- 409 | ● **PMode[1].Protocol.Address**: support required for “http” protocol.
- 410 | ● **PMode[1].Protocol.SOAPVersion**: support required for SOAP 1.2.
- 411 | **3.1.2.3 PMode[1].BusinessInfo**
- 412 | ● **PMode[1].BusinessInfo.Service**: support required.
- 413 | ● **PMode[1].BusinessInfo.Action**: support required.
- 414 | ● **PMode[1].BusinessInfo.Properties[]**: support required.
- 415 | ● **(PMode[1].BusinessInfo.PayloadProfile[])**: support not required)
- 416 | ● **(PMode[1].BusinessInfo.PayloadProfile.maxSize)**: support not required)
- 417 | **3.1.2.4 PMode[1].ErrorHandling**
- 418 | ● **(PMode[1].ErrorHandling.Report.SenderErrorsTo)**: support not required)
- 419 | ● **PMode[1].ErrorHandling.Report.AsResponse**: support required (true/false) as initiator of the
420 | [one-way / push](#), as well as for the [PullRequest](#) signal ([PMode\[1\]\[s\]](#)).
- 421 | ● **(PMode[1].ErrorHandling.Report.ProcessErrorNotifyConsumer)** support not required)
- 422 | ● **PMode[1].ErrorHandling.Report.ProcessErrorNotifyProducer**: support required (true/false)
- 423 | ● **PMode[1].ErrorHandling.Report.DeliveryFailuresNotifyProducer**: support required (true/false).
- 424 | **3.1.2.5 Pmode[1].Reliability**
- 425 | [Support not required](#).

426 | **3.1.2.6 PMode[1].Security**

- 427 | ● [PMode\[1\].Security.WSSVersion](#): support required for: 1.1
- 428 | ● [PMode\[1\].Security.X509.Sign](#): support required.
- 429 | ● [PMode\[1\].Security.X509.Signature.Certificate](#): support required.
- 430 | ● [PMode\[1\].Security.X509.Signature.HashFunction](#): support required.
- 431 | ● [PMode\[1\].Security.X509.Signature.Algorithm](#): support required.
- 432 | ● [PMode\[1\].Security.X509.Encryption.Encrypt](#): support not required.
- 433 | ● [PMode\[1\].Security.X509.Encryption.Certificate](#): support not required.
- 434 | ● [PMode\[1\].Security.X509.Encryption.Algorithm](#): support not required.
- 435 | ● [\(PMode\[1\].Security.X509.Encryption.MinimumStrength](#): support not required)
- 436 | ● [PMode\[1\].Security.UsernameToken.username](#): support required.
- 437 | ● [PMode\[1\].Security.UsernameToken.password](#): support required.
- 438 | ● [PMode\[1\].Security.UsernameToken.Digest](#): support required (true/false)
- 439 | ● [\(PMode\[1\].Security.UsernameToken.Nonce](#): support not required)
- 440 | ● [PMode\[1\].Security.UsernameToken.Created](#): support required.
- 441 | ● [PMode\[1\].Security.PModeAuthorize](#): support required (true/false)
- 442 | ● [PMode\[1\].Security.SendReceipt](#): support required (true/false)
- 443 | ● [Pmode\[1\].Security.SendReceipt.ReplyPattern](#): support required for "response" if
- 444 | [PMode.MEPbinding](#) is "push", and for "callback" if [PMode.MEPbinding](#) is "pull".

445 | This conformance profile will require compliance with the following WS-I profile, once formally approved-

446 | by WS-I (currently in Board approval draft status):

- 447 | ● [Basic Profile 2.0 \[WSIBP20\]](#)

448 | Note: the above WS-I profile MUST be complied with within the scope of features exhibited by the AS4-

449 | Light Client - ebMS conformance profile.

450 | Conformance Profiles

451 | Compatibility

452 | The AS4 profile is compatible with the following ebMS V3 conformance profiles, defined in [\[ebMS3-CP\]](#)

453 | [\[ebMS3-CP\]](#):

- 454 | ● Gateway RM V2/3
- 455 | ● Gateway RM V3
- 456 | ● Gateway RX V2/3
- 457 | ● Gateway RX V3

458 AS4 may be deployed on any MSH that conforms to one of the above conformance profiles.

459 NOTE: AS4 may also be deployed on an MSH that supports B2B messaging protocols other than ebMS,
460 such as AS2 [RFC4130]. Such an MSH could be used by organizations that use AS2 for some business
461 partners, or for some types of documents, and AS4 for others.

4 AS4 Additional Features

This section defines features that were not specified in the ebMS V3 Core Specification and therefore out of scope for the previous conformance profiles (ebHandler CP and Light Client CP). These features should be considered as additional capabilities that are either required by or made optional to AS4 implementations as indicated below.

~~The profiling tables below can be used for adding user-defined profiling requirements to be adopted within a business community. Whenever the feature, or its profiling, is mandatory, the right-side column (Profile Requirement) will specify it.~~
~~is-section-defines-features-that-were-not-specified-in-ebMS-V3-and-therefore-out-of-scope-for-the-previous-conformance-profiles-(ebHandler-CP-and-Light-Client-CP).-These-features-should-be-considered-as-additional-capabilities-that-are-either-required-by-or-made-optional-to-AS4-implementations-as-indicated-below.~~

~~The profiling tables below can be used for adding user-defined profiling requirements to be adopted within a business community. Whenever the feature — or its profiling — is mandatory, the right-side column (Profile Requirement) will specify it.~~

Compression

Application payloads that are built in conformance with the SOAP Messages with Attachments [SOAPATTACH] specification may be compressed. Support for compression MUST then be provided by AS4 implementations. Compression of the SOAP envelope and/or payload containers within the SOAP Body of an ebMS Message is not supported.

To compress the payload(s) of a message built in conformance with the SOAP Messages with Attachments [SOAPATTACH] specification, the GZIP [RFC1952] compression algorithm MUST be used. Compression MUST be applied before payloads are attached to the SOAP Message.

~~Application payloads that are built in conformance with the SOAP Messages with Attachments [SOAPATTACH] specification may be compressed. Support for compression MUST then be provided by AS4 implementations. Compression of the SOAP envelope and/or payload containers within the SOAP Body of an ebMS Message is not supported.~~

~~To compress the payload(s) of a message build in conformance with the SOAP Messages with Attachments [SOAPATTACH] specification the GZIP [GZIP] compression algorithm MUST be used. Compression MUST be applied before payloads are attached to the SOAP Message.~~

The eb:PartInfo element in the message header that relates to the compressed message part, MUST have an eb:Property element with @name =“Compressed”:

```
<eb:Property name="Compressed"/>
```

The content type of the compressed attachment MUST be "application/gzip".

These are indicators to the receiver that compression has been used on this part.

When compression, signature and encryption are required of the MSH, the message MUST be compressed prior to being signed and/or encrypted.

Packaging requirements:

- An eb:PartInfo/eb:PartProperties/eb:Property/@name="MimeType" value is RECOMMENDED to identify the mimetype of the payload before compression was applied.

- An `eb:PartInfo/eb:PartProperties/eb:Property/@name="CharacterSet"` value is RECOMMENDED to identify the character set of the payload before compression was applied.

509 Example:

```

510 <eb:PartInfo href="cid:attachment1234@example.com"=foo@example.com"
511 <mailto:cid=foo@example.com> >
512 <eb:PartProperties>
513 <eb:Property name="MimeType">application/xml</eb:Property>
514 <eb:Property name="CharacterSet">utf-8</eb:Property>
515 <eb:Property name="Compressed"/>
516 <eb:Property name="Compressed"/>
517 </eb:PartProperties>
518 <eb:PartInfo>
519

```

520 An additional `P_Mode` parameter is defined, that MUST be supported:

- **PMode[1].PayloadService.Compression:** {true / false}

522 **True:** some attached payload(s) may be compressed over this MEP segment.

523 **False** (default): no compression is used over this MEP segment.

524 NOTE: the requirement for Compression feature applies to both conformance profiles (AS4 ebHandler
525 and AS4 light Client).

526 NOTE: the requirement for Compression feature applies to both conformance profiles (AS4 ebHandler-
527 and AS4 light Client)

528

529 Reception Awareness features and Duplicate Detection

530 These capabilities make use of the eb:Receipt as the sole type of acknowledgement. Duplicate detection
531 only relies on the eb:MessageInfo/eb:MessageId.

<u>Features</u>	<u>Profile requirements</u>
<u>Reception awareness error handling (REQUIRED support)</u>	<u>Ability for the MSH expecting an eb:Receipt to generate an error in case no eb:Receipt has been received for a sent message. It is RECOMMENDED that this error be a new error: Code = EBMS:0301, Short Description = MissingReceipt, Severity = Failure, Category = Communication.</u> <u>Ability for the MSH expecting an eb:Receipt to report a MissingReceipt error to the message Producer</u> -
<u>Message Retry (OPTIONAL support)</u>	<u>Ability for a User message sender that has not received an expected eb:Receipt to resend the User message. If doing so, the eb:MessageInfo/eb:MessageId element of the resend message and of the original User message MUST be same. When resending a message for which non-repudiation of receipt is required, the sender MUST ensure that the hash values for the digests to be included in the Receipt (i.e. the content of MessagePartNRInformation elements), do not vary from the original message to the retry(ies), so that non-repudiation of</u>

	<p><u>receipt can be asserted based on the original message and the receipt of any of its retries.</u></p>
<p><u>Duplicate Detection (REQUIRED support)</u></p>	<p><u>Ability for the MSH receiving a User message to detect and/or eliminate duplicates based on eb:MessageInfo/eb:MessageId. If duplicates are just detected (not eliminated) then at the very least it is REQUIRED that the Receiving MSH notifies its application (message Consumer) of the duplicates. For examples, these could be logged.</u></p> <p><u>Related quantitative parameters (time window for the detection, or maximum message log size) are left to the implementation.</u></p> <p>-</p>

532 These capabilities are making use of the eb:Receipt as the sole type of acknowledgement. Duplicate-
533 detection only relies on the eb:MessageInfo/eb:MessageId.

534

Features	Profile requirements
<p>Reception awareness error handling (REQUIRED support)</p>	<p>Ability for the MSH expecting an eb:Receipt to generate an error in case no eb:Receipt has been received for a sent message. It is RECOMMENDED that this error be a new error: Code = EBMS:0301, Short Description = MissingReceipt, Severity = Failure, Category = Communication.</p> <p>Ability for the MSH expecting an eb:Receipt to report a MissingReceipt error to the message Producer</p> <p>-</p>
<p>Message Retry (OPIONAL support)</p>	<p>Ability for a User message sender that has not received an expected eb:Receipt to resend the User message. If doing so, the eb:MessageInfo/eb:MessageId element of the resend message and of the original User message MUST be same. [removed: However, the eb:MessageInfo/eb:Timestamp MUST be different.] When resending a message for which non-repudiation of receipt is required, the sender MUST ensure that the hash values for the digests to be included in the Receipt (i.e. the content of MessagePartNRInformation elements), do not vary from the original message to the retry(ies), so that non-repudiation of receipt can be asserted based on the original message and the receipt of any of its retries.</p>
<p>Duplicate Detection (REQUIRED support)</p>	<p>Ability for the MSH receiving a User message to detect and/or eliminate duplicates based on eb:MessageInfo/eb:MessageId. If duplicates are just detected (not eliminated) then at the very least it is REQUIRED that the Receiving MSH notifies its application (message Consumer) of the duplicates. For examples, these could be logged.</p> <p>Related quantitative parameters (time window for the detection, or maximum message log size) are left for implementors to decide.</p> <p>-</p>

535

536 NOTE: these requirements apply to both conformance profiles (AS4 ebHandler and AS4 light Client)

537 The following additional P_Mode parameters are defined and MUST be supported:

- 538 • **PMode[1].ReceptionAwareness: (true / false) Note: when set to true, the**
539 **PMode[1].Security.SendReceipt must also be set to true.**
- 540 • **PMode[1].ReceptionAwareness: (true / false)**
- 541 • **PMode[1].ReceptionAwareness.Replay: (true / false)**
- 542 • **PMode[1].ReceptionAwareness.Replay.Parameters:**. (contains a composite string specifying:
543 (a) maximum number of retries or some timeout, (b) frequency of retries or some retry rule). The
544 string contains a sequence of parameters of the form: name=value, separated by either comas or
545 ‘;’. Example: “maxretries=10,period=3000”, in case the retry period is 3000 ms.
- 546 • **PMode[1].ReceptionAwareness.DuplicateDetection: (true / false)**
- 547 • **PMode[1].ReceptionAwareness.DetectDuplicates.Parameters:** (contains an implementation
548 specific composite string. As an example this string may specify composite string specifying
549 either (a) maximum size of message log over which duplicate detection is supported, (b)
550 maximum time window over which duplicate detection is supported). The string contains a
551 sequence of parameters of the form: name=value, separated by either comas or ‘;’. Example:
552 “maxsize=10Mb,checkwindow=7D”, in case the duplicate check window is guaranteed of 7 days
553 minimum.

554

555 Alternative Pull Authorization

556 In addition to the two authorization options described in the AS4 Conformance Profile (section 2.1.1), an
557 implementation MAY optionally decide to support a third authorization technique, based on transient
558 security (SSL or TLS).

559 SSL/TLS can provide certificate-based client authentication.- Once the identity of the Pulling client is
560 established, the Security module may pass this identity to the ebms module, which can then associate it
561 with the right authorization entry, e.g. the set of MPCs this client is allowed to pull from.

562 This third authorization option, compatible with AS4 although not specified in ebMS Core V3, relies on the
563 ability of the ebms module to obtain the client credentials. This capability represents an (optional) new
564 feature. When using this option for authorizing pulling, there is no need to insert any WS-Security header
565 in the Pull request at all—compatible with AS4 although not specified in ebMS Core V3—relies on the
566 ability of the ebms module to obtain the client credentials. This capability represents an (optional) new
567 feature.

568 Pull request authentication service, there may be no need for any WS-Security headers in the Pull request
569 at all.

570

571 Semantics of Receipt in AS4

572 The notion of Receipt in ebMS V3 is not associated with any particular semantics, such as delivery
573 assurance. However, when combined with security (signing), it is intended to support Non Repudiation of
574 Receipt (NRR).

575 | ~~The notion of Receipt in ebMS V3 is not associated with any particular semantics. However, when~~
576 | ~~combined with security (signing), it is intended to support Non-Repudiation of Receipt (NRR).~~

577 | In AS4, the eb:Receipt message serves both as a business receipt (its content is profiled in Section 2),
578 | and as a reception indicator, being a key element of the reception awareness feature. No particular
579 | delivery semantics can be assumed however: the sending of an eb:Receipt only means the following,
580 | from a message processing viewpoint:

581 | (a) The related ebMS user message has been received and is well-formed.

582 | (b) The Receiving MSH is taking responsibility for processing this user message. However, no
583 | guarantee can be made that this user message will be ultimately delivered to its Consumer
584 | application (this responsibility lays however now on the Receiver side).

585 | The meaning of NOT getting an expected Receipt, for the sender of a related user message, is one of the
586 | following:

587 | 1. The user message was lost and never received by the Receiving MSH.

588 | 2. The user message was received, but the eb:Receipt was never generated, e.g. due to a faulty
589 | configuration (P_Mode).

590 | 3. The user message was received, the eb:Receipt was sent back but was lost on the way.

591 | See section 4.1.8 for AS4 usage rules about Receipts.

592 | Note: The use of the phrase 'business receipt' in AS4 is to distinguish the nature of the AS4/ebMS3
593 | receipt as being sufficient for Non-Repudiation of Receipt (NRR). In this sense it is very similar to the
594 | Message Disposition Notification (MDN, [RFC3798]) response that is used by AS2 as a business receipt
595 | for non-repudiation. This receipt in AS4/ebMS3 contains the same information as the MDN, and thus
596 | distinguishes itself from the web services reliable messaging (sequence) acknowledgment.

5 Complementary Requirements for the AS4 Multi-Hop Profile

The ebMS 3.0 Part 2, Advanced Features specification [ebMS3ADV] defines several advanced messaging features. One of these is a multi-hop feature that provides functionality to exchange ebMS messages through clouds of intermediaries, or *I-Clouds*. These intermediaries serve various purposes, including message routing and store-and-forward (or store-and-collect) connections. Intermediaries allow messages to flow through a *multi-hop* path and serve to interconnect (private or public) networks and clouds. This section specifies an optional profile for AS4 endpoints in order to converse with ebMS 3.0 intermediaries. This profile is complementary to the primary profiles defined in section 2. This complementary profile:

- Simplifies the fine-grained endpoint configuration options of [ebMS3ADV] to a single processing mode parameter (section 5.3).
- Extends the capability of AS4 endpoints to exchange messages in a peer-to-peer fashion to exchanges across intermediaries (section 5.4).

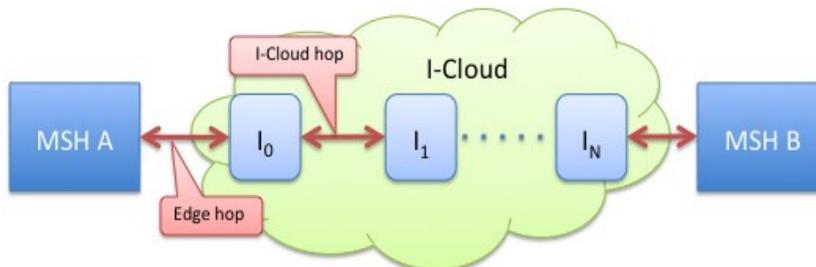

Section 5.1 is non-normative and provides the rationale and context for using AS4 and intermediaries. Section 5.2 defines some general constraints and assumptions. Section 5.3 presents the single additional processing mode parameter required for multi-hop. Section 5.4 provides a minimal interoperability subset for AS4 endpoints in an *I-Cloud*.

5.1 Rationale and Context

A key motivation for AS4 is to provide a simplified profile of ebMS 3.0 that allows Small and Medium-Size Enterprises (SMEs) to exchange messages using Web Services. Two situations can be distinguished:

- Situations where one partner in an exchange is an SME and the other is a larger organization. AS4 allows SME trading partners of a large organization to operate “client-only” endpoints and pull messages from a B2B gateway server operated by the large organization. That B2B gateway operates as a server and is addressable and available for pulling. These exchanges can be said to be *asymmetric*.
- Situations where all partners are SMEs, organized in collaborative SME B2B networks. In these situations there is no single larger partner that the other partners are organized around. These exchanges can be said to be *symmetric*.

When two endpoints exchange messages directly, they cannot both be client-only endpoints. Intermediaries can serve SME networks by offering store-and-collect capabilities, just like Internet Service Providers (ISPs) offer mailbox services for email, Value-Added Network (VAN) services offer document exchange services, and Cloud-based File Storage services offer secure temporary storage and exchange of large files.

632 | In the diagram, messages can be sent any time to MSH A or MSH B as long as the I-Cloud is able to
633 | forward messages to AS4 edge intermediaries I_0 and I_N , from which they can be pulled at a convenient
634 | time.

635 | **5.2 General Constraints**

636 | This profile defines the following general constraints:

- 637 | ● Whether or not two AS4 endpoint exchange user messages in a peer-to-peer fashion or across
638 | an I-Cloud is determined by a single processing mode parameter.
- 639 | ● Sender and Receiver MSH can diverge in some “init” and “resp” parameters (terminology from
640 | section 2.7.2 of [ebMS3ADV]), as some parameters in an exchange relate to the edge
641 | intermediaries, not to the ultimate destination MSH.
- 642 | ● Whether or not an AS4 endpoint returns related response signals (receipts, errors) in a peer-to-
643 | peer fashion or across an I-Cloud is not based on configuration, but is determined by how the
644 | associated user message was delivered:
 - 645 | ○ Receipts and errors for user messages received directly are sent back directly.
 - 646 | ○ Receipts and errors for user messages received through an I-Cloud are sent back through the
647 | I-Cloud.
- 648 | ● Edge intermediaries connect to AS4 endpoints as servers: they do not pull messages from
649 | endpoints.
- 650 | ● Pull signals from AS4 endpoints target AS4 edge intermediaries and are not forwarded across an
651 | I-Cloud.
- 652 | ● An AS4 edge intermediary that is capable of delivering a particular user message to an AS4
653 | endpoint SHOULD be configured to provide initial reverse routing of any related signals (receipts,
654 | errors).
- 655 | ● There is no requirement to support WS-ReliableMessaging lifecycle messages.

656 | **5.3 Processing Mode Parameter**

657 | In this profile, AS4 processors either operate in peer-to-peer exchange mode or exchange messages
658 | across intermediaries based on the value of a single processing mode parameter, defined in section 6.4.2
659 | of [ebMS3ADV]: **Pmode[1].Protocol.AddActorOrRoleAttribute**.

- 660 | ● If this value is set to *true* for a P-Mode, the ebMS header in AS4 user messages MUST have a
661 | SOAP 1.2 *role* attribute and its value MUST be set to the fixed value [open.org/ebxml-msg/ebms/v3.0/ns/part2/200811/nextmsh](http://docs.oasis-</u>
662 | <u><a href=).
- 663 | ● For AS4, the default value of this parameter is *false*, meaning that the SOAP 1.2 *role* attribute is
664 | not present. In SOAP 1.2, this is equivalent to the attribute being present with the value
665 | <http://www.w3.org/2003/05/soap-envelope/role/ultimateReceiver>.

666 | **5.4 AS4 Endpoint Requirements**

667 | The ebMS 3.0 multi-hop feature specifies requirements on endpoints to be able to exchange messages in
668 | an I-Cloud. This section further constrains these requirements and provides a minimal interoperability
669 | subset for AS4 endpoints. The structure of this section follows the structure of section 2.6 of [ebMS3ADV],
670 | which considers initiating messages and responding messages.

671 | The section distinguishes three types of initiating messages:

- 672 | ● User Messages. No special processing is required of an AS4 processor, other than being able to
673 | insert the `role` attribute with the appropriate value, subject to the selected processing mode, as
674 | specified in section 5.3.
- 675 | ● ebMS Signal Messages. This AS4 profile constrains this further as follows:
 - 676 | ○ No `RoutingInput` reference parameter and no `role` attribute are added to
677 | `PullRequest` messages.
 - 678 | ○ AS4 endpoints MUST NOT send initiating error messages.
- 679 | ● Non-ebMS Messages: this situation is not relevant in the case of AS4 as it does not require
680 | support for Web Services protocols like WS-ReliableMessaging [WSRM12]. For this reason there
681 | is no need to support initiating non-ebMS messages.

682 | Section 2.6 of [ebMS3ADV] distinguishes the following type of responding messages:

- 683 | ● ebMS response User Messages. This is handled in the same way as ebMS request User
684 | Messages.
- 685 | ● ebMS Signal Messages. These messages are making use of WS-Addressing headers
686 | [WSADDRCORE] under certain conditions. This profile restricts or relaxes further the use of
687 | and/or support for these “wsa” headers.
 - 688 | ○ AS4 endpoints are NOT REQUIRED to support `wsa:ReplyTo` header or `wsa:FaultTo`
689 | when generating responses.
 - 690 | ○ If the user message that the signal relates to DOES NOT contain a `role` attribute with a
691 | value of `http://docs.oasis-open.org/ebxml-msg/ebms/v3.0/ns/part2/200811/nextmsh`,
692 | processing of signals is as specified in the ebMS 3.0 Core Specification and in the other
693 | chapters of this specification.
 - 694 | ○ If the user message that the signal relates to DOES contain a `role` attribute with a value of
695 | `http://docs.oasis-open.org/ebxml-msg/ebms/v3.0/ns/part2/200811/nextmsh`, a response
696 | signal MUST contain
 - 697 | ○ a `wsa:To` header element with value `http://docs.oasis-open.org/ebxml-`
698 | `msg/ebms/v3.0/ns/part2/200811/icloud`
 - 699 | ○ a `wsa:Action` header element with value `http://docs.oasis-open.org/ebxml-`
700 | `msg/ebms/v3.0/ns/core/200704/oneWay.receipt` or `http://docs.oasis-open.org/ebxml-`
701 | `msg/ebms/v3.0/ns/core/200704/oneWay.error`
 - 702 | ○ and a WS-Addressing reference parameter with content as specified in the subsection
703 | “Inferred `RoutingInput` for the reverse path” of section 2.6.2 of [ebMS3ADV]. The value of
704 | the MPC attribute is to be set based on the value of the MPC attribute in the user
705 | message. If that value is not set, the default value `http://docs.oasis-open.org/ebxml-`
706 | `msg/ebms/v3.0/ns/core/200704/defaultMPC` is assumed (as defined in section 3.4.1 in
707 | [ebMS3CORE]):
 - 708 | ■ The MPC value for an AS4 receipt signal is formed by concatenating the string
709 | “`.receipt`” to the (default) MPC value of the received message.
 - 710 | ■ The MPC value for an AS4 error signal is formed by concatenating the string
711 | “`.error`” to the (default) MPC value of the message in error.
 - 712 | ● Non-ebMS Messages: this situation is not relevant in the case of AS4, because AS4 does not
713 | require support for Web Services protocols that return signal messages, such as reliable
714 | messaging acknowledgments.

6 AS4 Usage Profile of ebMS 3.0 Core Specification

716

7 AS4 Usage Profile of ebMS 3.0

717

718 **8 While the previous sections were describing**
 719 **messaging handler requirements for AS4**
 720 **compliance (i.e. mostly intended for product**
 721 **developers), this section is about configuration and**
 722 **usage options.**

723 This section is split in two major subsections:

- 724 • **AS4 Usage Rules:** ~~this section provides the rules for using messaging features in an AS4-~~
 725 ~~compliant way.~~
- 726 • **AS4 Usage Agreements:** ~~this section provides notes to the users on the main options left open~~
 727 ~~by the AS4 profiles, that have to be agreed on in order to interoperate~~**The AS4 Usage Rules:** ~~this-~~
 728 ~~section is stating the rules for using messaging features in an AS4-compliant way.~~
- 729 • **The AS4 Usage Agreements:** ~~this section is reminding the users of what are the main options left~~
 730 ~~open by the AS4 profiles, that they have to agree on in order to interoperate.~~
- 731
- 732 • Both sections are about features that are under responsibility of the user when using an AS4-
 733 compliant product.
- 734

735 AS4 Usage Rules

736

737 Core Components / Modules to be Used

738 This table summarizes which functional modules in the ebMS V3 specification are required to be
 739 implemented by the AS4 profile, and whether or not these modules are actually profiled for AS4.

740

ebMS V3 Component Name and Reference	Profiling status
Messaging Model (section 2)	Usage: Required Profiled: Yes Notes: This Profile only supports the One-Way/Push MEP (Sync and Async) and the One-Way/Pull MEP
Message Pulling and Partitioning (section 3)	Usage: Required Profiled: No Notes: The profiling of QoS associated with Pulling is defined in another module. The MPC and pulling feature itself are not profiled.
Processing Modes (section 4)	Usage: Required Profiled: Yes

Message Packaging (section 5)	Usage: Required Profiled: Yes Notes: Default business process defines acceptable defaults for Role, Service, and Action. Bundling options for message headers (piggybacking) are restricted.
Error Handling (section 6)	Usage: Required Profiled: Yes Notes: Addition of some new Error Codes regarding Reception Awareness
Security Module (section 7)	Usage: Required Profiled: Yes Notes: Guidance regarding which part(s) of the message may be encrypted and included in the signature. Further guidance on how to secure the PullRequest Signal and the preventing of replay attacks..
Reliable Messaging Module (section 8)	Usage: Not Required Profiled: No Notes: This profile does not require the use of the Reliable Messaging Module using either WS-ReliableMessaging or WS-Reliability. It relies instead on eb:Receipts for supporting a light reliability feature called "Reception-Awareness".

741

<u>ebMS V3 Component Name and Reference</u>	<u>Profiling status</u>
<u>Messaging Model (section 2)</u>	Usage: Required Profiled: Yes <u>Notes: This Profile only supports the One-Way/Push MEP (Sync and Async) and the One-Way/Pull MEP</u>
<u>Message Pulling and Partitioning (section 3)</u>	Usage: Required Profiled: No <u>Notes: The profiling of QoS associated with Pulling is defined in another module. The MPC and pulling feature itself are not profiled.</u>
<u>Processing Modes (section 4)</u>	Usage: Required Profiled: Yes

Security Module (section 7)	Usage: Required Profiled: Yes Notes: Guidance regarding which part(s) of the message may be encrypted and included in the signature. Further guidance on how to secure the PullRequest Signal and the preventing of replay attacks..
Reliable Messaging Module (section 8)	Usage: Not Required Profiled: No Notes: This profile does not require the use of the Reliable Messaging Module using either WS-ReliableMessaging or WS-Reliability. It relies instead on eb:Receipts for supporting a light reliability feature called "Reception Awareness".

742 **8.0.1 Bundling rules**

Scope of the Profile Feature	Defines bundling (or "piggybacking") rules of ebMS MEPs, including Receipts.
Specification Feature	
Specification Reference	ebMS v3.0, Section 2.2
Profiling Rule (a)	This profile supports the One-Way/Push MEP. Both synchronous and asynchronous transport channels for the response (eb:Receipt) are allowed by this profile. When sending a Receipt for this MEP, a Receiving MSH conforming to this profile SHOULD NOT bundle the Receipt with any other ebMS message header or body.
Profiling Rule (b)	This profile supports the One-Way/Pull MEP. When sending a Receipt for this MEP, a Receiving MSH conforming to this profile SHOULD NOT bundle the Receipt with any other ebMS message header (including a PullRequest signal) or message body.

761 **Generating Receipts**

<u>Specification Feature</u>	<u>eb:Receipt signal messages</u>
<u>Specification Reference</u>	<u>ebMS v3.0, Section 7.12..2 (Persistent Signed Receipt)</u> <u>ebMS v3.0, Section 5.2.3.3, eb:Messaging/eb:SignalMessage/eb:Receipt</u>
<u>Profiling Rule (a): Receipts for reception awareness</u>	<p><u>In AS4, the content of the eb:Receipt element MUST be a valid ebbpsig:NonRepudiationInformation element. When a Receipt is to be used solely as a reception indicator (for reception awareness), the sender of the Receipt MUST use ebbp:MessagePartIdentifier elements in the ebbpsig:NonRepudiationInformation instead of ds:Reference elements to reference message parts. The eb:Receipt</u></p> <ul style="list-style-type: none"> <u>MUST contain an ebbp:MessagePartIdentifier element for each eb:PartInfo. The content of each of these elements MUST be identical to the value of the "href" attribute in the corresponding eb:PartInfo element.</u> <u>SHOULD include an ebbp:MessagePartIdentifier element that identifies the MIME part in the received message that contains the AS4 SOAP envelope. Its content MUST be an MIME Content-Id Uniform Resource Locator that matches the "start" parameter of the received SOAP-with-attachments message. The element is REQUIRED in receipts for user messages that have no eb:PartInfo</u>

	<p><u>elements, as the cardinality of the ebbp:MessagePartIdentifier in the ebbp:NonRepudiationInformation schema definition is non-zero.</u></p> <p><u>The eb:RefToMessageId in the eb:MessageInfo group in the eb:SignalMessage contains the message identifier of the received message.</u></p>
<p><u>Profiling Rule (b): Receipts for Non Repudiation of Receipt (NRR)</u></p>	<p><u>In AS4, the content of the eb:Receipt element MUST be a valid ebbpsig:NonRepudiationInformation element. When a Receipt is to be used for Non Repudiation of Receipt (NRR), the sender of the Receipt:</u></p> <ul style="list-style-type: none"> <u>MUST use ds:Reference elements containing digests of the original message parts for which NRR is required. Message parts MUST NOT be identified using ebbp:MessagePartIdentifier elements.</u> <u>MUST sign the AS4 receipt Signal Message.</u> <p><u>When signed receipts are requested in AS4 that make use of default conventions, the Sending message handler (i.e. the MSH sending messages for which signed receipts are expected) MUST identify message parts (referenced in eb:PartInfo elements in the received User Message) and MUST sign the SOAP body and all attachments using the http://docs.oasis-open.org/wss/oasis-wss-SwAProfile-1.1#Attachment-Content-Signature-Transform . The Receiving message handler (i.e. the MSH generating receipt signal) can reuse the ds:Reference elements from the SignedInfo reference list in the received message.</u></p> <p><u>Note that the Sending message handler MUST NOT encrypt any signed content before signing (Section 7.6 in ebMS V3). If using compression in an attachment, the Sending message handler MUST sign the data after compression (see section 3.1). Variations from default conventions can be agreed to bilaterally, but conforming implementations are only required to provide receipts using the default conventions described in this section.</u></p>
<p><u>Profiling Rule (c)</u></p>	<p><u>An AS4 message that has been digitally signed MUST be acknowledged with a message containing an eb:Receipt signal that itself is digitally signed. The eb:Receipt MUST contain the information necessary to provide non-repudiation of receipt of the original message, as described in profiling rule (b).</u></p> <p><u>NOTE: the digest(s) to be inserted in the ebbp:MessagePartNRInformation element(s) or the Receipt, related to the original message parts for which a receipt is required, may be obtained from the signature information of the original message (ds:SignedInfo element), as only those parts that have been signed are subject to NRR. This means a Receiving message handler may not have to compute digests outside its security module.</u></p>

<p><u>Test References</u></p>	
<p><u>Specification Feature</u></p>	<p><u>eb:Receipt signal messages</u></p>
<p><u>Specification Reference</u></p>	<p><u>ebMS v3.0, Section 7.12..2 (Persistent Signed Receipt)</u> <u>ebMS v3.0, Section 5.2.3.3, eb:Messaging/eb:SignalMessage/eb:Receipt-</u></p>

762

Profiling Rule (a):- Receipts for reception- awareness	When a Receipt is to be used solely as a reception indicator (for reception-awareness), the sender of the Receipt MAY decide to not insert the <code>ebbbsig:NonRepudiationInformation</code> child element. No other element than <code>ebbbsig:NonRepudiationInformation</code> is allowed as child of <code>eb:Receipt</code> . If this element is not used, then <code>eb:Receipt</code> MUST be empty.
Profiling Rule (b):- Receipts for Non- Repudiation of Receipt (NRR)	<p>Non-Repudiation of Receipt (NRR) requires <code>eb:Receipt</code> signals to be signed, and to contain digests of the original message parts for which NRR is required.</p> <p>When signed receipts as requested in AS4 that make use of default conventions, the Sending message handler (i.e. sending messages for which signed receipts are expected) MUST identify message parts using Content-Id values in the MIME headers, and MUST sign the SOAP body and all attachments using the http://docs.oasis-open.org/wss/oasis-wss-SwAProfile-1.1#Attachment-Content-Signature-Transform within the SignedInfo-References list.</p> <p>As a reminder, the Sending message handler MUST not encrypt any signed content before signing (Section 7.6 in ebMS V3). If using compression in an attachment, the Sending message handler MUST sign the data after compression (see section 3.1). Variations from default conventions can be agreed to bilaterally, but conforming implementations are only required to provide receipts using the default conventions described in this section.</p>
Profiling Rule (c)	<p>An AS4 message that has been digitally signed MUST be acknowledged with a message containing an <code>eb:Receipt</code> signal that itself is digitally signed. The <code>eb:Receipt</code> MUST contain the information necessary to provide nonrepudiation of receipt of the original message, as described in profiling rule (b).</p> <p>NOTE: the digest(s) to be inserted in the <code>ebbp:MessagePartNRInformation</code> element(s) or the Receipt, related to the original message parts for which a receipt is required, may be obtained from the signature information of the original message (<code>ds:SignedInfo</code> element), as only those parts that have been signed are subject to NRR. This means a Receiving message handler may not have to compute digests outside its security module.</p>

769 AS4 Usage Agreements

770 This section defines the operational aspect of the profile configuration aspects that users have to agree
 771 on, mode of operation, etc to interoperate. This section is not normative and is provided here only as
 772 guidance for users.

773 All the user agreement options related to a specific type of message exchange instance (e.g. related to a
 774 specific type of business transaction) are controlled by the Processing Mode (P-Mode) parameters
 775 defined in the ebMS Core V3 specification. This section only lists the parameters that are particularly
 776 relevant to AS4~~This section defines the operational aspect of the profile: configuration aspects that users-~~

813 9 Conformance Clauses

814 This chapter defines five AS4 conformance clauses.

815 9.1 AS4 ebHandler Conformance Clause

816 In order to conform to the AS4 ebHandler Profile, an implementation must comply with all normative
817 statements and requirements in Section 2.1.

818 In particular, it must:

- 819 ● ~~Q~~—observe all requirements stated as such in the Feature Set table of Section 2.1.1.
- 820 ● ~~C~~—comply with WS-I requirements listed in Section 2.1.2.
- 821 ● Support the P—~~support the P~~Mode parameters as required in Section 2.1.3.

822 In addition, the implementation must implement the additional features as indicated in Section 3.

823 Finally, the implementation must support the Usage Rules defined in Section ~~4.1~~.

824 The Usage Agreements in Section are not prescriptive, and implementations are free to support any
825 subset of the features described, that are not already mandated in sections 2.1, 3 or 4.2 are not
826 prescriptive, and implementations are free to support any subset of the features described, that are not
827 already mandated in sections 2.1, 3 or 4.1.

829 AS4 Light Client Conformance Clause

830 In order to conform to the AS4 Light Client Profile, an implementation must comply with all normative
831 statements and requirements in Section 2.2.

832 In particular, it must:

- 833 ● ~~Q~~—observe all requirements stated as such in the Feature Set table of Section 2.2.1.
- 834 ● ~~C~~—comply with WS-I requirements listed in Section 2.2.2.
- 835 ● Support the P—~~support the P~~Mode parameters as required in Section 2.2.3.

836 In addition, the implementation must implement the additional features as indicated in Section 3.

837 Finally, the implementation must support the Usage Rules defined in Section ~~4.1~~.

838 The Usage Agreements in Section are not prescriptive, and implementations are free to support any
839 subset of the features described that are not already mandated in sections 2.2, 3 or 4.2 are not
840 prescriptive, and implementations are free to support any subset of the features described, that are not
841 already mandated in sections 2.2, 3 or 4.1.

842 9.2 AS4 Minimal Client Conformance Clause

843 In order to conform to the AS4 Minimal Client Profile, an implementation MUST comply with all normative
844 statements and requirements for the AS4 Light Client Conformance Clause stated in Section , with the
845 exception that support for WS-Security is limited to support for the WS-Security UsernameToken profile
846 [WSS11-UT], to be used for authorization of message pull signals (see section 7.10 in Core Spec).
847 Support for the WS-Security X.509 Certificate Token Profile 1.1 [WSS11-X509] is not REQUIRED. Clients
848 and servers SHOULD use transport level security for message security for any message exchange.

849 | **9.3 AS2/AS4 ebHandler Conformance Clause**

850 | In order to conform to the AS2/AS4 ebHandler Profile, an implementation MUST, in addition to supporting
851 | AS4 message exchanges that comply with all normative statements and requirements specified in section
852 | 9.1 , also conform to the EDIINT Applicability Statement 2 (AS2, [RFC4130]).

853 | **9.4 AS4 Multi-Hop Endpoint Conformance Clause**

854 | In AS4, support for the multi-hop feature of ebMS 3.0 Part 2 is optional. In order to conform to the AS4
855 | Multi-Hop Endpoint Conformance Clause, an implementation MUST conform to:

- 856 | ● All normative statements and requirements specified in section 5 .
- 857 | ● At least one of the other conformance clauses (AS4 ebHandler Conformance Clause, AS4 Light
858 | Client Conformance Clause, AS4 Minimal Client Conformance Clause, or the AS2/AS4 ebHandler
859 | Conformance Clause).

860 |

Appendix A Sample Messages

This appendix contains examples of:

- an AS4 user message;
- AS4 receipts providing Non-Repudiation of Receipt (NRR);
- an AS4 Pull message signal.

Appendix A.1 User Message

The following example contains the SOAP envelope of an AS4 message from a Seller to a Buyer to exchange an electronic invoice document. Both parties are identified using the GS1 global location numbers [GLN] encoded using the ebCore Party Id type notation [ebCorePartyId]. The XML business document is an XML document (only the root element is displayed) based on the version 2.0 UN/CEFACT Cross-Industry Invoice schema [CII], which is contained in the SOAP body. The values of eb:Service and eb:Action adopt the AS4 default values. The message is secured using a WS-Security header, details of which are omitted. In AS4, a SOAP envelope is included in a SOAP-with-attachment container, which is also not shown here.

919 | Receipts Samples

920 |

921 |

922 | **Appendix A.2 Non-Repudiation of Receipt**

923 | When the NonRepudiationInformation element is used in a Receipt, it contains a sequence of
924 | MessagePartNRInformation items for each message part for which evidence of non repudiation of receipt
925 | is being provided. In the normal default usage, these message parts are those that have been signed in
926 | the original message. Each message part is described with information defined by an XML Digital
927 | Signature Reference information item. The following example illustrates the ebMS V3 Signal Message
928 | header.

929 |

```
930 | <eb3:Messaging xmlns:wsu="http://docs.oasis-

1093 **Appendix A.3 Pull Request Signal Message**

1094 The following example shows an AS4 Pull Request Signal on a particular message partition channel. The
1095 message contains two WS-Security headers:

- 1096 1. The first WS-Security header is targeted to the "ebms" role, and is used for authorization of
1097 access to the pull channel. This header is added to the message before the second WS-Security
1098 header.
- 1099 2. A second WS-Security header is used to protect the signal message itself. This header is added
1100 to the message after the authorization header, and signs this authorization header, the ebMS
1101 Messaging header and the (empty) SOAP Body element.

```

1102

1184

Appendix B Generating an AS4 Receipt

1185

1186

1187

1188

1189

1190

1191

The following XSLT 1.0 stylesheet generates an AS4 Receipt message from an AS4 message, as specified in section 5.4 . The stylesheet supports processing signed messages for which the **Pmode[1].Security.SendReceipt.NonRepudiation** is set to true. It could be used in an AS4 MSH after a WS-Security module has verified the `wsse:Security` header in the user message, allowing the reuse of `ds:Reference` elements in the user message in the AS4 Receipt. Note that this section is non-normative: AS4 implementations are not required to use this (or any other) XSLT stylesheet to generate receipts for user messages.

1192

1193

1194

The stylesheet handles both the peer-to-peer, direct exchange (based on AS4 profiling of [ebMS3CORE]) and indirect exchange through an I-Cloud (based on AS4 profiling of [ebMS3ADV]). The generation of `ebint:RoutingInput` structures supports default MPC values in the user messages.

Revision History

1325

Rev	Date	By Whom	What
	25 Jul 2008	J. Durand / T. Bennett	Initial draft
Rev 02	28 Oct 2008	J. Durand	candidate CD draft
Rev 03	15 Feb 2009	J. Durand	Various edits, updates on Receipts, Message samples.
CD 2	10/03/09	J. Durand	CD 2 draft for PR
CS 01	04/24/10	J. Durand	Document voted Committee Specification 01
Rev 06	02/22/11	J. Durand / P. van der Eijk	CSD 3 draft for PR: Many minor editorial updates and clarifications; updated references; new sections 2.2.3 and A.2.
CSD 03	02/23/11	P. van der Eijk	Document approved as CSD_03 on 2011-02-23 http://www.oasis-open.org/apps/org/workgroup/ebxml-msg/download.php/41302/MessagingTC022311.htm
WD 8	03/28/11	J. Durand / T. Kramer	Follow-up on Theo comments; normalized PMode name as "P-Mode", when in plain text. 2.1.3.1 and 2.2.3.1: made support "required" for PMode.ID and PMode.agreement (meaning an implementation must be able to use this Pmode value - if present - to fill-in the related message header element.)
WD 9	04/04/11	P. van der Eijk	Updated revision history and frontpage; suppressed line numbering in footers. Renamed some references to ebMS3 to "ebMS3 Core".

Rev	Date	By Whom	What
			<p><u>New optional profiling of the ebMS3, Part 2 multi-hop feature;</u></p> <p><u>New sample user message in appendix A.</u></p> <p><u>New Appendix B, Generating an AS4 Receipt .</u></p> <p><u>In Acknowledgments, names are ordered alphabetically by last name.</u></p>
<u>WD 10</u>	<u>04/11/11</u>	<u>P. van der Eijk</u>	<p><u>Improved language in section 4 (comment made by Theo), A.1 and B.</u></p> <p><u>In sample user message, added an id attribute to eb:Messaging (as it would need one to be signed).</u></p> <p><u>Appendix A.3, fixed a hash value. (The values are illustrative only but should be different).</u></p>
<u>WD 11</u>	<u>04/12/11</u>	<u>P. van der Eijk</u>	<u>Improved sample message (added missing S12:mustUnderstand attribute). Removed requirement to pass receipts to applications.</u>
<u>WD 12</u>	<u>04/20/11</u>	<u>P. van der Eijk</u>	<p><u>Fixed bad reference in 9.4</u></p> <p><u>Fixed two affiliations</u></p>
<u>WD 13 / WD 14</u>	<u>04/22/11</u>	<u>P. van der Eijk</u>	<u>Fixed citations and front matter.</u>
<u>WD 15</u>	<u>05/09/11</u>	<u>P. van der Eijk</u>	<p><u>Update for message format of receipts for unsigned messages, supporting “reception awareness”.</u></p> <p><u>Section added clarification that reception awareness requires sending of receipts.</u></p>
<u>WD 16</u>	<u>05/16/11</u>	<u>P. van der Eijk / Jacques Durand</u>	<p><u>Discussion of receipts for messages without PayloadInfo.</u></p> <p><u>Fixed some section reference numbers and missing references. Many minor textual improvements.</u></p> <p><u>Part 2 profiling as “complementary” to a “primary” profiling of Part 1.</u></p>
<u>WD 17</u>	<u>05/18/11</u>	<u>P. van der Eijk</u>	<p><u>Simplified Encryption, ebMS header is never encrypted (section)</u></p> <p><u>Added note on “id” attribute in section .</u></p>
