Abstract:

Common Transactive Services (CTS) permits energy consumers and producers to interact through energy markets by simplifying actor interaction with any market. CTS is a streamlined and simplified profile of the OASIS Energy Interoperation (EI) specification, which describes an information and communication model to coordinate the exchange of energy between any two Parties that consume or supply energy, such as energy suppliers and customers, markets and service providers.

Status

This document was last revised or approved by the OASIS Energy Interoperation TC on the above date. The level of approval is also listed above. Check the "Latest stage" location noted above for possible later revisions of this document. Any other numbered Versions and other technical work produced by the Technical Committee (TC) are listed at https://www.oasis-open.org/committees/tc_home.php?wg_abbrev=energyinterop#technical.

TC members should send comments on this document to the TC's email list. Others should send comments to the TC's public comment list, after subscribing to it by following the instructions at the "Send A Comment" button on the TC's web page at <https://www.oasis-open.org/committees/energyinterop/>.

This document is provided under the [RF on Limited Terms](#) Mode of the [OASIS IPR Policy](#), the mode chosen when the Technical Committee was established. For information on whether any patents have been disclosed that may be essential to implementing this document, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the TC's web page (<https://www.oasis-open.org/committees/energyinterop/ipr.php>).

Note that any machine-readable content ([Computer Language Definitions](#)) declared Normative for this Work Product is provided in separate plain text files. In the event of a discrepancy between any such plain text file and display content in the Work Product's prose narrative document(s), the content in the separate plain text file prevails.

Key words:

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [[RFC2119](#)] and [[RFC8174](#)] when, and only when, they appear in all capitals, as shown here.

1 Introduction

The Common Transactive Services (CTS) is an application profile of the OASIS Energy Interoperation 1.0 ([EI]) specification, with most optionality and complexity stripped away. CTS defines the messages for transactive energy, leaving communication details unspecified. Transactive energy names the collaboration techniques to balance energy supply and energy demand at every moment even as power generation becomes decentralized and as the ownership of energy assets becomes more diverse.

The purpose of CTS is to enable broad semantic interoperation between systems in transactive energy-based markets, or in any markets whose products are commodities distinguished chiefly by time of delivery. These time-volatile commodities are termed resources, and the interactions defined in CTS are common to any market used to manage resources over time.

To encourage broad adoption, CTS uses terms from financial markets in preference to the relatively obscure terms used in specialized energy markets. Among these is the use of the term instrument for a tradable asset, or a negotiable item. In CTS, the term instrument encompasses a quantity of a Resource delivered at a particular time for a particular duration. A transaction is created when a buyer and seller agree on the price for an instrument.

Transactive resource markets coordinate Resource supply and Resource use through markets that trade instruments. The initial research into transactive resource markets used a market to allocate heat from a single furnace within a commercial building. Transactive resource markets balance supply and demand over time using automated voluntary transactions between market participants.

Examples of transactable resources include, but are not limited to, electrical energy, electrical power, natural gas, and thermal energy such as steam, hot water, or chilled water. The capability to transmit such time-dependent resources is also a transactable resource, as instruments can be defined for transmission rights as well as for the services that maintain grid frequency or voltage.

When we apply transactive resource markets to the distribution of power or energy, we refer to it as transactive energy. A significant driver of transactive energy is the desire to smooth supply and demand variability, or alternatively, to match demand to variable supply. We anticipate this variability to increase as additional variable and distributed generation sources are connected to the power grid. The reader can find an extended discussion of Transactive Energy (TE) in the EI specification [EI]

A goal of CTS is to enable systems and devices developed today or in the future to address the challenges of increasing distributed energy resources. CTS enables distributed actors to participate in markets deployed today or in the future. The reader can find an extended discussion of Transactive Energy (TE) in the [EI] specification.

CTS defines interactions between actors in energy markets. We do not identify whether an Actor is a single integrated system, or a distributed collection of systems and devices working together. See Section 1.5 for a discussion of the term Actor in this specification. Autonomous market actors must be able to recognize patterns and make choices to best support their own needs.

CTS messages are simple and strongly-typed, and make no assumptions about the systems or technologies behind the actors. Rather, CTS defines a technology-agnostic minimal set of messages to enable interoperation through markets of participants irrespective of internal technology. In a similar manner, CTS does not specify the internal organization of a market, but rather a common set of messages that can be used to communicate with any transactive energy market.

The Common Transactive Services, strictly speaking, are a definition of the payloads and exchange patterns necessary for a full-service environment for interaction with markets. In other words, CTS describes the message payloads to be exchanged, defining the semantic content and ordering of messages. Any message exchange mechanism may be used, including but not limited to message queues and Service-Oriented mechanisms.

In a Service-Oriented Architecture [SOA] environment, the semantic payloads are those sent and returned by the *services* described. CTS enables any SOA or other framework to exchange equivalent

49 semantic information without presuming the specific messaging system(s) or architecture used, thus
50 allowing straightforward semantic interoperation.¹ See Section 2.2.

51 1.1 Application of the Common Transactive Services

52 The purpose of this specification is to codify the common interactions and messages required for energy
53 markets. Any system able to use CTS should be able to interoperate with any CTS-conforming market
54 with minimal or no change to system logic. The full protocol stack and cybersecurity requirements for
55 message exchange between systems using CTS are out of scope.

56 Systems that can be represented by CTS actors include but are not limited to

- 57 • Smart Buildings/Homes/Industrial Facilities
- 58 • Building systems/devices
- 59 • Business Enterprises
- 60 • Electric Vehicles
- 61 • Microgrids
- 62 • Collections of IoT (Internet of Things) devices

63 TE demonstrations and deployments have seldom been interoperable—each uses its own message
64 model and its own market dynamics. Many early implementations required transmitting information far
65 beyond that needed for transactions to remote or cloud-based decision aggregators termed markets.
66 Such markets discount local decision making while introducing new barriers to resilience such as network
67 failure. Others rely on a single price-setting supplier. Systems built to participate in these demonstrations
68 and deployments have been unable to interoperate with other implementations. The intent of this
69 specification is to enable systems and markets developed for future deployments to interoperate even as
70 the software continues to evolve.

71 CTS does not presume a Market with a single seller (e.g., a utility). CTS recognizes two parties to a
72 transaction, and the role of any Party can switch from buyer to seller from one transaction to the next.
73 Each Resource Offer (Tender) has a Side attribute (Buy or Sell). when each transaction is committed
74 (once the product has been purchased) it is owned by the purchaser, and it can be re-sold as desired or
75 needed.

76 A CTS-operated micromarket may balance power over time in a traditional distribution system attached to
77 a larger power grid or it may bind to and operate a stand-alone autonomous microgrid
78 **[SmartGridBusiness]**.

79 1.2 Support for Developers

80 Specific coding, message, and protocol recommendations are beyond the scope of this specification
81 which specifies information content and interactions between systems. The Common Transactive
82 Services payloads are using the Universal Modelling Language **[UML]** and defined in XML schemas
83 **[XSD]**. Many software development tools can accept artifacts in UML or in XSD to enforce proper
84 message formation. To further support message interoperability, two additional common serializations are
85 defined:

86 This specification provides **[JSON]** schemas compatible with JSON Abstract Data Notation **[JADN]**
87 format.

88 The FIX Simple Binary Encoding **[SBE]** specification is used in financial markets. SBE is designed to
89 encode and decode messages using fewer CPU instructions than standard encodings and without forcing
90 memory management delays. SBE-based messaging is used when very high rates of message
91 throughput are required. This specification will deliver schemas for generating SBE messages based on
92 the common message content.

¹ SOA is occasionally mis-described as a *client-server* approach. In distinction, services are requested by an Actor, and fulfilled by another Actor. In SOA the services offered are key, and the actors take different roles in different interactions.

93 1.3 Naming Conventions

94 This specification follows some naming conventions for artifacts defined by the specification, as follows:

95 For the names of elements and the names of attributes within XSD files and UML models, the names
96 follow the lowerCamelCase convention, with all names starting with a lower-case letter. For example,

```
97 <element name="componentType" type="ei:ComponentType"/>
```

98 For the names of types within XSD files, the names follow the UpperCamelCase convention with all
99 names starting with an upper-case letter prefixed by "type-". For example,

```
100 <complexType name="ComponentServiceType">
```

101 For clarity in UML models the suffix "type" is not always used.

102 For the names of intents and for attributes in the UML models, names follow the lowerCamelCase
103 convention, with all names starting with a lower-case letter, EXCEPT for cases where the intent
104 represents an established acronym, in which case the entire name is in upper case.

105 JSON and where possible SBE names follow the same conventions.

106 1.4 Editing Conventions

107 For readability, element names in tables appear as separate words. The actual names are
108 lowerCamelCase, as specified above, and as they appear in the UML models, and in the XML and JSON
109 schemas.

110 All elements in the tables not marked as "optional" are mandatory.

111 Information in the **Meaning** column of the tables is normative. Information appearing in the **Notes** column
112 is explanatory and non-normative.²

113 Examples and Appendices are non-normative. In particular, architectural and functional examples are
114 presented only to support narrative description. The specific processes, structures, and algorithms are out
115 of scope.

116 1.5 Use of terms Actors and Facets in this specification

117 This specification defines message content and interaction patterns.

118 The EI 1.0 specification in 2011, presumed web services for interactions. That specification described a
119 Service-Oriented Architecture (SOA) approach. Service orientation complements loose integration and
120 organizes distributed capabilities that may be in different ownership domains by focusing solely on
121 requested results rather than on mechanisms. [EI] uses the language of web services to describe all
122 interactions.

123 There is a growing use of the descriptive term "cloud-native computing" for extending the architecture and
124 technologies developed for use in clouds not only in data centers but to edge computing, where IoT
125 devices reside. A discussion of the rapidly-evolving topics of cloud-native computing and edge computing
126 is beyond the scope of this specification.

127 At the time of this specification, typical architectures decompose applications into smaller, independent
128 building blocks that are easier to develop, deploy and maintain. A single market participant in energy may
129 be embodied as several of these independent blocks (actors). Message queues provide loosely-coupled
130 communication and coordination within and among these distributed applications. Message queues
131 enable asynchronous communication, i.e., the endpoints that are producing and consuming messages
132 interact with the queue, not each other. Publishers can add requests to the queue without waiting for their
133 processing. Subscribers process messages only when they are available.

134 In the Internet of Things (IoT), the term Actor is preferred as the "actor model" makes no assumptions of
135 the mechanisms or even motives internal to an Actor. An Actor is simply a thing that acts. The Actor

² In ISO and IEC standards, portions that are not normative are *informative*. OASIS uses the term *non-normative*.

136 implementation may be by a traditional computer, a cloud node, a human behind a user interface, or any
137 device in the Internet of things.

138 In transactive energy, we see the diversity supported by the term Actor in the IoT. An energy seller may
139 be a generator or a solar panel or a virtual power plant or a demand responsive facility or a financial
140 entity. An energy buyer may be a home or commercial facility or an embedded device or a microgrid or an
141 energy district. A Marketplace acts to match Tenders, but may also participate to buy or sell power for
142 itself. An energy storage system may act as a buyer or as a seller at any time.

143 Architectures MAY decompose applications into smaller independent Actors. We use the term “Facet” to
144 name a coherent set of interactions that such an Actor may use to communicate with other Actors. An
145 Actor submits tenders to buy or to sell. An Actor may operate a Market. If the architecture requires
146 telemetry for Resource flow (metering), one of many facets supported by a Resource-consuming Actor
147 MAY provide it, or separate Actor MAY present only the telemetry, logically and physically separated from
148 the Resource-consuming Actor. This specification makes no requirement as to how to distribute these
149 facets.

150 While this specification discusses messages between Actors, it establishes no requirement or expectation
151 of specific implementation. While this specification uses the language of Actor and Facet, there is no
152 architectural expectation linked to this language. One could apply the terms Actor and Facet throughout
153 the [EI] specification. A traditional [EI] application consisting of a several unitary systems each presenting
154 all facets as web services described by WSDL can be conformant so long as it uses a compatible set of
155 information payloads.

156 A discussion of the rapidly-evolving topic of cloud-native computing is beyond the scope of this
157 specification. This specification does not require that implementations conform to any specific
158 implementation of cloud-native computing. Cloud-native and edge computing have informed the
159 language of this specification, just as web services and SOA informed [EI].

160 1.6 Security and Privacy

161 Service requests and responses are generally considered public actions of each interoperating system,
162 with limitations to address privacy and security considerations (see Appendix B). Service actions are
163 independent from private actions behind the interface (i.e., device control actions). A Facet is used
164 without needing to know all the details of its implementation. Consumers of services generally pay for
165 results, not for effort.

166 1.6.1 Security Considerations

167 Size of transactions, costs of failure to perform, confidentiality agreements, information stewardship, and
168 even changing regulatory requirements can require that similar transactions be expressed within quite
169 different security contexts. Loose integration using the service-oriented architecture (SOA) style assumes
170 careful definition of security requirements between partners. It is a feature of the SOA approach that
171 security is composed in to meet the specific and evolving needs of different markets and transactions.
172 Security implementation is free to evolve over time and to support different needs. The Common
173 Transactive Services allow for this composition, without prescribing any particular security
174 implementation.

175 The best practice in cloud-native computing is to use Zero-Trust security [**ZeroTrust**]. Zero Trust security
176 requires authentication and authorization of every device, person, and application. The best practice is to
177 encrypt all messages, even those between the separate components of an application within the cloud.

178 This specification makes no attempt to describe methods or technologies to enable Zero Trust
179 interactions between Actors.

180 1.6.2 Privacy Considerations

181 Detailed knowledge of offers to buy or sell or knowledge of energy inputs and outputs for an Actor may
182 reveal information on actions and operations. For example, transactions or tenders may indicate whether
183 a production line is starting or stopping, or anticipated energy needs, or who has been buying or selling

184 power. Making such information public may be damaging to actors. Similarly, an adverse party may be
185 able to determine the likelihood that a dwelling is presently occupied.

186 The essence of any transaction is the agreement of a Party to sell, and a Party to buy. The identity of the
187 buyer and the identity of the seller are each part of the transaction. Some transaction notifications may
188 hide the identity of the buyer from the seller. Some transaction notifications may hide the identity of the
189 seller from the buyer. Some transactions, such as double auction, may be between the market
190 participants as a whole, and not with any particular counterparty. Where this is required, the Market itself
191 may be designated as the counterparty in a notification.

192 Both security and privacy considerations are addressed in Appendix B.

193 **1.7 Semantic Composition**

194 The semantics and interactions of CTS are selected from and derived from [EI].

195 EI references two other standards, [EMIX] and [WS-Calendar], and uses an earlier Streams definition. We
196 adapt, update, and simplify the use of the referenced standards, while maintaining conformance.

- 197 • EMIX describes price and product for electricity markets.
- 198 • WS-Calendar communicates schedules and sequences of operations. CTS uses the
199 [Streams] optimization which is a standalone specification, rather than part of EI 1.0.
- 200 • EI uses the vocabulary and information models defined by those specifications to describe
201 the services that it provides. The payload for each EI service references a product defined
202 using **[EMIX]**. EMIX schedules and sequences are defined using [WS-Calendar]. Any
203 additional schedule-related information required by [EI] is expressed using [WS-Calendar].
- 204 • Since [EI] was published, a semantically equivalent but simpler [Streams] specification was
205 developed in the OASIS WS-Calendar Technical Committee. CTS uses that simpler
206 [Streams] specification.

207 All terms used in this specification are as defined in their respective specifications.

208 In [EI], the fundamental resource definition was the [EMIX] Item, composed of: a resource name, a unit of
209 measure, a scale factor, and a quantity. For example, a specific EMIX item may define a Market
210 denominated in 25 MW-hour bids. [EI] defined how to buy and sell items during specific intervals defined
211 by a duration and a start time. The Quotes, Tenders, and Transactions that are the subject of [EI] added
212 specific prices and quantities to the item and interval. EMIX optionally included a location, i.e., a point of
213 delivery for each [EI] service.

214 In CTS, we group and name these elements as a Resource, Product, and Instrument. These terms are
215 defined in Section 2.1.3, “Resources, Products, and Instruments”

216 Note that the informational elements in a fully defined tender or transaction are identical to those
217 described in EMIX. The conceptual regrouping enables common behaviors including Market discovery
218 and interoperation between Actors built on different code bases.

219 **1.7.1 Conformance with Energy Interoperation**

220 EI defines an end-to-end interaction model for transactive services and for demand response. CTS uses
221 the EI transactive services, and draws definitions of parties and transactive interactions primarily from the
222 [EI] TEMIX profile.

223 This specification can be viewed as a minimal transactive profile of [EI]

224 **1.7.2 Conformance with EMIX**

225 This specification uses a simplified profile of the models and artifacts defined in OASIS Energy Market
226 Information Exchange **[EMIX]** to communicate Product definitions, quantities, and prices. EMIX provides
227 a succinct way to indicate how prices, quantities, or both vary over time.

228 The EMIX Product definition is the Transactive Resource in CTS 1.0.

229 EMIX also defines Market Context, a URI used as the identifier of the Market. EMIX further defines
230 Standard Terms as retrievable information about the Marketplace that an actor can use to configure itself

231 for interoperation with a given Marketplace. We extend and clarify those terms, provide an extension
232 mechanism, and discuss the relationship of markets, Marketplaces, and products.

233 1.7.3 Conformance with WS-Calendar Streams

234 WS-Calendar expresses events and sequences to support machine-to-machine (M2M) negotiation of
235 schedules while being semantically compatible with human schedules as standardized in [iCalendar].
236 Schemas in [WS-Calendar] support messages that are nearly identical to those used in human
237 schedules. We use a conformant but simpler and more abstract Platform Independent Model [CAL-PIM]
238 and the [Streams] compact expression³, to support telemetry (Delivery Facet) and series of Tenders
239 while not extending the semantics of [Streams].⁴

240 By design and intent, the [WS-Calendar] schemas provide the capability of mapping between human and
241 M2M schedules.

242 WS-Calendar conveys domain specific information in a per-event payload. An essential concept of WS-
243 Calendar is inheritance, by which a starting time can be applied to an existing message, or by which all
244 events in a sequence share common information such as duration. Inheritance is used to “complete” a
245 partial message during negotiation. CTS makes use of this to apply a common market Product across a
246 sequence, or to convey a specific starting time to a market Product.

247 CTS messages conform to [Streams] format. See also Section 3.1.

248 1.7.4 Compatibility with Facilities Smart Grid Information Model

249 The Facilities Smart Grid Information Model [FSGIM] was developed to define the power capabilities and
250 requirements of building systems over time. FSGIM addresses the so-called *built environment* and uses
251 the semantics of WS-Calendar and EMIX to construct its information models for power or other Resource
252 use over time. These sequences of [power] requirements are referred to as load curves. Load curves can
253 potentially be relocated in time, perhaps delaying or accelerating the start time to get a more
254 advantageous price for [power].

255 Because FSGIM load curves use the information models of EMIX and WS-Calendar, conforming load
256 curves submitted by a facility could be the basis upon which a TE Agent would base its market decisions.

257 The Architecture of CTS is premised on distinct physical systems being able to interoperate by
258 coordinating their production and consumption of energy irrespective of their ownership, motivations, or
259 internal mechanisms. This specification defines messages and interactions of that interoperation.

260 FSGIM load requests can be expressed using CTS tenders. CTS 1.0 uses single-interval [Streams] to
261 express single-interval tenders in anticipation of possible future use of Streams in FSGIM-conformant
262 communications.

³ Simplified as CTS Streams in this specification.

⁴ Some specifications (e.g. [FSGIM]) have extended the basic [Streams] capabilities, but this brings additional complexity which does not benefit our use cases.

263

2 Overview of Common Transactive Services

264

2.1 Scope of Common Transactive Services

265
266
267

CTS provides for the exchange of resources among parties which represent any provider or consumer of energy (e.g., a distributed energy resource). CTS makes no assumptions as to their internal processes or technology.

268
269

This specification supports agreements and transactional obligations, while offering flexibility of implementation to support specific approaches and goals of the various participants.

270
271
272

No particular agreements are endorsed, proposed or required in order to implement this specification. Energy market operations are beyond the scope of this specification although interactions that enable management of the actual delivery and acceptance are within scope but not included in CTS 1.0.

273
274

As shown in [CTS2016] the Common Transactive Services with suitable Product definitions can be used to communicate with essentially any market.

275

2.1.1 Applicability to Microgrids (Informative)

276
277
278
279

As an extended example, using the Common Transactive Services terminology, a microgrid is comprised of interacting nodes each represented by an actor (interacting as CTS parties). Those actors interact in a micromarket co-extensive in scope with the microgrid. No actor reveals any internal mechanisms, but only its interest in buying and selling power.

280
281
282

An actor can represent a microgrid within a larger micromarket; the actor would in effect aggregate the resources in the microgrid. As above, such an actor would not reveal any internal mechanisms, but only its interest in buying and selling power. There is no explicit bound on repeating this interoperation pattern.

283
284
285
286
287

An actor representing a microgrid may interoperate with markets in a regional grid, which may or may not be using CTS. The regional grid may use transactive energy expressed in non-CTS messages, or infrastructure capacity may limit delivery to the microgrid. In either case, the An actor representing a microgrid must translate and enforce constraints and share information with the other nodes in the microgrid solely by means of CTS. Any translations or calculations performed are out of scope.

288
289
290

See informative references [**StructuredEnergy**] and [**SmartGridBusiness**] for a discussion. [**Fractal Microgrids**] is an early reference that describes hierarchies of microgrids. [**Transactive Microgrids**] describes transactive energy in microgrids.

291

2.1.2 Specific scope statements

292
293

Interaction patterns and facet definitions to support the following are in scope for Common Transactive Services:

294
295

- Interaction patterns to support transactive energy, including tenders, transactions, and supporting information

296

- Information models for price and Product communication

297

- Information models for Marketplace and Market characteristics

298

- Payload definitions for Common Transactive Services

299

The following are out of scope for Common Transactive Services:

300
301

- Requirements specifying the type of agreement, contract, Product definition, or tariff used by a particular market.

302

- Computations or agreements that describe how power is sold into or sold out of a Marketplace.

303

- Communication protocols, although semantic interaction patterns are in scope.

304

This specification describes standard messages, the set of which may be extended.

305 **2.1.3 Resources, Products, and Instruments**

306 Systems use the common transactive services to operate transactive resource markets. A transactive
 307 resource market balances the supply of a resource over time and the demand for that resource by using a
 308 market specifying the time of delivery.

309 In [EI], the fundamental resource definition was the [EMIX] Item, composed of: a resource name, a unit of
 310 measure, a scale factor, and a quantity. For example, a specific EMIX item may define a Market
 311 denominated in 25 MW-hour bids. [EI] defined how to buy and sell items during specific intervals defined
 312 by a duration and a start time. The Quotes, Tenders, and Transactions that are the subject of [EI] added
 313 specific prices and quantities to the item and interval. EMIX optionally included a location, i.e., a point of
 314 delivery for each [EI] service.

315 In CTS, we group and name these elements as a Resource, Product, and Instrument. A Resource is the
 316 name and the unit of measure, as in the EMIX Item. A Product, i.e., what can be bought and sold in a
 317 Market, in addition specifies “how much” and “for how long” as well as optional elements such as location
 318 and Warrants. The term Instrument, as in financial markets, adds a specific start time to a Product.

319 We define a Resource as any commodity whose value is determined by a fine-grained time of delivery.
 320 Transactable resources include, but are not limited to, energy, heat, natural gas, water, and transport as a
 321 support service for these. The ancillary services reactive power, voltage control, and frequency control
 322 are also transactable.

323 A Product names a transactive Resource that has been “chunked” for Market. These chunks define the
 324 Market’s granularity in quantity and in time. For example, the Product may be 1 MW of power delivered
 325 over an hour. Similarly, another Product may be 1 kW of power over a 5-minute period. Some transactive
 326 energy markets in North America today have durations as brief as two seconds. Temporal granularity is
 327 equally important as quantity for Product definition.

328 An Instrument is a Product at a specific time, following common usage in financial markets where an
 329 instrument names the thing that is bought or sold. For example, the 1 MW of Power delivered over an
 330 hour beginning at 3:00 PM is a different Instrument than the same Product delivered starting at 11:00 PM.

331 A Market considers all the tenders it has received offering to buy or sell an Instrument, using a Matching
 332 Engine to decide which can be cleared (*satisfied*) in full or in part. The 3:00pm Instrument is traded
 333 independently from the 4:00pm Instrument. This specification does not assume or require an Order Book,
 334 a Double Auction, or any other mechanism in the Matching Engine.

335 The Resource definition is extensible using standard UML techniques (subclassing); however CTS 1.0
 336 uses only this base definition.

337 These terms are summarized in Table 2-1: .

338 *Table 2-1: Definitions of CTS Market terms*

Transactive Entity	Definition
Resource	A measurable commodity, substance, service, or force, whose value is determined by time of delivery.
Product	A Resource defined by size/granularity of the Resource and by the granularity of time. A Market is defined by its Product. Example 1: electric power in 10 kW units delivered over an hour of time. Example 2: electric energy in 1 kWh units delivered over a quarter hour.
Instrument	A Product instantiated by a particular begin time. Example: the Product beginning at 9:00 AM on April 3. An Instrument is Tendered to a Market with specific quantity and price.

Transactive Entity	Definition
Party	An Actor or a set of coordinating Actors that buys or sells Instruments in a CTS Marketplace. A Party may be described by a specific role in a specific interaction, such as Party or Counter Party. For semantic and privacy issues, see Section 2.2.3 below.
Market	A Facet where Parties trade a Product using tenders submitted to buy or sell an Instrument.
Marketplace	<p>A Marketplace names a set of Markets accessible to a Party. The Marketplace Facet supplies limited information common to all Markets in the Marketplace. The Facet also enumerates all Resources and Products available in the Marketplace, as well as a directory of the Markets for each Resource.</p> <p>CTS differs from EMIX in adding a distinction between Market and Marketplace, while making no assumption about how the distinction is implemented or even whether Markets and Marketplaces share common ownership. The [EMIX] Market Context, identified by a URI, is akin to the CTS Marketplace.</p>
Market Context	A URI identifying an individual Market, as defined in EMIX.
Marketplace Context	A URI identifying a Marketplace, as defined in the EMIX Market Context.
Matching Engine	There are many Market processes to exchange offers and reach agreements on transactions. Different parts of the same Marketplace MAY employ different Market processes. We term each of these processes a Matching Engine. This specification uses the term Matching Engine only to support narrative description. The specific processes, structures, and algorithms of Matching Engines are out of scope.

339 **2.2 Common Transactive Services Roles**

340 Actors interact through Facets. The specification makes no assertions about the behaviors, processes, or
341 motives within each Actor. A particular Actor may use all Facets, a subset of Facets, or even a single
342 Facet. This specification defines Facet messages and interactions.

343 **[EI]** defines contracts between Actors as services with defined messages and interactions. All **[EI]**
344 services map to CTS Facets. Nearly all Facets defined in CTS are services as defined in **[EI]**. CTS
345 defines two additional Facets for market operations not derived from the Services in **[EI]**, namely Position
346 and Delivery, as well as two facets for Market discovery, the Marketplace and Market Facets. CTS does
347 not require a conforming transactive energy market to use every Facet.

348 **2.2.1 Parties as Market Participants**

349 The Common Transactive Services (CTS) defines interactions in a Resource Market. This Resource
350 Market is a means to make collaborative decisions that allocate power or other Resource over time. We
351 follow **[EI]** and financial markets by terming market participants as Parties.

352 A Party can take one of two Sides in Transaction:

- 353 • Buy, or
- 354 • Sell

355 A Party selling an Instrument takes the Sell Side of the Transaction. A Party buying [an Instrument] takes
 356 the Buy Side of the Transaction. The offering Party is called the Party in a Transaction; the other Party is
 357 called the Counterparty

358 From the perspective of the Market, there is no distinction between a Party selling additional power and
 359 Party selling from its previously acquired position. An Actor representing a generator would generally take
 360 the Sell side of a transaction. An Actor representing a consumer generally takes the Buy side of a
 361 transaction. However, a generator may take the Buy Side of a Transaction to reduce its own generation,
 362 in response either to changes in physical or market conditions or to reflect other commitments made by
 363 the actor. A consumer may choose to sell from its current position if its plans change, or if it receives an
 364 attractive price. A power storage system actor may choose to buy or sell from Interval to Interval,
 365 consistent with its operating and financial goals.

366 A Party may represent a single actor, or the roles (see Facets, below) of a single Party may distributed
 367 across multiple Actors.

368 We do not specify how to manage delivery of the Resource.

369 **2.2.2 Facets in CTS**

370 This specification refers to coherent se of interactions, that is, closely related requests, responses, as
 371 Facets. A Facet sends and receives defined messages to interact with other Actors that expose the same
 372 Facet. An Actor in a CTS-based system of systems may expose all Facets, a single Facet, or any
 373 collection of Facets. A particular Market may use some or all named Facets. A participant in a Market
 374 must include Actors supporting each Facet required in that Market; there is no requirement that each
 375 Actor supports all these Facets.

376 Each Facet named below groups a mandatory set of related messages and interactions. Detailed
 377 descriptions of each facet begin in Section 6.

378 *Table 2-2: Facets Defined in CTS*

Facet	Definition
Marketplace	The Marketplace Facet exchanges information about the Marketplace and its Products and Markets. A Party registers with a Marketplace through this Facet. A Party may query the Marketplace to discover the Resources and Products traded in a Marketplace. When a Marketplace includes multiple Products, the Party needs to know where to find the Market for each Product. While a Marketplace may change slowly over time, the Marketplace facet can generally be viewed AS conveying static information.
Market	A Market Facet exchanges information for trading a particular Product in a particular Market. Parties submit Tenders to a Market, and the Market notifies the Parties of Transactions. A Market Facet contains a Matching Engine that matches Tenders to buy and Tenders to sell. The Market Facet conveys information as to how the Market matches orders, which may change the strategies used by a Market participant. Some Markets MAY register transactions privately agreed to among Parties. See Section 8 Market Facet

Facet	Definition
Registration	<p>A Party must Register with a Marketplace to participate in the Markets in that Marketplace.</p> <p>See Section 6, Party Registration Facet.</p>
Tender	<p>Tenders are actionable offers to buy or to sell an Instrument at a given price. Tenders go to the Market and are generally private. It is possible to request that a Tender be advertised to all Parties in the Market. Note: a Tender for one side MAY match more than one Tender on the other side, which could generate multiple Transactions.</p> <p>See Section 9, Tender Facet.</p>
Transaction	<p>A Transaction records a contract when a Tender to buy and a Tender to sell are matched. Each Party is notified of the creation of the Transaction. Note: a Tender for one side MAY match more than one Tender on the other side, which would generate multiple Transactions.</p> <p>See Section 10, Transaction Facet.</p>
Position	<p>At any moment, a Party has a position which represents the cumulative amount of an Instrument that an actor has previously transacted for within a bounding time interval. A Position for an Instrument reflects the algebraic sum of all quantities previously bought or sold.</p> <p>See Section 11, Position Facet.</p>
Delivery	<p>It is simplest to think of Delivery as a meter reading, although that meter may be virtual or computed. Some implementations may compare what was purchased or sold with what was delivered. What a system does after this comparison is out of scope.</p> <p>See Section 12, Delivery Facet.</p>
Quote	<p>A Quote is a non-actionable indication of a potential price or availability of an Instrument. [EI] defines the EiQuote service. This specification extends the Quote to include forecasts, information about completed Transactions, and other Market information.</p> <p>See Section 13 Market Information—the Quote and Ticker Facets</p>
Ticker	<p>Named for the stock ticker, best known for its printed output the ticker tape. A ticker provides public information about transactions over time.</p> <p>See Section 13 Market Information—the Quote and Ticker Facets</p>

379 Each of these facets includes multiple messages which are described starting in Section 4. Sometimes
380 one facet precedes the use of another facet, as Tenders may initiate messages for the Transaction Facet.

381 **2.2.3 Party and Counterparty in Tenders and Transactions**

382 The Party in a Tender is offering to buy or sell. The *PartyID* in a Tender should always reference the
383 Party that is tendering.

384 When the Market recognizes Tenders that match each other, however defined, the Market generates a
385 Transaction that represents a contract between the buyer and the seller. This Transaction includes a
386 Party and a Counterparty.

387 See Section 13, “Market Information—the Quote and Ticker Facets” for a discussion of Market
388 Information.

389 2.3 Responses

390 This section re-iterates terms and simplifies models from [EI]. That specification is normative. The form of
391 the Response is common across all Facets.

392 *Table 2-3: Responses*

Attribute	Meaning
Request ID	A reference ID which identifies the artifact or message element to which this is a response. The Request ID uniquely identifies this request and can serve as a messaging correlation ID ⁵ .
Response Code	The Response Code indicates success or failure of the operation requested. The Response Description is unconstrained text, perhaps for use in a user interface. The code ranges are those used for HTTP response codes, ⁶ specifically 1xx: Informational - Request received, continuing process 2xx: Success - The action was successfully received, understood, and accepted 3xx: Pending - Further action must be taken in order to complete the request 4xx: Requester Error - The request contains bad syntax or cannot be fulfilled 5xx: Responder Error - The responder failed to fulfill an apparently valid request

393 The Most operations have a response.

⁵ As an example of the *Correlation Pattern* for messages

⁶ See e.g. https://en.wikipedia.org/wiki/List_of_HTTP_status_codes

394

3 Common Semantic Elements of CTS

395
396

The messages of CTS use a few common elements. These elements are derived from and compatible with definitions in [WS-Calendar], [EMIX], and in [EI].

397

3.1 Semantic Elements from WS-Calendar

398
399
400
401
402

Time and Duration are the essential elements of defining an Instrument as well as for interacting with a Market. A Stream [Streams] is a series of back-to-back intervals each with its own associated information. Section 5 defines the CTS Stream as a conformant specialization of [Streams], integrating information that is outside of a Stream data structure but associated with a Stream.⁷

Table 3-1: CTS Elements from WS-Calendar

Attribute	Meaning
Duration	<p>Duration is used to define Products, as in “Power can be purchased and there is a one-hour (duration) market for Power”.</p> <p>Duration is also used in Delivery to specify the period over which Delivery is measured, as in “How much Power was delivered in the 4 hours beginning with the Begin Date-Time?”</p>
Offset	<p>An offset (expressed as a WS-Calendar Duration) that some markets MAY use to transfer trading away from hourly boundaries.</p> <p>A power distribution entity may experience disruption if there is a big price change on the hour. Offset enables a Market to trade, for example, 3 minutes after the hour. See also Market Facet</p>
Begin Date-Time	<p>Begin Date-Time fully binds a Duration into an Interval. When applied to a Product, the Begin Date-Time defines an Instrument., i.e., something that is directly traded in the Market.</p>
Expiration Date-Time	<p>Expiration is used to limit the time a Tender is on the Market. There is an implicit expiration for every Tender equal to the Begin Date-Time of the Instrument. Expiration Date-Time is needed only if the requested Expiration is prior to the Begin Date-Time of the Instrument.</p>
Interval	<p>An Interval in CTS is a Duration with a Begin Date-Time. This maps to what WS-Calendar names a “Scheduled Interval”.</p>

403

404

3.2 Semantic Elements from EMIX

405
406
407
408
409
410

EMIX defines the specification of commodity goods and services whose value is determined by time and location of delivery. EMIX defines an “Item” by what is sold in a Market, when it is sold, what the units are, and what the standard trade size is. EMIX further defines how to communicate the date and time of delivery for that commodity to define a unique Product that can be bought and sold in a Market. In CTS, we maintain the semantics of EMIX while giving name to each refinement of the information. These names are the Resource (what is sold), the Product (how the Resource is packaged into a size

⁷ Including Resource Designator, Stream Start, and Decimal Fraction

411 and Duration for sale), and the Instrument (a Product sold at a specific time). Instruments are what are
 412 bought and sold in CTS markets.

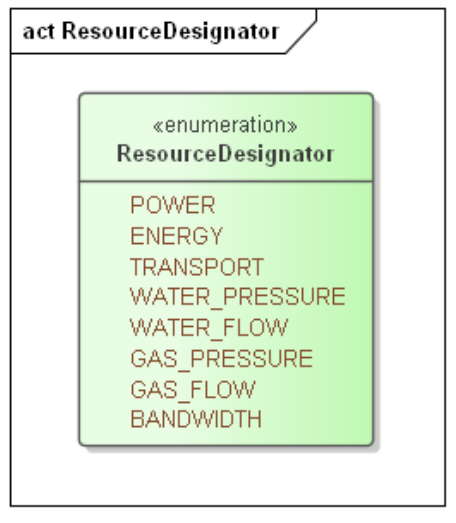

413 **3.2.1 Defining Resource**

414 Here we define a Resource as a commodity that is bought or sold in a CTS Marketplace. A Party can
 415 query a Marketplace to discover the Resources that can traded in each of the Markets in the Marketplace.

416 *Table 3-2: Defining the Resource*

Attribute	Meaning
Resource	A Resource consists of a Resource Designator, a Resource Name and a Resource [Item] Description.
Item Description	The Item Description is a common name, as defined in EMIX
Item Unit	Item Unit is the unit of measure for the Resource.
Attributes	Optional elements that further describe the Resource, as in hertz and voltage

417
 418 A Resource Designator is an extensible enumeration. The standard enumeration is defined in Figure 3-1
 419 Resource Designator Extensible Enumeration:

420
 421 *Figure 3-1 Resource Designator Extensible Enumeration*

422 **3.2.2 Defining Product**

423 The Product is a Resource packaged for Market. The size and duration of the Resource define what is, in
 424 effect, the “package size” for the commodity. A Marketplace may offer multiple Products for the same
 425 Resource.

426 *Table 3-3: Defining the Product*

Attribute	Meaning
Product	Abstract Base for all defining all Products. The core of each Product is the Resource, as referenced by the Resource Designator.

Attribute	Meaning
Scale	Exponent that specifies the size of the Resource Unit. For example, a Product denominated in Megawatts has a Scale of 6.
Size	An integer “chunking” the Product, i.e., the Product could be traded in units of 5 kW, a size of 5 and a scale of 3.
Warrant	Undefined element of a Product that restricts the Product beyond the Resource definition. For example, it is possible to trade in power designated to be Neighborhood Solar Power. In CTS, Products that are identical other than the Warrant are traded in different Markets within the same Marketplace.

427 Products with differing Warrants are different Products and therefore traded in different Markets.

428 As non-normative examples, if an Actor wishes to buy energy with a *Green Warrant* (however defined)
 429 then the Actor, not the Market, is responsible for defining its trading strategies if the warranted Product is
 430 not available. Similarly, an Actor that wishes to buy or sell Neighborhood Solar Power is responsible for
 431 submitting Tenders that expire in time to make alternate arrangements, or in time to cancel Tenders
 432 before fulfillment. This specification establishes no expectation that the Market engine address these
 433 issues automatically.

434 Warrants are defined in [EMIX], and are permitted in CTS to support this complexity if desired, but not
 435 described in this specification.

436 3.2.3 Market Semantics from EMIX

437 EMIX defines vocabulary used in market messages and interactions.

438 *Table 3-4: Market-related elements from EMIX*

Attribute	Meaning
PartyID	The Marketplace-based ID of an actor participating in Markets, particularly the actor originating a Tender, Quote, or Contract.
Counter PartyID	The Marketplace-based ID of an actor participating in Markets, particularly the actor taking the other side of a contract from the Party. See Section 2.2.3.
Side	An indication of what a Party offers in a Tender or other message, i.e., “Buy” or “Sell”.
Expiration Date-Time	Expiration is used to limit the time a Tender is on the Market. There is an implicit expiration for every Tender equal to the Begin Date-Time of the Instrument. Expiration Date-Time is needed only if the requested Expiration is prior or subsequent to the Begin Date-Time of the Instrument.
Market Context	In EMIX, the Market Context is simply a URI to name a Market, and need not be resolvable. CTS distinguishes between a Marketplace, where many Products may be sold and the Market, where a specific Product is sold. See Section 6. “Marketplace Facet”.

Standard Terms	Standard Terms are the machine-readable information about a Marketplace or Market, and the interactions it supports. In CTS, the Standard Terms include an enumeration of the Products and their respective Markets tradable in this Marketplace. See Section 6, “Market Facet”.
----------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

439

440 EMIX does not define how an Actor discovers the Standard Terms in a Marketplace. CTS defines the
441 Marketplace Facet and the Market Facet to discover and expose Products and Standard Terms.

442

4 Basic Interaction and Terminology

4.1 Structure of Common Transactive Services and Operations

The Common Transactive Services presented in this specification are described in the following sections, and are

- Marketplace Facet—characteristics and to know what Products and Instruments can be traded
- Party Registration Facet—identification of actors within a Market or Marketplace
- Tender Facet—make offers to buy and sell Instruments
- Transaction Facet—for expressing transactions.
- Position Facet—Describe what has been previously bought or sold
- Delivery Facet—Request data on actual deliveries
- Market Information—the Quote and Ticker Facets

We include UML definitions for the standard payloads for service requests, rather than the service, communication, or other characteristics. In Section 14 we describe standard serialization for the CTS standard payloads; additional bindings may be used by conforming implementations.

Transactive Services in EI define and support the lifecycle of transactions from preparation (registration) to initial Tender to final settlement. The phases described in EI are in the following table with the CTS Facets in Column 2.

Table 4-1: Mapping CTS Facets to EI Phases

EI Phase	CTS Facet(s)
Registration (and Market discovery)	Party Registration Facet Marketplace Facet Market Facet
Pre-Transaction	Quote Facet Tender Facet
Transaction	Transaction Facet
Post-Transaction	Position Facet Delivery Facet Ticker Facet

461

4.2 Naming of Services and Operations

The naming of services and operations and service operation payloads follows the pattern defined in [EI]. Services are named starting with the letters **Ei** following the Upper Camel Case convention. Operations in each service use one or more of the following patterns. The first listed is a fragment of the name of the initial service operation; the second is a fragment of the name of the response message which acknowledges receipt, describes errors, and may pass information back to the invoker of the first operation.

469 *Create—Created* An object is created and sent to the other Party

470 *Cancel—Canceled* A previously created request is canceled

471 For example, to construct an operation name for the Tender facet, "Ei" is concatenated with the name
472 fragment (verb) as listed. An operation to cancel an outstanding Tender is called *EiCancelTender*.⁸

473 *Facets* describe what would be called services in a full Service-Oriented Architecture implementation, as
474 we do not define SOA services, but only imply and follow a service structure from [EI].

475 4.3 Payloads and Messages

476 We define only the payloads; the particular networking technique and message structure is determined by
477 the applications sending and receiving CTS payloads.

478 While the payloads are logically complete with respect to the SOA interactions in [EI], the payloads may
479 be exchanged by any means; such exchanges are below the semantic level of this specification.

480 4.4 Description of the Facets and Payloads

481 The sections below provide the following for each service:

- 482 • Facet description
- 483 • Table of Payloads
- 484 • Interaction patterns for payload exchange in graphic form, using EI normative interactions and
485 UML Sequence Diagrams [UML].
- 486 • Normative information model using [UML] for key artifacts used by the facet
- 487 • Normative operation payloads using [UML] for each interaction

488 4.5 Responses

489 Responses may need to be tracked to determine whether an operation succeeds or not. This may be
490 complicated by the fact that any given Transaction may involve the transmission of one or more
491 information objects.

492 An *EiResponse* returns the success or failure of the entire operation, with possible detail included in
493 *responseTermsViolated* (see Section 5).

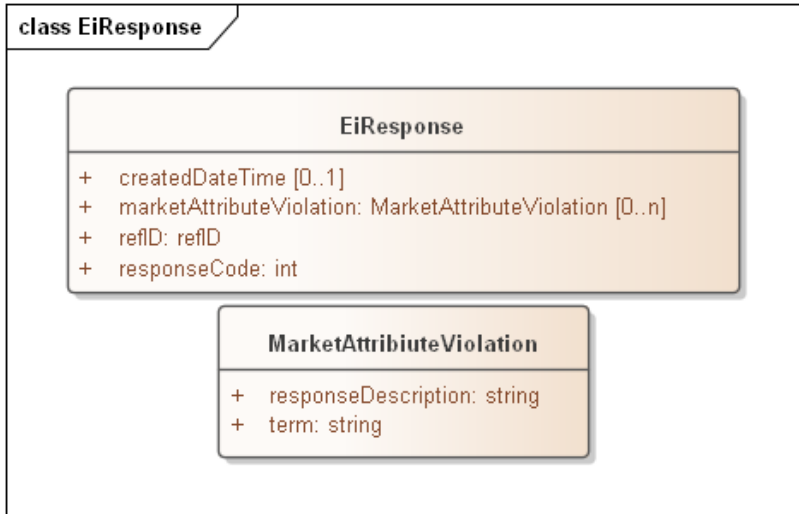

494 It is MANDATORY to return responses⁹ indicating partial or complete success or failure.

495 The class diagram in Figure 4-1 shows the generic CTS response.

496 CTS uses a simplified version of *EiResponseType* from EI, deleting *ArrayOfResponseTermsViolated* and
497 *responseDescription* (to zero, that is, not passed). *Response Terms Violated* is renamed *Market Attribute*
498 *Violation*.

⁸ This pattern was developed and is used by IEC Technical Committee 57 (Power Systems).

⁹ This contrasts with EI, where it is not mandatory to return any responses if the entire *EiCancelTender* service operation was completed successfully. The pattern in EI is to return those that have failed (required) and those that succeeded (optional).

499

500

Figure 4-1: Example of generic response object

501 There is no exhaustive list of all possible Response Codes. More detail on Response Codes is in Section
 502 2.3.

503 The Response Codes are intended to enable even the smallest device to interpret Response. This
 504 specification uses a pattern consisting of a 3-digit code, with the most significant digit sufficient to
 505 interpret success or failure. This pattern is intended to support that smallest device, while still supporting
 506 more nuanced messages that may be developed.¹⁰

507 The only defined value in EI after the leading digit of the Response Code is 00. Conforming specifications
 508 may extend these codes to define more fine-grained response codes. These should extend the pattern
 509 above; for example, a response code of 403 should always indicate Requester Error. Response codes
 510 not of the form x00 MAY be treated as the parallel x00 response.

511 As an example, consider a request to quote 13.5 kW at three minutes offset for 17 minutes where the
 512 market characteristics and its product include 10kW granularity, zero offset, and five minute duration. The
 513 terms in the Market Attribute Violation therefore include at least these violations:

- 514 • T_GRAIN, 5m
- 515 • Q_GRAIN, 10kW
- 516 • OFFSET, 0

517 The definition of the respective terms is in *Section 8, Market Facet*.

¹⁰ This is parallel to HTTP response codes.

518 5 CTS Streams

519 Aside from registration and market information, Payloads in CTS are derived from and conformant with
520 WS-Calendar Streams. The essence of Streams is that for a series of consecutive Durations over time,
521 called Intervals, invariant information is in the header or preface to the stream, and only the varying
522 information is expressed in each Interval.

523 For CTS, this means that a Product is fully described in the header, and only the elements that vary, such
524 as the Price or the Quantity, are expressed in the intervals.

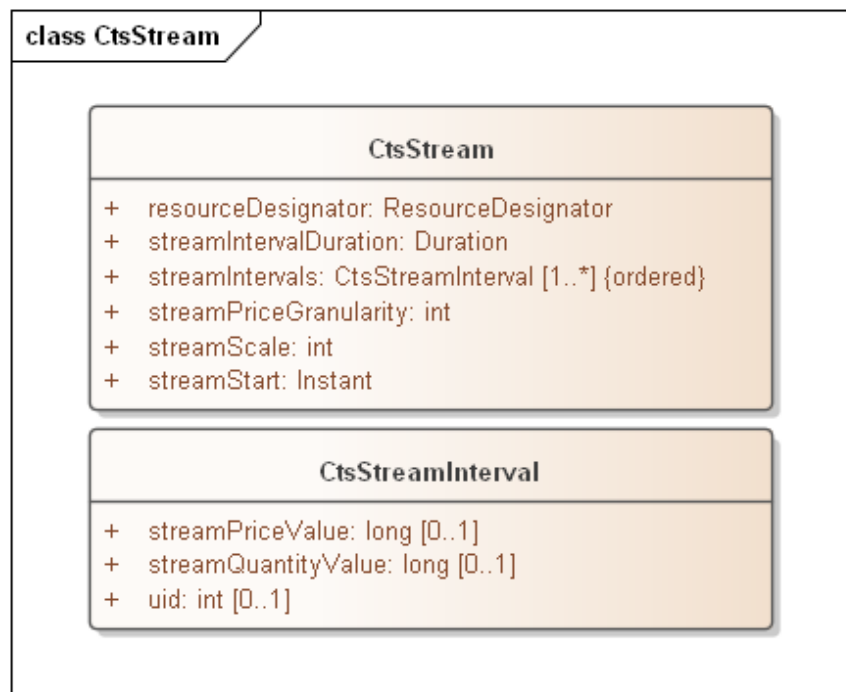

525 CTS Streams use this same format even when the Intervals contain only a single Interval.

526 In addition, CTS Streams include energy-market elements that are outside the Streams standard but
527 follow the pattern of referrals as defined in [Streams] conformance.

528 CTS Streams have neither interaction patterns nor payloads, as they are a common abstract information
529 model used to define the messages used in Facet messages.

530 5.1 Information Model for CTS Streams

531 The CTS Stream is defined as follows. The elements from [Streams] have been flattened into the CTS
532 Stream, and the Stream Interval and payload flattened into a streamPayloadValue and the internal local
533 UID for the stream element.

534

535

Figure 5-1: CTS Stream Definition

536 As with [Streams], CTS Stream Intervals are ordered, that is the sequence of intervals is essential. Some
537 serialization specifications, notably XML, do not require that order be preserved when deserializing a list.
538 The UID enables proper ordering of the Stream Intervals if order is not preserved. Since conformant CTS
539 implementations need not be owned by the same implementer, and may pass through multiple
540 translations, the UID property is required.

541 The following tables describe the attributes for CTS Streams and Stream Intervals.

Table 5-1: CTS Stream Attributes

Attribute	Meaning	Notes
Resource Designator	An item from an enumeration that indicates the Resource for the Product and Market	The Resource Designator in a Market should match the Resource Designator indicated in the Marketplace
Stream Scale	The Scale is the exponent that determines the size of the Resource.	For example, if Scale is 3 and the Resource is Watts, then the value is in kW. If the Scale is 6, then the value is in MW.
Stream Interval Duration	The duration for each of the contiguous Stream Intervals	This completes the Product definition of a Resource at a Scale and Size delivered over a Duration.
Stream Price Granularity	Price granularity expressed as an exponent. Applies to all Intervals in the Stream. Not required for all Facets.	For example, if the price granularity is -3, and the value is 1500, the price is 1.500 currency units.
Stream Start	The Start Date and Time for a bound CTS Stream	See WS-Calendar Date-Time in Section 3.1.
Stream Intervals	The ordered set of Stream Intervals	The set of Intervals is ordered by means of a local UID which is concatenated with the Stream UID as described in [Streams] and in [EI]

Table 5-2: Stream Interval Attributes

Attribute	Meaning	Notes
Stream Price Value	The Price value for this specific Stream Interval, subject to indicated Scale/Granularity	At least one of (Stream Price Value, Stream Quantity Value) MUST be present.
Stream Quantity Value	The Quantity value for this specific Stream Interval, subject to indicated Scale/Granularity	At least one of (Stream Price Value, Stream Quantity Value) MUST be present.
UID	A “Local UID” used to order the Interval within the Stream	As conformant CTS implementations need not be owned by the same implementer, intermarket gateways (however defined) may deserialize and re-serialize to different specifications

570

Background (adapted from [EI])

A valid Party ID is required to interact with a Market and is included in most payloads.

Party Registration is described in EI. This facet describes the messages necessary for an actor to register and obtain a Party ID in order to participate in a Market.

- EiCreateParty associates an actor with a Party ID and informs the Marketplace of that ID. CTS makes no representation on whether that ID is an immutable characteristic, such as a MAC address, a stable network address, such as an IP, or assigned during registration,
- EiRegisterParty names the exchange of information about an actor that enables full participation in a CTS Marketplace. It may exchange information needed for financial transfers including, perhaps, reference to an existing customer or vendor ID, or proof of financial bond for large participants, or issuance of crypto-tokens, or any other local market requirements. A Registered Party is ready to be a full participant in the local Market.
- Cancel Party Registration removes a Party from the Market. It may include final settlement, cancellation of outstanding Tenders, backing out of future contracts, or other activities as defined in a particular CTS Marketplace.

Aside from the business services as described, Party Registration may have additional low-level requirements tied to the protocol itself used in a particular implementation based on CTS.

This specification does not attempt to standardize these interactions and messages beyond naming the Register Party facet. A more complete discussion can be found in the [EI] specification.

Some Marketplaces MAY wish to associate one or more measurement points with a Party. Such measurement points could be used to audit Transaction completion, to assess charges for using uncontracted for energy, etc. Measurement points are referenced in *Section 12 "Delivery Facet"*, Markets that require this functionality may want to include an enumeration of Measurement Points in Party Registration.

571 7 Marketplace Facet

572 The Marketplace facet is an extension of [EI]. In CTS the Marketplace includes all the Markets wherein a
573 Party can trade, and are associated with all the Products a Party can trade for.

574 For example, where all trading is in a single microgrid, the Marketplace is implicitly tied to that microgrid.
575 Where trading is across a city or across a traditional utility or across a region the Marketplace hosts all
576 Market interactions for that utility or region. Nothing in this specification prohibits multiple Marketplaces,
577 such as a Wholesale or a Retail, or a sourced Marketplace such as Solar.

578 Using the Resource / Product / Instrument terminology, each Product has its own market, and these
579 different markets may have different rules, or different matching engines. All are in the same Marketplace.

580 The Marketplace Facet defines characteristics common to all the local Markets, and catalogs how to
581 participate in each Market.

582 7.1 The [EI] Market Context and the Marketplace

583 Market Contexts in [EMIX] and [EI] are URIs and are used to request information about the Market or
584 Marketplace that rarely changes, so it is not necessary to communicate it with each message.

585 Note that a Market Context is associated with and identifies a collection of values and behaviors; while an
586 [EI] implementation MAY use operations such as POST to a Market Context URI, that behavior is not
587 required.

588 For any Marketplace, there are standing terms and expectations about Product offerings. If these
589 standing terms and expectations are not known, many exchanges may need to occur before finding
590 Products and Tenders that meet those expectations. If all information about the Marketplace were to be
591 transmitted in every information exchange, messages would be overly repetitive.

592 7.2 Registering in a Marketplace

593 The scope of a Party ID is a Marketplace. The Party ID MUST be unique within a Marketplace.

594 Only the acquiring of Party ID is in scope in the following list:

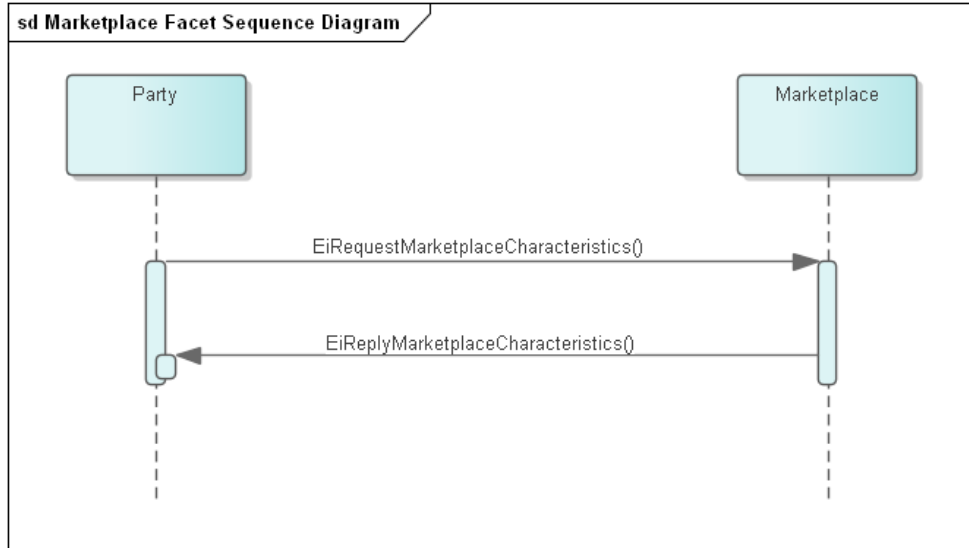

- 595 - Obtain Party ID
- 596 - Establish billing terms, if any
- 597 - Exchange Location, if required

598 See Party Registration Facet for more information.

599 7.3 Interaction Pattern for the Marketplace Facet

600 An Actor MUST interact with a specific Market to trade a specific Product. A Market matches Tenders for
601 all Instruments based on a given Product. The matching engine is contained within the Market and
602 different matching engines have no visibility past the Market Facet.

603 The Marketplace Facet enables a Party to request the details of a Marketplace and the Markets contained
604 in the Marketplace. Using the Marketplace Facet for discovery, Parties MAY request and compare Market
605 Characteristics to select which markets to participate in.

606
607
608
609
610

Figure 7-1: UML Sequence Diagram for the Marketplace Facet

Once Markets are identified as a candidate, the Market Facet can retrieve the standard terms associated with those Markets. See Market Facet.

611 7.4 Information Model for the Marketplace Facet

612 Table 7-1 Information Model for the Marketplace Facet

Attribute	Attribute Name	Attribute Type	Meaning
Marketplace Name	NAME	String	Text providing a descriptive name for a Marketplace. While the Name MAY be displayed in a user interface; it is not meaningful to the Actors.
Currency	CURRENCY	String	String indicating how value is denominated in a market. If fiat currency, should be selected from current codes maintained by UN CEFACT. May also be cryptocurrencies or local currency.
Time Offset	T_OFFSET	Long	A Duration that some Marketplaces MAY use to describe trading where a first interval is not on an hourly boundary. ¹¹

¹¹ A power distribution entity may experience disruption if there is a big price change on the hour. For example, a distribution system operator (DSO) that operates multiple CTS Marketplaces could opt to set a different offset on each Marketplace operated out of a given substation. In this model, a Market could use an offset duration of 3 minutes to indicate that all tenders are based on three minutes after the hour.

Attribute	Attribute Name	Attribute Type	Meaning
Time Zone	TZ	String	A Time Zone indicates how all Times and Dates are expressed.
Price Decimal Fraction Digits	PRICE_FRAC	Long	Some market implementations use a Marketplace-wide indication of how many decimal fraction digits are used.
Resource Descriptor	RESOURCE	String	The Resource traded in this Market.
Markets	MARKETS	Market Description	A list of Market Descriptions for each Market contained in the Marketplace.

613

614 Market Descriptions in a Marketplace

615 A marketplace itemizes each of the Markets in the marketplace. This is indicated by a set of Market
616 Descriptors with the following attributes, one for each contained Market:

617

618

Table 7-2 Market Description

Attribute	Attribute Name	Attribute Type	Meaning
Market Name	MARKET	String	Optional text providing a descriptive name for a Market. While the Name MAY be displayed in a user interface; it is not meaningful to the Actors.
Resource	Resource	Resource Designator	[Extensible] enumeration indicating what is sold in each Market
URI	MARKET-URI	String	URI to access the Market.

619 Descriptions of the Product found in each Market are found in each Market and are not replicated into the
620 Marketplace.

621

622 8 Market Facet

623 All interactions in a Market are subject to Standard Terms which are discovered through the Market
624 Facet.

- 625 1. A Party interacts with the Marketplace to discover all Markets in which the Resources the Party is
626 interested in are traded.
- 627 2. A Party queries each of the Markets trading that Resource discover the Products in each Market,
628 and the Standard Terms for each.
- 629 3. Resources with Warrants are in their own Markets, which may have their own Standard Terms.
630 The Warrant is a Market Term.
- 631 4. The Party uses the Party ID determined during Marketplace Registration for all Tenders.
- 632 5. The Party determines which Products it wants by submitting Tenders to the Market is chooses.
- 633 6. Each Tender is for a specific Instrument, which is the Market Product plus a Starting Time.

634 A Market matches Tenders to create Transactions using the Tender and Transaction Facets.

635 While there is no standard matching algorithm defined in CTS, the Standard Terms include indicators of
636 how the Market matches Tenders. For example, different bidding strategies may be used when submitting
637 to a double auction market than for an order book market.

638 Interactions with the Market are through the Tender (see Section 9) and Transaction (see Section 10)
639 Facets.

640 8.1 Market Context History

641 Market Contexts in [EMIX] and [EI] are URIs and express Standard Terms that rarely changes, so it is not
642 necessary to communicate it with each message.

643 In CTS, this is refined to the Marketplace Facet (Section 7) and the Market Facet (Section 8).

644 8.2 Payloads for the Market Facet

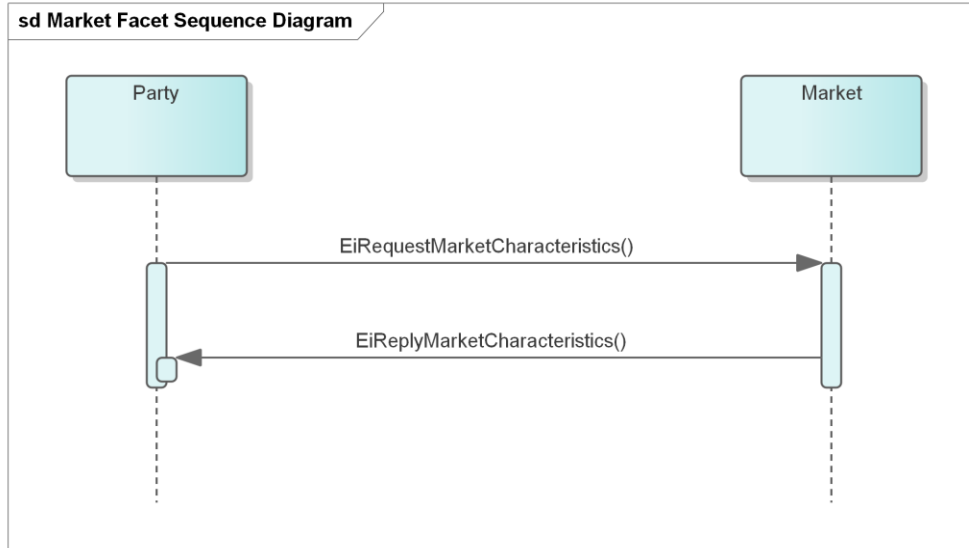

Facet	Request Payload	Response Payload	Notes
Market	EiRequestMarketCharacteristics	EiReplyMarketCharacteristics	Request specific Market Characteristics

645

646 8.3 Interaction Pattern for the Market Facet

647 An Actor interacts with a specific Market to trade a specific Product. A Market matches Tenders for all
648 Instruments based on a given Product. The matching engine is contained within the Market and different
649 matching engines have no visibility past the Market Facet.

650 The Market Facet enables a Party to request the details of a Marketplace. Using the Market Facet,
651 Parties MAY be able to request and compare Market Contexts to select which markets to participate in.

652

653

Figure 8-1: UML Sequence Diagram for the Market Facet. TODO: Update for Market Facet

654

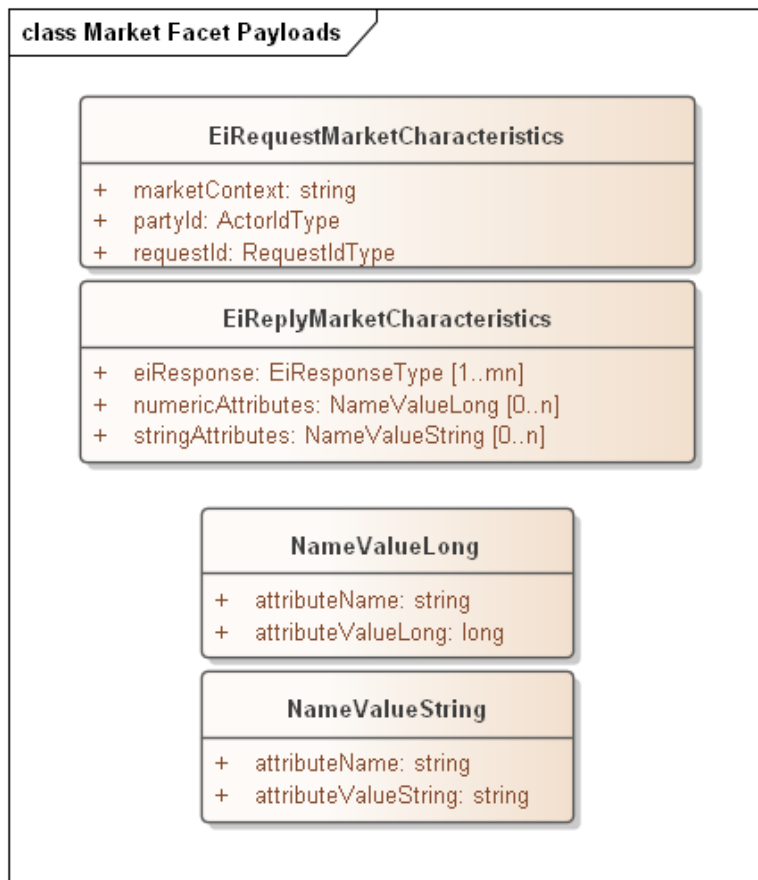

The Market Facet can be used to retrieve the standard terms associated with a Market.

655

An EiRequestMarketCharacteristics payload requests the standard terms for a Market; the reply payload

656

EiReplyMarketCharacteristics returns those terms as name-value pairs.

657

659 8.4 Information Model for the Market Facet

660 Sending an EiRequestMarketCharacteristics payload referencing a Market requests standard terms as
661 given in Table 8-1: Standard Terms .

662 These are derived and extended from EMIX Terms; those are extrinsic to the Product delivery but effect
663 how each Party interacts with others. Terms may be tied to basic operational needs, or schedules of
664 availability, or limits on bids and prices acceptability.

665 The CTS Standard Terms MAY be extended to reflect additional capabilities and description.

666 Strings returned for attribute values MUST be no longer than 256 bytes.

667 **TODO Consider requiring resolvable URIs for contexts, or pairing with potential transport endpoints.**

668 *Table 8-1: Standard Terms returned by Market Facet*

Attribute	Attribute Name	Attribute Type	Meaning
Market Name	NAME	String	Text providing a descriptive name for a Market. While the Name MAY be displayed in a user interface; it is not meaningful to the Actors.
Currency	CURRENCY	String	String indicating how value is denominated in a market. If fiat currency, should be selected from current codes maintained by UN CEFACT. May also be cryptocurrencies or local currency.
Time Offset	T_OFFSET	Long	A Duration that some Marketplaces MAY use to describe trading where a first interval is not on an hourly boundary. ¹²
Time Zone	TZ	String	A Time Zone indicates how all Times and Dates are expressed.
Price Decimal Fraction Digits	PRICE_FRAC	Long	Some market implementations use a Marketplace-wide indication of how many decimal fraction digits are used. ¹³
Market Party ID	MPARTYID	String	The PartyID to use in a Tender (reference 2.2.3)

¹² A power distribution entity may experience disruption if there is a big price change on the hour. For example, a distribution system operator (DSO) that operates multiple CTS Marketplaces could opt to set a different offset on each Marketplace operated out of a given substation. In this model, a Market could use an offset duration of 3 minutes to indicate that all tenders are based on three minutes after the hour.

¹³ Integer operations are typically much more efficient than fixed or floating point, so it is likely to be much faster to apply decimal shift on input and output rather than for more frequent comparison operations in the matching engine implementation

Attribute	Attribute Name	Attribute Type	Meaning
Bilateral OK	BILATERAL OK	Long	Boolean expressed as an integer: 0 - False—bilateral Tenders or Transactions not permitted, only Market Tenders 1 - True—bilateral Tenders or Transactions with identified parties are permitted.
Resource Designator	R_ID	Resource Designator	[Extensible] enumeration indicating the Resource traded in this Market. This establishes the Resource Designator used in Product definitions and in messages
Containing Marketplace	MPLACE	String	URI for Marketplace Context
Product	PRODUCT	Array of Ordered Pairs	See Product Definition, Table 8-2: Elements that define Products in a Market. It SHALL match the Product Definition indicated in the Marketplace for this Market.
Tender Grouping	TGROUP	Long	Enumeration expressed as an integer for treatment of multiple tenders either in a single EiCreateTender payload or across all Tenders for the same Instrument: 0 – Tenders are independent (<i>JBOT</i>) 1 – All Tenders within a single EiCreateTenderPayload SHALL BE treated by the market as points on a supply or demand curve as indicated by the Side of the Tenders (<i>ALLINPAYLOAD</i>)
Clearing Approach	CLEAR	Long	Enumeration expressed as an integer to describe market clearing approach: 0 – CONTINUOUS – continuous clearing 1 – PERIODIC – not continuous, typically with periodicity related to Product T_GRAIN.
Clearing Duration	CLEAR-DURATION	String	Duration before Instrument start time used for market matches. Only valid if Clearing Approach is 1 – PERIODIC Not valid if Periodic Time is specified. <i>“All matches on the hourly market are made 30 minutes before the hour”</i>

Attribute	Attribute Name	Attribute Type	Meaning
Clearing Time	CLEAR-TIME	String	Time for market matches. Only valid if Clearing Approach is 1 – PERIODIC Not valid if Periodic Duration is specified. <i>“All matches on the Day-Ahead hourly market are made at 3:00 PM”</i> . Table 9-1
Clearing Days Ahead	CLEAR-DA	Long	Number of days prior to the Instruments for the CLEAR-TIME. For example if a Two-day ahead market clears at 3pm, CLEAR-DA = 2 and CLEAR-TIME = “3:00PM”
All transactions for an Instrument at the same clearing price	ALL_AT_CLEAR	Long	Boolean expressed as integer 0 - False—Tenders for a specific Instrument MAY clear at different prices. ¹⁴ 1 - True—As in Double Auction, all participants clear at the same price.
Maximum	MAX	Integer	Maximum Transaction size the Market will accept.
Quote Reference	QUOTE-REF	String	A string indicating the Quote Reference for this Market to which an actor may subscribe or unsubscribe.
Ticker Reference	TICKER-REF	String	A string indicating the Ticker Reference for this Market to which an actor may subscribe or unsubscribe.

669

670 Each Product in a Marketplace is defined using attributes as below

671

Table 8-2: Elements that define Products in a Market

Attribute	Attribute Name	Meaning
Resource Designator	R_ID	[Extensible] enumeration indicating the required Resource
Time Granularity	T_GRAIN	The interval duration in seconds for the specific Product definition

¹⁴ A sophisticated Party may change its Bidding strategy based on this Market Characteristic. For example, in a Double Auction all negative tenders clear at a market price that may be positive, so a negative bid in a market with positive prices ensures that the bidder is “in the money”, so negative bids are a realistic strategy.

Attribute	Attribute Name	Meaning
Quantity Scale	Q_SCALE	The exponent of the Quantity. For example, a Product denominated in kilowatts has a Q_SCALE of 3.
Quantity Granularity	Q_GRAIN	The allowed quantity unit size, e.g. Q_GRAIN == 10 means that a Tender for 9 units will be rejected but any multiple of 10 will be accepted.
Price Granularity	PRICE_GRAIN	The allowed price unit, e.g. Price Granularity == 10 means that that any multiple of 10 CURRENCY units is acceptable, but any price not matching, say a price of 9 CURRENCY units, is rejected. May be negative as in -3, Prices are multiples of .001.
Market	MARKET	The message endpoint to access the market where this Product is traded.
Warrants	WARRANT	Optional further specificity of Product

672

673 9 Tender Facet

674 The terminology of this section is that of business agreements: Tender and Transaction. The Service
675 descriptions and payloads are simplified and updated from those defined in EI.

676 9.1 Tenders as a Pre-Transaction Payloads

677 Pre-transaction interactions are those between parties that may prepare for a transaction. The pre-
678 transaction facet in CTS is the Tender Facet (and including EiDistributeTender), with payloads shown in
679 Table 9-1.

680 Tenders and transactions are artifacts based on **[EMIX]** artifacts suitably flattened and simplified, and
681 which contain schedules and prices in varying degrees of specificity or concreteness.

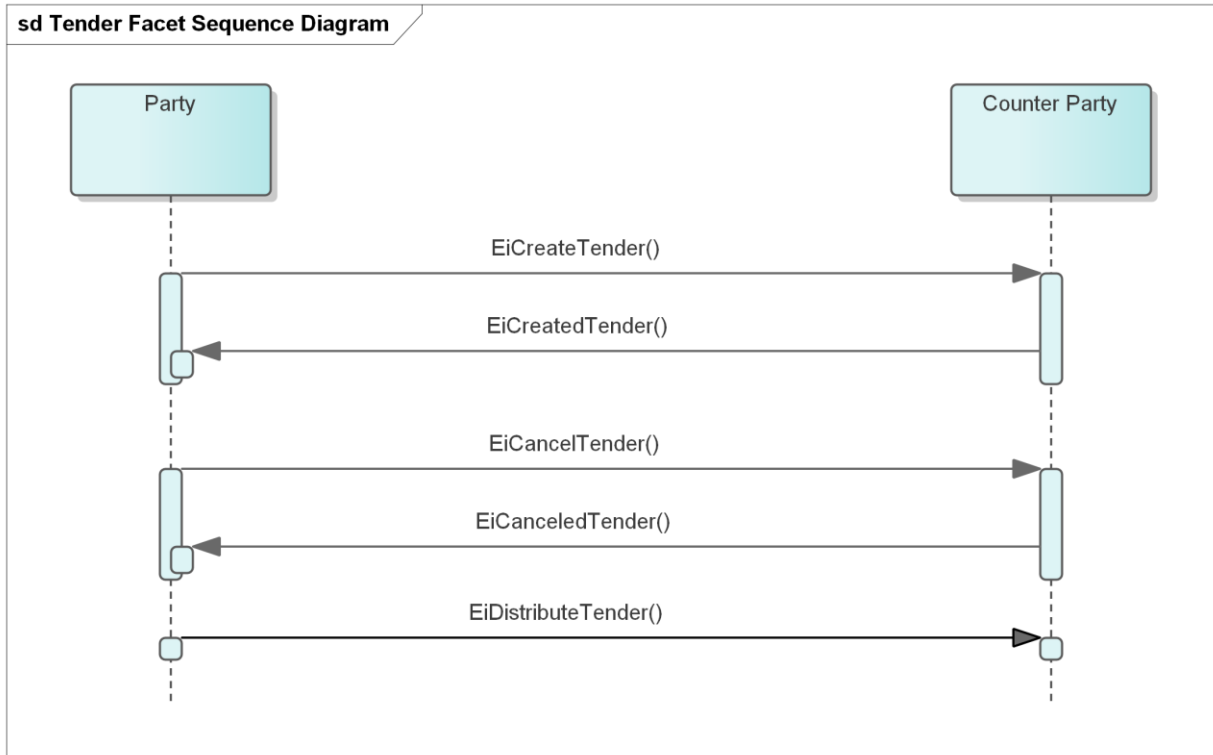

682 *Table 9-1: Pre-Transaction Tender Facets*

Facet	Request Payload	Response Payload	Notes
EiTender	EiCreateTender	EiCreatedTender	Send a CTS-Stream of one or more Tenders. Create and emit Request Payload
EiTender	EiCancelTender	EiCanceledTender	Cancel one or more Tenders
EiTender	EiDistributeTender	None	Describe a list of Tenders to be notified to a set of parties

683

684 9.2 Interaction Patterns for the Tender Facet

685 Figure 9-1 presents the [UML] sequence diagram for the EiTender Facet. Note that EiDistributeTender is
686 not part of CTS 1.0 at present, but is being considered for a future release.

687

688

Figure 9-1: UML Sequence Diagram for the Tender Facet

689

9.3 Information Model for the Tender Facet

690

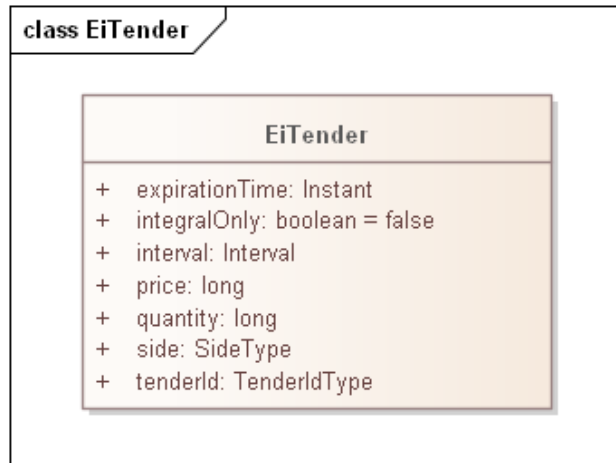

The information model for the EiTender Facet artifacts follows that of **[EMIX]**, but flattened and with Product definition implied by the implementation. See Section Payloads for the Tender Facet below.

691

692

Start time, price, and quantity are key elements for an Instrument offering to buy or sell a Product. The other aspects of Product definition (e.g. Resource, units, and duration) are described in Section 3.2.

693

694
695
696

Figure 9-2: Class EiTender

Table 9-2: EiTender Attributes

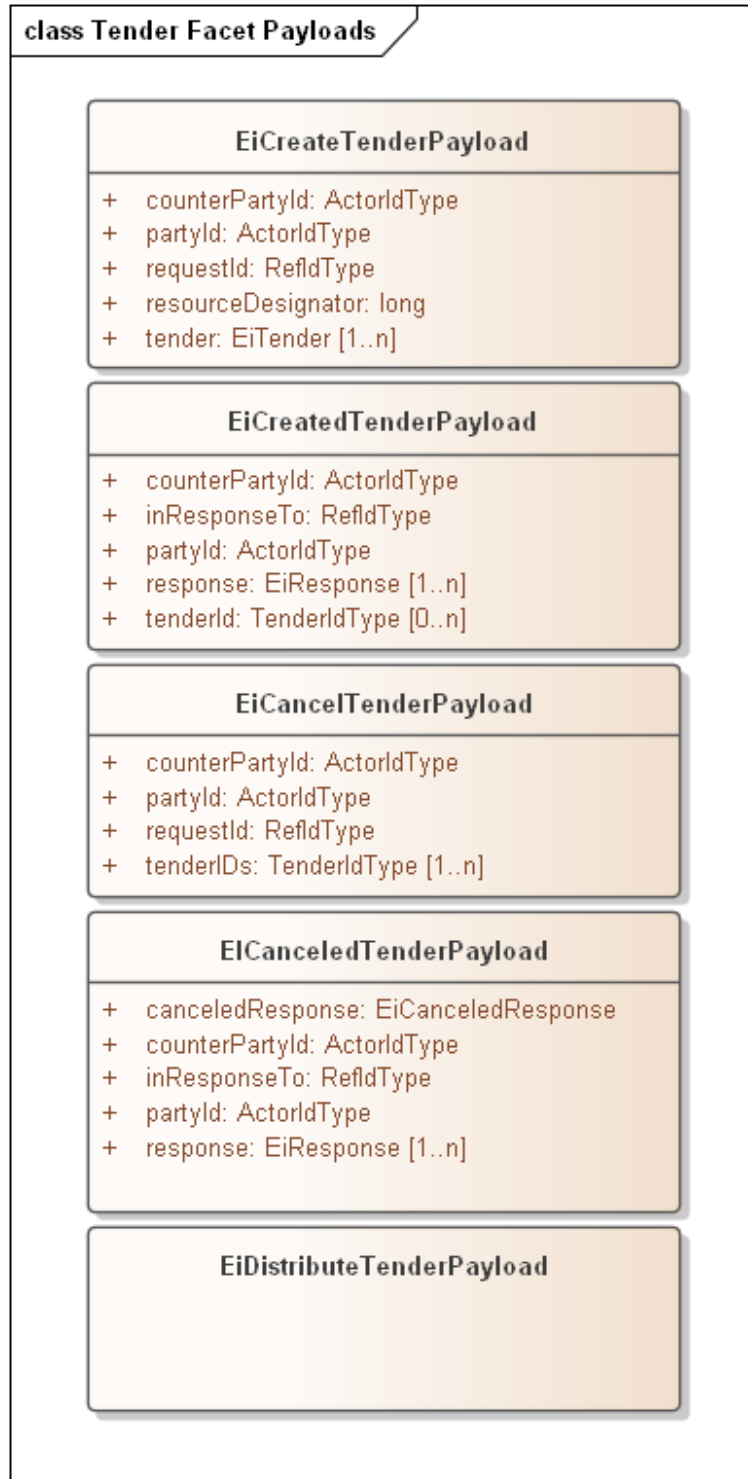

Attribute	Meaning	Notes
Expiration Time	The date and time after which this Tender is no longer valid.	
Integral Only	All of the Tender must be bought or sold at once; no partial sale or purchase	In CTS set to False. Partial sale or purchase is always allowed. The attribute is present for possible future evolution.
Interval	The time interval for the Product being offered	
Price	The unit price for the Product being Tendered	Total price is the product of price and quantity. Note that price is subject to the Price Decimal Fraction value. See Scale and Granularity constraints in Section 8, “Market Facet”
Quantity	The quantity of the Product being Tendered	Total price is the product of price and quantity suitably scaled
Side	Whether The Tender is to buy or to sell the Product	
Tender ID	An ID for this Tender	

697

698

699 9.4 Payloads for the Tender Facet

700 The [UML] class diagram describes the payloads for the Tender Facet operations.

701

702

Figure 9-3: UML Class Diagram for the Operation Payloads for the Tender Facet

703 The following table describes the attributes for EiCreateTenderPayload

704 *Table 9-3 EiCreateTenderPayload Attributes*

Attribute	Meaning	Notes
Counter Party ID	The Actor ID for the CounterParty for which the Tender is created.	This is most frequently the PartyID for the Market. To indicate a bilateral exchange, i.e., a Tender between two specific parties, the PartyID of a specific Party is used.
Party ID	The Actor ID for the Party on whose behalf this Tender is made.	Indicates which Actor proposes the buy or sell side EiCreateTender.
EiTender	One or more EiTenders to be created.	In CTS an object describing a Tender is instantiated then sent; the latter is a consequence of processing an EiCreateTender payload.
Resource Designator	The Resource being tendered	Must match the Market Resource Designator on receipt at the Market
Request ID	A reference ID which identifies the artifact or message element. The Request ID uniquely identifies this request, and can serve as a messaging correlation ID ¹⁵ .	
Responses	Responses for each attempted EiTender creation	Array Of Responses [EI]

705 EiCreateTenderPayload with more than one EiTender SHALL be treated as a shorthand for sending each
706 EiTender in a separate payload.

707 See Information Model for the Market Facet. Note that if more than one EiTender is included in a single
708 EiCreateTenderPayload, and the Market Characteristics include TGROUP = JBOT , there is no
709 implication that there be an all or none meaning. This avoids the complexity of database-style transaction
710 processing consistency, and simplifies implementations.

711 If TGROUP is ALLINPAYLOAD then all Tenders in the EiCreateTenderPayload SHALL be
712 taken by the market to represent a supply or demand curve

713 **TODO: Add example of how different components in a building can create their own bid curves**
714 **independently.**

¹⁵ As an example of the *Correlation Pattern* for messages

715 10 Transaction Facet

716 10.1 Transaction Services

717 This section presents the Transaction Facet payloads, used by Actors in the role of creating and
718 responding to Transactions.

719 This section makes them explicit, consistent with the definitions in Section 3.

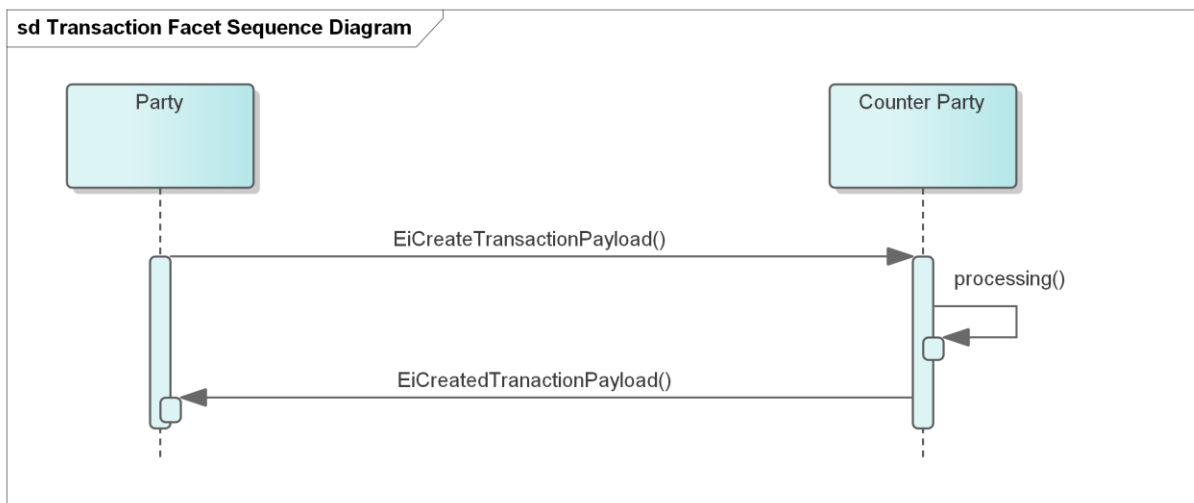

720 here is no CTS payload that permits Canceling or modifying Transactions; given disparate ownership
721 techniques from Distributed Agreement Protocols SHOULD be applied is not permitted.¹⁶

722 Table 10-1: Transaction Management Service

Service	Request Payload	Response Payload	Notes
EiTransaction	EiCreateTransaction	EiCreatedTransaction	Create and acknowledge creation of a Transaction

723 10.2 Interaction Pattern for the Transaction Facet

724 This is the [UML] sequence diagram or the EiTransaction Facet:

725

726 *Figure 10-1: UML Sequence Diagram for the EiTransaction Facet*

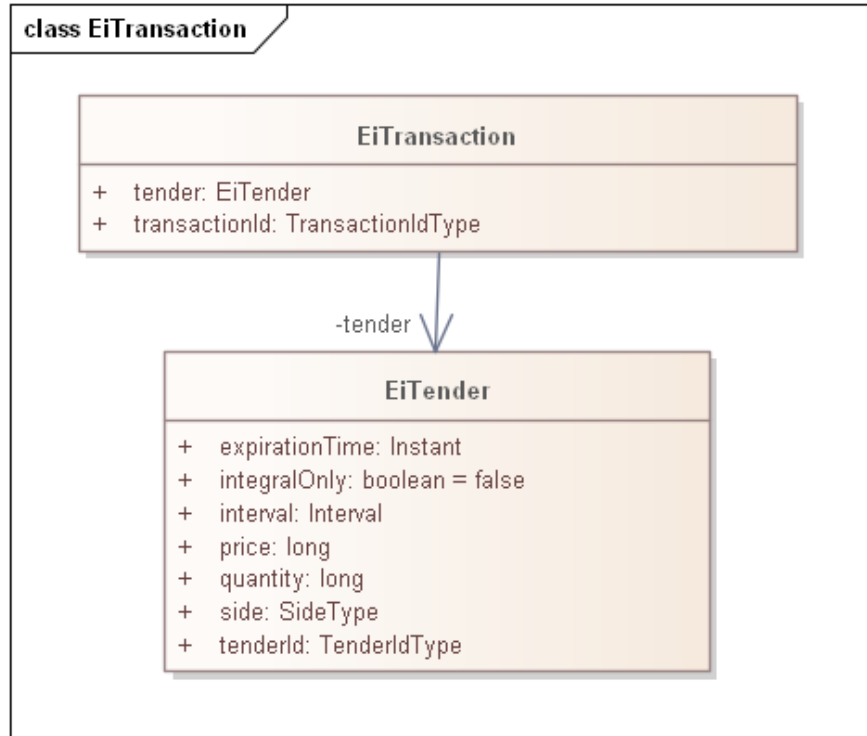

727 A transaction may be mediated by a market, in which case an EiCreateTransactionPayload is sent to
728 each of the matched Parties.

729 10.3 Information Model for the Transaction Facet

730 Transactions are a CTS artifact evolved from EMIX (including a Stream with time, quantity, and price.
731 Flattening similar to that in the Tender Facet) is used.

732 The EiTransaction object includes the original EiTender, possibly rewritten to reflect the clearing price and
733 quantity.

¹⁶ Following the approach of distributed agreement protocols, compensating tenders and transactions SHOULD be created as needed to compensate for any effects. This is consistent with the way that distributed agreement protocols such as [WS-BusinessActivity] manage compensation rather than cancellation.

734
735
736
737

Figure 10-2: UML Class Diagram of EiTransaction

The attributes of EiTransaction are shown in the following table.

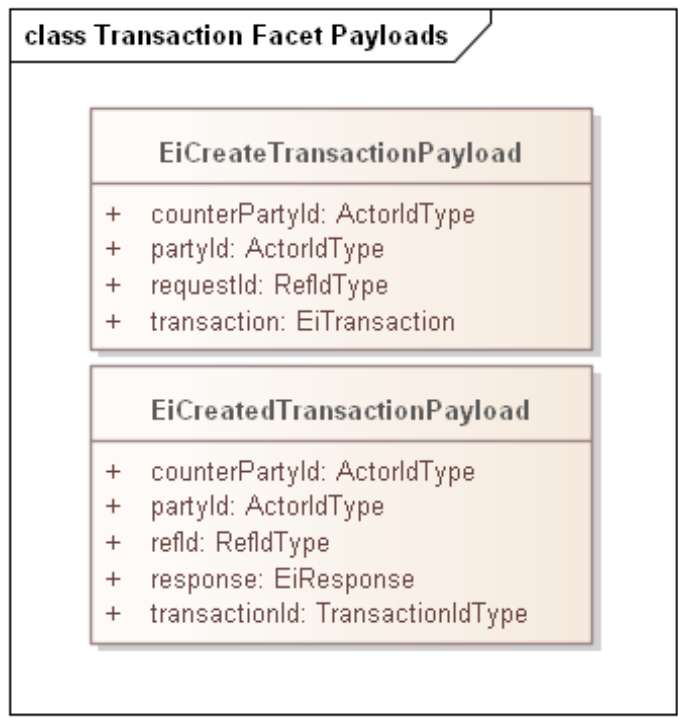

Table 10-2: EiTransaction Attributes

Attribute	Meaning	Notes
Tender	The Tender (Fig. 4-2) that led to this Transaction.	The ID, quantity and price may differ from that originally tendered due to market actions.
Transaction ID	An ID for this Transaction	The contained Tender has its own Tender Id

738

739 **10.4 Payloads for the Transaction Facet**

740 The [UML] class diagram describes the payloads for the EiTransaction facet operations.

741

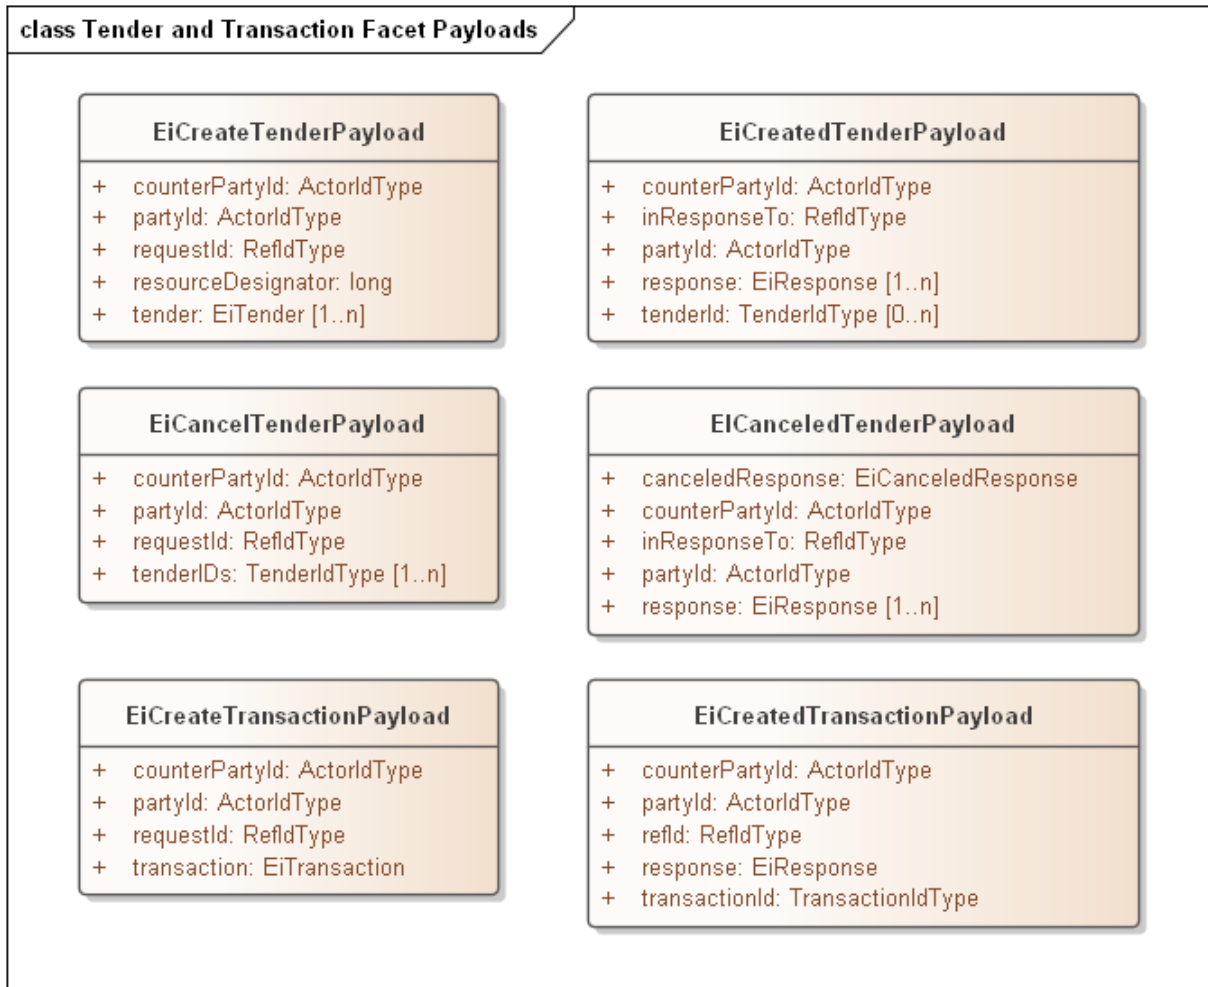

742

Figure 10-3: UML Class Diagram of EiTransaction Facet Operation Payloads

743 **10.5 Comparison of Transactive Payloads**

744 In this section we show the payloads for the Tender and Transactive Facets

Figure 10-4: UML Diagram comparing Tender and Transaction Facet Payloads

746

747 While most transactions originate as Tenders submitted to the Market, matched by the Market, and the
748 result in a Transaction created by the Market, there are use cases for bilateral actions that generate a
749 Transaction that did not come through the market.

750 For example, two parties within a market may choose to transact directly. A party may opt to buy directly
751 from his neighbor's solar power. Another market may permit Charity, that is an anonymous donation to
752 the Position of a neighbor. In either case, the Transaction is to the Market so that each Party's Position is
753 maintained and so that the Buyer does not get double billed. These transactions are referred to as over-
754 the-counter (OTC) agreements.

755 OTC Agreements can span multiple instruments.

756 The parties must wait for the Market's acknowledgment and approval before they proceed with the
757 delivery. This acknowledgment is by an EiTransactionCreated message to each Party.

758 [The Committee is most interested in comments on OTC Transactions, and the potential errors that would
759 prevent them being registered. It is possible that EiRegisterTransaction and EiTransactionAcknowledged
760 is a correct interaction.]

761

762

763 11 Position Facet

764 11.1 Introduction

765 The purpose of the Position Facet is to allow access to the accumulated position for actors.

766 Roles in using the Position Facet include

- 767 • The Actor whose position is being requested—the *position Party*
- 768 • An Actor who is authorized to request position information for other actors—including but not
769 limited to an auditor—the *requestor*
- 770 • The Market and Product for which the Position is being requested.

771 11.2 Position Definition

772 A Party's **Position** for a time period is the algebraic sum of committed supply or sale typically represented
773 as purchases and sales expressed by means of EiCreateTransaction payloads for that instrument and
774 Party.¹⁷

775 The time period for position intervals SHOULD be the same as for the underlying market used to buy and
776 sell, but need not be; conversion of differing time granularity is programmatic and not required by this
777 specification.

778 A Party needs to know both

- 779 • The Party's projected needs for a time interval (not in scope)
- 780 • The Party's committed net inflow and outflow for the interval

781 Note that committed inflow and outflow may be outside a market, e.g. local generation or battery
782 interaction.

783 An Actor may, with appropriate authorization, request positions for other parties. This permits the
784 specification and implementation of an auditor Actor.

785 An Actor sees its own Tenders and Transactions, and can maintain its own position. This facet allows the
786 offloading of that data management, but could in fact be a request to a local Position manager.

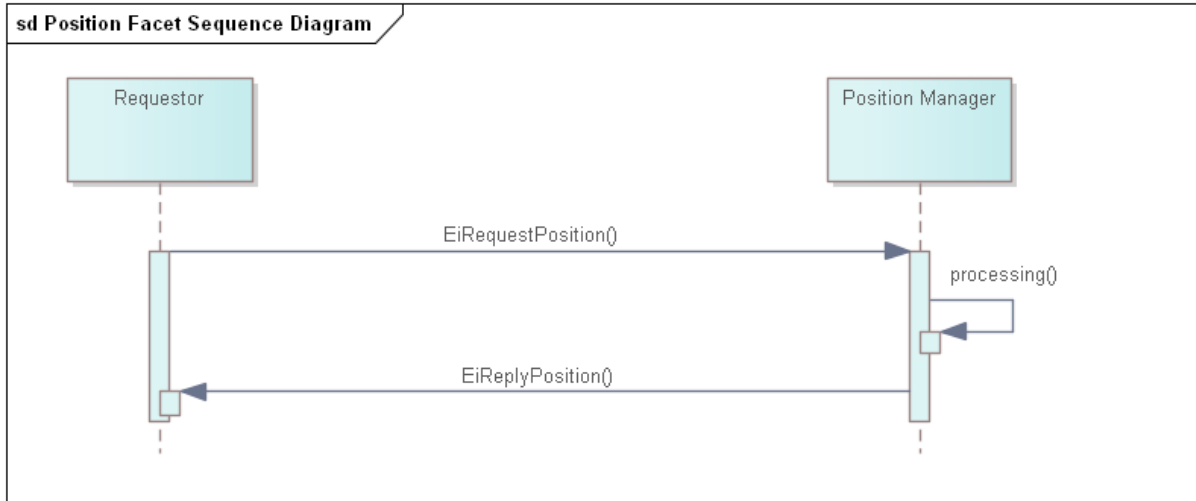

787 11.3 Interaction Pattern for the Position Facet

788 *Table 11-1: Position Facet*

Facet	Request Payload	Response Payload	Notes
Position	EiRequestPosition	EiReplyPosition	Request an Actor's Position(s) for a specific time interval, and reply with those Position(s) if access is authorized.

789 This is the [UML] sequence diagram for the Position Facet:

¹⁷ One may say that a Party's position for an Instrument is evolved from an accumulation of trades for that Instrument.

790

791

Figure 11-1: UML Sequence Diagram for the Position Facet

792

11.4 Information Model for the Position Facet

793

For Position, a bounding interval is specified and the position in each interval contained in the closed bounding interval is returned. An Actor has a position in a Product, and a Product specifies a temporal granularity or Interval duration. This Product duration defines the Interval duration for the returned CTS Stream. All elements of the stream share the duration and the stream has an explicitly stated start time.

797

A position is concerned with the total amount under contract, not the prices. If an Actor has positions in more than one Product, say, in a one-hour Product and in a one-minute Product, then that requires two requests for position, and the two replies have different interval durations. The integration of these two Positions into a single combined Position is the responsibility of the Requestor.

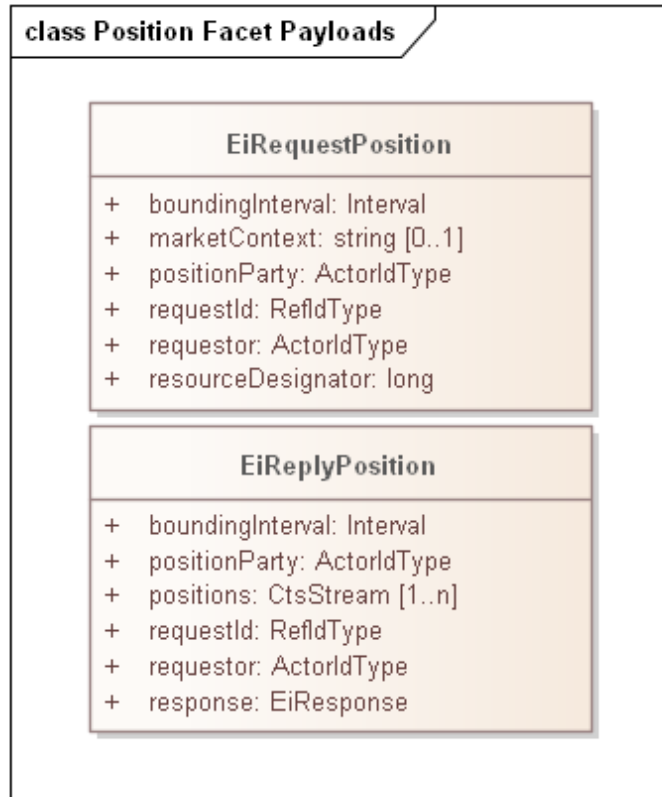

801

The attributes are shown in the following section.

802 **11.5 Payloads for the Position Facet**

803 The Position payload is in the format of a CTS Stream, with only a Quantity in the Interval Payload.
 804 TODO: discuss overlapping positions, as in 1 Hour position overlaid with a 5 minute position.

805
 806 The [UML] class diagram describes the payloads for the Position facet.

807
 808 *Figure 11-2: UML Class Diagram of Payloads for the Position Facet*

809
 810 *Table 11-2: Attributes of Position Facet Payloads*

Attribute	Meaning	Notes
Bounding Interval	The [closed] time interval for which position information is requested. The first Positions Stream element starts at or after the start of the Bounding Interval. The last Stream element ends at or before the start of the Bounding Interval.	
Position Party	The Party whose position is being requested.	Allows a request for another Party's position, with appropriate privacy and security constraints

Attribute	Meaning	Notes
Market Context	The market context of interest	Used to determine the Resource for position. If not present, any Resource of which the responder is aware, with no claim to completeness, will be used
Request ID	A reference to this payload	May be used as a correlation ID
Requestor	The Party requesting the position.	A failure indication will be returned if the Requestor is not authorized to access position information for Position Party. Addresses the auditor use case.
Positions	CTS Streams containing the positions for Position Party for each Resource. Positions are signed or zero.	Each CTS Stream interval that is contained within the Bounding Interval will have a value associated (signed integer, zero permitted). Note that a CTS Stream contains a Resource Designator
Response	An EiResponse. Will indicate failure if Requestor is not authorized to access position information for Position Party for any of the requested intervals.	

811 The following system-specific requirements are out of scope:

- 812 • Different systems may support Position requests for different purposes. An Actor MAY request its
- 813 own position(s) to recover from failure.
- 814 • Positions MAY be used to compute Actor reliability.
- 815 • A supplier of last resort MAY compare Positions to Delivery to impute transactions for
- 816 unpurchased power delivered. (See 12 Delivery Facet)

817 12 Delivery Facet

818 The CTS Delivery Facet can be considered as the telemetry facet. We term it “Delivery” to align with the
819 market focus of this specification, i.e., a building takes delivery of power or a distributed energy Resource
820 (DER) delivers power. A CTS Delivery payload contains a CTS Stream that conveys the flow of a specific
821 Resource through a particular point on the Product’s delivery network between particular times.

822 CTS Delivery is typically derived from reading one or more meters, but it may be computed, implied or
823 derived from some other method. Every contract is between a Party that promises to buy and a Party that
824 promises to sell. Consider an actor that performs temporal arbitrage, i.e., buys one-hour Products and
825 sells one-minute Products during the same hour. The Actor MAY report that it took delivery in each
826 minute of that Interval, and the sales to other Actors MAY be visible only as reductions as recorded in
827 Delivery.

828 In most TE markets, a node that takes delivery of more power or other Resource during an Interval than
829 contracted for must eventually pay for that delivery. For example, An auditor, however defined, could sum
830 all positions (See section 11, *Position Facet*) and compare the result to Delivery. The Auditor can then
831 impute a transaction for the over-delivery. This may not be a simple “spot price”; if multiple Actors are
832 taking over-delivery, then the last small transaction is likely underpriced. Systems that track “actor
833 reputation” may lower the reputation score. These examples explain the potential use of the information
834 delivered by this facet, and are not meant not to dictate any particular business process or system model.

835 A CTS Delivery payload reports on the flow of a Resource because the temporal granularity MAY not
836 match that of any particular Product. The payload may (e.g.) report the sum of a one-hour market and of
837 a one-minute market for the same Resource.

838 A CTS Marketplace MAY have expectations about levelized load—as do many of today’s tariffed markets.
839 Exceeding the limiting bounds for Delivery may result in a market penalty. It is outside the scope of this
840 specification to define the bounds or the nature of the penalty.

841 A request for delivery specifies a Resource, physical granularity, and temporal granularity. While the
842 physical granularity and temporal granularity need to be within the capabilities of the telemetry node, they
843 need not match any particular Product.]

844 12.1 Interaction Pattern for the Delivery Facet

845 *Table 12-1: Delivery Facet*

Facet	Request Payload	Response Payload	Notes
Delivery	EiRequestDelivery	EiReplyDelivery	Request Delivery through a specific Measurement Point

846 Figure 4-1 is the [UML] sequence diagram for the Delivery Facet:

847

848

Figure 12-1: UML Sequence Diagram for the Delivery Facet

849

12.2 Information Model for the Delivery Facet

850

A Delivery response returns a single CTS Stream of intervals of the requested Duration, with a quantity in each.

851

852

As with the Position Facet a bounding interval is specified and the delivery in each interval contained in the closed bounding interval is returned. The granularity as requested MAY not be available, or the

853

Delivery Actor may convert and combine—for example a request for one hour delivery intervals could be responded to using information from 1 minute or 5-minute measurement cycles.

854

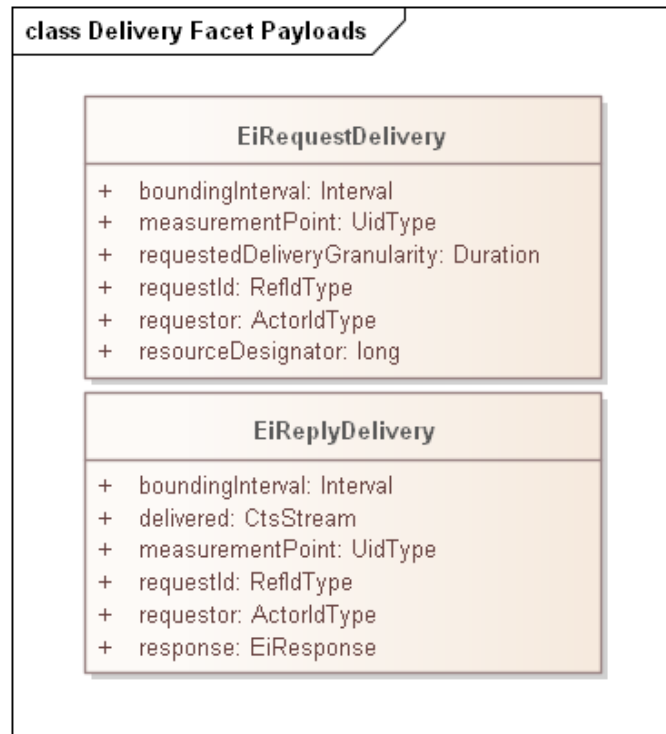

855

The attributes are shown in the following section.

856

857 **12.3 Payloads for the Delivery Facet**

858 The [UML] class diagram describes the payloads for the Delivery facet.

859

860 *Figure 12-2: UML Class Diagram of Payloads for the Position Facet*

861

862 *Table 12-2: Attributes of Delivery Facet Payloads*

Attribute	Meaning	Notes
Bounding Interval	The [closed] time interval for which position information is requested. The first Positions Stream element starts at or after the start of the Bounding Interval. The last Stream element ends at or before the start of the Bounding Interval.	
Measurement Point	The Point for which telemetry is provided about the flow of the resources..	Allows a request to any Measurement Point for information on Resource flow at that point over time. Information should be secured in conformance with appropriate privacy and security constraints
Request ID	A reference to this payload	May be used as a correlation ID

Attribute	Meaning	Notes
Requestor	The Party requesting the position.	A failure indication will be returned if the Requestor is not authorized to access position information for Position Party. Addresses the auditor use case.
Delivered	A CTS Stream containing the Delivery information for the Resource. Delivery value is signed or zero.	Each CTS Stream interval that is contained within the Bounding Interval will have a value associated (signed integer, zero permitted). Note that a CTS Stream contains a Resource Designator which SHOULD match that in the requested Resource Designator
Response	<p>An EiResponse. Will indicate failure if Requestor is not authorized to access position information for Position Party for any of the requested intervals.</p> <p>If the Requested Delivery Granularity cannot be used, MAY indicate what granularity can be used.</p>	

864 **13 Market Information—the Quote and Ticker Facets**

865 Tenders are typically private in a market, whether the market matches tenders using an order book, a
 866 double auction, or some other means to match buyer and seller to award contracts. Markets generate
 867 order by enabling price knowledge to emerge from the tenders of independent actors. If all tenders are
 868 public, then this price cannot emerge. No seller would ever offer a price less than the highest outstanding
 869 tender to buy; no buyer would ever offer a price higher than the lowest outstanding tender to sell.
 870 Moreover, analysis of tenders can reveal detailed information about the market participant beyond that
 871 necessary to balance supply and demand. (See *Appendix B.2, CTS and Privacy Considerations.*)

872 Even so, some Actors may wish to advertise specific Tenders. In a transitional environment, a utility may
 873 wish to publish day ahead prices for each hour of the day. An Actor may wish to draw others into the
 874 market quickly in response to a system failure or unplanned-for need—and may offer an unusually high or
 875 low price to attract sellers or buyers. Others may wish to quickly dispose of a previous position. A
 876 distribution operator in TE markets may wish to advertise short term deals temporal price boundaries to
 877 protect grid components by smoothly ramping power delivery requirements. Whatever the reason, [EI]
 878 specifies the EiQuote service for advertising Tenders.

879 Transaction prices are public information. Consider a financial market, which lists the current stock price,
 880 or more precisely, the price of the last transaction. Parties use this public information to plan whether to
 881 submit new Tenders, or perhaps to cancel old Tenders. An old technology for broadcasting financial
 882 transactions was the ticker producing ticker tape, so named for the sound it made with each transmission.
 883 CTS uses the term “Ticker” for the completed transaction information.

884 The information payloads for Quotes and Tickers are nearly identical.

885 For each Market, there MAY be URI for the Ticker service and for the Quote service. The Marketplace
 886 Characteristics MAY include a URI for the Ticker service and a URI for the Quote service.

887 This specification has no position on the whether a common Ticker for all Markets for a given Resource is
 888 better than a Ticker for each Market. Similarly, a Marketplace MAY choose to put all “Green” (however
 889 defined) Products in one Ticker stream and “conventional” in another. Any number of Markets within a
 890 Marketplace MAY use the same URI for the ticker service, and other Markets share another. Such
 891 decisions are left up to the developers of CTS-based systems.

892 Quotes use the same mechanisms, and like Tickers may have many Markets or a single Market in a
 893 single Quote service.

894 **13.1 Quotes**

895 [EI] defines a quotation as a market price or possible price, which does not replace the Tender and
 896 acceptance to reach a Transaction. The Quote message looks very much like a Tender.

897 As noted above in Section 9, the Tender Facet, a Party may wish to advertise certain of its Tenders to the
 898 market. An advertisement of an attractive price for limited amount of power might only be available to the
 899 first to respond Such a public Tender is distributed to other Parties by the Quote Facet by including a
 900 Tender ID for the parallel Tender.

901 Publish-Subscribe semantics are a likely communication paradigm.

902 **13.1.1 Interaction Pattern for the Quote Facet**

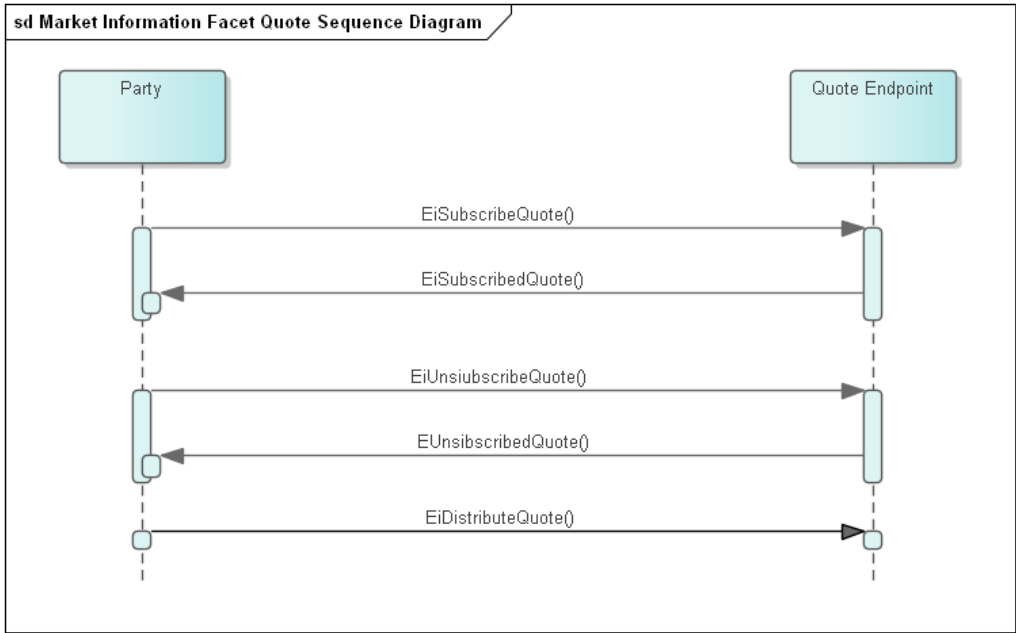

903 *Table 13-1: Quote Facet*

Facet	Request Payload	Response Payload	Notes
Quote	EiSubscribeQuote	EiSubscribedQuote	As multiple Markets may use same Quote service, must tolerate multiple subscriptions.

Facet	Request Payload	Response Payload	Notes
Quote	EiUnsubscribeQuote	EiUnsubscribedQuote	Unsubscribe for all Markets on this facet.
Quote	EiDistributeQuote	None	Post to a Quote endpoint.

904

905 See Figure 13-1 for the UML sequence diagram for the Quote Facet:

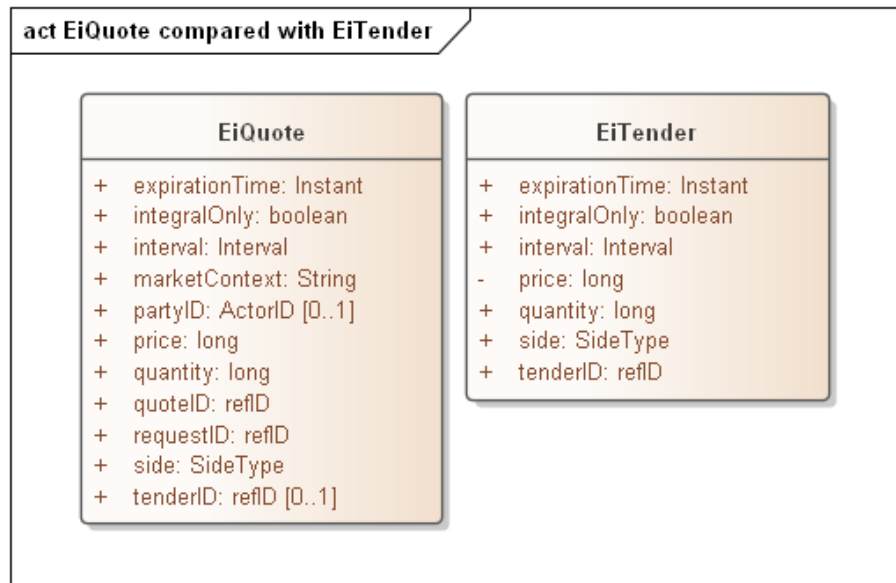

906

907 *Figure 13-1: UML Sequence Diagram for the Quote Facet*

908 The Quote Service does not wait for or expect acknowledgements of distributed Quotes.

909 **13.1.2 Information Model for the Quote Facet**

910 The [UML] class diagram describes the information model for EiQuote for the Quote Facet. The diagram
911 includes an informative class diagram of EiTender for comparison.

912

913

Figure 13-2: UML Class Diagram of EiQuote

914

The following table details the attributes of the EiQuote class.

Table 13-2: EiQuote Attributes

Attribute	Meaning	Notes
Expiration Time	The date and time after which this Quote is no longer valid.	If an advertised Tender, the expiration time for the Tender.
Integral Only	All of the Quote must be bought or sold at once; no partial sale or purchase	Useful for advertisement of Tenders. In CTS Integral Only is conformed to False.
Interval	The time interval for the Product being offered	The Resource Designator is that from the Market.
Party ID	Identifies the Party making the Quote	See Appendix B.2, CTS and Privacy Considerations. Optional.
Price	The unit price for the Product being Quoted	Total price is the product of price and quantity. Note that price is subject to the Price Decimal Fraction value for the Market. See Scale and Granularity Constraints in Section 8, "Market Facet"
Quantity	The quantity of the Product being Tendered	Total price is the product of price and quantity suitably scaled
Side	Whether the Quote is to buy or to sell the Product	
Quote ID	An ID for this Quote	
Tender ID	ID for the Tender being advertised, if any.	Optional. If present MAY claim that a Tender has been submitted to the Market, in effect advertising that Tender.
Market Context	The market context for which this is a quote	The Quote Reference is a Market Characteristic.

916 An Actor may submit quotes for several consecutive Intervals, a set of Instruments for an identical
 917 Product. An example is a load serving entity quoting 24 prices for the next day. All elements of the stream
 918 share the duration and the stream has the explicitly stated start time.¹⁸

¹⁸ Integration of CtsStreams is pending. **TODO**

919 13.1.3 Payloads for the Quote Facet

920 Conceptually the Quote streams may be considered implemented as Publish-Subscribe streams (Pub-
921 Sub).

922 The Market Characteristics provide a Quote Reference for a Market by requesting the QUOTE-REF
923 characteristic.

924 The mechanism and setup for subscribing is out of scope, as is the mechanism for publishing. The
925 payloads are as follows:

- 926 • EiSubscribeQuote – PartyID for the sender and the Quote Reference for the market as found in
927 Market Characteristics
- 928 • EiSubscribedQuote – EiResponse indicating success or failure. Implementations MAY send
929 information related to the Subscribed stream.
- 930 • EiUnsubscribeQuote – Removes the subscription to the indicated Quote Reference
- 931 • EiUnsubscribedQuote – EiResponse indicating success or failure. Implementations MAY send
932 information related to the now un-Subscribed stream.
- 933 • EiDistributeQuote – Publish an EiQuote to the Quote Reference.

934 13.2 Tickers

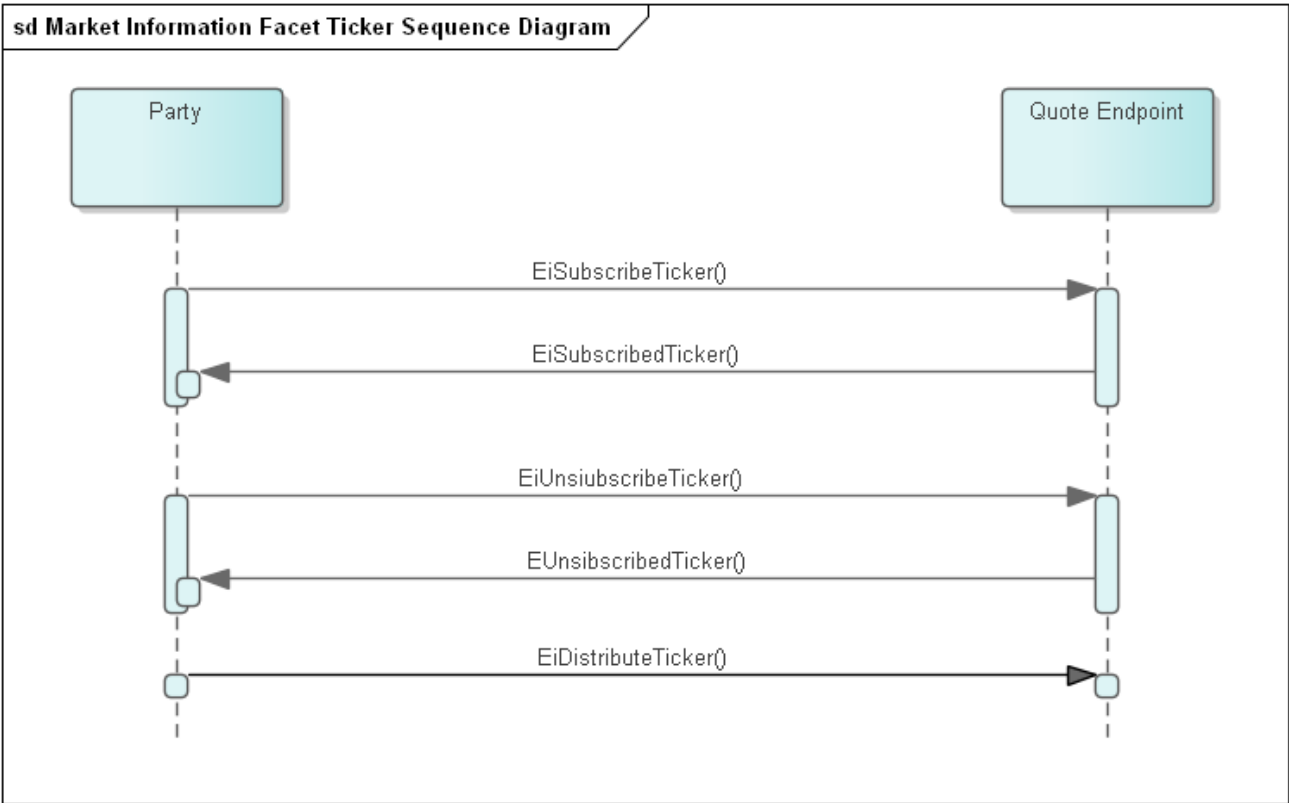

935 Ticker interactions and payloads are nearly identical to those for Quotes. Tickers are anonymized public
936 information about Transactions submitted to the Ticker service by the Markets. The mechanism and
937 interactions of this submission are out of scope.

938 13.2.1 Interaction Pattern for the Ticker Facet

939 *Table 13-3: Ticker Facet*

Facet	Request Payload	Response Payload	Notes
Ticker	EiSubscribeTicker	EiSubscribedTicker	As multiple Markets may use same Ticker service, must tolerate multiple subscriptions.
Ticker	EiUnsubscribeTicker	EiUnsubscribedTicker	Unsubscribe for all Markets on this facet.
Ticker	EiDistributeTicker	None	Publish to the Ticker Reference

940

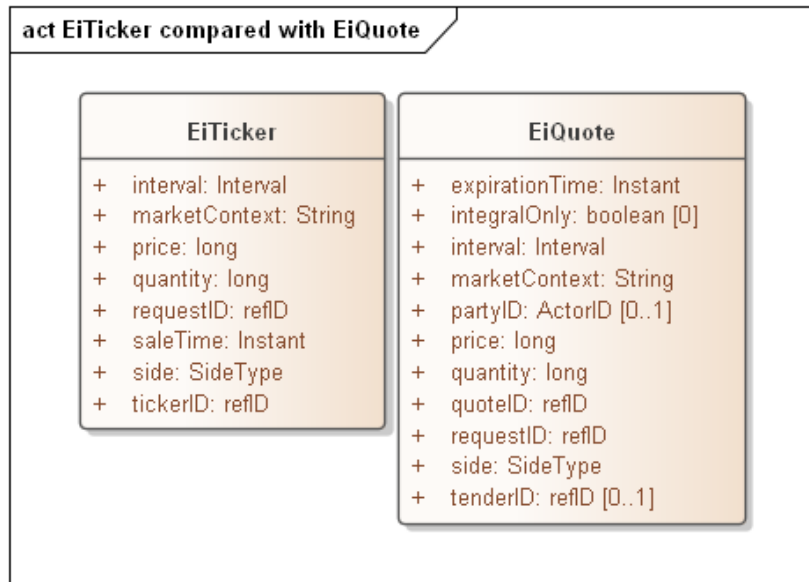

941
942

Figure 13-3: UML Sequence Diagram for the Ticker Facet

943 **13.2.2 Information Model for the Ticker Facet**

944 The [UML] class diagram describes the information model for `EiTicker` for the Ticker Facet. The diagram
945 includes an informative class diagram of `EiQuote` for comparison.

946
947

Figure 13-4: UML Class Diagram of `EiTicker` compared with `EiQuote`

948 The following table details the attributes of the EiTicker class.

949 *Table 13-4: EiTicker Attributes*

Attribute	Meaning	Notes
Interval	The time interval for the Product sold	The Resource Designator is that from the Market.
Market Context	The market context for which this is a Ticker	The Ticker Reference is a Market Characteristic.
Price	The unit price for the Product sold	Total price is the product of price and quantity. Note that price is subject to the Price Decimal Fraction value for the Market. See Scale and Granularity Constraints in Section 8, “Market Facet”
Quantity	The quantity of the sold	Total price is the product of price and quantity suitably scaled
Sale Time	Timestamp indicating when the sale took place.	
Side	Whether the sale was to buy or to sell the Product.	An implementation MAY deliver only Buy side Ticker elements
Ticker ID	An ID for this Ticker	

950 An Actor may submit ticker instances for several consecutive Intervals, a set of Instruments for an
951 identical Product. An example is a load serving entity quoting 24 prices for the next day. All elements of
952 the stream share the duration and the stream has the explicitly stated start time.¹⁹

953 13.2.3 Payloads for the Ticker Facet

954 The [UML] class diagram describes the payloads for the Delivery facet.

955 Conceptually the Ticker streams may be considered implemented as Publish-Subscribe streams (Pub-
956 Sub).

957 The Market Characteristics provide a Ticker Reference for a Market by requesting the TICKER-REF
958 characteristic.

959 The mechanism and setup for subscribing is out of scope, as is the mechanism for publishing. The
960 payloads are as follows:

- 961 • EiSubscribeTicker – PartyID for the sender and the Ticker Reference for the market as found in
962 Market Characteristics
- 963 • EiSubscribedTicker – EiResponse indicating success or failure. Implementations MAY send
964 information related to the Subscribed stream.

¹⁹ Integration of CtsStreams is pending. **TODO**

- 965 • EiUnsubscribeTicker – Removes the subscription to the indicated Ticker Reference
- 966 • EiUnsubscribedTicker – EiResponse indicating success or failure. Implementations MAY send
- 967 information related to the now un-Subscribed stream.
- 968 • EiDistributeTicker – Publish an EiTicker to the Ticker Reference.
- 969
- 970

971 **14 Bindings**

972 Payloads and interaction patterns are described in **[UML]** in Sections 6 through 12 above. This section
973 contains bindings for the payloads in three encoding schemes:

- 974 • JSON **[JSON]**
- 975 • XML Schema **[XSD]**
- 976 • FIX Simple Binary Encoding **[SBE]**

977 **14.1 JSON**

978 PENDING—JSON Schema awaiting stable payload definitions

979 **14.2 XML Schema**

980 PENDING—XML Schema awaiting stable payload definitions

981 **14.2.1 XML Namespaces**

982 PENDING—XML Namespaces awaiting XML Schema

983 **14.3 Simple Binary Encoding**

984 TODO—SBE Schema awaiting stable payload definitions

985 15 Conformance

986 15.1 Introduction to Conformance

987 By design, CTS is a simplified and restricted subset profile of TeMIX. See Appendix

988 Portions of CTS conform to and use updated and simplified versions of the specifications consumed by
989 EI, specifically

- 990 • OASIS WS-Calendar **[WS-Calendar]**
- 991 • A definition of Streams contained in **[EI]**

992 We normatively reference and apply the evolution of these specifications, in particular

- 993 • OASIS WS-Calendar Schedule Streams and signals **[Streams]**, simplified as CTS Streams (see
994 CTS Streams
- 995 • The WS-Calendar **[CAL-MIN]** interval is used directly (as IntervalType).

996 This specification simplifies WS-Calendar Schedule Streams and Signals [Streams] as CTS Streams, and
997 refactors the TEMIX profile of **[EI]**.

998 Conformance of the CTS evolved specification can be shown with the techniques of **[IEC62746-10-3]** is
999 described in informative Appendix C.

1000 15.2 Claiming Conformance to Common Transactive Services

1001 Implementations claim conformance to Common Transactive Services 1.0 by asserting conformance
1002 statements on the numbered items below.

- 1003 1. The conformance statement **MUST** list all Facets which it supports in full or and in part.
- 1004 2. The conformance statement **MUST** describe all extensions to payloads described in this
1005 specification.
- 1006 3. The conformance statement **MUST** describe the Binding(s) which it supports along with any
1007 extensions. If the implementation does not use a standard binding as defined in Section 13, the
1008 conformance statement **MUST** define the binding used, at a similar level to detail to Section 13.
- 1009 4. The conformance statement **MUST** describe how each payload definition conforms to the UML
1010 and/or profiled definitions for each payload unless it uses only standard Bindings in Section 13.
- 1011 5. The conformance statement **MUST** indicate cardinality for message payload attributes where
1012 there is flexibility in this specification.
- 1013 6. The conformance statement **MUST** describe any facets it defines to extend this specification.

1014 Appendix A. References

1015 This appendix contains the normative and informative references that are used in this document.
1016 Normative references are specific (identified by date of publication and/or edition number or Version
1017 number) and Informative references may be either specific or non-specific.

1018 While any hyperlinks included in this appendix were valid at the time of publication, OASIS cannot
1019 guarantee their long-term validity.

1020 A.1 Normative References

1021 The following documents are referenced in such a way that some or all of their content constitutes
1022 requirements of this document.

1138 Appendix B. Security and Privacy Considerations

1139 This specification defines message payloads only. Security must be composed in. Privacy considerations
1140 must be decided when implementing specific systems for specific purposes.

1141 B.1 CTS and Security Considerations

1142 Procuring energy for local use and selling energy for remote use are each at the cusp of finance and
1143 operations.

- 1144 • A price that is falsely low may cause the buyer to operate a system when there is inadequate
1145 power, potentially harming systems within a facility, or harming other facilities on the same circuit.
- 1146 • A price that is falsely low may cause the seller to leave the market.
- 1147 • A price that is falsely high may cause the buyer to shut down operation of systems or equipment.
- 1148 • A price that is falsely high may cause the seller to increase operations when there is neither a
1149 ready consumer or perhaps even grid capacity to take delivery.

1150 For these reasons, it is important that each system guard the integrity of each message, assure the
1151 identities of the sender and of the receiver, and prove whether a message was received or not.

1152 Messages should be encrypted to prevent eavesdropping. Any node should be able to detect replay,
1153 message insertion, deletion, and modification. A system must guard against and detect man-in-the-
1154 middle” attacks wherein an intermediary node passes of messages as originating from a known and
1155 trusted source.

1156 The Technical Committee generally recommends that production implementations use Zero-Trust security
1157 **[ZeroTrust]**, especially because of the wide distribution and potentially diverse ownership of TRM Actors.
1158 Zero Trust security requires authentication and authorization of every device, person, and application.
1159 The best practice is to encrypt all messages, even those between the separate components of an
1160 application within the cloud.

1161 This specification makes no attempt to describe methods or technologies to enable Zero Trust
1162 interactions between Actors.

1163 B.2 CTS and Privacy Considerations

1164 The United Nations has defined privacy as “the presumption that individuals should have an area of
1165 autonomous development, interaction and liberty, a ‘private sphere’ with or without interaction with others,
1166 free from state intervention and excessive unsolicited intervention by other uninvited individuals. The right
1167 to privacy is also the ability of individuals to determine who holds information about them and how that
1168 information is used” (UN General Assembly 2013:15).

1169 Electrical usage data inherently creates a privacy risk. Published work has demonstrated that simple
1170 usage data can be used to reveal the inner operations and decisions in a home. Other research has
1171 demonstrated that anonymous electrical usage data can be “de-anonymized” to identify an individual
1172 electricity user. The more fine-grained the data, the more intimate the details that can be garnered from
1173 meter telemetry.

1174 In an amicus brief in a case on smart metering, the Electronic Freedom Foundation testified that that
1175 aggregate smart meter data collected from someone’s home in 15-minute intervals could be used to infer,
1176 for example, whether they tend to cook meals in the microwave or on the stove; whether they make
1177 breakfast; whether and how often they use exercise equipment, such as a treadmill; whether they have
1178 an in-home alarm system; when they typically take a shower; if they have a washer and dryer, and how
1179 often they use them; and whether they switch on the lights at odd hours, such as in the middle of the
1180 night. And these inferences, in turn, can permit intimate deductions about a person’s lifestyle, including
1181 their occupation, health, religion, sexuality, and financial circumstances. These privacy concerns are
1182 linked to increased security risks criminals may be able to access the data and use the information to
1183 enable inferences about what people are doing in their home or if they are away from home.

1184 This specification describes how to share communications beyond mere electrical usage telemetry.
1185 Communications reveal what the user would like to buy, how much they would be willing to spend, and
1186 future intents and plans.

1187 System developers using this specification should consider legal requirements under the Fair Practice
1188 Principles and the European Union's General Data Protection Regulation. These include:

- 1189 1) The Collection Limitation Principle. There should be limits to the collection of personal data and
1190 any such data should be obtained by lawful and fair means and, where appropriate, with the
1191 knowledge or consent of the data subject.
- 1192 2) The Data Quality Principle. Personal data should be relevant to the purposes for which they are
1193 to be used and, to the extent necessary for those purposes, should be accurate, complete and
1194 kept up-to-date.
- 1195 3) The Purpose Specification Principle. The purposes for which personal data are collected should
1196 be specified not later than at the time of data collection and the subsequent use limited to the
1197 fulfillment of those purposes or such others as are not incompatible with those purposes and as
1198 are specified on each occasion of change of purpose.
- 1199 4) The Use Limitation Principle. Personal data should not be disclosed, made available or otherwise
1200 used for purposes other than those specified, except a) with the consent of the data subject, or b)
1201 by the authority of law.
- 1202 5) The Security Safeguards Principle. Personal data should be protected by reasonable security
1203 safeguards against such risks as loss or unauthorized access, destruction, use, modification or
1204 disclosure of data.
- 1205 6) The Openness Principle. There should be a general policy of openness about developments,
1206 practices and policies with respect to personal data. Means should be readily available of
1207 establishing the existence and nature of personal data and the main purposes of their use, as
1208 well as the identity and usual residence of the data controller.
- 1209 7) The Individual Participation Principle. An individual should have the right:
 - 1210 a. to obtain from a data controller, or otherwise, confirmation of whether or not the data
1211 controller has data relating to him;
 - 1212 b. to have data relating to him communicated to him, within a reasonable time, at a charge,
1213 if any, that is not excessive; in a reasonable manner, and in a form that is readily
1214 intelligible to him;
 - 1215 c. to be given reasons if a request made under subparagraphs (a) and (b) is denied and to
1216 be able to challenge such denial; and
 - 1217 d. to challenge data relating to him and, if the challenge is successful, to have the data
1218 erased, rectified, completed or amended;
- 1219 8) The Accountability Principle. A data controller should be accountable for complying with
1220 measures which give effect to the principles stated above.

1221 In developing this specification, the Technical Committee has kept in mind the need to support a
1222 developer wishing to support privacy. Actors representing an up-stream electrical serving entity, say a
1223 distribution system operator or traditional utility, use the same messages as anyone else—no actor is
1224 inherently privileged. Messages to provide market information or “ticker-tape” functions do not include
1225 Party IDs. General advertising of Tenders, while necessary to draw matching Tenders quickly to market,
1226 may be anonymous.

1227 In some messages and some markets, it is necessary to use a proxy ID to protect privacy or to simply
1228 conveyance of a transaction from a complex matching mechanism. To protect privacy, a market may
1229 transmit such a proxy ID in place of a Party Id in Quotes, Tenders, Transactions, and Tickers. Markets
1230 that use cumulative matching algorithms such as double auction cannot identify a specific Counter Party
1231 to a transaction.

1232 The system developer should keep the privacy principals in mind when making specific technology
1233 choices. For example, messages between an actor and the market MAY be encrypted to protect the
1234 privacy of people represented by individual actors. While the transactive energy market must know both
1235 buyers and sellers to support transaction contracts and settlements, the developer should take steps to

1236 guard that information. A developer may opt that each notice of contract sent to an actor always has a
1237 counterparty of the market, so as to protect the sources and uses of electricity.
1238 It is beyond the scope of this specification to specify security practices and privacy design for markets
1239 built using this specification.

1240 **Appendix C. Conformance to the TEMIX Profile of**
1241 **Energy Interoperation**

1242 **TBD**

1243 **Appendix D. Glossary of Terms and Abbreviations**
1244 **Used in this document**

1245 Throughout this document, abbreviations are used to improve clarity and brevity, especially to reference
1246 specifications with long titles.

1247 *Table C--15-1 Abbreviations and Terms used throughout this document*

Attribute	Meaning
CTS	Common Transactive Services
EI	Energy Interoperation, an OASIS specification as per the normative references, CTS is a conforming profile of EI.
EMIX	Energy Market Information Exchange, an OASIS specification used to describe Products and markets for resources, particularly those traded in power grids.

1248

1249 **Appendix E. Acknowledgments**

1250 This work is derived from the specification Common Transactive Services 1.0 , contributed by The Energy
1251 Mashup Lab, written by William T. Cox and Toby Considine.

1252 Portions of models and text is derived from The Energy Mashup Lab open source project, EML-CTS and
1253 is used under terms of the Apache 2.0 License for that project.²⁰

1254 **E.1 Participants**

1255 The following individuals were members of this Technical Committee during the creation of this document
1256 and their contributions are gratefully acknowledged:

1257

1258 Rolf Bienert, OpenADR Alliance

1259 Toby Considine, University of North Carolina at Chapel Hill

1260 William T. Cox, Individual Member

1261 Pim van der Eijk, Sonnenglanz Consulting

1262 David Holmberg, National Institute for Standards & Technology (NIST)

1263 Elysa Jones, Individual

1264 Chuck Thomas, Electric Power Research Institute (EPRI)

1265

Appendix F. Revision History

1266

Revision	Date	Editor	Changes Made
WD01	2/15/2021	Toby Considine	Initial reformatting and conversion of the specification contributed by The Energy Mashup Lab to create a document for committee work.
WD02	3/3/2021	Toby Considine	Added prose definitions of Resource, Product, and Instrument
WD03	4/5/2021	Toby Considine	Simplified introductory material, raised message type to earlier in document. Removed some repetitive material. Revised UML required.
WD04	5/7/2021	Toby Considine David Holmberg William T Cox	Reordered intro material to reduce repetition, Reference Actor Model more consistently, Revise and re-factor Resource/Product/Instrument Add Section 3 to elevate common semantic elements
WD05	5/25/2021	Toby Considine David Holmberg William T Cox	Continues clean-up and condensation of sections 1, 2
WD06	6/7/2021	Toby Considine	Refines Item language into Resource and Products. Explains Message Groups as a conforming descendant of EI Services.
WD07	6/21/2021	Toby Considine William T Cox	Clarified terminology and relationship to implied Service-Oriented Architecture. Structured CTS facets for clearer explanation
WD08	8/5/2021	Toby Considine William T Cox David Holmberg	Clarify and simplify actor facets descriptions, including Tender, Transaction, and Configuration. Reduce redundant and less relevant content.
WD09	9/14/2021	William T Cox Toby Considine David Holmberg	Added Facet descriptions for Position, Market Characteristics, CTS Streams, and drafts of Privacy Consideration, Delivery and Party Registration Facets. Numerous edits for clarity and conciseness.
WD10	10/4/2021	Toby Considine William T Cox David Holmberg	Extended Market Facets. Defined Position and Delivery facets. Made references more consistent. Updated UML model and diagrams.
WD11	10/22/2021	David Holmberg William T Cox Toby Considine	Corrections for clarity. Improved UML diagrams. Flagged requests for comments in Public Review

CSD01	10/29/2021	OASIS TC Administration	Content as in WD11, formatted to include OASIS metadata and references to the published specification
WD12	1/10/2022	William T Cox Toby Considine	Simpler edits in response to comments from PR
WD13		William T Cox Toby Considine	Clarification of Resource/Product/Instrument Removal of references to "Architecture" Responses to "Clarity" tagged issues
WD14	2/22/2022	William T Cox Toby Considine	Clarification of front material Section 1/-2 compared to eliminate duplicative definitions Numerous issues resolutions applied as per Jira
WD15	3/20/2020	William T Cox Toby Considine	Clarity, responses to issues from Review
WD16	4/12/2022	William T Cox Toby Considine	Marketplace and Market characteristics responses to issues Expanded Quotes and Tickers Focus on capitalization
WD17	4/25/2022	William T Cox Toby Considine	Updated UML Market Information added OTC Transactions Edits for Clarity

1282 or assigns.

1283 This document and the information contained herein is provided on an "AS IS" basis and OASIS
1284 DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY
1285 WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY
1286 OWNERSHIP RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A
1287 PARTICULAR PURPOSE. OASIS AND ITS MEMBERS WILL NOT BE LIABLE FOR ANY DIRECT,
1288 INDIRECT, SPECIAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF ANY USE OF THIS
1289 DOCUMENT OR ANY PART THEREOF.

1290 As stated in the OASIS IPR Policy, the following three paragraphs in brackets apply to OASIS Standards
1291 Final Deliverable documents (Committee Specifications, OASIS Standards, or Approved Errata).

1292 [OASIS requests that any OASIS Party or any other party that believes it has patent claims that would
1293 necessarily be infringed by implementations of this OASIS Standards Final Deliverable, to notify OASIS
1294 TC Administrator and provide an indication of its willingness to grant patent licenses to such patent claims
1295 in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this
1296 deliverable.]

1297 [OASIS invites any party to contact the OASIS TC Administrator if it is aware of a claim of ownership of
1298 any patent claims that would necessarily be infringed by implementations of this OASIS Standards Final
1299 Deliverable by a patent holder that is not willing to provide a license to such patent claims in a manner
1300 consistent with the IPR Mode of the OASIS Technical Committee that produced this OASIS Standards
1301 Final Deliverable. OASIS may include such claims on its website, but disclaims any obligation to do so.]

1302 [OASIS takes no position regarding the validity or scope of any intellectual property or other rights that
1303 might be claimed to pertain to the implementation or use of the technology described in this OASIS
1304 Standards Final Deliverable or the extent to which any license under such rights might or might not be
1305 available; neither does it represent that it has made any effort to identify any such rights. Information on
1306 OASIS' procedures with respect to rights in any document or deliverable produced by an OASIS
1307 Technical Committee can be found on the OASIS website. Copies of claims of rights made available for
1308 publication and any assurances of licenses to be made available, or the result of an attempt made to
1309 obtain a general license or permission for the use of such proprietary rights by implementers or users of
1310 this OASIS Standards Final Deliverable, can be obtained from the OASIS TC Administrator. OASIS
1311 makes no representation that any information or list of intellectual property rights will at any time be
1312 complete, or that any claims in such list are, in fact, Essential Claims.]

1313 The name "OASIS" is a trademark of OASIS, the owner and developer of this document, and should be
1314 used only to refer to the organization and its official outputs. OASIS welcomes reference to, and
1315 implementation and use of, documents, while reserving the right to enforce its marks against misleading
1316 uses. Please see <https://www.oasis-open.org/policies-guidelines/trademark/> for above guidance.
