#### Abstract:

This document is intended for developers and architects who wish to design systems and applications that interoperate using the Key Management Interoperability Protocol Specification.

#### Status:

This document was last revised or approved by the OASIS Key Management Interoperability Protocol (KMIP) TC on the above date. The level of approval is also listed above. Check the "Latest version" location noted above for possible later revisions of this document.

Technical Committee members should send comments on this specification to the Technical Committee's email list. Others should send comments to the Technical Committee by using the "Send A Comment" button on the Technical Committee's web page at <http://www.oasis-open.org/committees/kmip/>.

For information on whether any patents have been disclosed that may be essential to implementing this specification, and any offers of patent licensing terms, please refer to the Intellectual Property Rights section of the Technical Committee web page (<http://www.oasis-open.org/committees/kmip/ipr.php>).

# Notices

Copyright © OASIS Open 2012. All Rights Reserved.

All capitalized terms in the following text have the meanings assigned to them in the OASIS Intellectual Property Rights Policy (the "OASIS IPR Policy"). The full [Policy](#) may be found at the OASIS website.

This document and translations of it may be copied and furnished to others, and derivative works that comment on or otherwise explain it or assist in its implementation may be prepared, copied, published, and distributed, in whole or in part, without restriction of any kind, provided that the above copyright notice and this section are included on all such copies and derivative works. However, this document itself may not be modified in any way, including by removing the copyright notice or references to OASIS, except as needed for the purpose of developing any document or deliverable produced by an OASIS Technical Committee (in which case the rules applicable to copyrights, as set forth in the OASIS IPR Policy, must be followed) or as required to translate it into languages other than English.

The limited permissions granted above are perpetual and will not be revoked by OASIS or its successors or assigns.

This document and the information contained herein is provided on an "AS IS" basis and OASIS DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY WARRANTY THAT THE USE OF THE INFORMATION HEREIN WILL NOT INFRINGE ANY OWNERSHIP RIGHTS OR ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

OASIS requests that any OASIS Party or any other party that believes it has patent claims that would necessarily be infringed by implementations of this OASIS Committee Specification or OASIS Standard, to notify OASIS TC Administrator and provide an indication of its willingness to grant patent licenses to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification.

OASIS invites any party to contact the OASIS TC Administrator if it is aware of a claim of ownership of any patent claims that would necessarily be infringed by implementations of this specification by a patent holder that is not willing to provide a license to such patent claims in a manner consistent with the IPR Mode of the OASIS Technical Committee that produced this specification. OASIS may include such claims on its website, but disclaims any obligation to do so.

OASIS takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to pertain to the implementation or use of the technology described in this document or the extent to which any license under such rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information on OASIS' procedures with respect to rights in any document or deliverable produced by an OASIS Technical Committee can be found on the OASIS website. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or users of this OASIS Committee Specification or OASIS Standard, can be obtained from the OASIS TC Administrator. OASIS makes no representation that any information or list of intellectual property rights will at any time be complete, or that any claims in such list are, in fact, Essential Claims.

The name "OASIS" is a trademark of [OASIS](#), the owner and developer of this specification, and should be used only to refer to the organization and its official outputs. OASIS welcomes reference to, and implementation and use of, specifications, while reserving the right to enforce its marks against misleading uses. Please see <http://www.oasis-open.org/policies-guidelines/trademark> for above guidance.

# 1 Introduction

This document is intended as a specification of the protocol used for the communication between clients and servers to perform certain management operations on objects stored and maintained by a key management system. These objects are referred to as *Managed Objects* in this specification. They include symmetric and asymmetric cryptographic keys, digital certificates, and templates used to simplify the creation of objects and control their use. Managed Objects are managed with *operations* that include the ability to generate cryptographic keys, register objects with the key management system, obtain objects from the system, destroy objects from the system, and search for objects maintained by the system. Managed Objects also have associated *attributes*, which are named values stored by the key management system and are obtained from the system via operations. Certain attributes are added, modified, or deleted by operations.

The protocol specified in this document includes several certificate-related functions for which there are a number of existing protocols – namely Validate (e.g., SCVP or XKMS), Certify (e.g. CMP, CMC, SCEP) and Re-certify (e.g. CMP, CMC, SCEP). The protocol does not attempt to define a comprehensive certificate management protocol, such as would be needed for a certification authority. However, it does include functions that are needed to allow a key server to provide a proxy for certificate management functions.

In addition to the normative definitions for managed objects, operations and attributes, this specification also includes normative definitions for the following aspects of the protocol:

- The expected behavior of the server and client as a result of operations,
- Message contents and formats,
- Message encoding (including enumerations), and
- Error handling.

This specification is complemented by three other documents. The Usage Guide **[KMIP-UG]** provides illustrative information on using the protocol. The KMIP Profiles Specification **[KMIP-Prof]** provides a selected set of conformance profiles and authentication suites. The Test Specification **[KMIP-TC]** provides samples of protocol messages corresponding to a set of defined test cases.

This specification defines the KMIP protocol version major 1 and minor 1 (see 6.1).

## 1.1 Terminology

The key words “MUST”, “MUST NOT”, “REQUIRED”, “SHALL”, “SHALL NOT”, “SHOULD”, “SHOULD NOT”, “RECOMMENDED”, “MAY”, and “OPTIONAL” in this document are to be interpreted as described in **[RFC2119]**.

For acronyms used in this document, see Appendix E. For definitions not found in this document, see **[SP800-57-1]**.

Archive	To place information not accessed frequently into long-term storage.
Asymmetric key pair (key pair)	A public key and its corresponding private key; a key pair is used with a public key algorithm.
Authentication	A process that establishes the origin of information, or determines an entity's identity.
Authentication code	A cryptographic checksum based on a security function (also known as a Message Authentication Code).
Authorization	Access privileges that are granted to an entity; conveying an “official”

	sanction to perform a security function or activity.
Certificate length	The length (in bytes) of an X.509 public key certificate.
Certification authority	The entity in a Public Key Infrastructure (PKI) that is responsible for issuing certificates, and exacting compliance to a PKI policy.
Ciphertext	Data in its encrypted form.
Compromise	The unauthorized disclosure, modification, substitution or use of sensitive data (e.g., keying material and other security-related information).
Confidentiality	The property that sensitive information is not disclosed to unauthorized entities.
Cryptographic algorithm	A well-defined computational procedure that takes variable inputs, including a cryptographic key and produces an output.
Cryptographic key (key)	A parameter used in conjunction with a cryptographic algorithm that determines its operation in such a way that an entity with knowledge of the key can reproduce or reverse the operation, while an entity without knowledge of the key cannot. Examples include: <ol style="list-style-type: none"> <li>1. The transformation of plaintext data into ciphertext data,</li> <li>2. The transformation of ciphertext data into plaintext data,</li> <li>3. The computation of a digital signature from data,</li> <li>4. The verification of a digital signature,</li> <li>5. The computation of an authentication code from data,</li> <li>6. The verification of an authentication code from data and a received authentication code.</li> </ol>
Decryption	The process of changing ciphertext into plaintext using a cryptographic algorithm and key.
Digest (or hash)	The result of applying a hashing algorithm to information.
Digital signature (signature)	The result of a cryptographic transformation of data that, when properly implemented with supporting infrastructure and policy, provides the services of: <ol style="list-style-type: none"> <li>1. origin authentication</li> <li>2. data integrity, and</li> <li>3. signer non-repudiation.</li> </ol>
Digital Signature Algorithm	A cryptographic algorithm used for digital signature.
Encryption	The process of changing plaintext into ciphertext using a cryptographic algorithm and key.
Hashing algorithm (or hash algorithm, hash function)	An algorithm that maps a bit string of arbitrary length to a fixed length bit string. Approved hashing algorithms satisfy the following properties: <ol style="list-style-type: none"> <li>1. (One-way) It is computationally infeasible to find any input that maps to any pre-specified output, and</li> <li>2. (Collision resistant) It is computationally infeasible to find any two distinct inputs that map to the same output.</li> </ol>
Integrity	The property that sensitive data has not been modified or deleted in an

	unauthorized and undetected manner.
Key derivation (derivation)	A function in the lifecycle of keying material; the process by which one or more keys are derived from 1) either a shared secret from a key agreement computation or a pre-shared cryptographic key, and 2) other information.
Key management	The activities involving the handling of cryptographic keys and other related security parameters (e.g., IVs and passwords) during the entire life cycle of the keys, including their generation, storage, establishment, entry and output, and destruction.
Key wrapping (wrapping)	A method of encrypting and/or MACing/signing keys.
Message authentication code (MAC)	A cryptographic checksum on data that uses a symmetric key to detect both accidental and intentional modifications of data.
PGP certificate	A transferable public key in the OpenPGP Message Format (see <b>[RFC4880]</b> ).
Private key	<p>A cryptographic key, used with a public key cryptographic algorithm, that is uniquely associated with an entity and is not made public. The private key is associated with a public key. Depending on the algorithm, the private key may be used to:</p> <ol style="list-style-type: none"> <li>1. Compute the corresponding public key,</li> <li>2. Compute a digital signature that may be verified by the corresponding public key,</li> <li>3. Decrypt data that was encrypted by the corresponding public key, or</li> <li>4. Compute a piece of common shared data, together with other information.</li> </ol>
Profile	A specification of objects, attributes, operations, message elements and authentication methods to be used in specific contexts of key management server and client interactions (see <b>[KMIP-Prof]</b> ).
Public key	<p>A cryptographic key used with a public key cryptographic algorithm that is uniquely associated with an entity and that may be made public. The public key is associated with a private key. The public key may be known by anyone and, depending on the algorithm, may be used to:</p> <ol style="list-style-type: none"> <li>1. Verify a digital signature that is signed by the corresponding private key,</li> <li>2. Encrypt data that can be decrypted by the corresponding private key, or</li> <li>3. Compute a piece of shared data.</li> </ol>
Public key certificate (certificate)	A set of data that uniquely identifies an entity, contains the entity's public key and possibly other information, and is digitally signed by a trusted party, thereby binding the public key to the entity.
Public key cryptographic algorithm	A cryptographic algorithm that uses two related keys, a public key and a private key. The two keys have the property that determining the private key from the public key is computationally infeasible.
Public Key Infrastructure	A framework that is established to issue, maintain and revoke public key certificates.

Recover	To retrieve information that was archived to long-term storage.
Split knowledge	A process by which a cryptographic key is split into $n$ multiple key components, individually providing no knowledge of the original key, which can be subsequently combined to recreate the original cryptographic key. If knowledge of $k$ (where $k$ is less than or equal to $n$ ) components is required to construct the original key, then knowledge of any $k-1$ key components provides no information about the original key other than, possibly, its length.
Symmetric key	A single cryptographic key that is used with a secret (symmetric) key algorithm.
Symmetric key algorithm	A cryptographic algorithm that uses the same secret (symmetric) key for an operation and its complement (e.g., encryption and decryption).
X.509 certificate	The ISO/ITU-T X.509 standard defined two types of certificates – the X.509 public key certificate, and the X.509 attribute certificate. Most commonly (including this document), an X.509 certificate refers to the X.509 public key certificate.
X.509 public key certificate	The public key for a user (or device) and a name for the user (or device), together with some other information, rendered un-forgable by the digital signature of the certification authority that issued the certificate, encoded in the format defined in the ISO/ITU-T X.509 standard.

## 2 Objects

The following subsections describe the objects that are passed between the clients and servers of the key management system. Some of these object types, called *Base Objects*, are used only in the protocol itself, and are not considered Managed Objects. Key management systems MAY choose to support a subset of the Managed Objects. The object descriptions refer to the primitive data types of which they are composed. These primitive data types are (see Section 9.1.1.4):

- Integer
- Long Integer
- Big Integer
- Enumeration – choices from a predefined list of values
- Boolean
- Text String – string of characters representing human-readable text
- Byte String – sequence of unencoded byte values
- Date-Time – date and time, with a granularity of one second
- Interval – a length of time expressed in seconds

Structures are composed of ordered lists of primitive data types or sub-structures.

### 2.1 Base Objects

These objects are used within the messages of the protocol, but are not objects managed by the key management system. They are components of Managed Objects.

#### 2.1.1 Attribute

An Attribute object is a structure (see Table 2) used for sending and receiving Managed Object attributes. The *Attribute Name* is a text-string that is used to identify the attribute. The *Attribute Index* is an index number assigned by the key management server. The Attribute Index is used to identify the particular instance. Attribute Indices SHALL start with 0. The Attribute Index of an attribute SHALL NOT change when other instances are added or deleted. Single-instance Attributes (attributes which an object MAY only have at most one instance thereof) SHALL have an Attribute Index of 0. The *Attribute Value* is either a primitive data type or structured object, depending on the attribute.

When an Attribute structure is used to specify or return a particular instance of an Attribute and the Attribute Index is not specified it SHALL be assumed to be 0.

Object	Encoding	REQUIRED
Attribute	Structure	
Attribute Name	Text String	Yes
Attribute Index	Integer	No
Attribute Value	Varies, depending on attribute. See Section 3	Yes, except for the Notify operation (see Section 5.1)

Table 2: Attribute Object Structure

## 2.1.2 Credential

A *Credential* is a structure (see Table 3) used for client identification purposes and is not managed by the key management system (e.g., user id/password pairs, Kerberos tokens, etc). It MAY be used for authentication purposes as indicated in [KMIP-Prof].

Object	Encoding	REQUIRED
Credential	Structure	
Credential Type	Enumeration, see 9.1.3.2.1	Yes
Credential Value	Varies. Structure for Username and Password Credential Type.	Yes

Table 3: Credential Object Structure

If the Credential Type in the Credential is *Username and Password*, then Credential Value is a structure as shown in Table 4. The Username field identifies the client, and the Password field is a secret that authenticates the client.

Object	Encoding	REQUIRED
Credential Value	Structure	
Username	Text String	Yes
Password	Text String	No

Table 4: Credential Value Structure for the Username and Password Credential

If the Credential Type in the Credential is *Device*, then Credential Value is a structure as shown in Table 5. One or a combination of the *Device Serial Number*, *Network Identifier*, *Machine Identifier*, and *Media Identifier* SHALL be unique. Server implementations MAY enforce policies on uniqueness for individual fields. Optionally a shared secret or password MAY also be used to authenticate the client.

Object	Encoding	REQUIRED
Credential Value	Structure	
Device Serial Number	Text String	No
Password	Text String	No
Device Identifier	Text String	No
Network Identifier	Text String	No
Machine Identifier	Text String	No
Media Identifier	Text String	No

Table 5: Credential Value Structure for the Device Credential

## 2.1.3 Key Block

A *Key Block* object is a structure (see Table 6) used to encapsulate all of the information that is closely associated with a cryptographic key. It contains a Key Value of one of the following *Key Format Types*:

- *Raw* – This is a key that contains only cryptographic key material, encoded as a string of bytes.

- 237 • *Opaque* – This is an encoded key for which the encoding is unknown to the key management  
238 system. It is encoded as a string of bytes.
- 239 • *PKCS1* – This is an encoded private key, expressed as a DER-encoded ASN.1 PKCS#1 object.
- 240 • *PKCS8* – This is an encoded private key, expressed as a DER-encoded ASN.1 PKCS#8 object,  
241 supporting both the RSAPrivateKey syntax and EncryptedPrivateKey.
- 242 • *X.509* – This is an encoded object, expressed as a DER-encoded ASN.1 X.509 object.
- 243 • *ECPrivateKey* – This is an ASN.1 encoded elliptic curve private key.
- 244 • *Several Transparent Key types* – These are algorithm-specific structures containing defined  
245 values for the various key types, as defined in Section 2.1.7
- 246 • *Extensions* – These are vendor-specific extensions to allow for proprietary or legacy key formats.

247 The Key Block MAY contain the Key Compression Type, which indicates the format of the elliptic curve  
248 public key. By default, the public key is uncompressed.

249 The Key Block also has the Cryptographic Algorithm and the Cryptographic Length of the key contained  
250 in the Key Value field. Some example values are:

- 251 • RSA keys are typically 1024, 2048 or 3072 bits in length
- 252 • 3DES keys are typically from 112 to 192 bits (depending upon key length and the presence of  
253 parity bits)
- 254 • AES keys are 128, 192 or 256 bits in length

255 The Key Block SHALL contain a Key Wrapping Data structure if the key in the Key Value field is wrapped  
256 (i.e., encrypted, or MACed/signed, or both).

Object	Encoding	REQUIRED
Key Block	Structure	
Key Format Type	Enumeration, see 9.1.3.2.3	Yes
Key Compression Type	Enumeration, see 9.1.3.2.2	No
Key Value	Byte String: for wrapped Key Value; Structure: for plaintext Key Value, see 2.1.4	Yes
Cryptographic Algorithm	Enumeration, see 9.1.3.2.13	Yes, MAY be omitted only if this information is available from the Key Value. Does not apply to Secret Data or Opaque Objects. If present, the Cryptographic Length SHALL also be present.
Cryptographic Length	Integer	Yes, MAY be omitted only if this information is available from the Key Value. Does not apply to Secret Data or Opaque Objects. If present, the Cryptographic Algorithm SHALL also be present.
Key Wrapping Data	Structure, see 2.1.5	No, SHALL only be present

		if the key is wrapped.
--	--	------------------------

Table 6: Key Block Object Structure

## 2.1.4 Key Value

The *Key Value* is used only inside a Key Block and is either a Byte String or a structure (see Table 7):

- The Key Value structure contains the key material, either as a byte string or as a Transparent Key structure (see Section 2.1.7), and OPTIONAL attribute information that is associated and encapsulated with the key material. This attribute information differs from the attributes associated with Managed Objects, and which is obtained via the Get Attributes operation, only by the fact that it is encapsulated with (and possibly wrapped with) the key material itself.
- The Key Value Byte String is either the wrapped TTLV-encoded (see Section 9.1) Key Value structure, or the wrapped un-encoded value of the Byte String Key Material field.

Object	Encoding	REQUIRED
Key Value	Structure	
Key Material	Byte String: for Raw, Opaque, PKCS1, PKCS8, ECPrivateKey, or Extension Key Format types; Structure: for Transparent, or Extension Key Format Types	Yes
Attribute	Attribute Object, see Section 2.1.1	No. MAY be repeated

Table 7: Key Value Object Structure

## 2.1.5 Key Wrapping Data

The Key Block MAY also supply OPTIONAL information about a cryptographic key wrapping mechanism used to wrap the Key Value. This consists of a *Key Wrapping Data* structure (see Table 8). It is only used inside a Key Block.

This structure contains fields for:

- A *Wrapping Method*, which indicates the method used to wrap the Key Value.
- Encryption Key Information*, which contains the Unique Identifier (see 3.1) value of the encryption key and associated cryptographic parameters.
- MAC/Signature Key Information*, which contains the Unique Identifier value of the MAC/signature key and associated cryptographic parameters.
- A *MAC/Signature*, which contains a MAC or signature of the Key Value.
- An *IV/Counter/Nonce*, if REQUIRED by the wrapping method.
- An *Encoding Option*, specifying the encoding of the Key Value Byte String that has been wrapped. If No Encoding is specified, then the Key Value SHALL NOT contain any attributes.

If wrapping is used, then the whole Key Value structure is wrapped unless otherwise specified by the Wrapping Method. The algorithms used for wrapping are given by the Cryptographic Algorithm attributes of the encryption key and/or MAC/signature key; the block-cipher mode, padding method, and hashing algorithm used for wrapping are given by the Cryptographic Parameters in the Encryption Key Information

and/or MAC/Signature Key Information, or, if not present, from the Cryptographic Parameters attribute of the respective key(s). At least one of the Encryption Key Information and the MAC/Signature Key Information SHALL be specified.

The following wrapping methods are currently defined:

- *Encrypt* only (i.e., encryption using a symmetric key or public key, or authenticated encryption algorithms that use a single key)
- *MAC/sign* only (i.e., either MACing the Key Value with a symmetric key, or signing the Key Value with a private key)
- *Encrypt then MAC/sign*
- *MAC/sign then encrypt*
- *TR-31*
- *Extensions*

The following encoding options are currently defined:

- *No Encoding* (i.e., the wrapped un-encoded value of the Byte String Key Material field)
- *TTLV Encoding* (i.e., the wrapped TTLV-encoded Key Value structure).

Object	Encoding	REQUIRED
Key Wrapping Data	Structure	
Wrapping Method	Enumeration, see 9.1.3.2.4	Yes
Encryption Key Information	Structure, see below	No. Corresponds to the key that was used to encrypt the Key Value.
MAC/Signature Key Information	Structure, see below	No. Corresponds to the symmetric key used to MAC the Key Value or the private key used to sign the Key Value
MAC/Signature	Byte String	No
IV/Counter/Nonce	Byte String	No
Encoding Option	Enumeration, see 9.1.3.2.32	No. Specifies the encoding of the Key Value Byte String. If not present, the wrapped Key Value SHALL be TTLV encoded.

Table 8: Key Wrapping Data Object Structure

The structures of the Encryption Key Information (see Table 9) and the MAC/Signature Key Information (see Table 10) are as follows:

Object	Encoding	REQUIRED
Encryption Key Information	Structure	
Unique Identifier	Text string, see 3.1	Yes
Cryptographic Parameters	Structure, see 3.6	No

305 Table 9: Encryption Key Information Object Structure

Object	Encoding	REQUIRED
MAC/Signature Key Information	Structure	
Unique Identifier	Text string, see 3.1	Yes. It SHALL be either the Unique Identifier of the Symmetric Key used to MAC, or of the Private Key (or its corresponding Public Key) used to sign.
Cryptographic Parameters	Structure, see 3.6	No

306 Table 10: MAC/Signature Key Information Object Structure

## 307 2.1.6 Key Wrapping Specification

308 This is a separate structure (see Table 11) that is defined for operations that provide the option to return  
 309 wrapped keys. The *Key Wrapping Specification* SHALL be included inside the operation request if clients  
 310 request the server to return a wrapped key. If Cryptographic Parameters are specified in the Encryption  
 311 Key Information and/or the MAC/Signature Key Information of the Key Wrapping Specification, then the  
 312 server SHALL verify that they match one of the instances of the Cryptographic Parameters attribute of the  
 313 corresponding key. If Cryptographic Parameters are omitted, then the server SHALL use the  
 314 Cryptographic Parameters attribute with the lowest Attribute Index of the corresponding key. If the  
 315 corresponding key does not have any Cryptographic Parameters attribute, or if no match is found, then an  
 316 error is returned.

317 This structure contains:

- 318 • A Wrapping Method that indicates the method used to wrap the Key Value.
- 319 • Encryption Key Information with the Unique Identifier value of the encryption key and associated  
 320 cryptographic parameters.
- 321 • MAC/Signature Key Information with the Unique Identifier value of the MAC/signature key and  
 322 associated cryptographic parameters.
- 323 • Zero or more Attribute Names to indicate the attributes to be wrapped with the key material.
- 324 • An Encoding Option, specifying the encoding of the Key Value before wrapping. If No Encoding is  
 325 specified, then the Key Value SHALL NOT contain any attributes

Object	Encoding	REQUIRED
Key Wrapping Specification	Structure	
Wrapping Method	Enumeration, see 9.1.3.2.4	Yes
Encryption Key Information	Structure, see 2.1.5	No, SHALL be present if MAC/Signature Key Information is omitted
MAC/Signature Key Information	Structure, see 2.1.5	No, SHALL be present if Encryption Key Information is omitted
Attribute Name	Text String	No, MAY be repeated
Encoding Option	Enumeration, see 9.1.3.2.32	No. If Encoding Option is not present, the wrapped Key

		Value SHALL be TTLV encoded.
--	--	------------------------------

Table 11: Key Wrapping Specification Object Structure

## 2.1.7 Transparent Key Structures

*Transparent Key* structures describe the necessary parameters to obtain the key material. They are used in the Key Value structure. The mapping to the parameters specified in other standards is shown in Table 12.

Object	Description	Mapping
P	For DSA and DH, the (large) prime field order.  For RSA, a prime factor of the modulus.	p in [FIPS186-3], [X9.42], [SP800-56A] p in [PKCS#1], [SP800-56B]
Q	For DSA and DH, the (small) prime multiplicative subgroup order.  For RSA, a prime factor of the modulus.	q in [FIPS186-3], [X9.42], [SP800-56A] q in [PKCS#1], [SP800-56B]
G	The generator of the subgroup of order Q.	g in [FIPS186-3], [X9.42], [SP800-56A]
X	DSA or DH private key.	x in [FIPS186-3] x, $x_u$ , $x_v$ in [X9.42], [SP800-56A] for static private keys r, $r_u$ , $r_v$ in [X9.42], [SP800-56A] for ephemeral private keys
Y	DSA or DH public key.	y in [FIPS186-3] y, $y_u$ , $y_v$ in [X9.42], [SP800-56A] for static public keys t, $t_u$ , $t_v$ in [X9.42], [SP800-56A] for ephemeral public keys
J	DH cofactor integer, where $P = JQ + 1$ .	j in [X9.42]
Modulus	RSA modulus PQ, where P and Q are distinct primes.	n in [PKCS#1], [SP800-56B]
Private Exponent	RSA private exponent.	d in [PKCS#1], [SP800-56B]
Public Exponent	RSA public exponent.	e in [PKCS#1], [SP800-56B]
Prime Exponent P	RSA private exponent for the prime factor P in the CRT format, i.e., Private Exponent (mod (P-1)).	dP in [PKCS#1], [SP800-56B]
Prime Exponent Q	RSA private exponent for the prime factor Q in the CRT format, i.e., Private Exponent (mod (Q-1)).	dQ in [PKCS#1], [SP800-56B]
CRT Coefficient	The (first) CRT coefficient, i.e., $Q^{-1} \bmod P$ .	qInv in [PKCS#1], [SP800-56B]
Recommended Curve	NIST Recommended Curves (e.g., P-192).	See Appendix D of [FIPS186-3]

D	Elliptic curve private key.	d; $d_{e,U}, d_{e,V}$ (ephemeral private keys); $d_{s,U}, d_{s,V}$ (static private keys) in [X9-63], [SP800-56A]
Q String	Elliptic curve public key.	Q; $Q_{e,U}, Q_{e,V}$ (ephemeral public keys); $Q_{s,U}, Q_{s,V}$ (static public keys) in [X9-63], [SP800-56A]

Table 12: Parameter mapping.

### 2.1.7.1 Transparent Symmetric Key

If the Key Format Type in the Key Block is *Transparent Symmetric Key*, then Key Material is a structure as shown in Table 13.

Object	Encoding	REQUIRED
Key Material	Structure	
Key	Byte String	Yes

Table 13: Key Material Object Structure for Transparent Symmetric Keys

### 2.1.7.2 Transparent DSA Private Key

If the Key Format Type in the Key Block is *Transparent DSA Private Key*, then Key Material is a structure as shown in Table 14.

Object	Encoding	REQUIRED
Key Material	Structure	
P	Big Integer	Yes
Q	Big Integer	Yes
G	Big Integer	Yes
X	Big Integer	Yes

Table 14: Key Material Object Structure for Transparent DSA Private Keys

### 2.1.7.3 Transparent DSA Public Key

If the Key Format Type in the Key Block is *Transparent DSA Public Key*, then Key Material is a structure as shown in Table 15.

Object	Encoding	REQUIRED
Key Material	Structure	
P	Big Integer	Yes
Q	Big Integer	Yes
G	Big Integer	Yes
Y	Big Integer	Yes

Table 15: Key Material Object Structure for Transparent DSA Public Keys

### 2.1.7.4 Transparent RSA Private Key

If the Key Format Type in the Key Block is *Transparent RSA Private Key*, then Key Material is a structure as shown in Table 16.

Object	Encoding	REQUIRED
Key Material	Structure	
Modulus	Big Integer	Yes
Private Exponent	Big Integer	No
Public Exponent	Big Integer	No
P	Big Integer	No
Q	Big Integer	No
Prime Exponent P	Big Integer	No
Prime Exponent Q	Big Integer	No
CRT Coefficient	Big Integer	No

Table 16: Key Material Object Structure for Transparent RSA Private Keys

One of the following SHALL be present (refer to [PKCS#1]):

- Private Exponent
- P and Q (the first two prime factors of Modulus)
- Prime Exponent P and Prime Exponent Q.

### 2.1.7.5 Transparent RSA Public Key

If the Key Format Type in the Key Block is *Transparent RSA Public Key*, then Key Material is a structure as shown in Table 17.

Object	Encoding	REQUIRED
Key Material	Structure	
Modulus	Big Integer	Yes
Public Exponent	Big Integer	Yes

Table 17: Key Material Object Structure for Transparent RSA Public Keys

### 2.1.7.6 Transparent DH Private Key

If the Key Format Type in the Key Block is *Transparent DH Private Key*, then Key Material is a structure as shown in Table 18.

Object	Encoding	REQUIRED
Key Material	Structure	
P	Big Integer	Yes
Q	Big Integer	No
G	Big Integer	Yes
J	Big Integer	No
X	Big Integer	Yes

Table 18: Key Material Object Structure for Transparent DH Private Keys

### 2.1.7.7 Transparent DH Public Key

If the Key Format Type in the Key Block is *Transparent DH Public Key*, then Key Material is a structure as shown in Table 19.

Object	Encoding	REQUIRED
Key Material	Structure	
P	Big Integer	Yes
Q	Big Integer	No
G	Big Integer	Yes
J	Big Integer	No
Y	Big Integer	Yes

Table 19: Key Material Object Structure for Transparent DH Public Keys

### 2.1.7.8 Transparent ECDSA Private Key

If the Key Format Type in the Key Block is *Transparent ECDSA Private Key*, then Key Material is a structure as shown in Table 20.

Object	Encoding	REQUIRED
Key Material	Structure	
Recommended Curve	Enumeration, see 9.1.3.2.5	Yes
D	Big Integer	Yes

Table 20: Key Material Object Structure for Transparent ECDSA Private Keys

### 2.1.7.9 Transparent ECDSA Public Key

If the Key Format Type in the Key Block is *Transparent ECDSA Public Key*, then Key Material is a structure as shown in Table 21.

Object	Encoding	REQUIRED
Key Material	Structure	
Recommended Curve	Enumeration, see 9.1.3.2.5	Yes
Q String	Byte String	Yes

Table 21: Key Material Object Structure for Transparent ECDSA Public Keys

### 2.1.7.10 Transparent ECDH Private Key

If the Key Format Type in the Key Block is *Transparent ECDH Private Key*, then Key Material is a structure as shown in Table 22.

Object	Encoding	REQUIRED
Key Material	Structure	
Recommended Curve	Enumeration, see 9.1.3.2.5	Yes
D	Big Integer	Yes

Table 22: Key Material Object Structure for Transparent ECDH Private Keys

### 2.1.7.11 Transparent ECDH Public Key

If the Key Format Type in the Key Block is *Transparent ECDH Public Key*, then Key Material is a structure as shown in Table 23.

Object	Encoding	REQUIRED
Key Material	Structure	
Recommended Curve	Enumeration, see 9.1.3.2.5	Yes
Q String	Byte String	Yes

Table 23: Key Material Object Structure for Transparent ECDH Public Keys

### 2.1.7.12 Transparent ECMQV Private Key

If the Key Format Type in the Key Block is *Transparent ECMQV Private Key*, then Key Material is a structure as shown in Table 24.

Object	Encoding	REQUIRED
Key Material	Structure	
Recommended Curve	Enumeration, see 9.1.3.2.5	Yes
D	Big Integer	Yes

Table 24: Key Material Object Structure for Transparent ECMQV Private Keys

### 2.1.7.13 Transparent ECMQV Public Key

If the Key Format Type in the Key Block is *Transparent ECMQV Public Key*, then Key Material is a structure as shown in Table 25.

Object	Encoding	REQUIRED
Key Material	Structure	
Recommended Curve	Enumeration, see 9.1.3.2.5	Yes
Q String	Byte String	Yes

Table 25: Key Material Object Structure for Transparent ECMQV Public Keys

## 2.1.8 Template-Attribute Structures

These structures are used in various operations to provide the desired attribute values and/or template names in the request and to return the actual attribute values in the response.

The *Template-Attribute*, *Common Template-Attribute*, *Private Key Template-Attribute*, and *Public Key Template-Attribute* structures are defined identically as follows:

Object	Encoding	REQUIRED
Template-Attribute, Common Template-Attribute, Private Key Template- Attribute, Public Key Template-Attribute	Structure	
Name	Structure, see 3.2	No, MAY be repeated.
Attribute	Attribute Object, see 2.1.1	No, MAY be repeated

Table 26: Template-Attribute Object Structure

Name is the Name attribute of the Template object defined in Section 2.2.6.

## 2.1.9 Extension Information

An Extension Information object is a structure (see Table 27) describing Objects with Item Tag values in the Extensions range. The Extension Name is a Text String that is used to name the Object (first column of Table 213). The Extension Tag is the Item Tag Value of the Object (see Table 213). The Extension Type is the Item Type Value of the Object (see Table 211).

Object	Encoding	REQUIRED
Extension Information	Structure	
Extension Name	Text String	Yes
Extension Tag	Integer	No
Extension Type	Integer	No

Table 27: Extension Information Structure

## 2.2 Managed Objects

Managed Objects are objects that are the subjects of key management operations, which are described in Sections 4 and 5. *Managed Cryptographic Objects* are the subset of Managed Objects that contain cryptographic material (e.g. certificates, keys, and secret data).

### 2.2.1 Certificate

A Managed Cryptographic Object that is a digital certificate. Its is a DER-encoded X.509 public key certificate. For PGP certificates, it is a transferable public key in the OpenPGP message format.

Object	Encoding	REQUIRED
Certificate	Structure	
Certificate Type	Enumeration, see 9.1.3.2.6	Yes
Certificate Value	Byte String	Yes

Table 28: Certificate Object Structure

### 2.2.2 Symmetric Key

A Managed Cryptographic Object that is a symmetric key.

Object	Encoding	REQUIRED
Symmetric Key	Structure	
Key Block	Structure, see 2.1.3	Yes

Table 29: Symmetric Key Object Structure

## 2.2.3 Public Key

A Managed Cryptographic Object that is the public portion of an asymmetric key pair. This is only a public key, not a certificate.

Object	Encoding	REQUIRED
Public Key	Structure	
Key Block	Structure, see 2.1.3	Yes

Table 30: Public Key Object Structure

## 2.2.4 Private Key

A Managed Cryptographic Object that is the private portion of an asymmetric key pair.

Object	Encoding	REQUIRED
Private Key	Structure	
Key Block	Structure, see 2.1.3	Yes

Table 31: Private Key Object Structure

## 2.2.5 Split Key

A Managed Cryptographic Object that is a *Split Key*. A split key is a secret, usually a symmetric key or a private key that has been split into a number of parts, each of which MAY then be distributed to several key holders, for additional security. The *Split Key Parts* field indicates the total number of parts, and the *Split Key Threshold* field indicates the minimum number of parts needed to reconstruct the entire key. The *Key Part Identifier* indicates which key part is contained in the cryptographic object, and SHALL be at least 1 and SHALL be less than or equal to Split Key Parts.

Object	Encoding	REQUIRED
Split Key	Structure	
Split Key Parts	Integer	Yes
Key Part Identifier	Integer	Yes
Split Key Threshold	Integer	Yes
Split Key Method	Enumeration, see 9.1.3.2.7	Yes
Prime Field Size	Big Integer	No, REQUIRED only if Split Key Method is Polynomial Sharing Prime Field.
Key Block	Structure, see 2.1.3	Yes

Table 32: Split Key Object Structure

There are three *Split Key Methods* for secret sharing: the first one is based on XOR, and the other two are based on polynomial secret sharing, according to [SHAMIR1979].

Let  $L$  be the minimum number of bits needed to represent all values of the secret.

- When the Split Key Method is XOR, then the Key Material in the Key Value of the Key Block is of length  $L$  bits. The number of split keys is Split Key Parts (identical to Split Key Threshold), and the secret is reconstructed by XORing all of the parts.
- When the Split Key Method is Polynomial Sharing Prime Field, then secret sharing is performed in the field  $GF(\text{Prime Field Size})$ , represented as integers, where Prime Field Size is a prime bigger than  $2^L$ .
- When the Split Key Method is Polynomial Sharing  $GF(2^{16})$ , then secret sharing is performed in the field  $GF(2^{16})$ . The Key Material in the Key Value of the Key Block is a bit string of length  $L$ , and when  $L$  is bigger than  $2^{16}$ , then secret sharing is applied piecewise in pieces of 16 bits each. The Key Material in the Key Value of the Key Block is the concatenation of the corresponding shares of all pieces of the secret.

Secret sharing is performed in the field  $GF(2^{16})$ , which is represented as an algebraic extension of  $GF(2^8)$ :

$$GF(2^{16}) \approx GF(2^8) [y]/(y^2+ym), \quad \text{where } m \text{ is defined later.}$$

An element of this field then consists of a linear combination  $uy + v$ , where  $u$  and  $v$  are elements of the smaller field  $GF(2^8)$ .

The representation of field elements and the notation in this section rely on [FIPS197], Sections 3 and 4. The field  $GF(2^8)$  is as described in [FIPS197],

$$GF(2^8) \approx GF(2) [x]/(x^8+x^4+x^3+x+1).$$

An element of  $GF(2^8)$  is represented as a byte. Addition and subtraction in  $GF(2^8)$  is performed as a bit-wise XOR of the bytes. Multiplication and inversion are more complex (see [FIPS197] Section 4.1 and 4.2 for details).

An element of  $GF(2^{16})$  is represented as a pair of bytes  $(u, v)$ . The element  $m$  is given by

$$m = x^5+x^4+x^3+x,$$

which is represented by the byte 0x3A (or {3A} in notation according to [FIPS197]).

Addition and subtraction in  $GF(2^{16})$  both correspond to simply XORing the bytes. The product of two elements  $ry + s$  and  $uy + v$  is given by

$$(ry + s)(uy + v) = ((r + s)(u + v) + sv)y + (ru + svm).$$

The inverse of an element  $uy + v$  is given by

$$(uy + v)^{-1} = ud^1y + (u + v)d^1, \quad \text{where } d = (u + v)v + mu^2.$$

## 2.2.6 Template

A *Template* is a named Managed Object containing the client-settable attributes of a Managed Cryptographic Object (i.e., a stored, named list of attributes). A Template is used to specify the attributes of a new Managed Cryptographic Object in various operations. It is intended to be used to specify the cryptographic attributes of new objects in a standardized or convenient way. None of the client-settable attributes specified in a Template except the Name attribute apply to the template object itself, but instead apply to any object created using the Template.

The Template MAY be the subject of the Register, Locate, Get, Get Attributes, Get Attribute List, Add Attribute, Modify Attribute, Delete Attribute, and Destroy operations.

An attribute specified in a Template is applicable either to the Template itself or to objects created using the Template.

Attributes applicable to the Template itself are: Unique Identifier, Object Type, Name, Initial Date, Archive Date, and Last Change Date.

Attributes applicable to objects created using the Template are:

- 474 • Cryptographic Algorithm
- 475 • Cryptographic Length
- 476 • Cryptographic Domain Parameters
- 477 • Cryptographic Parameters
- 478 • Certificate Length
- 479 • Operation Policy Name
- 480 • Cryptographic Usage Mask
- 481 • Digital Signature Algorithm
- 482 • Usage Limits
- 483 • Activation Date
- 484 • Process Start Date
- 485 • Protect Stop Date
- 486 • Deactivation Date
- 487 • Object Group
- 488 • Application Specific Information
- 489 • Contact Information
- 490 • Custom Attribute

Object	Encoding	REQUIRED
Template	Structure	
Attribute	Attribute Object, see 2.1.1	Yes. MAY be repeated.

491 *Table 33: Template Object Structure*

## 492 2.2.7 Secret Data

493 A Managed Cryptographic Object containing a shared secret value that is not a key or certificate (e.g., a  
 494 password). The Key Block of the *Secret Data* object contains a Key Value of the Opaque type. The Key  
 495 Value MAY be wrapped.

Object	Encoding	REQUIRED
Secret Data	Structure	
Secret Data Type	Enumeration, see 9.1.3.2.9	Yes
Key Block	Structure, see 2.1.3	Yes

496 *Table 34: Secret Data Object Structure*

## 497 2.2.8 Opaque Object

498 A Managed Object that the key management server is possibly not able to interpret. The context  
 499 information for this object MAY be stored and retrieved using Custom Attributes.

Object	Encoding	REQUIRED
Opaque Object	Structure	
Opaque Data Type	Enumeration, see 9.1.3.2.10	Yes
Opaque Data Value	Byte String	Yes

500     *Table 35: Opaque Object Structure*

---

### 3 Attributes

The following subsections describe the attributes that are associated with Managed Objects. Attributes that an object MAY have multiple instances of are referred to as *multi-instance attributes*. All instances of an attribute SHOULD have a different value. Similarly, attributes which an object SHALL only have at most one instance of are referred to as *single-instance attributes*. Attributes are able to be obtained by a client from the server using the Get Attribute operation. Some attributes are able to be set by the Add Attribute operation or updated by the Modify Attribute operation, and some are able to be deleted by the Delete Attribute operation if they no longer apply to the Managed Object. *Read-only attributes* are attributes that SHALL NOT be modified by either server or client, and that SHALL NOT be deleted by a client.

When attributes are returned by the server (e.g., via a Get Attributes operation), the attribute value returned MAY differ for different clients (e.g., the Cryptographic Usage Mask value MAY be different for different clients, depending on the policy of the server).

The first table in each subsection contains the attribute name in the first row. This name is the canonical name used when managing attributes using the Get Attributes, Get Attribute List, Add Attribute, Modify Attribute, and Delete Attribute operations.

A server SHALL NOT delete attributes without receiving a request from a client until the object is destroyed. After an object is destroyed, the server MAY retain all, some or none of the object attributes, depending on the object type and server policy.

The second table in each subsection lists certain attribute characteristics (e.g., "SHALL always have a value"): Table 36 below explains the meaning of each characteristic that may appear in those tables. The server policy MAY further restrict these attribute characteristics.

SHALL always have a value	All Managed Objects that are of the Object Types for which this attribute applies, SHALL always have this attribute set once the object has been created or registered, up until the object has been destroyed.
Initially set by	Who is permitted to initially set the value of the attribute (if the attribute has never been set, or if all the attribute values have been deleted)?
Modifiable by server	Is the server allowed to change an existing value of the attribute without receiving a request from a client?
Modifiable by client	Is the client able to change an existing value of the attribute value once it has been set?
Deletable by client	Is the client able to delete an instance of the attribute?
Multiple instances permitted	Are multiple instances of the attribute permitted?
When implicitly set	Which operations MAY cause this attribute to be set even if the attribute is not specified in the operation request itself?
Applies to Object Types	Which Managed Objects MAY have this attribute set?

523 Table 36: Attribute Rules

## 524 3.1 Unique Identifier

525 The *Unique Identifier* is generated by the key management system to uniquely identify a Managed Object.  
526 It is only REQUIRED to be unique within the identifier space managed by a single key management  
527 system, however it is RECOMMENDED that this identifier be globally unique in order to allow for a key  
528 management domain export of such objects. This attribute SHALL be assigned by the key management  
529 system at creation or registration time, and then SHALL NOT be changed or deleted before the object is  
530 destroyed.

Object	Encoding	
Unique Identifier	Text String	

531 Table 37: Unique Identifier Attribute

SHALL always have a value	Yes
Initially set by	Server
Modifiable by server	No
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Create, Create Key Pair, Register, Derive Key, Certify, Re-certify, Re-key, Re-key Key Pair
Applies to Object Types	All Objects

Table 38: Unique Identifier Attribute Rules

## 3.2 Name

The *Name* attribute is a structure (see Table 39) used to identify and locate the object. This attribute is assigned by the client, and the *Name Value* is intended to be in a form that humans are able to interpret. The key management system MAY specify rules by which the client creates valid names. Clients are informed of such rules by a mechanism that is not specified by this standard. Names SHALL be unique within a given key management domain, but are not REQUIRED to be globally unique.

Object	Encoding	REQUIRED
Name	Structure	
Name Value	Text String	Yes
Name Type	Enumeration, see 9.1.3.2.11	Yes

Table 39: Name Attribute Structure

SHALL always have a value	No
Initially set by	Client
Modifiable by server	Yes
Modifiable by client	Yes
Deletable by client	Yes
Multiple instances permitted	Yes
When implicitly set	Re-key, Re-key Key Pair, Re-certify
Applies to Object Types	All Objects

Table 40: Name Attribute Rules

## 3.3 Object Type

The *Object Type* of a Managed Object (e.g., public key, private key, symmetric key, etc) SHALL be set by the server when the object is created or registered and then SHALL NOT be changed or deleted before the object is destroyed.

Object	Encoding	
Object Type	Enumeration, see 9.1.3.2.12	

Table 41: Object Type Attribute

SHALL always have a value	Yes
Initially set by	Server
Modifiable by server	No
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Create, Create Key Pair, Register, Derive Key, Certify, Re-certify, Re-key, Re-key Key Pair
Applies to Object Types	All Objects

Table 42: Object Type Attribute Rules

### 3.4 Cryptographic Algorithm

The *Cryptographic Algorithm* of an object (e.g., RSA, DSA, DES, 3DES, AES, etc). The Cryptographic Algorithm of a Certificate object identifies the algorithm for the public key contained within the Certificate. The digital signature algorithm used to sign the Certificate is identified in the Digital Signature Algorithm attribute defined in Section 3.16. This attribute SHALL be set by the server when the object is created or registered and then SHALL NOT be changed or deleted before the object is destroyed.

Object	Encoding	
Cryptographic Algorithm	Enumeration, see 9.1.3.2.13	

Table 43: Cryptographic Algorithm Attribute

SHALL always have a value	Yes
Initially set by	Server
Modifiable by server	No
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Certify, Create, Create Key Pair, Re-certify, Register, Derive Key, Re-key, Re-key Key Pair
Applies to Object Types	Keys, Certificates, Templates

Table 44: Cryptographic Algorithm Attribute Rules

### 3.5 Cryptographic Length

For keys, *Cryptographic Length* is the length in bits of the clear-text cryptographic key material of the Managed Cryptographic Object. For certificates, *Cryptographic Length* is the length in bits of the public

key contained within the Certificate. This attribute SHALL be set by the server when the object is created or registered, and then SHALL NOT be changed or deleted before the object is destroyed.

Object	Encoding	
Cryptographic Length	Integer	

Table 45: Cryptographic Length Attribute

SHALL always have a value	Yes
Initially set by	Server
Modifiable by server	No
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Certify, Create, Create Key Pair, Re-certify, Register, Derive Key, Re-key, Re-key Key Pair
Applies to Object Types	Keys, Certificates, Templates

Table 46: Cryptographic Length Attribute Rules

## 3.6 Cryptographic Parameters

The *Cryptographic Parameters* attribute is a structure (see Table 47) that contains a set of OPTIONAL fields that describe certain cryptographic parameters to be used when performing cryptographic operations using the object. Specific fields MAY pertain only to certain types of Managed Cryptographic Objects. The Cryptographic Parameters attribute of a Certificate object identifies the cryptographic parameters of the public key contained within the Certificate.

Object	Encoding	REQUIRED
Cryptographic Parameters	Structure	
Block Cipher Mode	Enumeration, see 9.1.3.2.14	No
Padding Method	Enumeration, see 9.1.3.2.15	No
Hashing Algorithm	Enumeration, see 9.1.3.2.16	No
Key Role Type	Enumeration, see 9.1.3.2.17	No

Table 47: Cryptographic Parameters Attribute Structure

SHALL always have a value	No
Initially set by	Client
Modifiable by server	No
Modifiable by client	Yes
Deletable by client	Yes
Multiple instances permitted	Yes
When implicitly set	Re-key, Re-key Key Pair, Re-certify
Applies to Object Types	Keys, Certificates, Templates

Table 48: Cryptographic Parameters Attribute Rules

Key Role Type definitions match those defined in ANSI X9 TR-31 [X9 TR-31] and are defined in Table 49:

BDK	Base Derivation Key (ANSI X9.24 DUKPT key derivation)
CVK	Card Verification Key (CVV/signature strip number validation)
DEK	Data Encryption Key (General Data Encryption)
MKAC	EMV/chip card Master Key: Application Cryptograms
MKSMC	EMV/chip card Master Key: Secure Messaging for Confidentiality
MKSMI	EMV/chip card Master Key: Secure Messaging for Integrity
MKDAC	EMV/chip card Master Key: Data Authentication Code
MKDN	EMV/chip card Master Key: Dynamic Numbers
MKCP	EMV/chip card Master Key: Card Personalization
MKOTH	EMV/chip card Master Key: Other
KEK	Key Encryption or Wrapping Key
MAC16609	ISO16609 MAC Algorithm 1
MAC97971	ISO9797-1 MAC Algorithm 1
MAC97972	ISO9797-1 MAC Algorithm 2
MAC97973	ISO9797-1 MAC Algorithm 3 (Note this is commonly known as X9.19 Retail MAC)
MAC97974	ISO9797-1 MAC Algorithm 4
MAC97975	ISO9797-1 MAC Algorithm 5
ZPK	PIN Block Encryption Key
PVKIBM	PIN Verification Key, IBM 3624 Algorithm
PVKPVV	PIN Verification Key, VISA PVV Algorithm
PVKOTH	PIN Verification Key, Other Algorithm

Table 49: Key Role Types

Accredited Standards Committee X9, Inc. - Financial Industry Standards ([www.x9.org](http://www.x9.org)) contributed to Table 49. Key role names and descriptions are derived from material in the Accredited Standards Committee X9, Inc's Technical Report "TR-31 2005 Interoperable Secure Key Exchange Key Block Specification for Symmetric Algorithms" and used with the permission of Accredited Standards Committee

577 X9, Inc. in an effort to improve interoperability between X9 standards and OASIS KMIP. The complete  
578 ANSI X9 TR-31 is available at [www.x9.org](http://www.x9.org).

## 579 3.7 Cryptographic Domain Parameters

580 The *Cryptographic Domain Parameters* attribute is a structure (see Table 50) that contains a set of  
581 OPTIONAL fields that MAY need to be specified in the Create Key Pair Request Payload. Specific fields  
582 MAY only pertain to certain types of Managed Cryptographic Objects.

583 The domain parameter Qlength correponds to the bit length of parameter Q (refer to **[FIPS186-3]** and  
584 **[SP800-56A]**). Qlength applies to algorithms such as DSA and DH. The bit length of parameter P (refer to  
585 **[FIPS186-3]** and **[SP800-56A]**) is specified separately by setting the Cryptographic Length attribute.

586 Recommended Curve is applicable to elliptic curve algorithms such as ECDSA, ECDH, and ECMQV.

Object	Encoding	Required
Cryptographic Domain Parameters	Structure	Yes
Qlength	Integer	No
Recommended Curve	Enumeration, see 9.1.3.2.5	No

587 Table 50: *Cryptographic Domain Parameters Attribute Structure*

Shall always have a value	No
Initially set by	Client
Modifiable by server	No
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Re-key, Re-key Key Pair
Applies to Object Types	Asymmetric Keys, Templates

588 Table 51: *Cryptographic Domain Parameters Attribute Rules*

## 589 3.8 Certificate Type

590 The type of a certificate (e.g., X.509, PGP, etc). The *Certificate Type* value SHALL be set by the server  
591 when the certificate is created or registered and then SHALL NOT be changed or deleted before the  
592 object is destroyed.

Object	Encoding	
Certificate Type	Enumeration, see 9.1.3.2.6	

593 Table 52: *Certificate Type Attribute*

SHALL always have a value	Yes
Initially set by	Server
Modifiable by server	No
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Register, Certify, Re-certify
Applies to Object Types	Certificates

Table 53: Certificate Type Attribute Rules

### 3.9 Certificate Length

The length in bytes of the Certificate object. The *Certificate Length* SHALL be set by the server when the object is created or registered, and then SHALL NOT be changed or deleted before the object is destroyed.

Object	Encoding	
Certificate Length	Integer	

Table 54: Certificate Length Attribute

SHALL always have a value	Yes
Initially set by	Server
Modifiable by server	No
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Register, Certify, Re-certify
Applies to Object Types	Certificates

Table 55: Certificate Length Attribute Rules

### 3.10 X.509 Certificate Identifier

The *X.509 Certificate Identifier* attribute is a structure (see Table 56) used to provide the identification of an X.509 public key certificate. The X.509 Certificate Identifier contains the Issuer Distinguished Name (i.e., from the Issuer field of the X.509 certificate) and the Certificate Serial Number (i.e., from the Serial Number field of the X.509 certificate). The X.509 Certificate Identifier SHALL be set by the server when the X.509 certificate is created or registered and then SHALL NOT be changed or deleted before the object is destroyed.

Object	Encoding	REQUIRED
X.509 Certificate Identifier	Structure	
Issuer Distinguished Name	Byte String	Yes
Certificate Serial Number	Byte String	Yes

609 *Table 56: X.509 Certificate Identifier Attribute Structure*

SHALL always have a value	Yes
Initially set by	Server
Modifiable by server	No
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Register, Certify, Re-certify
Applies to Object Types	X.509 Certificates

610 *Table 57: X.509 Certificate Identifier Attribute Rules*

### 611 3.11 X.509 Certificate Subject

612 The *X.509 Certificate Subject* attribute is a structure (see Table 58) used to identify the subject of a X.509  
613 certificate. The X.509 Certificate Subject contains the Subject Distinguished Name (i.e., from the Subject  
614 field of the X.509 certificate). It MAY include one or more alternative names (e.g., email address, IP  
615 address, DNS name) for the subject of the X.509 certificate (i.e., from the Subject Alternative Name  
616 extension within the X.509 certificate). The X.509 Certificate Subject SHALL be set by the server based  
617 on the information it extracts from the X.509 certificate that is created (as a result of a Certify or a Re-  
618 certify operation) or registered (as part of a Register operation) and SHALL NOT be changed or deleted  
619 before the object is destroyed.

620 If the Subject Alternative Name extension is included in the X.509 certificate and is marked critical within  
621 the X.509 certificate itself, then an X.509 certificate MAY be issued with the subject field left blank.  
622 Therefore an empty string is an acceptable value for the Subject Distinguished Name.

Object	Encoding	REQUIRED
X.509 Certificate Subject	Structure	
Subject Distinguished Name	Byte String	Yes, but MAY be the empty string
Subject Alternative Name	Byte String	Yes, if the Subject Distinguished Name is an empty string. MAY be repeated

623 *Table 58: X.509 Certificate Subject Attribute Structure*

SHALL always have a value	Yes
Initially set by	Server
Modifiable by server	No
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Register, Certify, Re-certify
Applies to Object Types	X.509 Certificates

624 *Table 59: X.509 Certificate Subject Attribute Rules*

### 3.12 X.509 Certificate Issuer

The *X.509 Certificate Issuer* attribute is a structure (see Table 64) used to identify the issuer of a X.509 certificate, containing the Issuer Distinguished Name (i.e., from the Issuer field of the X.509 certificate). It MAY include one or more alternative names (e.g., email address, IP address, DNS name) for the issuer of the certificate (i.e., from the Issuer Alternative Name extension within the X.509 certificate). The server SHALL set these values based on the information it extracts from a X.509 certificate that is created as a result of a Certify or a Re-certify operation or is sent as part of a Register operation. These values SHALL NOT be changed or deleted before the object is destroyed.

Object	Encoding	REQUIRED
X.509 Certificate Issuer	Structure	
Issuer Distinguished Name	Byte String	Yes
Issuer Alternative Name	Byte String	No, MAY be repeated

Table 60: X.509 Certificate Issuer Attribute Structure

SHALL always have a value	Yes
Initially set by	Server
Modifiable by server	No
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Register, Certify, Re-certify
Applies to Object Types	X.509 Certificates

Table 61: X.509 Certificate Issuer Attribute Rules

### 3.13 Certificate Identifier

This attribute is deprecated as of version 1.1 of this specification and MAY be removed from subsequent versions of this specification. The X.509 Certificate Identifier attribute (see Section 3.10) SHOULD be used instead.

The *Certificate Identifier* attribute is a structure (see Table 62) used to provide the identification of a certificate. For X.509 certificates, it contains the Issuer Distinguished Name (i.e., from the Issuer field of the certificate) and the Certificate Serial Number (i.e., from the Serial Number field of the certificate). For PGP certificates, the Issuer contains the OpenPGP Key ID of the key issuing the signature (the signature that represents the certificate). The Certificate Identifier SHALL be set by the server when the certificate is created or registered and then SHALL NOT be changed or deleted before the object is destroyed.

Object	Encoding	REQUIRED
Certificate Identifier	Structure	
Issuer	Text String	Yes
Serial Number	Text String	Yes (for X.509 certificates) / No (for PGP certificates since they do not contain a serial number)

Table 62: Certificate Identifier Attribute Structure

SHALL always have a value	Yes
Initially set by	Server
Modifiable by server	No
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Register, Certify, Re-certify
Applies to Object Types	Certificates

Table 63: Certificate Identifier Attribute Rules

### 3.14 Certificate Subject

This attribute is deprecated as of version 1.1 of this specification and MAY be removed from subsequent versions of this specification. The X.509 Certificate Subject attribute (see Section 3.11) SHOULD be used instead.

The *Certificate Subject* attribute is a structure (see Table 64) used to identify the subject of a certificate. For X.509 certificates, it contains the Subject Distinguished Name (i.e., from the Subject field of the certificate). It MAY include one or more alternative names (e.g., email address, IP address, DNS name) for the subject of the certificate (i.e., from the Subject Alternative Name extension within the certificate). For PGP certificates, the Certificate Subject Distinguished Name contains the content of the first User ID packet in the PGP certificate (that is, the first User ID packet after the Public-Key packet in the transferable public key that forms the PGP certificate). These values SHALL be set by the server based on the information it extracts from the certificate that is created (as a result of a Certify or a Re-certify operation) or registered (as part of a Register operation) and SHALL NOT be changed or deleted before the object is destroyed.

If the Subject Alternative Name extension is included in the certificate and is marked *CRITICAL* (i.e., within the certificate itself), then it is possible to issue an X.509 certificate where the subject field is left blank. Therefore an empty string is an acceptable value for the Certificate Subject Distinguished Name.

Object	Encoding	REQUIRED
Certificate Subject	Structure	
Certificate Subject Distinguished Name	Text String	Yes, but MAY be the empty string
Certificate Subject Alternative Name	Text String	No, MAY be repeated

Table 64: Certificate Subject Attribute Structure

SHALL always have a value	Yes
Initially set by	Server
Modifiable by server	No
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Register, Certify, Re-certify
Applies to Object Types	Certificates

Table 65: Certificate Subject Attribute Rules

### 3.15 Certificate Issuer

This attribute is deprecated as of version 1.1 of this specification and MAY be removed from subsequent versions of this specification. The X.509 Certificate Issuer attribute (see Section 3.12) SHOULD be used instead.

The *Certificate Issuer* attribute is a structure (see Table 67) used to identify the issuer of a certificate, containing the Issuer Distinguished Name (i.e., from the Issuer field of the certificate). It MAY include one or more alternative names (e.g., email address, IP address, DNS name) for the issuer of the certificate (i.e., from the Issuer Alternative Name extension within the certificate). The server SHALL set these values based on the information it extracts from a certificate that is created as a result of a Certify or a Re-certify operation or is sent as part of a Register operation. These values SHALL NOT be changed or deleted before the object is destroyed.

Object	Encoding	REQUIRED
Certificate Issuer	Structure	
Certificate Issuer Distinguished Name	Text String	Yes
Certificate Issuer Alternative Name	Text String	No, MAY be repeated

Table 66: Certificate Issuer Attribute Structure

SHALL always have a value	Yes
Initially set by	Server
Modifiable by server	No
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Register, Certify, Re-certify
Applies to Object Types	Certificates

Table 67: Certificate Issuer Attribute Rules

### 3.16 Digital Signature Algorithm

The *Digital Signature Algorithm* identifies the digital signature algorithm associated with a digitally signed object (e.g., Certificate). This attribute SHALL be set by the server when the object is created or registered and then SHALL NOT be changed or deleted before the object is destroyed.

Object	Encoding	
Digital Signature Algorithm	Enumeration, see 9.1.3.2.7	

Table 68: Digital Signature Algorithm Attribute

SHALL always have a value	Yes
Initially set by	Server
Modifiable by server	No
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	Yes for PGP certificates. No for X.509 certificates.
When implicitly set	Certify, Re-certify, Register
Applies to Object Types	Certificates

Table 69: Digital Signature Algorithm Attribute Rules

### 3.17 Digest

The *Digest* attribute is a structure (see Table 70) that contains the digest value of the key or secret data (i.e., digest of the Key Material), certificate (i.e., digest of the Certificate Value), or opaque object (i.e., digest of the Opaque Data Value). If the Key Material is a Byte String, then the Digest Value SHALL be calculated on this Byte String. If the Key Material is a structure, then the Digest Value SHALL be calculated on the TTLV-encoded (see Section 9.1) Key Material structure. The Key Format Type field in the Digest attribute indicates the format of the Managed Object from which the Digest Value was calculated. Multiple digests MAY be calculated using different algorithms listed in Section 9.1.3.2.16 and/or key format types listed in Section 9.1.3.2.3. If this attribute exists, then it SHALL have a mandatory attribute instance computed with the SHA-256 hashing algorithm. For objects registered by a client, the server SHALL compute the digest of the mandatory attribute instance using the Key Format Type of the registered object. In all other cases, the server MAY use any Key Format Type when computing the digest of the mandatory attribute instance, provided it is able to serve the object to clients in that same format. The digest(s) are static and SHALL be set by the server when the object is created or registered, provided that the server has access to the Key Material or the Digest Value (possibly obtained via out-of-band mechanisms).

Object	Encoding	REQUIRED
Digest	Structure	
Hashing Algorithm	Enumeration, see 9.1.3.2.16	Yes
Digest Value	Byte String	Yes, if the server has access to the Digest Value or the Key Material (for keys and secret data), the Certificate Value (for certificates) or the Opaque Data Value (for opaque objects).
Key Format Type	Enumeration, see 9.1.3.2.3	Yes, if the Managed Object is a key or secret data object.

Table 70: Digest Attribute Structure

SHALL always have a value	Yes, if the server has access to the Digest Value or the Key Material (for keys and secret data), the Certificate Value (for certificates) or the Opaque Data Value (for opaque objects).
Initially set by	Server
Modifiable by server	No
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	Yes
When implicitly set	Create, Create Key Pair, Register, Derive Key, Certify, Re-certify, Re-key, Re-key Key Pair
Applies to Object Types	All Cryptographic Objects, Opaque Objects

703 Table 71: Digest Attribute Rules

### 704 3.18 Operation Policy Name

705 An operation policy controls what entities MAY perform which key management operations on the object.  
706 The content of the *Operation Policy Name* attribute is the name of a policy object known to the key  
707 management system and, therefore, is server dependent. The named policy objects are created and  
708 managed using mechanisms outside the scope of the protocol. The policies determine what entities MAY  
709 perform specified operations on the object, and which of the object's attributes MAY be modified or  
710 deleted. The Operation Policy Name attribute SHOULD be set when operations that result in a new  
711 Managed Object on the server are executed. It is set either explicitly or via some default set by the server,  
712 which then applies the named policy to all subsequent operations on the object.

Object	Encoding	
Operation Policy Name	Text String	

713 Table 72: Operation Policy Name Attribute

SHALL always have a value	No
Initially set by	Server or Client
Modifiable by server	Yes
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Create, Create Key Pair, Register, Derive Key, Certify, Re-certify, Re-key, Re-key Key Pair
Applies to Object Types	All Objects

714 Table 73: Operation Policy Name Attribute Rules

### 3.18.1 Operations outside of operation policy control

Some of the operations SHOULD be allowed for any client at any time, without respect to operation policy. These operations are:

- Create
- Create Key Pair
- Register
- Certify
- Re-certify
- Validate
- Query
- Cancel
- Poll

### 3.18.2 Default Operation Policy

A key management system implementation SHALL implement at least one named operation policy, which is used for objects when the *Operation Policy* attribute is not specified by the Client in operations that result in a new Managed Object on the server, or in a template specified in these operations. This policy is named *default*. It specifies the following rules for operations on objects created or registered with this policy, depending on the object type. For the profiles defined in [KMIP-Prof], the creator SHALL be as defined in [KMIP-Prof].

#### 3.18.2.1 Default Operation Policy for Secret Objects

This policy applies to Symmetric Keys, Private Keys, Split Keys, Secret Data, and Opaque Objects.

Default Operation Policy for Secret Objects	
Operation	Policy
Re-key	Allowed to creator only
Re-key Key Pair	Allowed to creator only
Derive Key	Allowed to creator only
Locate	Allowed to creator only
Check	Allowed to creator only
Get	Allowed to creator only
Get Attributes	Allowed to creator only
Get Attribute List	Allowed to creator only
Add Attribute	Allowed to creator only
Modify Attribute	Allowed to creator only
Delete Attribute	Allowed to creator only
Obtain Lease	Allowed to creator only

Get Usage Allocation	Allowed to creator only
Activate	Allowed to creator only
Revoke	Allowed to creator only
Destroy	Allowed to creator only
Archive	Allowed to creator only
Recover	Allowed to creator only

Table 74: Default Operation Policy for Secret Objects

### 3.18.2.2 Default Operation Policy for Certificates and Public Key Objects

This policy applies to Certificates and Public Keys.

Default Operation Policy for Certificates and Public Key Objects	
Operation	Policy
Locate	Allowed to all
Check	Allowed to all
Get	Allowed to all
Get Attributes	Allowed to all
Get Attribute List	Allowed to all
Add Attribute	Allowed to creator only
Modify Attribute	Allowed to creator only
Delete Attribute	Allowed to creator only
Obtain Lease	Allowed to all
Activate	Allowed to creator only
Revoke	Allowed to creator only
Destroy	Allowed to creator only
Archive	Allowed to creator only
Recover	Allowed to creator only

Table 75: Default Operation Policy for Certificates and Public Key Objects

### 3.18.2.3 Default Operation Policy for Template Objects

The operation policy specified as an attribute in the *Register* operation for a template object is the operation policy used for objects created using that template, and is not the policy used to control operations on the template itself. There is no mechanism to specify a policy used to control operations on template objects, so the default policy for template objects is always used for templates created by clients using the *Register* operation to create template objects.

Default Operation Policy for Private Template Objects	
Operation	Policy
Locate	Allowed to creator only
Get	Allowed to creator only
Get Attributes	Allowed to creator only
Get Attribute List	Allowed to creator only
Add Attribute	Allowed to creator only
Modify Attribute	Allowed to creator only
Delete Attribute	Allowed to creator only
Destroy	Allowed to creator only
Any operation referencing the Template using a Template-Attribute	Allowed to creator only

Table 76: Default Operation Policy for Private Template Objects

In addition to private template objects (which are controlled by the above policy, and which MAY be created by clients or the server), publicly known and usable templates MAY be created and managed by the server, with a default policy different from private template objects.

Default Operation Policy for Public Template Objects	
Operation	Policy
Locate	Allowed to all
Get	Allowed to all
Get Attributes	Allowed to all
Get Attribute List	Allowed to all
Add Attribute	Disallowed to all
Modify Attribute	Disallowed to all
Delete Attribute	Disallowed to all
Destroy	Disallowed to all
Any operation referencing the Template using a Template-Attribute	Allowed to all

Table 77: Default Operation Policy for Public Template Objects

### 3.19 Cryptographic Usage Mask

The *Cryptographic Usage Mask* defines the cryptographic usage of a key. This is a bit mask that indicates to the client which cryptographic functions MAY be performed using the key, and which ones SHALL NOT be performed.

- Sign
- Verify
- Encrypt
- Decrypt
- Wrap Key
- Unwrap Key

- 761 • Export
- 762 • MAC Generate
- 763 • MAC Verify
- 764 • Derive Key
- 765 • Content Commitment
- 766 • Key Agreement
- 767 • Certificate Sign
- 768 • CRL Sign
- 769 • Generate Cryptogram
- 770 • Validate Cryptogram
- 771 • Translate Encrypt
- 772 • Translate Decrypt
- 773 • Translate Wrap
- 774 • Translate Unwrap

775 This list takes into consideration values that MAY appear in the Key Usage extension in an X.509  
 776 certificate. However, the list does not consider the additional usages that MAY appear in the Extended  
 777 Key Usage extension.

778 X.509 Key Usage values SHALL be mapped to Cryptographic Usage Mask values in the following  
 779 manner:

X.509 Key Usage to Cryptographic Usage Mask Mapping	
X.509 Key Usage Value	Cryptographic Usage Mask Value
digitalSignature	Sign or Verify
contentCommitment	Content Commitment (Non Repudiation)
keyEncipherment	Wrap Key or Unwrap Key
dataEncipherment	Encrypt or Decrypt
keyAgreement	Key Agreement
keyCertSign	Certificate Sign
cRLSign	CRL Sign
encipherOnly	Encrypt
decipherOnly	Decrypt

780 Table 78: X.509 Key Usage to Cryptographic Usage Mask Mapping

781

Object	Encoding	
Cryptographic Usage Mask	Integer	

782 Table 79: Cryptographic Usage Mask Attribute

SHALL always have a value	Yes
Initially set by	Server or Client
Modifiable by server	Yes
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Create, Create Key Pair, Register, Derive Key, Certify, Re-certify, Re-key, Re-key Key Pair
Applies to Object Types	All Cryptographic Objects, Templates

Table 80: Cryptographic Usage Mask Attribute Rules

## 3.20 Lease Time

The *Lease Time* attribute defines a time interval for a Managed Cryptographic Object beyond which the client SHALL NOT use the object without obtaining another lease. This attribute always holds the initial length of time allowed for a lease, and not the actual remaining time. Once its lease expires, the client is only able to renew the lease by calling Obtain Lease. A server SHALL store in this attribute the maximum Lease Time it is able to serve and a client obtains the lease time (with Obtain Lease) that is less than or equal to the maximum Lease Time. This attribute is read-only for clients. It SHALL be modified by the server only.

Object	Encoding	
Lease Time	Interval	

Table 81: Lease Time Attribute

SHALL always have a value	No
Initially set by	Server
Modifiable by server	Yes
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Create, Create Key Pair, Register, Derive Key, Certify, Re-certify, Re-key, Re-key Key Pair
Applies to Object Types	All Cryptographic Objects

Table 82: Lease Time Attribute Rules

## 3.21 Usage Limits

The *Usage Limits* attribute is a mechanism for limiting the usage of a Managed Cryptographic Object. It only applies to Managed Cryptographic Objects that are able to be used for applying cryptographic protection and it SHALL only reflect their usage for applying that protection (e.g., encryption, signing, etc.). This attribute does not necessarily exist for all Managed Cryptographic Objects, since some objects are able to be used without limit for cryptographically protecting data, depending on client/server policies.

800 Usage for processing cryptographically-protected data (e.g., decryption, verification, etc.) is not limited.  
 801 The Usage Limits attribute has the three following fields:

- 802 • *Usage Limits Total* – the total number of Usage Limits Units allowed to be protected. This is the  
 803 total value for the entire life of the object and SHALL NOT be changed once the object begins to  
 804 be used for applying cryptographic protection.
- 805 • *Usage Limits Count* – the currently remaining number of Usage Limits Units allowed to be  
 806 protected by the object.
- 807 • *Usage Limits Unit* – The type of quantity for which this structure specifies a usage limit (e.g., byte,  
 808 object).

809 When the attribute is initially set (usually during object creation or registration), the Usage Limits Count is  
 810 set to the Usage Limits Total value allowed for the useful life of the object, and are decremented when the  
 811 object is used. The server SHALL ignore the Usage Limits Count value if the attribute is specified in an  
 812 operation that creates a new object. Changes made via the Modify Attribute operation reflect corrections  
 813 to the Usage Limits Total value, but they SHALL NOT be changed once the Usage Limits Count value  
 814 has changed by a Get Usage Allocation operation. The Usage Limits Count value SHALL NOT be set or  
 815 modified by the client via the Add Attribute or Modify Attribute operations.

Object	Encoding	REQUIRED
Usage Limits	Structure	
Usage Limits Total	Long Integer	Yes
Usage Limits Count	Long Integer	Yes
Usage Limits Unit	Enumeration, see 9.1.3.2.31	Yes

816 Table 83: Usage Limits Attribute Structure

SHALL always have a value	No
Initially set by	Server (Total, Count, and Unit) or Client (Total and/or Unit only)
Modifiable by server	Yes
Modifiable by client	Yes (Total and/or Unit only, as long as Get Usage Allocation has not been performed)
Deletable by client	Yes, as long as Get Usage Allocation has not been performed
Multiple instances permitted	No
When implicitly set	Create, Create Key Pair, Register, Derive Key, Re-key, Re-key Key Pair, Get Usage Allocation
Applies to Object Types	Keys, Templates

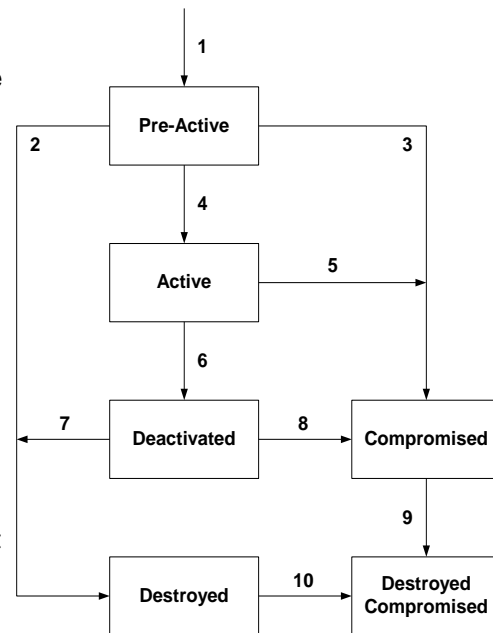

817 Table 84: Usage Limits Attribute Rules

## 3.22 State

This attribute is an indication of the *State* of an object as known to the key management server. The State SHALL NOT be changed by using the Modify Attribute operation on this attribute. The state SHALL only be changed by the server as a part of other operations or other server processes. An object SHALL be in one of the following states at any given time. (Note: These states correspond to those described in [SP800-57-1]).

Figure 1: Cryptographic Object States and Transitions

- Pre-Active:** The object exists but is not yet usable for any cryptographic purpose.
- Active:** The object MAY be used for all cryptographic purposes that are allowed by its Cryptographic Usage Mask attribute and, if applicable, by its Process Start Date (see 3.25) and Protect Stop Date (see 3.26) attributes.
- Deactivated:** The object SHALL NOT be used for applying cryptographic protection (e.g., encryption or signing), but, if permitted by the Cryptographic Usage Mask attribute, then the object MAY be used to process cryptographically-protected information (e.g., decryption or verification), but only under extraordinary circumstances and when special permission is granted.
- Compromised:** It is possible that the object has been compromised, and SHOULD only be used to process cryptographically-protected information in a client that is trusted to use managed objects that have been compromised.
- Destroyed:** The object is no longer usable for any purpose.
- Destroyed Compromised:** The object is no longer usable for any purpose; however its compromised status MAY be retained for audit or security purposes.

State transitions occur as follows:

- The transition from a non-existent key to the Pre-Active state is caused by the creation of the object. When an object is created or registered, it automatically goes from non-existent to Pre-Active. If, however, the operation that creates or registers the object contains an Activation Date that has already occurred, then the state immediately transitions from Pre-Active to Active. In this case, the server SHALL set the Activation Date attribute to the value specified in the request, or fail the request attempting to create or register the object, depending on server policy. If the operation contains an Activation Date attribute that is in the future, or contains no Activation Date, then the Cryptographic Object is initialized in the key management system in the Pre-Active state.
- The transition from Pre-Active to Destroyed is caused by a client issuing a Destroy operation. The server destroys the object when (and if) server policy dictates.
- The transition from Pre-Active to Compromised is caused by a client issuing a Revoke operation with a Revocation Reason of Compromised.
- The transition from Pre-Active to Active SHALL occur in one of three ways:
  - The Activation Date is reached.
  - A client successfully issues a Modify Attribute operation, modifying the Activation Date to a date in the past, or the current date.

- 866           • A client issues an Activate operation on the object. The server SHALL set the Activation  
867           Date to the time the Activate operation is received.
- 868       5. The transition from Active to Compromised is caused by a client issuing a Revoke operation with  
869       a Revocation Reason of Compromised.
- 870       6. The transition from Active to Deactivated SHALL occur in one of three ways:
- 871           • The object's Deactivation Date is reached.
- 872           • A client issues a Revoke operation, with a Revocation Reason other than Compromised.
- 873           • The client successfully issues a Modify Attribute operation, modifying the Deactivation Date  
874           to a date in the past, or the current date.
- 875       7. The transition from Deactivated to Destroyed is caused by a client issuing a Destroy operation, or  
876       by a server, both in accordance with server policy. The server destroys the object when (and if)  
877       server policy dictates.
- 878       8. The transition from Deactivated to Compromised is caused by a client issuing a Revoke operation  
879       with a Revocation Reason of Compromised.
- 880       9. The transition from Compromised to Destroyed Compromised is caused by a client issuing a  
881       Destroy operation, or by a server, both in accordance with server policy. The server destroys the  
882       object when (and if) server policy dictates.
- 883       10. The transition from Destroyed to Destroyed Compromised is caused by a client issuing a Revoke  
884       operation with a Revocation Reason of Compromised.
- 885       Only the transitions described above are permitted.

Object	Encoding	
State	Enumeration, see 9.1.3.2.18	

886       Table 85: State Attribute

SHALL always have a value	Yes
Initially set by	Server
Modifiable by server	Yes
Modifiable by client	No, but only by the server in response to certain requests (see above)
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Create, Create Key Pair, Register, Derive Key, Activate, Revoke, Destroy, Certify, Re-certify, Re-key, Re-key Key Pair
Applies to Object Types	All Cryptographic Objects

887       Table 86: State Attribute Rules

## 888       3.23 Initial Date

889       The *Initial Date* is the date and time when the Managed Object was first created or registered at the  
890       server. This time corresponds to state transition 1 (see Section 3.22). This attribute SHALL be set by the  
891       server when the object is created or registered, and then SHALL NOT be changed or deleted before the

object is destroyed. This attribute is also set for non-cryptographic objects (e.g., templates) when they are first registered with the server.

Object	Encoding

When implicitly set	Create, Create Key Pair, Register, Derive Key, Certify, Re-certify, Re-key, Re-key Key Pair
Applies to Object Types	All Objects

Table 88: Initial Date Attribute Rules

## 3.24 Activation Date

This is the date and time when the Managed Cryptographic Object MAY begin to be used. This time corresponds to state transition 4 (see Section 3.22). The object SHALL NOT be used for any cryptographic purpose before the *Activation Date* has been reached. Once the state transition from Pre-Active has occurred, then this attribute SHALL NOT be changed or deleted before the object is destroyed.

Object	Encoding	
Activation Date	Date-Time	

Table 89: Activation Date Attribute

SHALL always have a value	No
Initially set by	Server or Client
Modifiable by server	Yes, only while in Pre-Active state
Modifiable by client	Yes, only while in Pre-Active state
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Create, Create Key Pair, Register, Derive Key, Activate Certify, Re-certify, Re-key, Re-key Key Pair
Applies to Object Types	All Cryptographic Objects, Templates

Table 90: Activation Date Attribute Rules

### 3.25 Process Start Date

This is the date and time when a Managed Symmetric Key Object MAY begin to be used to process cryptographically-protected information (e.g., decryption or unwrapping), depending on the value of its Cryptographic Usage Mask attribute. The object SHALL NOT be used for these cryptographic purposes before the *Process Start Date* has been reached. This value MAY be equal to or later than, but SHALL NOT precede, the Activation Date. Once the Process Start Date has occurred, then this attribute SHALL NOT be changed or deleted before the object is destroyed.

Object	Encoding	
Process Start Date	Date-Time	

Table 91: Process Start Date Attribute

SHALL always have a value	No
Initially set by	Server or Client
Modifiable by server	Yes, only while in Pre-Active or Active state and as long as the Process Start Date has been not reached.
Modifiable by client	Yes, only while in Pre-Active or Active state and as long as the Process Start Date has been not reached.
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Create, Register, Derive Key, Re-key
Applies to Object Types	Symmetric Keys, Split Keys of symmetric keys, Templates

Table 92: Process Start Date Attribute Rules

### 3.26 Protect Stop Date

This is the date and time when a Managed Symmetric Key Object SHALL NOT be used for applying cryptographic protection (e.g., encryption or wrapping), depending on the value of its Cryptographic Usage Mask attribute. This value MAY be equal to or earlier than, but SHALL NOT be later than the Deactivation Date. Once the *Protect Stop Date* has occurred, then this attribute SHALL NOT be changed or deleted before the object is destroyed.

Object	Encoding	
Protect Stop Date	Date-Time	

Table 93: Protect Stop Date Attribute

SHALL always have a value	No
Initially set by	Server or Client
Modifiable by server	Yes, only while in Pre-Active or Active state and as long as the Protect Stop Date has not been reached.
Modifiable by client	Yes, only while in Pre-Active or Active state and as long as the Protect Stop Date has not been reached.
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Create, Register, Derive Key, Re-key
Applies to Object Types	Symmetric Keys, Split Keys of symmetric keys, Templates

919 Table 94: Protect Stop Date Attribute Rules

## 920 3.27 Deactivation Date

921 The *Deactivation Date* is the date and time when the Managed Cryptographic Object SHALL NOT be  
922 used for any purpose, except for decryption, signature verification, or unwrapping, but only under  
923 extraordinary circumstances and only when special permission is granted. This time corresponds to state  
924 transition 6 (see Section 3.22). This attribute SHALL NOT be changed or deleted before the object is  
925 destroyed, unless the object is in the Pre-Active or Active state.

Object	Encoding	
Deactivation Date	Date-Time	

926 Table 95: Deactivation Date Attribute

SHALL always have a value	No
Initially set by	Server or Client
Modifiable by server	Yes, only while in Pre-Active or Active state
Modifiable by client	Yes, only while in Pre-Active or Active state
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Create, Create Key Pair, Register, Derive Key, Revoke Certify, Re-certify, Re-key, Re-key Key Pair
Applies to Object Types	All Cryptographic Objects, Templates

927 Table 96: Deactivation Date Attribute Rules

## 3.28 Destroy Date

The *Destroy Date* is the date and time when the Managed Object was destroyed. This time corresponds to state transitions 2, 7, or 9 (see Section 3.22). This value is set by the server when the object is destroyed due to the reception of a Destroy operation, or due to server policy or out-of-band administrative action.

Object	Encoding	
Destroy Date	Date-Time	

Table 97: Destroy Date Attribute

SHALL always have a value	No
Initially set by	Server
Modifiable by server	No
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Destroy
Applies to Object Types	All Cryptographic Objects, Opaque Objects

Table 98: Destroy Date Attribute Rules

## 3.29 Compromise Occurrence Date

The *Compromise Occurrence Date* is the date and time when the Managed Cryptographic Object was first believed to be compromised. If it is not possible to estimate when the compromise occurred, then this value SHOULD be set to the Initial Date for the object.

Object	Encoding	
Compromise Occurrence Date	Date-Time	

Table 99: Compromise Occurrence Date Attribute

SHALL always have a value	No
Initially set by	Server
Modifiable by server	No
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Revoke
Applies to Object Types	All Cryptographic Objects, Opaque Object

Table 100: Compromise Occurrence Date Attribute Rules

## 3.30 Compromise Date

The *Compromise Date* is the date and time when the Managed Cryptographic Object entered into the compromised state. This time corresponds to state transitions 3, 5, 8, or 10 (see Section 3.22). This time

944 indicates when the key management system was made aware of the compromise, not necessarily when  
 945 the compromise occurred. This attribute is set by the server when it receives a Revoke operation with a  
 946 Revocation Reason of Compromised, or due to server policy or out-of-band administrative action.

Object	Encoding	
Compromise Date	Date-Time	

947 *Table 101: Compromise Date Attribute*

SHALL always have a value	No
Initially set by	Server
Modifiable by server	No
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Revoke
Applies to Object Types	All Cryptographic Objects, Opaque Object

948 *Table 102: Compromise Date Attribute Rules*

### 949 3.31 Revocation Reason

950 The *Revocation Reason* attribute is a structure (see Table 103) used to indicate why the Managed  
 951 Cryptographic Object was revoked (e.g., “compromised”, “expired”, “no longer used”, etc). This attribute is  
 952 only set by the server as a part of the Revoke Operation.

953 The *Revocation Message* is an OPTIONAL field that is used exclusively for audit trail/logging purposes  
 954 and MAY contain additional information about why the object was revoked (e.g., “Laptop stolen”, or  
 955 “Machine decommissioned”).

Object	Encoding	REQUIRED
Revocation Reason	Structure	
Revocation Reason Code	Enumeration, see 9.1.3.2.19	Yes
Revocation Message	Text String	No

956 *Table 103: Revocation Reason Attribute Structure*

SHALL always have a value	No
Initially set by	Server
Modifiable by server	Yes
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Revoke
Applies to Object Types	All Cryptographic Objects, Opaque Object

957 *Table 104: Revocation Reason Attribute Rules*

### 3.32 Archive Date

The *Archive Date* is the date and time when the Managed Object was placed in archival storage. This value is set by the server as a part of the Archive operation. The server SHALL delete this attribute whenever a Recover operation is performed.

Object	Encoding	
Archive Date	Date-Time	

Table 105: Archive Date Attribute

SHALL always have a value	No
Initially set by	Server
Modifiable by server	No
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Archive
Applies to Object Types	All Objects

Table 106: Archive Date Attribute Rules

### 3.33 Object Group

An object MAY be part of a group of objects. An object MAY belong to more than one group of objects. To assign an object to a group of objects, the object group name SHOULD be set into this attribute. "default" is a reserved Text String for Object Group.

Object	Encoding	
Object Group	Text String	

Table 107: Object Group Attribute

SHALL always have a value	No
Initially set by	Client or Server
Modifiable by server	Yes
Modifiable by client	Yes
Deletable by client	Yes
Multiple instances permitted	Yes
When implicitly set	Create, Create Key Pair, Register, Derive Key, Certify, Re-certify, Re-key, Re-key Key Pair
Applies to Object Types	All Objects

Table 108: Object Group Attribute Rules

### 3.34 Fresh

The *Fresh* attribute is a Boolean attribute that indicates if the object has not yet been served to a client. The *Fresh* attribute SHOULD be set to True when a new object is created on the server. The server SHALL change the attribute value to False as soon as the object has been served to a client.

Object	Encoding	
Fresh	Boolean	

Table 109: Fresh Attribute

SHALL always have a value	No
Initially set by	Client or Server
Modifiable by server	Yes
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Create, Create Key Pair, Register, Derive Key, Certify, Re-certify, Re-key, Re-key Key Pair, Re-key Key Pair
Applies to Object Types	All Cryptographic Objects

Table 110: Fresh Attribute Rules

### 3.35 Link

The *Link* attribute is a structure (see Table 111) used to create a link from one Managed Cryptographic Object to another, closely related target Managed Cryptographic Object. The link has a type, and the allowed types differ, depending on the Object Type of the Managed Cryptographic Object, as listed below. The *Linked Object Identifier* identifies the target Managed Cryptographic Object by its Unique Identifier. The link contains information about the association between the Managed Cryptographic Objects (e.g., the private key corresponding to a public key; the parent certificate for a certificate in a chain; or for a derived symmetric key, the base key from which it was derived).

Possible values of *Link Type* in accordance with the Object Type of the Managed Cryptographic Object are:

- *Private Key Link*. For a Public Key object: the private key corresponding to the public key.
- *Public Key Link*. For a Private Key object: the public key corresponding to the private key. For a Certificate object: the public key contained in the certificate.
- *Certificate Link*. For Certificate objects: the parent certificate for a certificate in a certificate chain. For Public Key objects: the corresponding certificate(s), containing the same public key.
- *Derivation Base Object Link* for a derived Symmetric Key object: the object(s) from which the current symmetric key was derived.
- *Derived Key Link*: the symmetric key(s) that were derived from the current object.
- *Replacement Object Link*. For a Symmetric Key, an Asymmetric Private Key, or an Asymmetric Public Key object: the key that resulted from the re-key of the current key. For a Certificate object: the certificate that resulted from the re-certify. Note that there SHALL be only one such replacement object per Managed Object.

- *Replaced Object Link*. For a Symmetric Key, an Asymmetric Private Key, or an Asymmetric Public Key object: the key that was re-keyed to obtain the current key. For a Certificate object: the certificate that was re-certified to obtain the current certificate.

The Link attribute SHOULD be present for private keys and public keys for which a certificate chain is stored by the server, and for certificates in a certificate chain.

Note that it is possible for a Managed Object to have multiple instances of the Link attribute (e.g., a Private Key has links to the associated certificate, as well as the associated public key; a Certificate object has links to both the public key and to the certificate of the certification authority (CA) that signed the certificate).

It is also possible that a Managed Object does not have links to associated cryptographic objects. This MAY occur in cases where the associated key material is not available to the server or client (e.g., the registration of a CA Signer certificate with a server, where the corresponding private key is held in a different manner).

Object	Encoding	REQUIRED
Link	Structure	
Link Type	Enumeration, see 9.1.3.2.20	Yes
Linked Object Identifier, see 3.1	Text String	Yes

Table 111: Link Attribute Structure

SHALL always have a value	No
Initially set by	Client or Server
Modifiable by server	Yes
Modifiable by client	Yes
Deletable by client	Yes
Multiple instances permitted	Yes
When implicitly set	Create Key Pair, Derive Key, Certify, Re-certify, Re-key, Re-key Key Pair
Applies to Object Types	All Cryptographic Objects

Table 112: Link Attribute Structure Rules

### 3.36 Application Specific Information

The *Application Specific Information* attribute is a structure (see Table 113) used to store data specific to the application(s) using the Managed Object. It consists of the following fields: an *Application Namespace* and *Application Data* specific to that application namespace.

Clients MAY request to set (i.e., using any of the operations that result in new Managed Object(s) on the server or adding/modifying the attribute of an existing Managed Object) an instance of this attribute with a particular Application Namespace while omitting Application Data. In that case, if the server supports this namespace (as indicated by the Query operation in Section 4.25), then it SHALL return a suitable Application Data value. If the server does not support this namespace, then an error SHALL be returned.

Object	Encoding	REQUIRED
Application Specific Information	Structure	
Application Namespace	Text String	Yes
Application Data	Text String	Yes

Table 113: Application Specific Information Attribute

SHALL always have a value	No
Initially set by	Client or Server (only if the Application Data is omitted, in the client request)
Modifiable by server	Yes (only if the Application Data is omitted in the client request)
Modifiable by client	Yes
Deletable by client	Yes
Multiple instances permitted	Yes
When implicitly set	Re-key, Re-key Key Pair, Re-certify
Applies to Object Types	All Objects

Table 114: Application Specific Information Attribute Rules

### 3.37 Contact Information

The *Contact Information* attribute is OPTIONAL, and its content is used for contact purposes only. It is not used for policy enforcement. The attribute is set by the client or the server.

Object	Encoding	
Contact Information	Text String	

Table 115: Contact Information Attribute

SHALL always have a value	No
Initially set by	Client or Server
Modifiable by server	Yes
Modifiable by client	Yes
Deletable by client	Yes
Multiple instances permitted	No
When implicitly set	Create, Create Key Pair, Register, Derive Key, Certify, Re-certify, Re-key, Re-key Key Pair
Applies to Object Types	All Objects

Table 116: Contact Information Attribute Rules

### 3.38 Last Change Date

The *Last Change Date* attribute is a meta attribute that contains the date and time of the last change to the contents or attributes of the specified object.

Object	Encoding	
Last Change Date	Date-Time	

Table 117: Last Change Date Attribute

SHALL always have a value	Yes
Initially set by	Server
Modifiable by server	Yes
Modifiable by client	No
Deletable by client	No
Multiple instances permitted	No
When implicitly set	Create, Create Key Pair, Register, Derive Key, Activate, Revoke, Destroy, Archive, Recover, Certify, Re-certify, Re-key, Re-key Key Pair, Add Attribute, Modify Attribute, Delete Attribute, Get Usage Allocation
Applies to Object Types	All Objects

Table 118: Last Change Date Attribute Rules

### 3.39 Custom Attribute

A *Custom Attribute* is a client- or server-defined attribute intended for vendor-specific purposes. It is created by the client and not interpreted by the server, or is created by the server and MAY be interpreted by the client. All custom attributes created by the client SHALL adhere to a naming scheme, where the name of the attribute SHALL have a prefix of 'x-'. All custom attributes created by the key management server SHALL adhere to a naming scheme where the name of the attribute SHALL have a prefix of 'y-'. The server SHALL NOT accept a client-created or modified attribute, where the name of the attribute has a prefix of 'y-'. The tag type Custom Attribute is not able to identify the particular attribute; hence such an attribute SHALL only appear in an Attribute Structure with its name as defined in Section 2.1.1.

Object	Encoding	
Custom Attribute	Any data type or structure. If a structure, then the structure SHALL NOT include sub structures	The name of the attribute SHALL start with 'x-' or 'y-'.

Table 119 Custom Attribute

SHALL always have a value	No
Initially set by	Client or Server
Modifiable by server	Yes, for server-created attributes
Modifiable by client	Yes, for client-created attributes
Deletable by client	Yes, for client-created attributes
Multiple instances permitted	Yes
When implicitly set	Create, Create Key Pair, Register, Derive Key, Activate, Revoke, Destroy, Certify, Re-certify, Re-key, Re-key Key Pair
Applies to Object Types	All Objects

1046      *Table 120: Custom Attribute Rules*

---

## 4 Client-to-Server Operations

The following subsections describe the operations that MAY be requested by a key management client. Not all clients have to be capable of issuing all operation requests; however any client that issues a specific request SHALL be capable of understanding the response to the request. All Object Management operations are issued in requests from clients to servers, and results obtained in responses from servers to clients. Multiple operations MAY be combined within a batch, resulting in a single request/response message pair.

A number of the operations whose descriptions follow are affected by a mechanism referred to as the *ID Placeholder*.

The key management server SHALL implement a temporary variable called the ID Placeholder. This value consists of a single Unique Identifier. It is a variable stored inside the server that is only valid and preserved during the execution of a batch of operations. Once the batch of operations has been completed, the ID Placeholder value SHALL be discarded and/or invalidated by the server, so that subsequent requests do not find this previous ID Placeholder available.

The ID Placeholder is obtained from the Unique Identifier returned in response to the Create, Create Pair, Register, Derive Key, Re-key, Re-key Key Pair, Certify, Re-Certify, Locate, and Recover operations. If any of these operations successfully completes and returns a Unique Identifier, then the server SHALL copy this Unique Identifier into the ID Placeholder variable, where it is held until the completion of the operations remaining in the batched request or until a subsequent operation in the batch causes the ID Placeholder to be replaced. If the Batch Error Continuation Option is set to Stop and the Batch Order Option is set to true, then subsequent operations in the batched request MAY make use of the ID Placeholder by omitting the Unique Identifier field from the request payloads for these operations.

Requests MAY contain attribute values to be assigned to the object. This information is specified with a Template-Attribute (see Section 2.1.8) that contains zero or more template names and zero or more individual attributes. If more than one template name is specified, and there is a conflict between the single-instance attributes in the templates, then the value in the last of the conflicting templates takes precedence. If there is a conflict between the single-instance attributes in the request and the single-instance attributes in a specified template, then the attribute values in the request take precedence. For multi-instance attributes, the union of attribute values is used when the attributes are specified more than once.

Responses MAY contain attribute values that were not specified in the request, but have been implicitly set by the server. This information is specified with a Template-Attribute that contains one or more individual attributes.

For any operations that operate on Managed Objects already stored on the server, any archived object SHALL first be made available by a Recover operation (see Section 4.23) before they MAY be specified (i.e., as on-line objects).

### 4.1 Create

This operation requests the server to generate a new symmetric key as a Managed Cryptographic Object. This operation is not used to create a Template object (see Register operation, Section 4.3).

The request contains information about the type of object being created, and some of the attributes to be assigned to the object (e.g., Cryptographic Algorithm, Cryptographic Length, etc). This information MAY be specified by the names of Template objects that already exist.

The response contains the Unique Identifier of the created object. The server SHALL copy the Unique Identifier returned by this operation into the ID Placeholder variable.

Request Payload		
Object	REQUIRED	Description
Object Type, see 3.3	Yes	Determines the type of object to be created.
Template-Attribute, see 2.1.8	Yes	Specifies desired object attributes using templates and/or individual attributes.

1091 Table 121: Create Request Payload

Response Payload		
Object	REQUIRED	Description
Object Type, see 3.3	Yes	Type of object created.
Unique Identifier, see 3.1	Yes	The Unique Identifier of the newly created object.
Template-Attribute, see 2.1.8	No	An OPTIONAL list of object attributes with values that were not specified in the request, but have been implicitly set by the key management server.

1092 Table 122: Create Response Payload

1093 Table 123 indicates which attributes SHALL be included in the Create request using the Template-  
1094 Attribute object.

Attribute	REQUIRED
Cryptographic Algorithm, see 3.4	Yes
Cryptographic Usage Mask, see 3.19	Yes

1095 Table 123: Create Attribute Requirements

## 1096 4.2 Create Key Pair

1097 This operation requests the server to generate a new public/private key pair and register the two  
1098 corresponding new Managed Cryptographic Objects.

1099 The request contains attributes to be assigned to the objects (e.g., Cryptographic Algorithm,  
1100 Cryptographic Length, etc). Attributes and Template Names MAY be specified for both keys at the same  
1101 time by specifying a Common Template-Attribute object in the request. Attributes not common to both  
1102 keys (e.g., Name, Cryptographic Usage Mask) MAY be specified using the Private Key Template-Attribute  
1103 and Public Key Template-Attribute objects in the request, which take precedence over the Common  
1104 Template-Attribute object.

1105 A Link Attribute is automatically created by the server for each object, pointing to the corresponding  
1106 object. The response contains the Unique Identifiers of both created objects. The ID Placeholder value  
1107 SHALL be set to the Unique Identifier of the Private Key.

Request Payload		
Object	REQUIRED	Description
Common Template-Attribute, see 2.1.8	No	Specifies desired attributes in templates and/or as individual attributes that apply to both the Private and Public Key Objects.
Private Key Template-Attribute, see 2.1.8	No	Specifies templates and/or attributes that apply to the Private Key Object. Order of precedence applies.
Public Key Template-Attribute, see 2.1.8	No	Specifies templates and/or attributes that apply to the Public Key Object. Order of precedence applies.

*Table 124: Create Key Pair Request Payload*

For multi-instance attributes, the union of the values found in the templates and attributes of the Common, Private, and Public Key Template-Attribute is used. For single-instance attributes, the order of precedence is as follows:

1. attributes specified explicitly in the Private and Public Key Template-Attribute, then
2. attributes specified via templates in the Private and Public Key Template-Attribute, then
3. attributes specified explicitly in the Common Template-Attribute, then
4. attributes specified via templates in the Common Template-Attribute

If there are multiple templates in the Common, Private, or Public Key Template-Attribute, then the last value of the single-instance attribute that conflicts takes precedence.

Response Payload		
Object	REQUIRED	Description
Private Key Unique Identifier, see 3.1	Yes	The Unique Identifier of the newly created Private Key object.
Public Key Unique Identifier, see 3.1	Yes	The Unique Identifier of the newly created Public Key object.
Private Key Template-Attribute, see 2.1.8	No	An OPTIONAL list of attributes, for the Private Key Object, with values that were not specified in the request, but have been implicitly set by the key management server.
Public Key Template-Attribute, see 2.1.8	No	An OPTIONAL list of attributes, for the Public Key Object, with values that were not specified in the request, but have been implicitly set by the key management server.

*Table 125: Create Key Pair Response Payload*

Table 126 indicates which attributes SHALL be included in the Create Key pair request using Template-Attribute objects, as well as which attributes SHALL have the same value for the Private and Public Key.

Attribute	REQUIRED	SHALL contain the same value for both Private and Public Key
Cryptographic Algorithm, see 3.4	Yes	Yes
Cryptographic Length, see 3.5	No	Yes
Cryptographic Usage Mask, see 3.19	Yes	No
Cryptographic Domain Parameters, see 3.7	No	Yes
Cryptographic Parameters, see 3.6	No	Yes

Table 126: Create Key Pair Attribute Requirements

Setting the same Cryptographic Length value for both private and public key does not imply that both keys are of equal length. For RSA, Cryptographic Length corresponds to the bit length of the Modulus. For DSA and DH algorithms, Cryptographic Length corresponds to the bit length of parameter P, and the bit length of Q is set separately in the Cryptographic Domain Parameters attribute. For ECDSA, ECDH, and ECMQV algorithms, Cryptographic Length corresponds to the bit length of parameter Q.

### 4.3 Register

This operation requests the server to register a Managed Object that was created by the client or obtained by the client through some other means, allowing the server to manage the object. The arguments in the request are similar to those in the Create operation, but also MAY contain the object itself for storage by the server. Optionally, objects that are not to be stored by the key management system MAY be omitted from the request (e.g., private keys).

The request contains information about the type of object being registered and some of the attributes to be assigned to the object (e.g., Cryptographic Algorithm, Cryptographic Length, etc). This information MAY be specified by the use of a Template-Attribute object.

The response contains the Unique Identifier assigned by the server to the registered object. The server SHALL copy the Unique Identifier returned by this operations into the ID Placeholder variable. The Initial Date attribute of the object SHALL be set to the current time.

Request Payload		
Object	REQUIRED	Description
Object Type, see 3.3	Yes	Determines the type of object being registered.
Template-Attribute, see 2.1.8	Yes	Specifies desired object attributes using templates and/or individual attributes.
Certificate, Symmetric Key, Private Key, Public Key, Split Key, Template Secret Data or Opaque Object, see 2.2	No	The object being registered. The object and attributes MAY be wrapped. Some objects (e.g., Private Keys), MAY be omitted from the request.

Table 127: Register Request Payload

Response Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	Yes	The Unique Identifier of the newly registered object.
Template-Attribute, see 2.1.8	No	An OPTIONAL list of object attributes with values that were not specified in the request, but have been implicitly set by the key management server.

1140 *Table 128: Register Response Payload*

1141 If a Managed Cryptographic Object is registered, then the following attributes SHALL be included in the  
 1142 Register request, either explicitly, or via specification of a template that contains the attribute.

Attribute	REQUIRED
Cryptographic Algorithm, see 3.4	Yes, MAY be omitted only if this information is encapsulated in the Key Block. Does not apply to Secret Data. If present, then Cryptographic Length below SHALL also be present.
Cryptographic Length, see 3.5	Yes, MAY be omitted only if this information is encapsulated in the Key Block. Does not apply to Secret Data. If present, then Cryptographic Algorithm above SHALL also be present.
Certificate Length, see 3.9	Yes. Only applies to Certificates.
Cryptographic Usage Mask, see 3.19	Yes.
Digital Signature Algorithm, see 3.16	Yes, MAY be omitted only if this information is encapsulated in the Certificate object. Only applies to Certificates.

1143 *Table 129: Register Attribute Requirements*

## 1144 4.4 Re-key

1145 This request is used to generate a replacement key for an existing symmetric key. It is analogous to the  
 1146 Create operation, except that attributes of the replacement key are copied from the existing key, with the  
 1147 exception of the attributes listed in Table 131.

1148 As the replacement key takes over the name attribute of the existing key, Re-key SHOULD only be  
 1149 performed once on a given key.

1150 The server SHALL copy the Unique Identifier of the replacement key returned by this operation into the ID  
 1151 Placeholder variable.

1152 As a result of Re-key, the Link attribute of the existing key is set to point to the replacement key and vice  
 1153 versa.

1154 An *Offset* MAY be used to indicate the difference between the Initialization Date and the Activation Date  
 1155 of the replacement key. If no *Offset* is specified, the Activation Date, Process Start Date, Protect Stop  
 1156 Date and Deactivation Date values are copied from the existing key. If *Offset* is set and dates exist for the  
 1157 existing key, then the dates of the replacement key SHALL be set based on the dates of the existing key  
 1158 as follows:

Attribute in Existing Key	Attribute in Replacement Key
Initial Date ( $IT_1$ )	Initial Date ( $IT_2$ ) $> IT_1$
Activation Date ( $AT_1$ )	Activation Date ( $AT_2$ ) $= IT_2 + Offset$
Process Start Date ( $CT_1$ )	Process Start Date $= CT_1 + (AT_2 - AT_1)$
Protect Stop Date ( $TT_1$ )	Protect Stop Date $= TT_1 + (AT_2 - AT_1)$
Deactivation Date ( $DT_1$ )	Deactivation Date $= DT_1 + (AT_2 - AT_1)$

1159 Table 130: Computing New Dates from Offset during Re-key

1160 Attributes that are not copied from the existing key and are handled in a specific way for the replacement  
 1161 key are:

Attribute	Action
Initial Date, see 3.23	Set to the current time
Destroy Date, see 3.28	Not set
Compromise Occurrence Date, see 3.29	Not set
Compromise Date, see 3.30	Not set
Revocation Reason, see 3.31	Not set
Unique Identifier, see 3.1	New value generated
Usage Limits, see 3.21	The Total value is copied from the existing key, and the Count value is set to the Total value.
Name, see 3.2	Set to the name(s) of the existing key; all name attributes are removed from the existing key.
State, see 3.22	Set based on attributes values, such as dates, as shown in Table 130
Digest, see 3.16	Recomputed from the replacement key value
Link, see 3.35	Set to point to the existing key as the replaced key
Last Change Date, see 3.38	Set to current time

1162 Table 131: Re-key Attribute Requirements

Request Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	No	Determines the existing Symmetric Key being re-keyed. If omitted, then the ID Placeholder value is used by the server as the Unique Identifier.
Offset	No	An Interval object indicating the difference between the Initialization Date and the Activation Date of the replacement key to be created.
Template-Attribute, see 2.1.8	No	Specifies desired object attributes using templates and/or individual attributes.

1163 Table 132: Re-key Request Payload

Response Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	Yes	The Unique Identifier of the newly-created replacement Symmetric Key.
Template-Attribute, see 2.1.8	No	An OPTIONAL list of object attributes with values that were not specified in the request, but have been implicitly set by the key management server.

1164 Table 133: Re-key Response Payload

## 1165 4.5 Re-key Key Pair

1166 This request is used to generate a replacement key pair for an existing public/private key pair. It is  
1167 analogous to the Create Key Pair operation, except that attributes of the replacement key pair are copied  
1168 from the existing key pair, with the exception of the attributes listed in Table 135.

1169 As the replacement of the key pair takes over the name attribute for the existing public/private key pair,  
1170 Re-key Key Pair SHOULD only be performed once on a given key pair.

1171 As a result of the Re-key Key Pair operation the Link Attribute for both the existing public key and private  
1172 key objects are updated to point to the replacement public and private key, respectively, and vice-versa .

1173 The server SHALL copy the Private Key Unique Identifier of the replacement private key returned by this  
1174 operation into the ID Placeholder variable.

1175 An Offset MAY be used to indicate the difference between the Initialization Date and Activation Date of  
1176 the replacement key pair. If the Offset is set and the dates exist for the existing key pair, then the dates  
1177 of the replacement key pair SHALL be set based on the dates of the existing key pair as follows:

Attribute in Existing Key Pair	Attribute in Replacement Key Pair
Initial Date ( $IT_1$ )	Initial Date ( $IT_2$ ) $> IT_1$
Activation Date ( $AT_1$ )	Activation Date ( $AT_2$ ) $= IT_2 + \text{Offset}$
Deactivation Date ( $DT_1$ )	Deactivation Date $= DT_1 + (AT_2 - AT_1)$

1178 Table 134: Computing New Dates from Offset during Re-key Key Pair

1179 Attributes that are not copied from the existing key pair and which are handled in a specific way are:

Attribute	Action
Private Key Unique Identifier, see 3.1	New value generated
Public Key Unique Identifier, see 3.1	New value generated
Name, see 3.2	Set to the name(s) of the existing public/private keys; all name attributes of the existing public/private keys are removed.
Digest, see 3.17	Recomputed for both replacement public and private keys from the new public and private key values
Usage Limits, see 3.21	The Total Bytes/Total Objects value is copied from the existing key pair, while the Byte Count/Object Count values are set to the Total Bytes/Total Objects.
State, see 3.22	Set based on attributes values, such as dates, as shown in Table xx
Initial Date, see 3.23	Set to the current time
Destroy Date, see 3.28	Not set
Compromise Occurrence Date, see 3.29	Not set
Compromise Date, see 3.30	Not set
Revocation Reason, see 3.31	Not set
Link, see 3.35	Set to point to the existing public/private keys as the replaced public/private keys
Last Change Date, see 3.38	Set to current time

*Table 135: Re-key Key Pair Attribute Requirements*

Request Payload		
Object	REQUIRED	Description
Private Key Unique Identifier, see 3.1	No	Determines the existing Asymmetric key pair to be re-keyed. If omitted, then the ID Placeholder is substituted by the server.
Offset	No	An Interval object indicating the difference between the Initialization date and the Activation Date of the replacement key pair to be created.
Common Template-Attribute, see 2.1.8	No	Specifies desired attributes in templates and/or as individual attributes that apply to both the Private and Public Key Objects.
Private Key Template-Attribute, see 2.1.8	No	Specifies templates and/or attributes that apply to the Private Key Object. Order of precedence applies.
Public Key Template-Attribute, see 2.1.8	No	Specifies templates and/or attributes that apply to the Public Key Object. Order of precedence applies.

1184 *Table 136: Re-key Key Pair Request Payload*

1185 For multi-instance attributes, the union of the values found in the templates and attributes of the  
1186 Common, Private, and Public Key Template-Attribute is used. For single-instance attributes, the order of  
1187 precedence is as follows:

- 1188 1. attributes specified explicitly in the Private and Public Key Template-Attribute, then
- 1189 2. attributes specified via templates in the Private and Public Key Template-Attribute, then
- 1190 3. attributes specified explicitly in the Common Template-Attribute, then
- 1191 4. attributes specified via templates in the Common Template-Attribute

1192 If there are multiple templates in the Common, Private, or Public Key Template-Attribute, then the  
1193 subsequent value of the single-instance attribute takes precedence.

Response Payload		
Object	REQUIRED	Description
Private Key Unique Identifier, see 3.1	Yes	The Unique Identifier of the newly created replacement Private Key object.
Public Key Unique Identifier, see 3.1	Yes	The Unique Identifier of the newly created replacement Public Key object.
Private Key Template-Attribute, see 2.1.8	No	An OPTIONAL list of attributes, for the Private Key Object, with values that were not specified in the request, but have been implicitly set by the key management server.
Public Key Template-Attribute, see 2.1.8	No	An OPTIONAL list of attributes, for the Public Key Object, with values that were not specified in the request, but have been implicitly set by the key

		management server.
--	--	--------------------

Table 137: Re-key Key Pair Response Payload

## 4.6 Derive Key

This request is used to derive a symmetric key or Secret Data object from a key or secret data that is already known to the key management system. The request SHALL only apply to Managed Cryptographic Objects that have the Derive Key bit set in the Cryptographic Usage Mask attribute of the specified Managed Object (i.e., are able to be used for key derivation). If the operation is issued for an object that does not have this bit set, then the server SHALL return an error. For all derivation methods, the client SHALL specify the desired length of the derived key or Secret Data object using the Cryptographic Length attribute. If a key is created, then the client SHALL specify both its Cryptographic Length and Cryptographic Algorithm. If the specified length exceeds the output of the derivation method, then the server SHALL return an error. Clients MAY derive multiple keys and IVs by requesting the creation of a Secret Data object and specifying a Cryptographic Length that is the total length of the derived object. The length SHALL NOT exceed the length of the output returned by the chosen derivation method.

The fields in the request specify the Unique Identifiers of the keys or Secret Data objects to be used for derivation (e.g., some derivation methods MAY require multiple keys or Secret Data objects to derive the result), the method to be used to perform the derivation, and any parameters needed by the specified method. The method is specified as an enumerated value. Currently defined derivation methods include:

- *PBKDF2* – This method is used to derive a symmetric key from a password or pass phrase. The PBKDF2 method is published in **[PKCS#5]** and **[RFC2898]**.
- *HASH* – This method derives a key by computing a hash over the derivation key or the derivation data.
- *HMAC* – This method derives a key by computing an HMAC over the derivation data.
- *ENCRYPT* – This method derives a key by encrypting the derivation data.
- *NIST800-108-C* – This method derives a key by computing the KDF in Counter Mode as specified in **[SP800-108]**.
- *NIST800-108-F* – This method derives a key by computing the KDF in Feedback Mode as specified in **[SP800-108]**.
- *NIST800-108-DPI* – This method derives a key by computing the KDF in Double-Pipeline Iteration Mode as specified in **[SP800-108]**.
- *Extensions*

The server SHALL perform the derivation function, and then register the derived object as a new Managed Object, returning the new Unique Identifier for the new object in the response. The server SHALL copy the Unique Identifier returned by this operation into the ID Placeholder variable.

As a result of Derive Key, the Link attributes (i.e., Derived Key Link in the objects from which the key is derived, and the Derivation Base Object Link in the derived key) of all objects involved SHALL be set to point to the corresponding objects.

Request Payload		
Object	REQUIRED	Description
Object Type, see 3.3	Yes	Determines the type of object to be created.
Unique Identifier, see 3.1	Yes. MAY be repeated	Determines the object or objects to be used to derive a new key. At most, two identifiers MAY be specified: one for the derivation key and another for the secret data. Note that the current value of the ID Placeholder SHALL NOT be used in place of a Unique Identifier in this operation.
Derivation Method, see 9.1.3.2.21	Yes	An Enumeration object specifying the method to be used to derive the new key.
Derivation Parameters, see below	Yes	A Structure object containing the parameters needed by the specified derivation method.
Template-Attribute, see 2.1.8	Yes	Specifies desired object attributes using templates and/or individual attributes; the length and algorithm SHALL always be specified for the creation of a symmetric key.

1232 Table 138: Derive Key Request Payload

Response Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	Yes	The Unique Identifier of the newly derived key or Secret Data object.
Template-Attribute, see 2.1.8	No	An OPTIONAL list of object attributes with values that were not specified in the request, but have been implicitly set by the key management server.

1233 Table 139: Derive Key Response Payload

1234 The *Derivation Parameters* for all derivation methods consist of the following parameters, except  
1235 PBKDF2, which requires two additional parameters.

Object	Encoding	REQUIRED
Derivation Parameters	Structure	Yes
Cryptographic Parameters, see 3.6	Structure	Yes, except for HMAC derivation keys.
Initialization Vector	Byte String	No, depends on PRF and mode of operation: empty IV is assumed if not provided.
Derivation Data	Byte String	Yes, unless the Unique Identifier of a Secret Data object is provided.

Table 140: Derivation Parameters Structure (Except PBKDF2)

Cryptographic Parameters identify the Pseudorandom Function (PRF) or the mode of operation of the PRF (e.g., if a key is to be derived using the HASH derivation method, then clients are REQUIRED to indicate the hash algorithm inside Cryptographic Parameters; similarly, if a key is to be derived using AES in CBC mode, then clients are REQUIRED to indicate the Block Cipher Mode). The server SHALL verify that the specified mode matches one of the instances of Cryptographic Parameters set for the corresponding key. If Cryptographic Parameters are omitted, then the server SHALL select the Cryptographic Parameters with the lowest Attribute Index for the specified key. If the corresponding key does not have any Cryptographic Parameters attribute, or if no match is found, then an error is returned.

If a key is derived using HMAC, then the attributes of the derivation key provide enough information about the PRF and the Cryptographic Parameters are ignored.

Derivation Data is either the data to be encrypted, hashed, or HMACed. For the NIST SP 800-108 methods [SP800-108], Derivation Data is Label||{0x00}||Context, where the all-zero byte is OPTIONAL.

Most derivation methods (e.g., ENCRYPT) require a derivation key and the derivation data to be used. The HASH derivation method requires either a derivation key or derivation data. Derivation data MAY either be explicitly provided by the client with the Derivation Data field or implicitly provided by providing the Unique Identifier of a Secret Data object. If both are provided, then an error SHALL be returned.

The PBKDF2 derivation method requires two additional parameters:

Object	Encoding	REQUIRED
Derivation Parameters	Structure	Yes
Cryptographic Parameters, see 3.6	Structure	No, depends on the PRF
Initialization Vector	Byte String	No, depends on the PRF (if different than those defined in [PKCS#5]) and mode of operation: an empty IV is assumed if not provided.
Derivation Data	Byte String	Yes, unless the Unique Identifier of a Secret Data object is provided.
Salt	Byte String	Yes
Iteration Count	Integer	Yes

Table 141: PBKDF2 Derivation Parameters Structure

## 4.7 Certify

This request is used to generate a Certificate object for a public key. This request supports certification of a new public key as well as certification of a public key that has already been certified (i.e., certificate update). Only a single certificate SHALL be requested at a time. Server support for this operation is OPTIONAL, as it requires that the key management system have access to a certification authority (CA). If the server does not support this operation, an error SHALL be returned.

The Certificate Request object MAY be omitted, in which case the public key for which a Certificate object is generated SHALL be specified by its Unique Identifier only. If the Certificate Request Type and the Certificate Request objects are omitted from the request, then the Certificate Type SHALL be specified using the Template-Attribute object.

The Certificate Request is passed as a Byte String, which allows multiple certificate request types for X.509 certificates (e.g., PKCS#10, PEM, etc) or PGP certificates to be submitted to the server.

- 1267 The generated Certificate object whose Unique Identifier is returned MAY be obtained by the client via a  
 1268 Get operation in the same batch, using the ID Placeholder mechanism.
- 1269 As a result of Certify, the Link attribute of the Public Key and of the generated certificate SHALL be set to  
 1270 point at each other.
- 1271 The server SHALL copy the Unique Identifier of the generated certificate returned by this operation into  
 1272 the ID Placeholder variable.
- 1273 If the information in the Certificate Request conflicts with the attributes specified in the Template-Attribute,  
 1274 then the information in the Certificate Request takes precedence.

Request Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	No	The Unique Identifier of the Public Key being certified. If omitted, then the ID Placeholder value is used by the server as the Unique Identifier.
Certificate Request Type, see 9.1.3.2.22	No	An Enumeration object specifying the type of certificate request. It is REQUIRED if the Certificate Request is present.
Certificate Request	No	A Byte String object with the certificate request.
Template-Attribute, see 2.1.8	No	Specifies desired object attributes using templates and/or individual attributes.

1275 Table 142: Certify Request Payload

Response Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	Yes	The Unique Identifier of the generated Certificate object.
Template-Attribute, see 2.1.8	No	An OPTIONAL list of object attributes with values that were not specified in the request, but have been implicitly set by the key management server.

1276 Table 143: Certify Response Payload

## 1277 4.8 Re-certify

- 1278 This request is used to renew an existing certificate for the same key pair. Only a single certificate SHALL  
 1279 be renewed at a time. Server support for this operation is OPTIONAL, as it requires that the key  
 1280 management system to have access to a certification authority (CA). If the server does not support this  
 1281 operation, an error SHALL be returned.
- 1282 The Certificate Request object MAY be omitted, in which case the public key for which a Certificate object  
 1283 is generated SHALL be specified by its Unique Identifier only. If the Certificate Request Type and the  
 1284 Certificate Request objects are omitted and the Certificate Type is not specified using the Template-  
 1285 Attribute object in the request, then the Certificate Type of the new certificate SHALL be the same as that  
 1286 of the existing certificate.
- 1287

1288 The Certificate Request is passed as a Byte String, which allows multiple certificate request types for  
 1289 X.509 certificates (e.g., PKCS#10, PEM, etc) or PGP certificates to be submitted to the server.

1290 The server SHALL copy the Unique Identifier of the new certificate returned by this operation into the ID  
 1291 Placeholder variable.

1292 If the information in the Certificate Request field in the request conflicts with the attributes specified in the  
 1293 Template-Attribute, then the information in the Certificate Request takes precedence.

1294 As the new certificate takes over the name attribute of the existing certificate, Re-certify SHOULD only be  
 1295 performed once on a given (existing) certificate.

1296 The Link attribute of the existing certificate and of the new certificate are set to point at each other. The  
 1297 Link attribute of the Public Key is changed to point to the new certificate.

1298 An *Offset* MAY be used to indicate the difference between the Initialization Date and the Activation Date  
 1299 of the new certificate. If Offset is set, then the dates of the new certificate SHALL be set based on the  
 1300 dates of the existing certificate (if such dates exist) as follows:

Attribute in Existing Certificate	Attribute in New Certificate
Initial Date ( $IT_1$ )	Initial Date ( $IT_2$ ) $> IT_1$
Activation Date ( $AT_1$ )	Activation Date ( $AT_2$ ) = $IT_2 + \text{Offset}$
Deactivation Date ( $DT_1$ )	Deactivation Date = $DT_1 + (AT_2 - AT_1)$

1301 *Table 144: Computing New Dates from Offset during Re-certify*

1302 Attributes that are not copied from the existing certificate and that are handled in a specific way for the  
 1303 new certificate are:

Attribute	Action
Initial Date, see 3.23	Set to current time
Destroy Date, see 3.28	Not set
Revocation Reason, see 3.31	Not set
Unique Identifier, see 3.2	New value generated
Name, see 3.2	Set to the name(s) of the existing certificate; all name attributes are removed from the existing certificate.
State, see 3.22	Set based on attributes values, such as dates, as shown in Table 144
Digest, see 3.16	Recomputed from the new certificate value.
Link, see 3.35	Set to point to the existing certificate as the replaced certificate.
Last Change Date, see 3.38	Set to current time

1304 *Table 145: Re-certify Attribute Requirements*

Request Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	No	The Unique Identifier of the Certificate being renewed. If omitted, then the ID Placeholder value is used by the server as the Unique Identifier.
Certificate Request Type, see 9.1.3.2.22	No	An Enumeration object specifying the type of certificate request. It is REQUIRED if the Certificate Request is present.
Certificate Request	No	A Byte String object with the certificate request.
Offset	No	An Interval object indicating the difference between the Initial Date of the new certificate and the Activation Date of the new certificate.
Template-Attribute, see 2.1.8	No	Specifies desired object attributes using templates and/or individual attributes.

1305 Table 146: Re-certify Request Payload

Response Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	Yes	The Unique Identifier of the new certificate.
Template-Attribute, see 2.1.8	No	An OPTIONAL list of object attributes with values that were not specified in the request, but have been implicitly set by the key management server.

1306 Table 147: Re-certify Response Payload

## 1307 4.9 Locate

1308 This operation requests that the server search for one or more Managed Objects depending on the  
1309 attributes specified in the request. All attributes are allowed to be used. However, Attribute Index values  
1310 SHOULD NOT be specified in the request. Attribute Index values that are provided SHALL be ignored by  
1311 the Locate operation. The request MAY also contain a *Maximum Items* field, which specifies the  
1312 maximum number of objects to be returned. If the Maximum Items field is omitted, then the server MAY  
1313 return all objects matched, or MAY impose an internal maximum limit due to resource limitations.

1314 If more than one object satisfies the identification criteria specified in the request, then the response MAY  
1315 contain Unique Identifiers for multiple Managed Objects. Returned objects SHALL match **all** of the  
1316 attributes in the request. If no objects match, then an empty response payload is returned. If no attribute  
1317 is specified in the request, any object SHALL be deemed to match the Locate request.

1318 The server returns a list of Unique Identifiers of the found objects, which then MAY be retrieved using the  
1319 Get operation. If the objects are archived, then the Recover and Get operations are REQUIRED to be  
1320 used to obtain those objects. If a single Unique Identifier is returned to the client, then the server SHALL  
1321 copy the Unique Identifier returned by this operation into the ID Placeholder variable. If the Locate  
1322 operation matches more than one object, and the Maximum Items value is omitted in the request, or is set  
1323 to a value larger than one, then the server SHALL empty the ID Placeholder, causing any subsequent

1324 operations that are batched with the Locate, and which do not specify a Unique Identifier explicitly, to fail.  
 1325 This ensures that these batched operations SHALL proceed only if a single object is returned by Locate.

1326 Wild-cards or regular expressions (defined, e.g., in [ISO/IEC 9945-2]) MAY be supported by specific key  
 1327 management system implementations for matching attribute fields when the field type is a Text String or a  
 1328 Byte String.

1329 The Date attributes in the Locate request (e.g., Initial Date, Activation Date, etc) are used to specify a  
 1330 time or a time range for the search. If a single instance of a given Date attribute is used in the request  
 1331 (e.g., the Activation Date), then objects with the same Date attribute are considered to be matching  
 1332 candidate objects. If two instances of the same Date attribute are used (i.e., with two different values  
 1333 specifying a range), then objects for which the Date attribute is inside or at a limit of the range are  
 1334 considered to be matching candidate objects. If a Date attribute is set to its largest possible value, then it  
 1335 is equivalent to an undefined attribute. The KMIP Usage Guide [KMIP-UG] provides examples.

1336 When the Cryptographic Usage Mask attribute is specified in the request, candidate objects are  
 1337 compared against this field via an operation that consists of a logical AND of the requested mask with the  
 1338 mask in the candidate object, and then a comparison of the resulting value with the requested mask. For  
 1339 example, if the request contains a mask value of 1000100010000, and a candidate object mask contains  
 1340 10000100010000, then the logical AND of the two masks is 10000100010000, which is compared against  
 1341 the mask value in the request (1000100010000) and the match fails. This means that a matching  
 1342 candidate object has all of the bits set in its mask that are set in the requested mask, but MAY have  
 1343 additional bits set.

1344 When the Usage Limits attribute is specified in the request, matching candidate objects SHALL have an  
 1345 Usage Limits Count and Usage Limits Total equal to or larger than the values specified in the request.

1346 When an attribute that is defined as a structure is specified, all of the structure fields are not REQUIRED  
 1347 to be specified. For instance, for the Link attribute, if the Linked Object Identifier value is specified without  
 1348 the Link Type value, then matching candidate objects have the Linked Object Identifier as specified,  
 1349 irrespective of their Link Type.

1350 When the Object Group attribute and the Object Group Member flag are specified in the request, and the  
 1351 value specified for Object Group Member is 'Group Member Fresh', matching candidate objects SHALL  
 1352 be fresh objects (see 3.34) from the object group. If there are no more fresh objects in the group, the  
 1353 server MAY choose to generate a new object on the fly based on server policy. If the value specified for  
 1354 Object Group Member is 'Group Member Default', the server locates the default object as defined by  
 1355 server policy.

1356 The Storage Status Mask field (see Section 9.1.3.3.2) is used to indicate whether only on-line objects,  
 1357 only archived objects, or both on-line and archived objects are to be searched. Note that the server MAY  
 1358 store attributes of archived objects in order to expedite Locate operations that search through archived  
 1359 objects.

Request Payload		
Object	REQUIRED	Description
Maximum Items	No	An Integer object that indicates the maximum number of object identifiers the server MAY return.
Storage Status Mask, see 9.1.3.3.2	No	An Integer object (used as a bit mask) that indicates whether only on-line objects, only archived objects, or both on-line and archived objects are to be searched. If omitted, then on-line only is assumed.
Object Group Member, see 9.1.3.2.33	No	An Enumeration object that indicates the object group member type.
Attribute, see 3	No, MAY be	Specifies an attribute and its value(s)

	repeated	that are REQUIRED to match those in a candidate object (according to the matching rules defined above).
--	----------	---

Table 148: Locate Request Payload

Response Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	No, MAY be repeated	The Unique Identifier of the located objects.

Table 149: Locate Response Payload

## 4.10 Check

This operation requests that the server check for the use of a Managed Object according to values specified in the request. This operation SHOULD only be used when placed in a batched set of operations, usually following a Locate, Create, Create Pair, Derive Key, Certify, Re-Certify, Re-key or Re-key Key Pair operation, and followed by a Get operation.

If the server determines that the client is allowed to use the object according to the specified attributes, then the server returns the Unique Identifier of the object.

If the server determines that the client is not allowed to use the object according to the specified attributes, then the server empties the ID Placeholder and does not return the Unique Identifier, and the operation returns the set of attributes specified in the request that caused the server policy denial. The only attributes returned are those that resulted in the server determining that the client is not allowed to use the object, thus allowing the client to determine how to proceed.

In a batch containing Check operation the Batch Order Option SHOULD be set to true. Only STOP or UNDO Batch Error Continuation Option values SHOULD be used by the client in such a batch. Additional attributes that MAY be specified in the request are limited to:

- Usage Limits Count (see Section 3.21) – The request MAY contain the usage amount that the client deems necessary to complete its needed function. This does not require that any subsequent Get Usage Allocation operations request this amount. It only means that the client is ensuring that the amount specified is available.
- Cryptographic Usage Mask – This is used to specify the cryptographic operations for which the client intends to use the object (see Section 3.19). This allows the server to determine if the policy allows this client to perform these operations with the object. Note that this MAY be a different value from the one specified in a Locate operation that precedes this operation. Locate, for example, MAY specify a Cryptographic Usage Mask requesting a key that MAY be used for both Encryption and Decryption, but the value in the Check operation MAY specify that the client is only using the key for Encryption at this time.
- Lease Time – This specifies a desired lease time (see Section 3.20). The client MAY use this to determine if the server allows the client to use the object with the specified lease or longer. Including this attribute in the Check operation does not actually cause the server to grant a lease, but only indicates that the requested lease time value MAY be granted if requested by a subsequent, batched, Obtain Lease operation.

Note that these objects are not encoded in an Attribute structure as shown in Section 2.1.1

Request Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	No	Determines the object being checked. If omitted, then the ID Placeholder value is used by the server as the Unique Identifier.
Usage Limits Count, see 3.21	No	Specifies the number of Usage Limits Units to be protected to be checked against server policy.
Cryptographic Usage Mask, see 3.19	No	Specifies the Cryptographic Usage for which the client intends to use the object.
Lease Time, see 3.20	No	Specifies a Lease Time value that the Client is asking the server to validate against server policy.

1394 Table 150: Check Request Payload

Response Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	Yes, unless a failure,	The Unique Identifier of the object.
Usage Limits Count, see 3.21	No	Returned by the Server if the Usage Limits value specified in the Request Payload is larger than the value that the server policy allows.
Cryptographic Usage Mask, see 3.19	No	Returned by the Server if the Cryptographic Usage Mask specified in the Request Payload is rejected by the server for policy violation.
Lease Time, see 3.20	No	Returned by the Server if the Lease Time value in the Request Payload is larger than a valid Lease Time that the server MAY grant.

1395 Table 151: Check Response Payload

## 1396 4.11 Get

1397 This operation requests that the server returns the Managed Object specified by its Unique Identifier.

1398 Only a single object is returned. The response contains the Unique Identifier of the object, along with the  
1399 object itself, which MAY be wrapped using a wrapping key as specified in the request.

1400 The following key format capabilities SHALL be assumed by the client restrictions apply when the client  
1401 requests the server to return an object in a particular format:

- 1402 • If a client registered a key in a given format, the server SHALL be able to return the key during  
1403 the Get operation in the same format that was used when the key was registered.
- 1404 • Any other format conversion MAY optionally be supported by the server.

1405

Request Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	No	Determines the object being requested. If omitted, then the ID Placeholder value is used by the server as the Unique Identifier.
Key Format Type, see 9.1.3.2.3	No	Determines the key format type to be returned.
Key Compression Type, see 9.1.3.2.2	No	Determines the compression method for elliptic curve public keys.
Key Wrapping Specification, see 2.1.6	No	Specifies keys and other information for wrapping the returned object. This field SHALL NOT be specified if the requested object is a Template.

1406 Table 152: Get Request Payload

Response Payload		
Object	REQUIRED	Description
Object Type, see 3.3	Yes	Type of object.
Unique Identifier, see 3.1	Yes	The Unique Identifier of the object.
Certificate, Symmetric Key, Private Key, Public Key, Split Key, Template, Secret Data, or Opaque Object, see 2.2	Yes	The cryptographic object being returned.

1407 Table 153: Get Response Payload

## 1408 4.12 Get Attributes

1409 This operation requests one or more attributes of a Managed Object. The object is specified by its Unique  
1410 Identifier and the attributes are specified by their name in the request. If a specified attribute has multiple  
1411 instances, then all instances are returned. If a specified attribute does not exist (i.e., has no value), then it  
1412 SHALL NOT be present in the returned response. If no requested attributes exist, then the response  
1413 SHALL consist only of the Unique Identifier. If no attribute name is specified in the request, all attributes  
1414 SHALL be deemed to match the Get Attributes request. The same attribute name SHALL NOT be present  
1415 more than once in a request.

Request Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	No	Determines the object whose attributes are being requested. If omitted, then the ID Placeholder value is used by the server as the Unique Identifier.
Attribute Name, see 2.1.1	No, MAY be repeated	Specifies a desired attribute of the object.

1416 Table 154: Get Attributes Request Payload

Response Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	Yes	The Unique Identifier of the object.
Attribute, see 2.1.1	No, MAY be repeated	The requested attribute for the object.

Table 155: Get Attributes Response Payload

## 4.13 Get Attribute List

This operation requests a list of the attribute names associated with a Managed Object. The object is specified by its Unique Identifier.

Request Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	No	Determines the object whose attribute names are being requested. If omitted, then the ID Placeholder value is used by the server as the Unique Identifier.

Table 156: Get Attribute List Request Payload

Response Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	Yes	The Unique Identifier of the object.
Attribute Name, see 2.1.1	Yes, MAY be repeated	The names of the available attributes for the object.

Table 157: Get Attribute List Response Payload

## 4.14 Add Attribute

This request adds a new attribute instance to a Managed Object and sets its value. The request contains the Unique Identifier of the Managed Object to which the attribute pertains, along with the attribute name and value. For single-instance attributes, this is how the attribute value is created. For multi-instance attributes, this is how the first and subsequent values are created. Existing attribute values SHALL only be changed by the Modify Attribute operation. Read-Only attributes SHALL NOT be added using the Add Attribute operation. The Attribute Index SHALL NOT be specified in the request. The response returns a new Attribute Index and the Attribute Index MAY be omitted if the index of the added attribute instance is 0. Multiple Add Attribute requests MAY be included in a single batched request to add multiple attributes.

Request Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	No	The Unique Identifier of the object. If omitted, then the ID Placeholder value is used by the server as the Unique Identifier.
Attribute, see 2.1.1	Yes	Specifies the attribute to be added for the object.

Table 158: Add Attribute Request Payload

Response Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	Yes	The Unique Identifier of the object.
Attribute, see 2.1.1	Yes	The added attribute.

Table 159: Add Attribute Response Payload

## 4.15 Modify Attribute

This request modifies the value of an existing attribute instance associated with a Managed Object. The request contains the Unique Identifier of the Managed Object whose attribute is to be modified, and the attribute name, the optional Attribute Index, and the new value. If no Attribute Index is specified in the request, then the Attribute Index SHALL be assumed to be 0. Only existing attributes MAY be changed via this operation. New attributes SHALL only be added by the Add Attribute operation. Only the specified instance of the attribute SHALL be modified. Specifying an Attribute Index for which there exists no Attribute Value SHALL result in an error. The response returns the modified Attribute (new value) and the Attribute Index MAY be omitted if the index of the modified attribute instance is 0. Multiple Modify Attribute requests MAY be included in a single batched request to modify multiple attributes.

Request Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	No	The Unique Identifier of the object. If omitted, then the ID Placeholder value is used by the server as the Unique Identifier.
Attribute, see 2.1.1	Yes	Specifies the attribute of the object to be modified.

Table 160: Modify Attribute Request Payload

Response Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	Yes	The Unique Identifier of the object.
Attribute, see 2.1.1	Yes	The modified attribute with the new value.

Table 161: Modify Attribute Response Payload

## 4.16 Delete Attribute

This request deletes an attribute associated with a Managed Object. The request contains the Unique Identifier of the Managed Object whose attribute is to be deleted, the attribute name, and the optional Attribute Index of the attribute. If no Attribute Index is specified in the request, then the Attribute Index SHALL be assumed to be 0. Attributes that are always required to have a value SHALL never be deleted by this operation. Attempting to delete a non-existent attribute or specifying an Attribute Index for which there exists no Attribute Value SHALL result in an error. The response returns the deleted Attribute and the Attribute Index MAY be omitted if the index of the deleted attribute instance is 0. Multiple Delete Attribute requests MAY be included in a single batched request to delete multiple attributes.

Request Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	No	Determines the object whose attributes are being deleted. If omitted, then the ID Placeholder value is used by the server as the Unique Identifier.
Attribute Name, see 2.1.1	Yes	Specifies the name of the attribute to be deleted.
Attribute Index, see 2.1.1	No	Specifies the Index of the Attribute.

1455 Table 162: Delete Attribute Request Payload

Response Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	Yes	The Unique Identifier of the object.
Attribute, see 2.1.1	Yes	The deleted attribute.

1456 Table 163: Delete Attribute Response Payload

## 1457 4.17 Obtain Lease

1458 This request is used to obtain a new *Lease Time* for a specified Managed Object. The Lease Time is an  
1459 interval value that determines when the client's internal cache of information about the object expires and  
1460 needs to be renewed. If the returned value of the lease time is zero, then the server is indicating that no  
1461 lease interval is effective, and the client MAY use the object without any lease time limit. If a client's lease  
1462 expires, then the client SHALL NOT use the associated cryptographic object until a new lease is  
1463 obtained. If the server determines that a new lease SHALL NOT be issued for the specified cryptographic  
1464 object, then the server SHALL respond to the Obtain Lease request with an error.

1465 The response payload for the operation contains the current value of the Last Change Date attribute for  
1466 the object. This MAY be used by the client to determine if any of the attributes cached by the client need  
1467 to be refreshed, by comparing this time to the time when the attributes were previously obtained.

Request Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	No	Determines the object for which the lease is being obtained. If omitted, then the ID Placeholder value is used by the server as the Unique Identifier.

1468 Table 164: Obtain Lease Request Payload

Response Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	Yes	The Unique Identifier of the object.
Lease Time, see 3.20	Yes	An interval (in seconds) that specifies the amount of time that the object MAY be used until a new lease needs to be obtained.
Last Change Date, see 3.38	Yes	The date and time indicating when the latest change was made to the contents or any attribute of the

		specified object.
--	--	-------------------

Table 165: Obtain Lease Response Payload

## 4.18 Get Usage Allocation

This request is used to obtain an allocation from the current Usage Limits value to allow the client to use the Managed Cryptographic Object for applying cryptographic protection. The allocation only applies to Managed Cryptographic Objects that are able to be used for applying protection (e.g., symmetric keys for encryption, private keys for signing, etc.) and is only valid if the Managed Cryptographic Object has a Usage Limits attribute. Usage for processing cryptographically-protected information (e.g., decryption, verification, etc.) is not limited and is not able to be allocated. A Managed Cryptographic Object that has a Usage Limits attribute SHALL NOT be used by a client for applying cryptographic protection unless an allocation has been obtained using this operation. The operation SHALL only be requested during the time that protection is enabled for these objects (i.e., after the Activation Date and before the Protect Stop Date). If the operation is requested for an object that has no Usage Limits attribute, or is not an object that MAY be used for applying cryptographic protection, then the server SHALL return an error.

The field in the request specifies the number of units that the client needs to protect. If the requested amount is not available or if the Managed Object is not able to be used for applying cryptographic protection at this time, then the server SHALL return an error. The server SHALL assume that the entire allocated amount is going to be consumed. Once the entire allocated amount has been consumed, the client SHALL NOT continue to use the Managed Cryptographic Object for applying cryptographic protection until a new allocation is obtained.

Request Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	No	Determines the object whose usage allocation is being requested. If omitted, then the ID Placeholder is substituted by the server.
Usage Limits Count, see Usage Limits Count field in 3.21	Yes	The number of Usage Limits Units to be protected.

Table 166: Get Usage Allocation Request Payload

Response Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	Yes	The Unique Identifier of the object.

Table 167: Get Usage Allocation Response Payload

## 4.19 Activate

This request is used to activate a Managed Cryptographic Object. The request SHALL NOT specify a Template object. The operation SHALL only be performed on an object in the Pre-Active state and has the effect of changing its state to Active, and setting its Activation Date to the current date and time.

Request Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	No	Determines the object being activated. If omitted, then the ID Placeholder value is used by the server as the Unique Identifier.

Table 168: Activate Request Payload

Response Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	Yes	The Unique Identifier of the object.

Table 169: Activate Response Payload

## 4.20 Revoke

This request is used to revoke a Managed Cryptographic Object or an Opaque Object. The request SHALL NOT specify a Template object. The request contains a reason for the revocation (e.g., “key compromise”, “cessation of operation”, etc). Special authentication and authorization SHOULD be enforced to perform this request (see [KMIP-UG]). Only the object creator or an authorized security officer SHOULD be allowed to issue this request. The operation has one of two effects. If the revocation reason is “key compromise”, then the object is placed into the “compromised” state, and the Compromise Date attribute is set to the current date and time. Otherwise, the object is placed into the “deactivated” state, and the Deactivation Date attribute is set to the current date and time.

Request Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	No	Determines the object being revoked. If omitted, then the ID Placeholder value is used by the server as the Unique Identifier.
Revocation Reason, see 3.31	Yes	Specifies the reason for revocation.
Compromise Occurrence Date, see 3.29	No	SHALL be specified if the Revocation Reason is 'compromised'.

Table 170: Revoke Request Payload

Response Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	Yes	The Unique Identifier of the object.

Table 171: Revoke Response Payload

## 4.21 Destroy

This request is used to indicate to the server that the key material for the specified Managed Object SHALL be destroyed. The meta-data for the key material MAY be retained by the server (e.g., used to ensure that an expired or revoked private signing key is no longer available). Special authentication and authorization SHOULD be enforced to perform this request (see [KMIP-UG]). Only the object creator or an authorized security officer SHOULD be allowed to issue this request. If the Unique Identifier specifies a Template object, then the object itself, including all meta-data, SHALL be destroyed. Cryptographic Objects MAY only be destroyed if they are in either Pre-Active or Deactivated state. A Cryptographic Object in the Active state MAY be destroyed if the server sets the Deactivation date (the state of the object transitions to Deactivated) prior to destroying the object.

Request Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	No	Determines the object being destroyed. If omitted, then the ID Placeholder value is used by the server as the Unique Identifier.

Table 172: Destroy Request Payload

Response Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	Yes	The Unique Identifier of the object.

Table 173: Destroy Response Payload

## 4.22 Archive

This request is used to specify that a Managed Object MAY be archived. The actual time when the object is archived, the location of the archive, or level of archive hierarchy is determined by the policies within the key management system and is not specified by the client. The request contains the unique identifier of the Managed Object. Special authentication and authorization SHOULD be enforced to perform this request (see [KMIP-UG]). Only the object creator or an authorized security officer SHOULD be allowed to issue this request. This request is only an indication from a client that from its point of view it is possible for the key management system to archive the object.

Request Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	No	Determines the object being archived. If omitted, then the ID Placeholder value is used by the server as the Unique Identifier.

Table 174: Archive Request Payload

Response Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	Yes	The Unique Identifier of the object.

Table 175: Archive Response Payload

## 4.23 Recover

This request is used to obtain access to a Managed Object that has been archived. This request MAY require asynchronous polling to obtain the response due to delays caused by retrieving the object from the archive. Once the response is received, the object is now on-line, and MAY be obtained (e.g., via a Get operation). Special authentication and authorization SHOULD be enforced to perform this request (see [KMIP-UG]).

Request Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	No	Determines the object being recovered. If omitted, then the ID Placeholder value is used by the server as the Unique Identifier.

Table 176: Recover Request Payload

Response Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	Yes	The Unique Identifier of the object.

Table 177: Recover Response Payload

## 4.24 Validate

This requests that the server validate a certificate chain and return information on its validity. Only a single certificate chain SHALL be included in each request. Support for this operation at the server is OPTIONAL. If the server does not support this operation, an error SHALL be returned.

The request may contain a list of certificate objects, and/or a list of Unique Identifiers that identify Managed Certificate objects. Together, the two lists compose a certificate chain to be validated. The request MAY also contain a date for which all certificates in the certificate chain are REQUIRED to be valid.

The method or policy by which validation is conducted is a decision of the server and is outside of the scope of this protocol. Likewise, the order in which the supplied certificate chain is validated and the specification of trust anchors used to terminate validation are also controlled by the server.

Request Payload		
Object	REQUIRED	Description
Certificate, see 2.2.1	No, MAY be repeated	One or more Certificates.
Unique Identifier, see 3.1	No, MAY be repeated	One or more Unique Identifiers of Certificate Objects.
Validity Date	No	A Date-Time object indicating when the certificate chain needs to be valid. If omitted, the current date and time SHALL be assumed.

Table 178: Validate Request Payload

Response Payload		
Object	REQUIRED	Description
Validity Indicator, see 9.1.3.2.23	Yes	An Enumeration object indicating whether the certificate chain is valid, invalid, or unknown.

Table 179: Validate Response Payload

## 4.25 Query

This request is used by the client to interrogate the server to determine its capabilities and/or protocol mechanisms. The *Query* operation SHOULD be invocable by unauthenticated clients to interrogate server features and functions. The *Query Function* field in the request SHALL contain one or more of the following items:

- Query Operations
- Query Objects
- Query Server Information
- Query Application Namespaces
- Query Extension List
- Query Extension Map

The *Operation* fields in the response contain Operation enumerated values, which SHALL list all the operations that the server supports. If the request contains a Query Operations value in the Query Function field, then these fields SHALL be returned in the response.

1564 The *Object Type* fields in the response contain Object Type enumerated values, which SHALL list all the  
1565 object types that the server supports. If the request contains a *Query Objects* value in the Query Function  
1566 field, then these fields SHALL be returned in the response.

1567 The *Server Information* field in the response is a structure containing vendor-specific fields and/or  
1568 substructures. If the request contains a *Query Server Information* value in the Query Function field, then  
1569 this field SHALL be returned in the response.

1570 The Application Namespace fields in the response contain the namespaces that the server SHALL  
1571 generate values for if requested by the client (see Section 3.36). These fields SHALL only be returned in  
1572 the response if the request contains a Query Application Namespaces value in the Query Function field.

1573 The *Extension Information* fields in the response contain the descriptions of Objects with Item Tag values  
1574 in the Extensions range that are supported by the server (see Section 2.1.9). If the request contains a  
1575 *Query Extension List* and/or *Query Extension Map* value in the Query Function field, then the Extensions  
1576 Information fields SHALL be returned in the response. If the Query Function field contains the Query  
1577 Extension Map value, then the Extension Tag and Extension Type fields SHALL be specified in the  
1578 Extension Information values.

1579 Note that the response payload is empty if there are no values to return.

Request Payload		
Object	REQUIRED	Description
Query Function, see 9.1.3.2.24	Yes, MAY be Repeated	Determines the information being queried

1580 Table 180: Query Request Payload

Response Payload		
Object	REQUIRED	Description
Operation, see 9.1.3.2.27	No, MAY be repeated	Specifies an Operation that is supported by the server.
Object Type, see 3.3	No, MAY be repeated	Specifies a Managed Object Type that is supported by the server.
Vendor Identification	No	SHALL be returned if Query Server Information is requested. The Vendor Identification SHALL be a text string that uniquely identifies the vendor.
Server Information	No	Contains vendor-specific information possibly be of interest to the client.
Application Namespace, see 3.36	No, MAY be repeated	Specifies an Application Namespace supported by the server.
Extension Information, see 2.1.9	No, MAY be repeated	SHALL be returned if Query Extension List or Query Extension Map is requested and supported by the server.

1581 Table 181: Query Response Payload

1582 **4.26 Discover Versions**

1583 This request is used by the client to determine a list of protocol versions that is supported by the server.  
1584 The request payload contains an optional list of protocol versions that is supported by the client. The  
1585 protocol versions SHALL be ranked in order of preference (highest preference first).

1586 The response payload contains a list of protocol versions that is supported by the server. The protocol  
1587 versions are ranked in order of preference (highest preference first). If the client provides the server with

a list of supported protocol versions in the request payload, the server SHALL return only the protocol versions that are supported by both the client and server. The server SHOULD list all the protocol versions supported by both client and server. If the protocol version specified in the request header is not specified in the request payload and the server does not support any protocol version specified in the request payload, the server SHALL return an empty list in the response payload. If no protocol versions are specified in the request payload, the server SHOULD simply return all the protocol versions that are supported by the server.

Request Payload		
Object	REQUIRED	Description
Protocol Version, see 6.1	No, MAY be Repeated	The list of protocol versions supported by the client ordered in highest preference first.

Table 182: Discover Versions Request Payload

Response Payload		
Object	REQUIRED	Description
Protocol Version, see 6.1	No, MAY be repeated	The list of protocol versions supported by the server ordered in highest preference first.

Table 183: Discover Versions Response Payload

## 4.27 Cancel

This request is used to cancel an outstanding asynchronous operation. The correlation value (see Section 6.8) of the original operation SHALL be specified in the request. The server SHALL respond with a *Cancellation Result* that contains one of the following values:

- *Canceled* – The cancel operation succeeded in canceling the pending operation.
- *Unable To Cancel* – The cancel operation is unable to cancel the pending operation.
- *Completed* – The pending operation completed successfully before the cancellation operation was able to cancel it.
- *Failed* – The pending operation completed with a failure before the cancellation operation was able to cancel it.
- *Unavailable* – The specified correlation value did not match any recently pending or completed asynchronous operations.

The response to this operation is not able to be asynchronous.

Request Payload		
Object	REQUIRED	Description
Asynchronous Correlation Value, see 6.8	Yes	Specifies the request being canceled.

Table 184: Cancel Request Payload

Response Payload		
Object	REQUIRED	Description
Asynchronous Correlation Value, see 6.8	Yes	Specified in the request.
Cancellation Result, see 9.1.3.2.25	Yes	Enumeration indicating the result of the

		cancellation.
--	--	---------------

1611 *Table 185: Cancel Response Payload*

## 1612 4.28 Poll

1613 This request is used to poll the server in order to obtain the status of an outstanding asynchronous  
1614 operation. The correlation value (see Section 6.8) of the original operation SHALL be specified in the  
1615 request. The response to this operation SHALL NOT be asynchronous.

Request Payload		
Object	REQUIRED	Description
Asynchronous Correlation Value, see 6.8	Yes	Specifies the request being polled.

1616 *Table 186: Poll Request Payload*

1617 The server SHALL reply with one of two responses:

1618 If the operation has not completed, the response SHALL contain no payload and a Result Status of  
1619 Pending.

1620 If the operation has completed, the response SHALL contain the appropriate payload for the operation.  
1621 This response SHALL be identical to the response that would have been sent if the operation had  
1622 completed synchronously.

## 5 Server-to-Client Operations

Server-to-client operations are used by servers to send information or Managed Cryptographic Objects to clients via means outside of the normal client-server request-response mechanism. These operations are used to send Managed Cryptographic Objects directly to clients without a specific request from the client.

### 5.1 Notify

This operation is used to notify a client of events that resulted in changes to attributes of an object. This operation is only ever sent by a server to a client via means outside of the normal client request/response protocol, using information known to the server via unspecified configuration or administrative mechanisms. It contains the Unique Identifier of the object to which the notification applies, and a list of the attributes whose changed values have triggered the notification. The message uses the same format as a Request message (see 7.1, Table 205), except that the Maximum Response Size, Asynchronous Indicator, Batch Error Continuation Option, and Batch Order Option fields are not allowed. The client SHALL send a response in the form of a Response Message (see 7.1, Table 206) containing no payload, unless both the client and server have prior knowledge (obtained via out-of-band mechanisms) that the client is not able to respond.

Message Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	Yes	The Unique Identifier of the object.
Attribute, see 3	Yes, MAY be repeated	The attributes that have changed. This includes at least the Last Change Date attribute. In case an attribute was deleted, the Attribute structure (see 2.1.1) in question SHALL NOT contain the Attribute Value field.

Table 187: Notify Message Payload

### 5.2 Put

This operation is used to “push” Managed Cryptographic Objects to clients. This operation is only ever sent by a server to a client via means outside of the normal client request/response protocol, using information known to the server via unspecified configuration or administrative mechanisms. It contains the Unique Identifier of the object that is being sent, and the object itself. The message uses the same format as a Request message (see 7.1, Table 205), except that the Maximum Response Size, Asynchronous Indicator, Batch Error Continuation Option, and Batch Order Option fields are not allowed. The client SHALL send a response in the form of a Response Message (see 7.1, Table 206) containing no payload, unless both the client and server have prior knowledge (obtained via out-of-band mechanisms) that the client is not able to respond.

The *Put Function* field indicates whether the object being “pushed” is a new object, or is a replacement for an object already known to the client (e.g., when pushing a certificate to replace one that is about to expire, the Put Function field would be set to indicate replacement, and the Unique Identifier of the expiring certificate would be placed in the *Replaced Unique Identifier* field). The Put Function SHALL contain one of the following values:

- New* – which indicates that the object is not a replacement for another object.
- Replace* – which indicates that the object is a replacement for another object, and that the Replaced Unique Identifier field is present and contains the identification of the replaced object. In case the object with the Replaced Unique Identifier does not exist at the client, the client SHALL interpret this as if the Put Function contained the value New.

1659 The Attribute field contains one or more attributes that the server is sending along with the object. The  
1660 server MAY include attributes with the object to specify how the object is to be used by the client. The  
1661 server MAY include a Lease Time attribute that grants a lease to the client.

1662 If the Managed Object is a wrapped key, then the key wrapping specification SHALL be exchanged prior  
1663 to the transfer via out-of-band mechanisms.

Message Payload		
Object	REQUIRED	Description
Unique Identifier, see 3.1	Yes	The Unique Identifier of the object.
Put Function, see 9.1.3.2.26	Yes	Indicates function for Put message.
Replaced Unique Identifier, see 3.1	No	Unique Identifier of the replaced object. SHALL be present if the <i>Put Function</i> is <i>Replace</i> .
Certificate, Symmetric Key, Private Key, Public Key, Split Key, Template, Secret Data, or Opaque Object, see 2.2	Yes	The object being sent to the client.
Attribute, see 3	No, MAY be repeated	The additional attributes that the server wishes to send with the object.

1664 Table 188: Put Message Payload

---

## 6 Message Contents

The messages in the protocol consist of a message header, one or more batch items (which contain OPTIONAL message payloads), and OPTIONAL message extensions. The message headers contain fields whose presence is determined by the protocol features used (e.g., asynchronous responses). The field contents are also determined by whether the message is a request or a response. The message payload is determined by the specific operation being requested or to which is being replied.

The message headers are structures that contain some of the following objects.

### 6.1 Protocol Version

This field contains the version number of the protocol, ensuring that the protocol is fully understood by both communicating parties. The version number SHALL be specified in two parts, major and minor. Servers and clients SHALL support backward compatibility with versions of the protocol with the same major version. Support for backward compatibility with different major versions is OPTIONAL.

Object	Encoding
Protocol Version	Structure
Protocol Version Major	Integer
Protocol Version Minor	Integer

Table 189: Protocol Version Structure in Message Header

### 6.2 Operation

This field indicates the operation being requested or the operation for which the response is being returned. The operations are defined in Sections 4 and 5.

Object	Encoding
Operation	Enumeration, see 9.1.3.2.27

Table 190: Operation in Batch Item

### 6.3 Maximum Response Size

This field is optionally contained in a request message, and is used to indicate the maximum size of a response, in bytes, that the requester SHALL handle. It SHOULD only be sent in requests that possibly return large replies.

Object	Encoding
Maximum Response Size	Integer

Table 191: Maximum Response Size in Message Request Header

### 6.4 Unique Batch Item ID

This field is optionally contained in a request, and is used for correlation between requests and responses. If a request has a *Unique Batch Item ID*, then responses to that request SHALL have the same Unique Batch Item ID.

Object	Encoding
Unique Batch Item ID	Byte String

Table 192: Unique Batch Item ID in Batch Item

## 6.5 Time Stamp

This field is optionally contained in a client request. It is REQUIRED in a server request and response. It is used for time stamping, and MAY be used to enforce reasonable time usage at a client (e.g., a server MAY choose to reject a request if a client's time stamp contains a value that is too far off the server's time). Note that the time stamp MAY be used by a client that has no real-time clock, but has a countdown timer, to obtain useful "seconds from now" values from all of the Date attributes by performing a subtraction.

Object	Encoding
Time Stamp	Date-Time

Table 193: Time Stamp in Message Header

## 6.6 Authentication

This is used to authenticate the requester. It is an OPTIONAL information item, depending on the type of request being issued and on server policies. Servers MAY require authentication on no requests, a subset of the requests, or all requests, depending on policy. Query operations used to interrogate server features and functions SHOULD NOT require authentication. The Authentication structure SHALL contain a Credential structure.

The authentication mechanisms are described and discussed in Section 8.

Object	Encoding
Authentication	Structure
Credential	Structure, see 2.1.2

Table 194: Authentication Structure in Message Header

## 6.7 Asynchronous Indicator

This Boolean flag indicates whether the client is able to accept an asynchronous response. It SHALL have the Boolean value True if the client is able to handle asynchronous responses, and the value False otherwise. If not present in a request, then False is assumed. If a client indicates that it is not able to handle asynchronous responses (i.e., flag is set to False), and the server is not able to process the request synchronously, then the server SHALL respond to the request with a failure.

Object	Encoding
Asynchronous Indicator	Boolean

Table 195: Asynchronous Indicator in Message Request Header

## 6.8 Asynchronous Correlation Value

This is returned in the immediate response to an operation that is pending and that requires asynchronous polling. Note: the server decides which operations are performed synchronously or asynchronously. A server-generated correlation value SHALL be specified in any subsequent Poll or Cancel operations that pertain to the original operation.

Object	Encoding
Asynchronous Correlation Value	Byte String

Table 196: Asynchronous Correlation Value in Response Batch Item

## 6.9 Result Status

This is sent in a response message and indicates the success or failure of a request. The following values MAY be set in this field:

- *Success* – The requested operation completed successfully.
- *Operation Pending* – The requested operation is in progress, and it is necessary to obtain the actual result via asynchronous polling. The asynchronous correlation value SHALL be used for the subsequent polling of the result status.
- *Operation Undone* – The requested operation was performed, but had to be undone (i.e., due to a failure in a batch for which the Error Continuation Option (see 6.13 and 7.2) was set to Undo).
- *Operation Failed* – The requested operation failed.

Object	Encoding
Result Status	Enumeration, see 9.1.3.2.28

Table 197: Result Status in Response Batch Item

## 6.10 Result Reason

This field indicates a reason for failure or a modifier for a partially successful operation and SHALL be present in responses that return a Result Status of Failure. In such a case, the Result Reason SHALL be set as specified in Section 11. It is OPTIONAL in any response that returns a Result Status of Success. The following defined values are defined for this field:

- *Item not found* – A requested object was not found or did not exist.
- *Response too large* – The response to a request would exceed the *Maximum Response Size* in the request.
- *Authentication not successful* – The authentication information in the request could not be validated, or was not found.
- *Invalid message* – The request message was not understood by the server.
- *Operation not supported* – The operation requested by the request message is not supported by the server.
- *Missing data* – The operation requires additional OPTIONAL information in the request, which was not present.
- *Invalid field* – Some data item in the request has an invalid value.
- *Feature not supported* – An OPTIONAL feature specified in the request is not supported.
- *Operation canceled by requester* – The operation was asynchronous, and the operation was canceled by the Cancel operation before it completed successfully.
- *Cryptographic failure* – The operation failed due to a cryptographic error.
- *Illegal operation* – The client requested an operation that was not able to be performed with the specified parameters.
- *Permission denied* – The client does not have permission to perform the requested operation.
- *Object archived* – The object SHALL be recovered from the archive before performing the operation.
- *Index Out of Bounds* – The client tried to set more instances than the server supports of an attribute that MAY have multiple instances.

- 1759 • *Application Namespace Not Supported* – The particular Application Namespace is not supported,  
1760 and server was not able to generate the Application Data field of an Application Specific  
1761 Information attribute if the field was omitted from the client request.
- 1762 • *Key Format Type and/or Key Compression Type Not Supported* – The object exists but the server  
1763 is unable to provide it in the desired Key Format Type and/or Key Compression Type.
- 1764 • *General failure* – The request failed for a reason other than the defined reasons above.

Object	Encoding
Result Reason	Enumeration, see 9.1.3.2.29

1765 Table 198: Result Reason in Response Batch Item

1766 **6.11 Result Message**

1767 This field MAY be returned in a response. It contains a more descriptive error message, which MAY be  
1768 provided to an end user or used for logging/auditing purposes.

Object	Encoding
Result Message	Text String

1769 Table 199: Result Message in Response Batch Item

1770 **6.12 Batch Order Option**

1771 A Boolean value used in requests where the Batch Count is greater than 1. If True, then batched  
1772 operations SHALL be executed in the order in which they appear within the request. If False, then the  
1773 server MAY choose to execute the batched operations in any order. If not specified, then False is  
1774 assumed (i.e., no implied ordering). Server support for this feature is OPTIONAL, but if the server does  
1775 not support the feature, and a request is received with the batch order option set to True, then the entire  
1776 request SHALL be rejected.

Object	Encoding
Batch Order Option	Boolean

1777 Table 200: Batch Order Option in Message Request Header

1778 **6.13 Batch Error Continuation Option**

1779 This option SHALL only be present if the Batch Count is greater than 1. This option SHALL have one of  
1780 three values:

- 1781 • *Undo* – If any operation in the request fails, then the server SHALL undo all the previous  
1782 operations.
- 1783 • *Stop* – If an operation fails, then the server SHALL NOT continue processing subsequent  
1784 operations in the request. Completed operations SHALL NOT be undone.
- 1785 • *Continue* – Return an error for the failed operation, and continue processing subsequent  
1786 operations in the request.

1787 If not specified, then Stop is assumed.

1788 Server support for this feature is OPTIONAL, but if the server does not support the feature, and a request  
1789 is received containing the *Batch Error Continuation Option* with a value other than the default Stop, then  
1790 the entire request SHALL be rejected.

Object	Encoding
Batch Error Continuation	Enumeration, see 9.1.3.2.30

Option	
--------	--

1791 *Table 201: Batch Error Continuation Option in Message Request Header*

## 1792 6.14 Batch Count

1793 This field contains the number of Batch Items in a message and is REQUIRED. If only a single operation  
 1794 is being requested, then the batch count SHALL be set to 1. The Message Payload, which follows the  
 1795 Message Header, contains one or more batch items.

Object	Encoding
Batch Count	Integer

1796 *Table 202: Batch Count in Message Header*

## 1797 6.15 Batch Item

1798 This field consists of a structure that holds the individual requests or responses in a batch, and is  
 1799 REQUIRED. The contents of the batch items are described in Section 7.2.

Object	Encoding
Batch Item	Structure

1800 *Table 203: Batch Item in Message*

## 1801 6.16 Message Extension

1802 The *Message Extension* is an OPTIONAL structure that MAY be appended to any Batch Item. It is used  
 1803 to extend protocol messages for the purpose of adding vendor-specified extensions. The Message  
 1804 Extension is a structure that SHALL contain the Vendor Identification, Criticality Indicator, and Vendor  
 1805 Extension fields. The *Vendor Identification* SHALL be a text string that uniquely identifies the vendor,  
 1806 allowing a client to determine if it is able to parse and understand the extension. If a client or server  
 1807 receives a protocol message containing a message extension that it does not understand, then its actions  
 1808 depend on the *Criticality Indicator*. If the indicator is True (i.e., Critical), and the receiver does not  
 1809 understand the extension, then the receiver SHALL reject the entire message. If the indicator is False  
 1810 (i.e., Non-Critical), and the receiver does not understand the extension, then the receiver MAY process  
 1811 the rest of the message as if the extension were not present. The *Vendor Extension* structure SHALL  
 1812 contain vendor-specific extensions.

Object	Encoding
Message Extension	Structure
Vendor Identification	Text String
Criticality Indicator	Boolean
Vendor Extension	Structure

1813 *Table 204: Message Extension Structure in Batch Item*

## 7 Message Format

Messages contain the following objects and fields. All fields SHALL appear in the order specified.

### 7.1 Message Structure

Object	Encoding	REQUIRED
Request Message	Structure	
Request Header	Structure, see Table 207	Yes
Batch Item	Structure, see Table 208	Yes, MAY be repeated

Table 205: Request Message Structure

Object	Encoding	REQUIRED
Response Message	Structure	
Response Header	Structure, see Table 209	Yes
Batch Item	Structure, see Table 210	Yes, MAY be repeated

Table 206: Response Message Structure

### 7.2 Operations

If the client is capable of accepting asynchronous responses, then it MAY set the *Asynchronous Indicator* in the header of a batched request. The batched responses MAY contain a mixture of synchronous and asynchronous responses.

Request Header		
Object	REQUIRED in Message	Comment
Request Header	Yes	Structure
Protocol Version	Yes	See 6.1
Maximum Response Size	No	See 6.3
Asynchronous Indicator	No	If present, SHALL be set to True, see 6.7
Authentication	No	See 6.6
Batch Error Continuation Option	No	If omitted, then Stop is assumed, see 6.13
Batch Order Option	No	If omitted, then False is assumed, see 6.12
Time Stamp	No	See 6.5
Batch Count	Yes	See 6.14

Table 207: Request Header Structure

Request Batch Item		
Object	REQUIRED in Message	Comment
Batch Item	Yes	Structure, see 6.15
Operation	Yes	See 6.2
Unique Batch Item ID	No	REQUIRED if <i>Batch Count</i> > 1, see 6.4
Request Payload	Yes	Structure, contents depend on the Operation, see 4 and 5
Message Extension	No	See 6.16

1824 Table 208: Request Batch Item Structure

Response Header		
Object	REQUIRED in Message	Comment
Response Header	Yes	Structure
Protocol Version	Yes	See 6.1
Time Stamp	Yes	See 6.5
Batch Count	Yes	See 6.14

1825 Table 209: Response Header Structure

Response Batch Item		
Object	REQUIRED in Message	Comment
Batch Item	Yes	Structure, see 6.15
Operation	Yes, if specified in Request Batch Item	See 6.2
Unique Batch Item ID	No	REQUIRED if present in Request Batch Item, see 6.4
Result Status	Yes	See 6.9
Result Reason	Yes, if Result Status is <i>Failure</i>	REQUIRED if Result Status is <i>Failure</i> , otherwise OPTIONAL, see 6.10
Result Message	No	OPTIONAL if Result Status is not <i>Pending</i> or <i>Success</i> , see 6.11
Asynchronous Correlation Value	No	REQUIRED if Result Status is <i>Pending</i> , see 6.8
Response Payload	Yes, if not a failure	Structure, contents depend on the Operation, see 4 and 5
Message Extension	No	See 6.16

1826 Table 210: Response Batch Item Structure

1827

---

## 8 Authentication

1828

1829

1830

The mechanisms used to authenticate the client to the server and the server to the client are not part of the message definitions, and are external to the protocol. The KMIP Server SHALL support authentication as defined in **[KMIP-Prof]**.

---

## 9 Message Encoding

To support different transport protocols and different client capabilities, a number of message-encoding mechanisms are supported.

### 9.1 TTLV Encoding

In order to minimize the resource impact on potentially low-function clients, one encoding mechanism to be used for protocol messages is a simplified TTLV (Tag, Type, Length, Value) scheme.

The scheme is designed to minimize the CPU cycle and memory requirements of clients that need to encode or decode protocol messages, and to provide optimal alignment for both 32-bit and 64-bit processors. Minimizing bandwidth over the transport mechanism is considered to be of lesser importance.

#### 9.1.1 TTLV Encoding Fields

Every Data object encoded by the TTLV scheme consists of four items, in order:

##### 9.1.1.1 Item Tag

An Item Tag is a three-byte binary unsigned integer, transmitted big endian, which contains a number that designates the specific Protocol Field or Object that the TTLV object represents. To ease debugging, and to ensure that malformed messages are detected more easily, all tags SHALL contain either the value 42 in hex or the value 54 in hex as the high order (first) byte. Tags defined by this specification contain hex 42 in the first byte. Extensions, which are permitted, but are not defined in this specification, contain the value 54 hex in the first byte. A list of defined Item Tags is in Section 9.1.3.1

##### 9.1.1.2 Item Type

An Item Type is a byte containing a coded value that indicates the data type of the data object. The allowed values are:

Data Type	Coded Value in Hex
Structure	01
Integer	02
Long Integer	03
Big Integer	04
Enumeration	05
Boolean	06
Text String	07
Byte String	08
Date-Time	09
Interval	0A

Table 211: Allowed Item Type Values

### 9.1.1.3 Item Length

An Item Length is a 32-bit binary integer, transmitted big-endian, containing the number of bytes in the Item Value. The allowed values are:

Data Type	Length
Structure	Varies, multiple of 8
Integer	4
Long Integer	8
Big Integer	Varies, multiple of 8
Enumeration	4
Boolean	8
Text String	Varies
Byte String	Varies
Date-Time	8
Interval	4

Table 212: Allowed Item Length Values

If the Item Type is Structure, then the Item Length is the total length of all of the sub-items contained in the structure, including any padding. If the Item Type is Integer, Enumeration, Text String, Byte String, or Interval, then the Item Length is the number of bytes excluding the padding bytes. Text Strings and Byte Strings SHALL be padded with the minimal number of bytes following the Item Value to obtain a multiple of eight bytes. Integers, Enumerations, and Intervals SHALL be padded with four bytes following the Item Value.

### 9.1.1.4 Item Value

The item value is a sequence of bytes containing the value of the data item, depending on the type:

- Integers are encoded as four-byte long (32 bit) binary signed numbers in 2's complement notation, transmitted big-endian.
- Long Integers are encoded as eight-byte long (64 bit) binary signed numbers in 2's complement notation, transmitted big-endian.
- Big Integers are encoded as a sequence of eight-bit bytes, in two's complement notation, transmitted big-endian. If the length of the sequence is not a multiple of eight bytes, then Big Integers SHALL be padded with the minimal number of leading sign-extended bytes to make the length a multiple of eight bytes. These padding bytes are part of the Item Value and SHALL be counted in the Item Length.
- Enumerations are encoded as four-byte long (32 bit) binary unsigned numbers transmitted big-endian. Extensions, which are permitted, but are not defined in this specification, contain the value 8 hex in the first nibble of the first byte.
- Booleans are encoded as an eight-byte value that SHALL either contain the hex value 0000000000000000, indicating the Boolean value *False*, or the hex value 0000000000000001, transmitted big-endian, indicating the Boolean value *True*.

- 1881 • Text Strings are sequences of bytes that encode character values according to the UTF-8  
1882 encoding standard. There SHALL NOT be null-termination at the end of such strings.
- 1883 • Byte Strings are sequences of bytes containing individual unspecified eight-bit binary values, and  
1884 are interpreted in the same sequence order.
- 1885 • Date-Time values are POSIX Time values encoded as Long Integers. POSIX Time, as described  
1886 in IEEE Standard 1003.1 [IEEE1003-1], is the number of seconds since the Epoch (1970 Jan 1,  
1887 00:00:00 UTC), not counting leap seconds.
- 1888 • Intervals are encoded as four-byte long (32 bit) binary unsigned numbers, transmitted big-endian.  
1889 They have a resolution of one second.
- 1890 • Structure Values are encoded as the concatenated encodings of the elements of the structure. All  
1891 structures defined in this specification SHALL have all of their fields encoded in the order in which  
1892 they appear in their respective structure descriptions.

### 1893 9.1.2 Examples

1894 These examples are assumed to be encoding a Protocol Object whose tag is 420020. The examples are  
1895 shown as a sequence of bytes in hexadecimal notation:

- 1896 • An Integer containing the decimal value 8:  
1897 42 00 20 | 02 | 00 00 00 04 | 00 00 00 08 00 00 00 00
- 1898 • A Long Integer containing the decimal value 123456789000000000:  
1899 42 00 20 | 03 | 00 00 00 08 | 01 B6 9B 4B A5 74 92 00
- 1900 • A Big Integer containing the decimal value 12345678900000000000000000000000:  
1901 42 00 20 | 04 | 00 00 00 10 | 00 00 00 00 03 FD 35 EB 6B C2 DF 46 18 08  
1902 00 00
- 1903 • An Enumeration with value 255:  
1904 42 00 20 | 05 | 00 00 00 04 | 00 00 00 FF 00 00 00 00
- 1905 • A Boolean with the value *True*:  
1906 42 00 20 | 06 | 00 00 00 08 | 00 00 00 00 00 00 00 01
- 1907 • A Text String with the value "Hello World":  
1908 42 00 20 | 07 | 00 00 00 0B | 48 65 6C 6C 6F 20 57 6F 72 6C 64 00 00 00  
1909 00 00
- 1910 • A Byte String with the value { 0x01, 0x02, 0x03 }:  
1911 42 00 20 | 08 | 00 00 00 03 | 01 02 03 00 00 00 00 00
- 1912 • A Date-Time, containing the value for Friday, March 14, 2008, 11:56:40 GMT:  
1913 42 00 20 | 09 | 00 00 00 08 | 00 00 00 00 47 DA 67 F8
- 1914 • An Interval, containing the value for 10 days:  
1915 42 00 20 | 0A | 00 00 00 04 | 00 0D 2F 00 00 00 00 00
- 1916 • A Structure containing an Enumeration, value 254, followed by an Integer, value 255, having tags  
1917 420004 and 420005 respectively:  
1918 42 00 20 | 01 | 00 00 00 20 | 42 00 04 | 05 | 00 00 00 04 | 00 00 00 FE  
1919 00 00 00 00 | 42 00 05 | 02 | 00 00 00 04 | 00 00 00 FF 00 00 00 00

### 9.1.3 Defined Values

This section specifies the values that are defined by this specification. In all cases where an extension mechanism is allowed, this extension mechanism is only able to be used for communication between parties that have pre-agreed understanding of the specific extensions.

#### 9.1.3.1 Tags

The following table defines the tag values for the objects and primitive data values for the protocol messages.

Object	Tag
	Tag Value
(Unused)	000000 - 420000
Activation Date	420001
Application Data	420002
Application Namespace	420003
Application Specific Information	420004
Archive Date	420005
Asynchronous Correlation Value	420006
Asynchronous Indicator	420007
Attribute	420008
Attribute Index	420009
Attribute Name	42000A
Attribute Value	42000B
Authentication	42000C
Batch Count	42000D
Batch Error Continuation Option	42000E
Batch Item	42000F
Batch Order Option	420010

2012

# 11 Error Handling

2013

This section details the specific Result Reasons that SHALL be returned for errors detected.

2014

## 11.1 General

2015

These errors MAY occur when any protocol message is received by the server or client (in response to server-to-client operations).

2016

Error Definition	Action	Result Reason
Protocol major version mismatch	Response message containing a header and a Batch Item without Operation, but with the Result Status field set to Operation Failed	Invalid Message
Error parsing batch item or payload within batch item	Batch item fails; Result Status is Operation Failed	Invalid Message
The same field is contained in a header/batch item/payload more than once	Result Status is Operation Failed	Invalid Message
Same major version, different minor versions; unknown fields/fields the server does not understand	Ignore unknown fields, process rest normally	N/A
Same major & minor version, unknown field	Result Status is Operation Failed	Invalid Field
Client is not allowed to perform the specified operation	Result Status is Operation Failed	Permission Denied
Operation is not able to be completed synchronously and client does not support asynchronous requests	Result Status is Operation Failed	Operation Not Supported
Maximum Response Size has been exceeded	Result Status is Operation Failed	Response Too Large
Server does not support operation	Result Status is Operation Failed	Operation Not Supported
The Criticality Indicator in a Message Extension structure is set to True, but the server does not understand the extension	Result Status is Operation Failed	Feature Not Supported
Message cannot be parsed	Response message containing a header and a Batch Item without Operation, but with the Result Status field set to	Invalid Message

	Operation Failed	
--	------------------	--

2017 *Table 249: General Errors*

## 2018 11.2 Create

Error Definition	Result Status	Result Reason
Object Type is not recognized	Operation Failed	Invalid Field
Templates that do not exist are given in request	Operation Failed	Item Not Found
Incorrect attribute value(s) specified	Operation Failed	Invalid Field
Error creating cryptographic object	Operation Failed	Cryptographic Failure
Trying to set more instances than the server supports of an attribute that MAY have multiple instances	Operation Failed	Index Out of Bounds
Trying to create a new object with the same Name attribute value as an existing object	Operation Failed	Invalid Field
The particular Application Namespace is not supported, and Application Data cannot be generated if it was omitted from the client request	Operation Failed	Application Namespace Not Supported
Template object is archived	Operation Failed	Object Archived

2019 *Table 250: Create Errors*

## 2020 11.3 Create Key Pair

Error Definition	Result Status	Result Reason
Templates that do not exist are given in request	Operation Failed	Item Not Found
Incorrect attribute value(s) specified	Operation Failed	Invalid Field
Error creating cryptographic object	Operation Failed	Cryptographic Failure
Trying to create a new object with the same Name attribute value as an existing object	Operation Failed	Invalid Field

Trying to set more instances than the server supports of an attribute that MAY have multiple instances	Operation Failed	Index Out of Bounds
REQUIRED field(s) missing	Operation Failed	Invalid Message
The particular Application Namespace is not supported, and Application Data cannot be generated if it was omitted from the client request	Operation Failed	Application Namespace Not Supported
Template object is archived	Operation Failed	Object Archived

2021 *Table 251: Create Key Pair Errors*

## 2022 11.4 Register

Error Definition	Result Status	Result Reason
Object Type is not recognized	Operation Failed	Invalid Field
Object Type does not match type of cryptographic object provided	Operation Failed	Invalid Field
Templates that do not exist are given in request	Operation Failed	Item Not Found
Incorrect attribute value(s) specified	Operation Failed	Invalid Field
Trying to register a new object with the same Name attribute value as an existing object	Operation Failed	Invalid Field
Trying to set more instances than the server supports of an attribute that MAY have multiple instances	Operation Failed	Index Out of Bounds
The particular Application Namespace is not supported, and Application Data cannot be generated if it was omitted from the client request	Operation Failed	Application Namespace Not Supported
Template object is archived	Operation Failed	Object Archived
Encoding Option not permitted when Key Wrapping Specification contains attribute names	Operation Failed	Encoding Option Error

2023 *Table 252: Register Errors*

2024 

## 11.5 Re-key

Error Definition	Result Status	Result Reason
No object with the specified Unique Identifier exists	Operation Failed	Item Not Found
Object specified is not able to be re-keyed	Operation Failed	Permission Denied
Offset field is not permitted to be specified at the same time as any of the Activation Date, Process Start Date, Protect Stop Date, or Deactivation Date attributes	Operation Failed	Invalid Message
Cryptographic error during re-key	Operation Failed	Cryptographic Failure
The particular Application Namespace is not supported, and Application Data cannot be generated if it was omitted from the client request	Operation Failed	Application Namespace Not Supported
Object is archived	Operation Failed	Object Archived
An offset cannot be used to specify new Process Start, Protect Stop and/or Deactivation Date attribute values since no Activation Date has been specified for the existing key	Operation Failed	Illegal Operation

2025 *Table 253: Re-key Errors*2026 

## 11.6 Re-key Key Pair

Error Definition	Result Status	Result Reason
No object with the specified Unique Identifier exists	Operation Failed	Item Not Found
Object specified is not able to be re-keyed	Operation Failed	Permission Denied
Offset field is not permitted to be specified at the same time as any of the Activation Date or Deactivation Date attributes	Operation Failed	Invalid Message
Cryptographic error during re-key	Operation Failed	Cryptographic Failure
The particular Application Namespace is not supported, and Application Data cannot be generated if it was omitted from the client request	Operation Failed	Application Namespace Not Supported
Object is archived	Operation Failed	Object Archived
An offset cannot be used to specify new Process Start, Protect Stop and/or Deactivation Date attribute values since no Activation Date has been specified	Operation Failed	Illegal Operation

for the existing key		
----------------------	--	--

2027 *Table 254: Re-key Key Pair Errors*

## 2028 **11.7 Derive Key**

Error Definition	Result Status	Result Reason
One or more of the objects specified do not exist	Operation Failed	Item Not Found
One or more of the objects specified are not of the correct type	Operation Failed	Invalid Field
Templates that do not exist are given in request	Operation Failed	Item Not Found
Invalid Derivation Method	Operation Failed	Invalid Field
Invalid Derivation Parameters	Operation Failed	Invalid Field
Ambiguous derivation data provided both with Derivation Data and Secret Data object.	Operation Failed	Invalid Message
Incorrect attribute value(s) specified	Operation Failed	Invalid Field
One or more of the specified objects are not able to be used to derive a new key	Operation Failed	Invalid Field
Trying to derive a new key with the same Name attribute value as an existing object	Operation Failed	Invalid Field
The particular Application Namespace is not supported, and Application Data cannot be generated if it was omitted from the client request	Operation Failed	Application Namespace Not Supported
One or more of the objects is archived	Operation Failed	Object Archived
The specified length exceeds the output of the derivation method or other cryptographic error during derivation.	Operation Failed	Cryptographic Failure

2029 *Table 255: Derive Key Errors-*

2030 **11.8 Certify**

Error Definition	Result Status	Result Reason
No object with the specified Unique Identifier exists	Operation Failed	Item Not Found
Object specified is not able to be certified	Operation Failed	Permission Denied
The Certificate Request does not contain a signed certificate request of the specified Certificate Request Type	Operation Failed	Invalid Field
The particular Application Namespace is not supported, and Application Data cannot be generated if it was omitted from the client request	Operation Failed	Application Namespace Not Supported
Object is archived	Operation Failed	Object Archived

2031 *Table 256: Certify Errors*2032 **11.9 Re-certify**

Error Definition	Result Status	Result Reason
No object with the specified Unique Identifier exists	Operation Failed	Item Not Found
Object specified is not able to be certified	Operation Failed	Permission Denied
The Certificate Request does not contain a signed certificate request of the specified Certificate Request Type	Operation Failed	Invalid Field
Offset field is not permitted to be specified at the same time as any of the Activation Date or Deactivation Date attributes	Operation Failed	Invalid Message
The particular Application Namespace is not supported, and Application Data cannot be generated if it was omitted from the client request	Operation Failed	Application Namespace Not Supported
Object is archived	Operation Failed	Object Archived

2033 *Table 257: Re-certify Errors*2034 **11.10 Locate**

Error Definition	Result Status	Result Reason
Non-existing attributes, attributes that the server does not understand or templates that do not exist are given in the request	Operation Failed	Invalid Field

2035 *Table 258: Locate Errors*

## 2036 11.11 Check

Error Definition	Result Status	Result Reason
Object does not exist	Operation Failed	Item Not Found
Object is archived	Operation Failed	Object Archived
Check cannot be performed on this object	Operation Failed	Illegal Operation
The client is not allowed to use the object according to the specified attributes	Operation Failed	Permission Denied

2037 *Table 259: Check Errors*

## 2038 11.12 Get

Error Definition	Result Status	Result Reason
Object does not exist	Operation Failed	Item Not Found
Wrapping key does not exist	Operation Failed	Item Not Found
Object with Encryption Key Information exists, but it is not a key	Operation Failed	Illegal Operation
Object with Encryption Key Information exists, but it is not able to be used for wrapping	Operation Failed	Permission Denied
Object with MAC/Signature Key Information exists, but it is not a key	Operation Failed	Illegal Operation
Object with MAC/Signature Key Information exists, but it is not able to be used for MACing/signing	Operation Failed	Permission Denied
Object exists but cannot be provided in the desired Key Format Type and/or Key Compression Type	Operation Failed	Key Format Type and/or Key Compression Type Not Supported
Object exists and is not a Template, but the server only has attributes for this object	Operation Failed	Illegal Operation
Cryptographic Parameters associated with the object do not exist or do not match those provided in the Encryption Key Information and/or Signature Key Information	Operation Failed	Item Not Found
Object is archived	Operation Failed	Object Archived
Object exists but cannot be provided in the desired Encoding Option	Operation Failed	Encoding Option Error
Encoding Option not permitted when	Operation Failed	Encoding Option Error

Key Wrapping Specification contains attribute names		
---	--	--

2039 *Table 260: Get Errors*

## 2040 11.13 Get Attributes

Error Definition	Result Status	Result Reason
No object with the specified Unique Identifier exists	Operation Failed	Item Not Found
The same Attribute Name is present more than once	Operation Failed	Invalid Message
Object is archived	Operation Failed	Object Archived

2041 *Table 261: Get Attributes Errors*

## 2042 11.14 Get Attribute List

Error Definition	Result Status	Result Reason
No object with the specified Unique Identifier exists	Operation Failed	Item Not Found
Object is archived	Operation Failed	Object Archived

2043 *Table 262: Get Attribute List Errors*

## 2044 11.15 Add Attribute

Error Definition	Result Status	Result Reason
No object with the specified Unique Identifier exists	Operation Failed	Item Not Found
Attempt to add a read-only attribute	Operation Failed	Permission Denied
Attempt to add an attribute that is not supported for this object	Operation Failed	Permission Denied
The specified attribute already exists	Operation Failed	Illegal Operation
New attribute contains Attribute Index	Operation Failed	Invalid Field
Trying to add a Name attribute with the same value that another object already has	Operation Failed	Illegal Operation
Trying to add a new instance to an attribute with multiple instances but the server limit on instances has been reached	Operation Failed	Index Out of Bounds
The particular Application Namespace is not supported, and Application Data cannot be generated if it was omitted from the client request	Operation Failed	Application Namespace Not Supported

Object is archived	Operation Failed	Object Archived
--------------------	------------------	-----------------

2045 *Table 263: Add Attribute Errors*

## 2046 **11.16 Modify Attribute**

Error Definition	Result Status	Result Reason
No object with the specified Unique Identifier exists	Operation Failed	Item Not Found
A specified attribute does not exist (i.e., it needs to first be added)	Operation Failed	Invalid Field
No matching attribute instance exists	Operation Failed	Item Not Found
The specified attribute is read-only	Operation Failed	Permission Denied
Trying to set the Name attribute value to a value already used by another object	Operation Failed	Illegal Operation
The particular Application Namespace is not supported, and Application Data cannot be generated if it was omitted from the client request	Operation Failed	Application Namespace Not Supported
Object is archived	Operation Failed	Object Archived

2047 *Table 264: Modify Attribute Errors*

## 2048 **11.17 Delete Attribute**

Error Definition	Result Status	Result Reason
No object with the specified Unique Identifier exists	Operation Failed	Item Not Found
Attempt to delete a read-only/REQUIRED attribute	Operation Failed	Permission Denied
No matching attribute instance exists	Operation Failed	Item Not Found
No attribute with the specified name exists	Operation Failed	Item Not Found
Object is archived	Operation Failed	Object Archived

2049 *Table 265: Delete Attribute Errors*

## 2050 11.18 Obtain Lease

Error Definition	Result Status	Result Reason
No object with the specified Unique Identifier exists	Operation Failed	Item Not Found
The server determines that a new lease is not permitted to be issued for the specified cryptographic object	Operation Failed	Permission Denied
Object is archived	Operation Failed	Object Archived

2051 *Table 266: Obtain Lease Errors*

## 2052 11.19 Get Usage Allocation

Error Definition	Result Status	Result Reason
No object with the specified Unique Identifier exists	Operation Failed	Item Not Found
Object has no Usage Limits attribute, or the object is not able to be used for applying cryptographic protection	Operation Failed	Illegal Operation
No Usage Limits Count is specified	Operation Failed	Invalid Message
Object is archived	Operation Failed	Object Archived
The server was not able to grant the requested amount of usage allocation	Operation Failed	Permission Denied

2053 *Table 267: Get Usage Allocation Errors*

## 2054 11.20 Activate

Error Definition	Result Status	Result Reason
No object with the specified Unique Identifier exists	Operation Failed	Item Not Found
Unique Identifier specifies a template or other object that is not able to be activated	Operation Failed	Illegal Operation
Object is not in Pre-Active state	Operation Failed	Permission Denied
Object is archived	Operation Failed	Object Archived

2055 *Table 268: Activate Errors*

2056 

## 11.21 Revoke

Error Definition	Result Status	Result Reason
No object with the specified Unique Identifier exists	Operation Failed	Item Not Found
Revocation Reason is not recognized	Operation Failed	Invalid Field
Unique Identifier specifies a template or other object that is not able to be revoked	Operation Failed	Illegal Operation
Object is archived	Operation Failed	Object Archived

2057 *Table 269: Revoke Errors*2058 

## 11.22 Destroy

Error Definition	Result Status	Result Reason
No object with the specified Unique Identifier exists	Operation Failed	Item Not Found
Object exists, but has already been destroyed	Operation Failed	Permission Denied
Object is not in Pre-Active, Deactivated or Compromised state	Operation Failed	Permission Denied
Object is archived	Operation Failed	Object Archived

2059 *Table 270: Destroy Errors*2060 

## 11.23 Archive

Error Definition	Result Status	Result Reason
No object with the specified Unique Identifier exists	Operation Failed	Item Not Found
Object is already archived	Operation Failed	Object Archived

2061 *Table 271: Archive Errors*2062 

## 11.24 Recover

Error Definition	Result Status	Result Reason
No object with the specified Unique Identifier exists	Operation Failed	Item Not Found

2063 *Table 272: Recover Errors*2064 

## 11.25 Validate

Error Definition	Result Status	Result Reason
The combination of Certificate Objects and Unique Identifiers does not specify	Operation Failed	Invalid Message

a certificate list		
One or more of the objects is archived	Operation Failed	Object Archived

2065 *Table 273: Validate Errors*

## 2066 11.26 Query

2067 N/A

## 2068 11.27 Cancel

2069 N/A

## 2070 11.28 Poll

Error Definition	Result Status	Result Reason
No outstanding operation with the specified Asynchronous Correlation Value exists	Operation Failed	Item Not Found

2071 *Table 274: Poll Errors*

## 2072 11.29 Batch Items

2073 These errors MAY occur when a protocol message with one or more batch items is processed by the  
 2074 server. If a message with one or more batch items was parsed correctly, then the response message  
 2075 SHOULD include response(s) to the batch item(s) in the request according to the table below.

2076

Error Definition	Action	Result Reason
Processing of batch item fails with Batch Error Continuation Option set to Stop	Batch item fails and Result Status is set to Operation Failed. Responses to batch items that have already been processed are returned normally. Responses to batch items that have not been processed are not returned.	See tables above, referring to the operation being performed in the batch item that failed
Processing of batch item fails with Batch Error Continuation Option set to Continue	Batch item fails and Result Status is set to Operation Failed. Responses to other batch items are returned normally.	See tables above, referring to the operation being performed in the batch item that failed
Processing of batch item fails with Batch Error Continuation Option set to Undo	Batch item fails and Result Status is set to Operation Failed. Batch items that had been processed have been undone and their responses are returned with Undone result status.	See tables above, referring to the operation being performed in the batch item that failed

2077 *Table 275: Batch Items Errors*

---

## 12 KMIP Server and Client Implementation Conformance

### 12.1 KMIP Server Implementation Conformance

An implementation is a conforming KMIP Server if the implementation meets the conditions specified in one or more server profiles specified in [KMIP-Prof].

A KMIP server implementation SHALL be a conforming KMIP Server.

If a KMIP server implementation claims support for a particular server profile, then the implementation SHALL conform to all normative statements within the clauses specified for that profile and for any subclauses to each of those clauses.

### 12.2 KMIP Client Implementation Conformance

An implementation is a conforming KMIP Client if the implementation meets the conditions specified in one or more client profiles specified in [KMIP-Prof].

A KMIP client implementation SHALL be a conforming KMIP Client.

If a KMIP client implementation claims support for a particular client profile, then the implementation SHALL conform to all normative statements within the clauses specified for that profile and for any subclauses to each of those clauses.

---

## Appendix A. Acknowledgments

The following individuals have participated in the creation of this specification and are gratefully acknowledged:

### Original Authors of the initial contribution:

David Babcock, HP  
Steven Bade, IBM  
Paolo Bezoari, NetApp  
Mathias Björkqvist, IBM

## Appendix B. Attribute Cross-Reference

2205

The following table of Attribute names indicates the Managed Object(s) for which each attribute applies.

2206

This table is not normative.

Attribute Name	Managed Object							
	Certificate	Symmetric Key	Public Key	Private Key	Split Key	Template	Secret Data	Opaque Object
Unique Identifier	x	x	x	x	x	x	x	x
Name	x	x	x	x	x	x	x	x
Object Type	x	x	x	x	x	x	x	x
Cryptographic Algorithm	x	x	x	x	x	x		
Cryptographic Domain Parameters			x	x		x		
Cryptographic Length	x	x	x	x	x	x		
Cryptographic Parameters	x	x	x	x	x	x		
Certificate Type	x							
Certificate Identifier	x							
Certificate Issuer	x							
Certificate Length	x							
Certificate Subject	x							
Digital Signature Algorithm	x							
Digest	x	x	x	x	x		x	
Operation Policy Name	x	x	x	x	x	x	x	x
Cryptographic Usage Mask	x	x	x	x	x	x	x	
Lease Time	x	x	x	x	x		x	x
Usage Limits		x	x	x	x	x		
State	x	x	x	x	x		x	
Initial Date	x	x	x	x	x	x	x	x
Activation Date	x	x	x	x	x	x	x	
Process Start Date		x			x	x		
Protect Stop Date		x			x	x		
Deactivation Date	x	x	x	x	x	x	x	x
Destroy Date	x	x	x	x	x		x	x
Compromise Occurrence Date	x	x	x	x	x		x	x

Attribute Name	Managed Object							
Compromise Date	x	x	x	x	x		x	x
Revocation Reason	x	x	x	x	x		x	x
Archive Date	x	x	x	x	x	x	x	x
Object Group	x	x	x	x	x	x	x	x
Fresh	x	x	x	x	x			
Link	x	x	x	x	x		x	
Application Specific Information	x	x	x	x	x	x	x	x
Contact Information	x	x	x	x	x	x	x	x
Last Change Date	x	x	x	x	x	x	x	x
Custom Attribute	x	x	x	x	x	x	x	x

Table 276: Attribute Cross-reference

## Appendix D. Operations and Object Cross-Reference

2214 The following table indicates the types of Managed Object(s) that each Operation accepts as input or  
2215 provides as output. This table is not normative.

Operation	Managed Objects							
	Certificate	Symmetric Key	Public Key	Private Key	Split Key	Template	Secret Data	Opaque Object

## 2219 Appendix E. Acronyms

2220 The following abbreviations and acronyms are used in this document:

2221	3DES	- Triple Data Encryption Standard specified in ANSI X9.52
2222	AES	- Advanced Encryption Standard specified in FIPS 197
2223	ASN.1	- Abstract Syntax Notation One specified in ITU-T X.680
2224	BDK	- Base Derivation Key specified in ANSI X9 TR-31
2225	CA	- Certification Authority
2226	CBC	- Cipher Block Chaining
2227	CCM	- Counter with CBC-MAC specified in NIST SP 800-38C
2228	CFB	- Cipher Feedback specified in NIST SP 800-38A
2229	CMAC	- Cipher-based MAC specified in NIST SP 800-38B
2230	CMC	- Certificate Management Messages over CMS specified in RFC 5275
2231	CMP	- Certificate Management Protocol specified in RFC 4210
2232	CPU	- Central Processing Unit
2233	CRL	- Certificate Revocation List specified in RFC 5280
2234	CRMF	- Certificate Request Message Format specified in RFC 4211
2235	CRT	- Chinese Remainder Theorem
2236	CTR	- Counter specified in NIST SP 800-38A
2237	CVK	- Card Verification Key specified in ANSI X9 TR-31
2238	DEK	- Data Encryption Key
2239	DER	- Distinguished Encoding Rules specified in ITU-T X.690
2240	DES	- Data Encryption Standard specified in FIPS 46-3
2241	DH	- Diffie-Hellman specified in ANSI X9.42
2242	DNS	- Domain Name Server
2243	DSA	- Digital Signature Algorithm specified in FIPS 186-3
2244	DSKPP	- Dynamic Symmetric Key Provisioning Protocol
2245	ECB	- Electronic Code Book
2246	ECDH	- Elliptic Curve Diffie-Hellman specified in ANSI X9.63 and NIST SP 800-56A
2247	ECDSA	- Elliptic Curve Digital Signature Algorithm specified in ANSX9.62
2248	ECMQV	- Elliptic Curve Menezes Qu Vanstone specified in ANSI X9.63 and NIST SP 800-56A
2249	FFC	- Finite Field Cryptography
2250	FIPS	- Federal Information Processing Standard
2251	GCM	- Galois/Counter Mode specified in NIST SP 800-38D
2252	GF	- Galois field (or finite field)
2253	HMAC	- Keyed-Hash Message Authentication Code specified in FIPS 198-1 and RFC 2104
2254	HTTP	- Hyper Text Transfer Protocol

2255	HTTP(S)	- Hyper Text Transfer Protocol (Secure socket)
2256	IEEE	- Institute of Electrical and Electronics Engineers
2257	IETF	- Internet Engineering Task Force
2258	IP	- Internet Protocol
2259	IPsec	- Internet Protocol Security
2260	IV	- Initialization Vector
2261	KEK	- Key Encryption Key
2262	KMIP	- Key Management Interoperability Protocol
2263	MAC	- Message Authentication Code
2264	MKAC	- EMV/chip card Master Key: Application Cryptograms specified in ANSI X9 TR-31
2265	MKCP	- EMV/chip card Master Key: Card Personalization specified in ANSI X9 TR-31
2266	MKDAC	- EMV/chip card Master Key: Data Authentication Code specified in ANSI X9 TR-31
2267	MKDN	- EMV/chip card Master Key: Dynamic Numbers specified in ANSI X9 TR-31
2268	MKOTH	- EMV/chip card Master Key: Other specified in ANSI X9 TR-31
2269	MKSMC	- EMV/chip card Master Key: Secure Messaging for Confidentiality specified in X9 TR-31
2270	MKSMI	- EMV/chip card Master Key: Secure Messaging for Integrity specified in ANSI X9 TR-31
2271	MD2	- Message Digest 2 Algorithm specified in RFC 1319
2272	MD4	- Message Digest 4 Algorithm specified in RFC 1320
2273	MD5	- Message Digest 5 Algorithm specified in RFC 1321
2274	NIST	- National Institute of Standards and Technology
2275	OAEP	- Optimal Asymmetric Encryption Padding specified in PKCS#1
2276	OFB	- Output Feedback specified in NIST SP 800-38A
2277	PBKDF2	- Password-Based Key Derivation Function 2 specified in RFC 2898
2278	PCBC	- Propagating Cipher Block Chaining
2279	PEM	- Privacy Enhanced Mail specified in RFC 1421
2280	PGP	- OpenPGP specified in RFC 4880
2281	PKCS	- Public-Key Cryptography Standards
2282	PKCS#1	- RSA Cryptography Specification Version 2.1 specified in RFC 3447
2283	PKCS#5	- Password-Based Cryptography Specification Version 2 specified in RFC 2898
2284	PKCS#8	- Private-Key Information Syntax Specification Version 1.2 specified in RFC 5208
2285	PKCS#10	- Certification Request Syntax Specification Version 1.7 specified in RFC 2986
2286	POSIX	- Portable Operating System Interface
2287	RFC	- Request for Comments documents of IETF
2288	RSA	- Rivest, Shamir, Adelman (an algorithm)
2289	SCEP	- Simple Certificate Enrollment Protocol
2290	SCVP	- Server-based Certificate Validation Protocol
2291	SHA	- Secure Hash Algorithm specified in FIPS 180-2
2292	SP	- Special Publication

2293	SSL/TLS	- Secure Sockets Layer/Transport Layer Security
2294	S/MIME	- Secure/Multipurpose Internet Mail Extensions
2295	TDEA	- see 3DES
2296	TCP	- Transport Control Protocol
2297	TTLV	- Tag, Type, Length, Value
2298	URI	- Uniform Resource Identifier
2299	UTC	- Coordinated Universal Time
2300	UTF-8	- Universal Transformation Format 8-bit specified in RFC 3629
2301	XKMS	- XML Key Management Specification
2302	XML	- Extensible Markup Language
2303	XTS	- XEX Tweakable Block Cipher with Ciphertext Stealing specified in NIST SP 800-38E
2304	X.509	- Public Key Certificate specified in RFC 5280
2305	ZPK	- PIN Block Encryption Key specified in ANSI X9 TR-31
2306		
2307

## Appendix G. Revision History

Revision	Date	Editor	Changes Made
draft-01	2011-07-12	Robert Haas (with help of Mathias Bjoerkqvist)	<p>Incorporated various proposals towards v1.1, a few minor TODOs left (indicated as such).</p> <p>Incorporated the Re-key Key Pair proposal from:  <a href="http://www.oasis-open.org/apps/org/workgroup/kmip/download.php/37935/v0.4KMIPAsymmetricRekeyProposal.doc">http://www.oasis-open.org/apps/org/workgroup/kmip/download.php/37935/v0.4KMIPAsymmetricRekeyProposal.doc</a></p> <p>Incorporated the proposal of changes to Certify and Re-certify operations from: <a href="http://www.oasis-open.org/apps/org/workgroup/kmip/download.php/37999/v0.4KMIPNoCertReqProposal.doc">http://www.oasis-open.org/apps/org/workgroup/kmip/download.php/37999/v0.4KMIPNoCertReqProposal.doc</a></p> <p>Incorporated the Discover Versions proposal from:  <a href="http://www.oasis-open.org/apps/org/workgroup/kmip/download.php/42606/Proposal%20for%20Discover%20Versions.docx">http://www.oasis-open.org/apps/org/workgroup/kmip/download.php/42606/Proposal%20for%20Discover%20Versions.docx</a></p> <p>Incorporated the Vendor Extensions proposal from:  <a href="http://www.oasis-open.org/apps/org/workgroup/kmip/download.php/42409/VendorExtensionProposal-v2.3a.doc">http://www.oasis-open.org/apps/org/workgroup/kmip/download.php/42409/VendorExtensionProposal-v2.3a.doc</a></p> <p>Incorporated the Key Wrap of Unstructured Data from:  <a href="http://www.oasis-open.org/apps/org/workgroup/kmip/download.php/40055/key-wrap_of_unstructured_data-26oct2010-1.ppt">http://www.oasis-open.org/apps/org/workgroup/kmip/download.php/40055/key-wrap_of_unstructured_data-26oct2010-1.ppt</a></p> <p>Incorporated the Groups proposal from: <a href="http://www.oasis-open.org/apps/org/workgroup/kmip/download.php/42116/kmip-spec-1.GroupUpdates-v1.doc">http://www.oasis-open.org/apps/org/workgroup/kmip/download.php/42116/kmip-spec-1.GroupUpdates-v1.doc</a></p> <p>Incorporated the Device Credential proposal from:  <a href="http://www.oasis-open.org/apps/org/workgroup/kmip/download.php/42736/KMIP%20Usage%20Guide%20Proposal%20on%20Device%20Credentials%20v2.doc">http://www.oasis-open.org/apps/org/workgroup/kmip/download.php/42736/KMIP%20Usage%20Guide%20Proposal%20on%20Device%20Credentials%20v2.doc</a></p>
draft-02	2011-10-19	Robert Haas (with help of Mathias Bjoerkqvist)	<p>Incorporated various proposals towards v1.1, still a few minor TODOs left (indicated as such).</p> <p>Incorporated the Cryptographic Length of Certificates from:  <a href="http://www.oasis-open.org/apps/org/workgroup/kmip/ballot.php?id=2098">http://www.oasis-open.org/apps/org/workgroup/kmip/ballot.php?id=2098</a></p> <p>Incorporated the Digital Signature Algorithm proposal for Certificates from:  <a href="http://www.oasis-open.org/apps/org/workgroup/kmip/ballot.php?id=2099">http://www.oasis-open.org/apps/org/workgroup/kmip/ballot.php?id=2099</a></p> <p>Incorporated the Digest proposal from:  <a href="http://www.oasis-open.org/apps/org/workgroup/kmip/ballot.php?id=2106">http://www.oasis-open.org/apps/org/workgroup/kmip/ballot.php?id=2106</a></p> <p>Updated the Device Credential proposal from:  <a href="http://www.oasis-open.org/apps/org/workgroup/kmip/ballot.php?id=2107">http://www.oasis-open.org/apps/org/workgroup/kmip/ballot.php?id=2107</a></p>

			<p>Removed Section 9.2 on XML encoding from:  <a href="http://www.oasis-open.org/apps/org/workgroup/kmip/ballot.php?id=2109">http://www.oasis-open.org/apps/org/workgroup/kmip/ballot.php?id=2109</a></p> <p>Incorporated the Repeating Attributes proposal from:  <a href="http://www.oasis-open.org/apps/org/workgroup/kmip/ballot.php?id=2074">http://www.oasis-open.org/apps/org/workgroup/kmip/ballot.php?id=2074</a></p> <p>Updated the participants lists according to:  <a href="http://www.oasis-open.org/apps/org/workgroup/kmip/email/archives/201109/msg00029.html">http://www.oasis-open.org/apps/org/workgroup/kmip/email/archives/201109/msg00029.html</a></p> <p>Updated the Tags table.</p> <p>Renamed the "Key Wrapping Encoding Options" table to "Encoding Options".</p>
draft-03	2011-12-06	Robert Haas (with help of Mathias Bjoerkqvist)	<p>Incorporated the Certificate Attribute Update Proposal from: <a href="http://www.oasis-open.org/apps/org/workgroup/kmip/ballot.php?id=2143">http://www.oasis-open.org/apps/org/workgroup/kmip/ballot.php?id=2143</a></p> <p>Incorporated the Attribute Index Proposal from:  <a href="http://www.oasis-open.org/apps/org/workgroup/kmip/ballot.php?id=2132">http://www.oasis-open.org/apps/org/workgroup/kmip/ballot.php?id=2132</a></p> <p>Updated the Digital Signature Algorithm proposal for Certificates with:  <a href="http://www.oasis-open.org/apps/org/workgroup/kmip/download.php/43177/v5KMIPSignatureAlgorithmProposal.doc">http://www.oasis-open.org/apps/org/workgroup/kmip/download.php/43177/v5KMIPSignatureAlgorithmProposal.doc</a></p> <p>Updated the Cryptographic Length Proposal from:  <a href="http://www.oasis-open.org/apps/org/workgroup/kmip/ballot.php?id=2098">http://www.oasis-open.org/apps/org/workgroup/kmip/ballot.php?id=2098</a>  with the updated proposal from: <a href="http://www.oasis-open.org/apps/org/workgroup/kmip/download.php/43176/v3KMIPCertificateLengthProposal.doc">http://www.oasis-open.org/apps/org/workgroup/kmip/download.php/43176/v3KMIPCertificateLengthProposal.doc</a></p>
draft-04	2011-12-06	Robert Griffin	Reformatted in OASIS standards track document format
draft-05	2011-12-17	Robert Griffin	Editorial correction to include missing definitions and normative reference.
csd-01	2012-1-4	OASIS admin	Committee Specification Draft for Public Review
draft-06	2012-04-13	Denis Pochuev (with Mathias Bjoerkqvist)	Made minor modifications to address public review comments.
draft-07	2012-04-30	Denis Pochuev	Incorporated changes to attribute index and list of contributors
