Appendix B. Revision History	881

1 Introduction

The purpose of this document is to describe test cases to demonstrate the Key Management Interoperability Protocol (KMIP) [KMIP-SPEC-1_2], [KMIP-SPEC-1_1], and [KMIP-SPEC-1_0]. The test cases illustrate that the concepts within the protocol are sound and how the protocol may be used when implementing KMIP in applications. These test cases are not intended to fully test an implementation of KMIP. There are test cases for v1.0, v1.1 and v1.2 of the protocol.

2 KMIP Test Cases

The test cases define a number of request-response pairs for KMIP operations. Each test case is provided in the XML format specified in [KMIP-ENCODINGS] intended to be both human-readable and usable by automated tools. The time sequence (starting from 0) for each request-response pair is noted and line numbers are provided for ease of cross-reference for a given test sequence.

Each test case has a unique label (the section name) which includes the protocol version as part of the identifier.

Many of the test cases contained within this document depend on a specific configuration of a KMIP server to match the assumptions of the test case. Support for a test case depends on a server being configured in a manner consistent with the test case assumptions.

The test cases show one possible way to construct the messages, and the messages shown are not necessarily the only conformant constructions as many items within KMIP are optional and server behavior depends on the server's policy. Support for a test case is predicated on a server matching the test case assumptions and the behavior shown in the request-response pairs.

Where possible the flow of unique identifiers between tests, the date-time values, and other dynamic items are indicated using symbolic identifiers – in actual request and response messages these dynamic values will be filled in with valid values.

2.1 KMIP 1.0 Test Cases

2.1.1 TC-311-10 - Create / Destroy

In this test case the client issues a Create request, whereby the server creates a new symmetric key and returns the Unique Identifier. To clean up, the client then performs a Destroy operation to destroy the key.

```

46

47 2.1.2 TC-312-10 - Register / Create / Get attributes / Destroy

48 Here the client first registers a template object and then creates a symmetric key using the
49 registered template. To verify that the attributes of the key were set correctly from the
50 template, the client then issues a Get Attributes command, after which it destroys first the key
51 and then the template.

53 2.1.3 TC-313-10 - Create / Locate / Get / Destroy

54 This test case tests the Locate and Get operations, in addition to the previously used operations
55 Create and Destroy. A symmetric key is first created, and then a lookup is performed on the
56 Name attribute using the Locate operation. Subsequently, a Get request is issued to retrieve the
57 located key, after which the key on the server is destroyed.

59 2.1.4 TC-314-10 - Dual Client Test Case, ID Placeholder-linked Locate & Get 60 Batch

61 This test case has two clients performing operations on the same key. The first client initially
62 registers a template and creates a symmetric key using that template. The second client then
63 does a batched Locate and Get using the ID Placeholder to retrieve the key. The second client
64 thereafter performs a number of operations on the key (Get Attribute List, Get Attribute, Add
65 Attribute, Modify Attribute and Delete Attribute), before the first client finally destroys the key
66 and the template. The first client also tries to Get the key and the template after they have been
67 destroyed, but the Get operation fails in both cases. This test case demonstrates the fact that it
68 is possible for two clients to cooperate and use the same managed object while only having
69 knowledge of a single pre-agreed Name attribute value and without having to share any other
70 information.

72 2.1.5 TC-315-10 - Register / Destroy Secret Data

73 In this test case the client issues a Register request containing a Secret Data object, whereby the
74 server registers the object and returns the Unique Identifier. To clean up, the client then
75 performs a Destroy operation to destroy the object.

77 2.1.6 TC-32-10 - Asynchronous Locate

78 This test case tests the asynchronous capabilities of KMIP using the Locate operation. A key is
79 created and then a Locate request is sent containing the Name of the created key and with the
80 message header Asynchronous Indicator-field set to True. If the server returns an asynchronous
81 response to the Locate, the client then polls the server until the operation is ready. If the server
82 responded asynchronously, a subsequent Locate operation that is also handled asynchronously
83 is then Canceled, before the key is finally destroyed.

84 This test case shows the use of two clients with the same assumptions as in the test case
85 described in Section . Since the client is unable to force the server to respond asynchronously, it
86 is possible for a server to respond synchronously to the requests issued at times 1 and 4, in
87 which case the expected response are the ones shown at times 2 and 5, respectively. In the case
88 of the server not responding asynchronously to the Locate requests, the client is permitted to
89 skip the requests illustrated at time 7 and 8.

91 2.1.7 TC-41-10 - Revoke Scenario

92 This test case tests the revocation aspect of the key life cycle support in KMIP. A key is created
93 and a Get Attribute for the State-attribute reveals that the key is in Pre-active state. The
94 Activation Date is then set, which changes the state to Active. The key is then revoked with a
95 revocation reason of Compromised and the state subsequently changed to Compromised, but
96 this does not stop a client from being able to add, modify and delete attributes or even get the
97 key (since we assume here that the out-of-band registration has been used to make the server
98 aware of the fact that the client is capable of interpreting the attributes of the key and
99 determining what it is allowed to do with the key). To clean up, the created key is finally
100 destroyed.

```

101

102 2.1.8 TC-51-10 - Get Usage Allocation Scenario

103 This test case tests the usage management functionality of KMIP. A key is created and the
104 Activation Date and Protect Stop Date attributes are set in such a way as to allow the Get Usage
105 Allocation operation to be performed. The value of the Usage Limits attribute is set to 1000
106 bytes, and two subsequent requests for 500 bytes succeed (one of them also verifying the
107 amount that can be received using the Check operation), while a third fails since the usage
108 allocation has been used up. The key is finally revoked and destroyed. This test case shows the
109 use of multiple clients (Client-A, Client-B and Client-C).

110

111 2.1.9 TC-61-10 - Import of a Third-party Key

112 This test case tests the import of a foreign key using the Register operation. To validate that the
113 registered key is treated the same as a locally created key, an attribute is added to the key and
114 then modified. Finally, the key is destroyed.

116 2.1.10 TC-71-10 - Unrecognized Message Extension with Criticality Indicator

117 False

118 A create request is issued and the request contains a Message Extension with the Criticality
119 Indicator set to false. The server does not understand the extension, but since it is non-critical,
120 the create request is processed normally. Subsequently, the created key is deleted.

122 2.1.11 TC-72-10 - Unrecognized Message Extension with Criticality Indicator

123 True

124 A create request is issued and the request contains a Message Extension with the Criticality
125 Indicator set to true. The server does not understand the extension, and since it is critical, the
126 create request fails and an error is returned.

136

137 2.1.14 TC-91-10 - Create a Key, Re-key

138 Create a symmetric key with a specific name, and then use Locate to find the key. After using
139 Re-key to create a new key, verify that the name was removed from the existing key and copied
140 to the new key. Also verify that the key material for the old key is still retrievable. To clean up,
141 both keys are deleted.

142

143 2.1.15 TC-92-10 - Existing Key Expired, Re-key with Same Life-cycle

144 Create a new symmetric key. Then add the Activation Date and Deactivation Date attributes
145 based on the timestamp in the response to the Create request. The Activation Date is set to the
146 current time and the Deactivation Date to a time in the near future. Repeated Get Attribute calls
147 are performed to verify that the state is first 'Active', then subsequently 'Deactivated'. Then
148 issue a Re-key request, including an Offset value of zero leading to the Activation Date of the
149 replacement key to be set to the same value as the Initial Date of the replacement key. Verify
150 from the response that the Activation Date and Deactivation Date attributes were set correctly
151 (if they are not returned, issue a Get Attribute request). Do a Get Attribute operation to verify
152 that the state of the new key is 'Active'. To clean up, both keys are deleted.

154 2.1.16 TC-93-10 - Existing Key Compromised, Re-key with Same Life-cycle

155 Create a new symmetric key with the Activation Date in the past. Do a Get Attribute operation
156 on the State attribute to verify the key is 'Active'. Then revoke the key as compromised, verify
157 that the state has changed to 'Compromised'. Create a replacement key using Re-key with the
158 offset set to '0' to indicate that the times are to be copied from the existing key. Do a Get
159 Attribute operation to verify that the state of the new key is 'Active'. To clean up, both keys are
160 deleted.

------	--------------------

161

162 2.1.17 TC-94-10 - Create Key, Re-key with New Life-cycle

163 Create a symmetric key with a specific name, then use Locate to find the key. After using Re-key
164 to create a new key, verify that the name was removed from the existing key and copied to the
165 new key. To clean up, both keys are deleted.

166

167 2.1.18 TC-95-10 - Obtain Lease for Expired Key

168 Create a symmetric key with a specific name and obtain a lease. Revoke the key with state
169 'Compromised' and re-key the key. Try to obtain a lease on the old key which fails due to a
170 server policy which does not allow giving out leases for compromised keys. Locate the new key
171 with the original name. Get the new key and obtain a lease.

172

173 2.1.19 TC-101-10 - Create a Key, Archive and Recover it

174 Create a symmetric key with a specified name, then use Locate to find the key and get the key.
175 Archive the key (asynchronous operation, use Poll until it completes) and use Get and Locate on
176 it, but both fail. Add the Storage Status Mask to the Locate-command, indicating to the server to
177 search in both online and archived storage. The Locate finds the key. Recover the key from the
178 archive (also asynchronous), both Locate and Get succeed.

180 2.1.20 TC-111-10 - Credential, Operation Policy, Destroy Date

181 Pass a Credential object of type Username and Password in the message header in all requests
182 for identification purposes (how the Credential object is used is defined in [KMIP-Spec]). Create
183 a symmetric key and set the Operation Policy Name attribute to 'default'. Using another
184 Username and Password Credential, attempt to perform a Get operation batched with a Get
185 Attribute List on the created symmetric key - according to the Default Operation Policy, both
186 these request SHALL fail, and with the Batch Error Continuation Option set to 'Continue', the
187 client SHALL also receive both response payloads. Using the initially used Credential, destroy the
188 object and get the Destroy Date attribute. The message exchanges in this test case are based on
189 a certain server policy (e.g. handling of Credentials) that in some aspects differs from the policy

190 assumed in earlier test cases (e.g. in this test case, the Destroy Date is retained). The message
191 exchanges shown in this test case assume that both Credentials used in this example are for
192 valid users of the server.

200 2.1.22 TC-131-10 - Register an Asymmetric Key Pair in PKCS1 Format

201 Register a private key in the PKCS_1 key format, then register the corresponding public key, also
202 in PKCS_1 format, with the Link attribute pointing to the previously registered private key.
203 Thereafter add the Link attribute to the private key, and perform Locate operations to find the
204 public and private keys using the Link attribute. Get both the private and public keys in PKCS_1
205 key format, then destroy both the private and the public key.

2.1.23 TC-132-10 - Register an Asymmetric Key Pair and a Corresponding X509 Certificate

- 209 Register a public/private key pair in the PKCS_1 key format and a corresponding X509 certificate.
210 Add the appropriate links between the registered objects. Make sure the certificate was
211 registered and the attributes set correctly by listing and retrieving the attributes. Get the keys
212 and certificate, and finally destroy all the registered objects.

213

214 2.1.24 TC-134-10 - Register Key Pair, Certify and Re-certify Public Key

215 Register a public/private key pair on the server. Request the server to have a certificate created
216 using the Certify operation. Retrieve the certificate and its attributes, then execute the Re-
217 certify operation to re-certify the public key. Finally, destroy all the objects.

218 The new KMIP 1.1 certificate DN attributes are retrieved as are the original (deprecated) KMIP
219 1.0 certificate DN attributes.

220

221 2.1.25 TC-NP-1-10 - Put

222 In this test case the client issues a Create request, whereby the server creates a new symmetric
223 key and returns the Unique Identifier. To clean up, the client then performs a Destroy operation
224 to destroy the key.

225 The server sends Put messages to the client via a separate channel.

228 2.1.26 TC-NP-2-10 - Notify & Put

229 This test case tests the import of key using the Register operation. To validate that the
230 registered key is treated the same as a locally created key, an attribute is added to the key and
231 then modified. Finally, the key is destroyed.

232 The server sends Notify and Put messages to the client via a separate channel.

233

234 2.1.27 TC-ECC-1-10 - Register an ECC Key Pair

235 EC recommended curve is P-256 (secp256r1)

236 - Private Key format ECPrivateKey - <http://tools.ietf.org/html/rfc5915>

237 - Public Key format SubjectPublicKeyInfo - <http://tools.ietf.org/html/rfc5480>

238 Register a EC private key in the ECPrivateKey key format, then register the corresponding public
239 key, in X.509 (SubjectPublicKeyInfo) format, with the Link attribute pointing to the previously
240 registered private key. Then add the Link attribute to the private key, and perform Locate
241 operations to find the public and private keys using the Link attribute. Get both the private and
242 public keys in default format, then destroy both the private and the public key.

243

244 -----BEGIN EC PRIVATE KEY-----

255

256 2.1.28 TC-ECC-2-10 - Register an ECC Key Pair in PKCS8 Format

257 EC recommended curve is P-256 (secp256r1)

258 - Public Key format SubjectPublicKeyInfo - <http://tools.ietf.org/html/rfc5480>

259 Register a EC private key in PKCS8 key format (with passphrase 'secret' using pbeWithSHAAnd3-
260 KeyTripleDES-CBC), then register the corresponding public key, in X.509 (SubjectPublicKeyInfo)
261 format, with the Link attribute pointing to the previously registered private key. Then add the

262 Link attribute to the private key, and perform Locate operations to find the public and private
263 keys using the Link attribute. Get both the private and public keys in default format, then
264 destroy both the private and the public key.

265

```

278

279 2.1.29 TC-ECC-3-10 - Register an ECC Key Pair and ECDSA Certificate

280 EC recommended curve is P-256 (secp256r1)

281 - Private Key format ECPrivateKey - <http://tools.ietf.org/html/rfc5915>

282 - Public Key format SubjectPublicKeyInfo - <http://tools.ietf.org/html/rfc5480>

283 Register a EC private key in the ECPrivateKey key format, then register the corresponding public
284 key, in X.509 (SubjectPublicKeyInfo) format, and a corresponding ECDSA certificate, with the
285 Link attribute pointing to the previously registered private key. Return the attribute values for
286 the ECDSA certificate showing the correct server parsing of the certificate. Then add the Link
287 attribute to the private key, and perform Locate operations to find the public and private keys
288 using the Link attribute. Get both the private and public keys in default format, then destroy
289 both the private and the public key.

290

318

319 2.2 KMIP 1.1 Test Cases

320 2.2.1 TC-311-11 - Create / Destroy

321 In this test case the client issues a Create request, whereby the server creates a new symmetric
322 key and returns the Unique Identifier. To clean up, the client then performs a Destroy operation
323 to destroy the key.

324

325 2.2.2 TC-312-11 - Register / Create / Get attributes / Destroy

326 Here the client first registers a template object and then creates a symmetric key using the
327 registered template. To verify that the attributes of the key were set correctly from the
328 template, the client then issues a Get Attributes command, after which it destroys first the key
329 and then the template.

331 2.2.3 TC-313-11 - Create / Locate / Get / Destroy

332 This test case tests the Locate and Get operations, in addition to the previously used operations
333 Create and Destroy. A symmetric key is first created, and then a lookup is performed on the
334 Name attribute using the Locate operation. Subsequently, a Get request is issued to retrieve the
335 located key, after which the key on the server is destroyed.

```

337 2.2.4 TC-314-11 - Dual Client Test Case, ID Placeholder-linked Locate & Get 338 Batch

339 This test case has two clients performing operations on the same key. The first client initially
340 registers a template and creates a symmetric key using that template. The second client then
341 does a batched Locate and Get using the ID Placeholder to retrieve the key. The second client
342 thereafter performs a number of operations on the key (Get Attribute List, Get Attribute, Add
343 Attribute, Modify Attribute and Delete Attribute), before the first client finally destroys the key
344 and the template. The first client also tries to Get the key and the template after they have been
345 destroyed, but the Get operation fails in both cases. This test case demonstrates the fact that it
346 is possible for two clients to cooperate and use the same managed object while only having
347 knowledge of a single pre-agreed Name attribute value and without having to share any other
348 information.

350 2.2.5 TC-315-11 - Register / Destroy Secret Data

351 In this test case the client issues a Register request containing a Secret Data object, whereby the
352 server registers the object and returns the Unique Identifier. To clean up, the client then
353 performs a Destroy

355 2.2.6 TC-32-11 - Asynchronous Locate

356 This test case tests the asynchronous capabilities of KMIP using the Locate operation. A key is
357 created and then a Locate request is sent containing the Name of the created key and with the
358 message header Asynchronous Indicator-field set to True. If the server returns an asynchronous
359 response to the Locate, the client then polls the server until the operation is ready. If the server
360 responded asynchronously, a subsequent Locate operation that is also handled asynchronously
361 is then Canceled, before the key is finally destroyed.

362 This test case shows the use of two clients with the same assumptions as in the test case
363 described in Section . Since the client is unable to force the server to respond asynchronously, it
364 is possible for a server to respond synchronously to the requests issued at times 1 and 4, in
365 which case the expected response are the ones shown at times 2 and 5, respectively. In the case
366 of the server not responding asynchronously to the Locate requests, the client is permitted to
367 skip the requests illustrated at time 7 and 8.

369 2.2.7 TC-41-11 - Revoke Scenario

370 This test case tests the revocation aspect of the key life cycle support in KMIP. A key is created
371 and a Get Attribute for the State-attribute reveals that the key is in Pre-active state. The
372 Activation Date is then set, which changes the state to Active. The key is then revoked with a
373 revocation reason of Compromised and the state subsequently changed to Compromised, but
374 this does not stop a client from being able to add, modify and delete attributes or even get the
375 key (since we assume here that the out-of-band registration has been used to make the server
376 aware of the fact that the client is capable of interpreting the attributes of the key and
377 determining what it is allowed to do with the key). To clean up, the created key is finally
378 destroyed.

380 2.2.8 TC-51-11 - Get Usage Allocation Scenario

381 This test case tests the usage management functionality of KMIP. A key is created and the
382 Activation Date and Protect Stop Date attributes are set in such a way as to allow the Get Usage
383 Allocation operation to be performed. The value of the Usage Limits attribute is set to 1000
384 bytes, and two subsequent requests for 500 bytes succeed (one of them also verifying the
385 amount that can be received using the Check operation), while a third fails since the usage
386 allocation has been used up. The key is finally revoked and destroyed. This test case shows the
387 use of multiple clients (Client-A, Client-B and Client-C).

389 2.2.9 TC-61-11 - Import of a Third-party Key

390 This test case tests the import of a foreign key using the Register operation. To validate that the
391 registered key is treated the same as a locally created key, an attribute is added to the key and
392 then modified. Finally, the key is destroyed.

394 2.2.10 TC-71-11 - Unrecognized Message Extension with Criticality Indicator 395 False

396 A create request is issued and the request contains a Message Extension with the Criticality
397 Indicator set to false. The server does not understand the extension, but since it is non-critical,
398 the create request is processed normally. Subsequently, the created key is deleted.

414

415 2.2.14 TC-91-11 - Create a Key, Re-key

416 Create a symmetric key with a specific name, and then use Locate to find the key. After using
417 Re-key to create a new key, verify that the name was removed from the existing key and copied
418 to the new key. Also verify that the key material for the old key is still retrievable. To clean up,
419 both keys are deleted.

420

421 2.2.15 TC-92-11 - Existing Key Expired, Re-key with Same Life-cycle

422 Create a new symmetric key. Then add the Activation Date and Deactivation Date attributes
423 based on the timestamp in the response to the Create request. The Activation Date is set to the
424 current time and the Deactivation Date to a time in the near future. Repeated Get Attribute calls
425 are performed to verify that the state is first 'Active', then subsequently 'Deactivated'. Then
426 issue a Re-key request, including an Offset value of zero leading to the Activation Date of the
427 replacement key to be set to the same value as the Initial Date of the replacement key. Verify
428 from the response that the Activation Date and Deactivation Date attributes were set correctly
429 (if they are not returned, issue a Get Attribute request). Do a Get Attribute operation to verify
430 that the state of the new key is 'Active'. To clean up, both keys are deleted.

432 2.2.16 TC-93-11 - Existing Key Compromised, Re-key with Same Life-cycle

433 Create a new symmetric key with the Activation Date in the past. Do a Get Attribute operation
434 on the State attribute to verify the key is 'Active'. Then revoke the key as compromised, verify
435 that the state has changed to 'Compromised'. Create a replacement key using Re-key with the
436 offset set to '0' to indicate that the times are to be copied from the existing key. Do a Get
437 Attribute operation to verify that the state of the new key is 'Active'. To clean up, both keys are
438 deleted.

444

445 2.2.18 TC-95-11 - Obtain Lease for Expired Key

446 Create a symmetric key with a specific name and obtain a lease. Revoke the key with state
447 'Compromised' and re-key the key. Try to obtain a lease on the old key which fails due to a
448 server policy which does not allow giving out leases for compromised keys. Locate the new key
449 with the original name. Get the new key and obtain a lease.

```

450

451 2.2.19 TC-101-11 - Create a Key, Archive and Recover it

452 Create a symmetric key with a specified name, then use Locate to find the key and get the key.
453 Archive the key (asynchronous operation, use Poll until it completes) and use Get and Locate on
454 it, but both fail (Get returns an error and Locate returns no Unique Identifiers). Add the Storage
455 Status Mask to the Locate-command, indicating to the server to search in both online and
456 archived storage. The Locate then finds the archived key. Recover the key (asynchronous
457 operation, use Poll until it completes) from the archive, then repeat the Get operation which will
458 now succeed.

459 Since the client is unable to force the server to respond asynchronously, it is possible for a
460 server to respond synchronously to the requests issued at times 3 and 9, in which case the
461 expected responses are the ones shown at times 4 and 10 respectively.

462 Note: a server may perform Archive and Recover operations synchronously and not require the
463 use of Poll for the client to wait for the operation to complete

464

465 2.2.20 TC-111-11 - Credential, Operation Policy, Destroy Date

466 Pass a Credential object of type Username and Password in the message header in all requests
467 for identification purposes. Create a symmetric key and set the Operation Policy Name attribute
468 to 'default'. Using another Username and Password Credential, attempt to perform a Get
469 operation batched with a Get Attribute List on the created symmetric key - according to the
470 Default Operation Policy, both these request SHALL fail, and with the Batch Error Continuation
471 Option set to 'Continue', the client SHALL also receive both response payloads. Using the first
472 (correct) Credential, Destroy the object and then get the Destroy Date attribute.

473 The message exchanges shown in this test case assume that the first Credential (Fred) is valid
474 and the second credential (Barney) is either invalid or does not have access to the newly created
475 key (which should always be true under the 'default' Operation Policy).

476 Note: a server can elect to not return meta-data for destroyed objects and in those
477 circumstances the Get Attributes operation may fail.

479 2.2.21 TC-112-11 - Device Credential, Operation Policy, Destroy Date

480 Pass a Credential object of type Device Credential in the message header in all requests for
481 identification purposes. Create a symmetric key and set the Operation Policy Name attribute to
482 'default'. Using another Credential, attempt to perform a Get operation batched with a Get
483 Attribute List on the created symmetric key. According to the Default Operation Policy, both
484 these request SHALL fail, and with the Batch Error Continuation Option set to 'Continue', the
485 client SHALL also receive both response payloads. Using the first Credential, Destroy the object
486 and get the Destroy Date attribute. The message exchanges shown in this test case assume that
487 the first Credential (devID2233) is valid and the second credential (devID4444) is either invalid
488 or does not have access to the newly created key (which should always be true under the
489 'default' Operation Policy).

490 Note: a server can elect to not return meta-data for destroyed objects and in those
491 circumstances the Get Attributes operation may fail.

493 2.2.22 TC-121-11 - Query, Maximum Response Size

494 Perform a Query operation, querying the Operations and Objects supported by the server, with
495 a restriction on the Maximum Response Size set in the request header. Since the resulting Query
496 response is too large, an error is returned. Increase the Maximum Response Size, resubmit the
497 Query request, and get a successful response.

498 Note: the list of object types supported and operations will vary depending on the server
499 implementation. The server can report the Vendor Identification in whatever TextString form
500 the vendor selects. The server may return vendor specific tags in the Server Information
501 structure indicating additional vendor-specific information about the server.

503 2.2.23 TC-122-11 - Query Vendor Extensions

504 Query the server for a list and map of vendor extension tags it recognizes.

505 Note: Extension Type is an Integer as there is no corresponding enumerated type for the Item
506 Type field.

509 2.2.24 TC-131-11 - Register an Asymmetric Key Pair in PKCS1 Format

510 Register a private key in the PKCS_1 key format, then register the corresponding public key, also
511 in PKCS_1 format, with the Link attribute pointing to the previously registered private key.
512 Thereafter add the Link attribute to the private key, and perform Locate operations to find the
513 public and private keys using the Link attribute. Get both the private and public keys in PKCS_1
514 key format, then destroy both the private and the public key.

515

516 2.2.25 TC-132-11 - Register an Asymmetric Key Pair and a Corresponding 517 X509 Certificate

518 Register a public/private key pair in the PKCS_1 key format and a corresponding X509 certificate.
519 Add the appropriate links between the registered objects. Make sure the certificate was
520 registered and the attributes set correctly by listing and retrieving the attributes. Get the keys
521 and certificate, and finally destroy all the registered objects.

522

523 2.2.26 TC-133-11 - Create, Re-key Key Pair

524 Create a public/private key pair on the server and retrieve the keys in PKCS_1 format. Re-key the
525 key pair and retrieve the new public/private key pair in transparent format. To verify that the
526 links are set correctly, the Link attributes are retrieved. Finally, all the keys are destroyed.

527 Note: a server is not required to support conversion between key formats so returning keys in
528 Transparent form when registered in PKCS_1 may not be supported.

530 2.2.27 TC-134-11 - Register Key Pair, Certify and Re-certify Public Key

531 Register a public/private key pair on the server. Request the server to have a certificate created
532 using the Certify operation. Retrieve the certificate and its attributes, then execute the Re-
533 certify operation to re-certify the public key. Finally, destroy all the objects.

534 The new KMIP 1.1 certificate DN attributes are retrieved as are the original (deprecated) KMIP
535 1.0 certificate DN attributes.

537 2.2.28 TC-141-11 - Key Wrapping using AES Key Wrap and No Encoding

538 Register a 128-bit AES key encryption key (KEK) with the Cryptographic Usage Mask attribute set
539 to Wrap and the Cryptographic Parameters specifying NIST Key Wrap as the Block Cipher Mode.
540 Subsequently, register another 128-bit AES data key (DEK). Retrieve the DEK wrapped using the
541 NIST Key Wrap algorithm and the KEK. The Cryptographic Usage Mask Attribute Name is
542 specified, indicating to the server that this attribute is to be wrapped together with the key
543 material. The Encoding Option field is omitted, which means that the default TTLV-encoding is
544 used. Finally, destroy both keys to return the server to the initial state.

545 The key material for both the KEK and the DEK are from the test vectors specified in Section 4.6
546 of [NISTKeyWrap].

547

548 2.2.29 TC-142-11 - Key Wrapping using AES Key Wrap with Attributes

549 Register a 128-bit AES key encryption key (KEK) with the Cryptographic Usage Mask attribute set
550 to Wrap and the Cryptographic Parameters specifying NIST Key Wrap as the Block Cipher Mode.
551 Subsequently, register another 128-bit AES data key (DEK). Retrieve the data key wrapped using
552 the NIST Key Wrap algorithm and the KEK. The Encoding Option is set to No Encoding, which
553 means that only the key material is wrapped as opposed to the whole TTLV-encoded Key Value
554 structure being wrapped. Finally, destroy both keys to return the server to the initial state. The
555 key material for both the KEK and the DEK are from the test vectors specified in Section 4.6 of
556 [NISTKeyWrap].

557

558 2.2.30 TC-151-11 - Locate a Fresh Object from the Default Group

559 Locate a single fresh object from the default object group. Perform a Get Attribute to retrieve
560 the value of the Fresh attribute to make sure that the key is fresh. Get the object (the kind of
561 object returned depends on the server policy), and get the Fresh attribute again to verify that
562 the object is no longer fresh. Finally, destroy the object. This test case illustrates only one
563 possible behavior related to the default group. In this test case, it is assumed that the server has
564 fresh objects available in the default group, or that it creates a new object on-the-fly as a
565 consequence of the Locate request. It is also assumed that no other client retrieves the object
566 after the Locate but before the batched Get Attributes request, thereby toggling the value of the
567 Fresh attribute.

569 2.2.31 TC-152-11 - Client-side Group Management

570 Register two symmetric keys, both with the same (non-default) Object Group name specified
571 and the Fresh attribute set to true. Get the Fresh attribute from both keys to make sure it was
572 set. Perform three batched Locate and Get requests to get a fresh key from the group. The first
573 two requests should return both the registered keys, whereas the third request should return no
574 key. To clean up, destroy both keys. This test case assumes that the server supports and sets
575 the Fresh attribute when requested to do so by the client.

```

577 2.2.32 TC-153-11 - Default Object Group Member

578 This test case exercises the 'default' Object Group Member flag in the Locate request. Three
579 keys are created on the server and put into the same group (the Object Group attribute is set to
580 the same value for all keys). Thereafter, the client performs four batched Locate and Get
581 requests, asking for the default object from the group. This test case assumes that the server
582 policy is such that it serves objects from the group in a round-robin fashion. The pointer to the
583 default object is advanced each time an object is retrieved using a Get request. The first three
584 times Locate and Get is executed, the three keys are returned one after the other. When Locate
585 and Get is executed for the fourth time, the first key is again returned. Finally, all keys are
586 destroyed.

587 Note: there is no requirement for a server to implement support for any round-robin based
588 allocation; this test case illustrates a server which supports such a policy.

```

590 2.2.33 TC-161-11 - Discover Versions

591 Exercise the Discover Versions operation in different ways in order to find out which versions a
592 server supports, as well as to get a list of versions supported by both client and server.

593 This test case shows the expected responses from a KMIP 1.2 server that supports versions 1.1
594 and 1.0, with 1.1 being the preferred version.

596 2.2.34 TC-171-11 - Handling of Attributes and Attribute Index Values

597 This test case illustrates the changes in Attribute and Attribute Index handling introduced in
598 KMIP-1.1. A symmetric key is created on the server, and two Name attributes and the Contact
599 Information attribute is specified for the key. A Get Attributes request containing the Object
600 Type attribute name twice is sent, but this operation fails since a single Attribute Name cannot
601 be specified more than once in a Get Attributes request. The Object Type Attribute is then
602 requested once, and this request succeeds. Thereafter, the Contact Information Attribute is
603 modified, with the Attribute Index value of 0 specified. The Name attribute is deleted without
604 specifying the Attribute Index which succeeds (which would have failed under KMIP-1.0). Finally,
605 the created key is destroyed.

606

607 2.2.35 TC-181-11 - Digests of Symmetric Keys

608 Exercise the Digest attribute by registering two symmetric keys with the same key material but
609 using different Key Format Type. The Digest Value for the key with the Key Format Type set to
610 Transparent Symmetric Key is calculated on the TTLV-encoded Key Material structure, whereas
611 the Digest Value for the key registered in the Raw Key Format Type is calculated on the raw Key
612 Material Byte String. The server calculates the value of the mandatory Digest attribute instance
613 using the Key Format Type used by the client when registering the keys. Thereafter, the client
614 asks the server to create a symmetric key using the Create operation. In this situation, it is up to
615 the server to choose what Key Format Type of the created key it uses to calculate the Digest
616 Value.

617 Note: This test case assumes a server that does not compute any additional Digest attributes
618 using another Hashing Algorithm and/or Key Format Type. A server is permitted to provide
619 multiple Digest attributes.

621

622 2.2.36 TC-182-11 - Digests of RSA Private Keys

623 Exercise the Digest attribute by registering two RSA private keys with the same key material but
624 using different Key Format Type. The Digest Value for the key with the Key Format Type set to
625 Transparent RSA Private Key is calculated on the TTLV-encoded Key Material structure, whereas
626 the Digest Value for the key registered in the PKCS_1 Key Format Type is calculated on the Key
627 Material Byte String. The server calculates the value of the mandatory Digest attribute instance
628 using the Key Format Type used by the client when registering the keys.

629 Note: This test case assumes a server that does not compute any additional Digest attributes
630 using another Hashing Algorithm and/or Key Format Type. A server is permitted to provide
631 multiple Digest attributes.

632

633 2.2.37 TC-NP-1-11 - Put

634 In this test case the client issues a Create request, whereby the server creates a new symmetric
635 key and returns the Unique Identifier. To clean up, the client then performs a Destroy operation
636 to destroy the key.

637 The server sends Put messages to the client via a separate channel.

640 2.2.38 TC-NP-2-11 - Notify & Put

641 This test case tests the import of key using the Register operation. To validate that the
642 registered key is treated the same as a locally created key, an attribute is added to the key and
643 then modified. Finally, the key is destroyed.

644 The server sends Notify and Put messages to the client via a separate channel.

645

646 2.2.39 TC-ECC-1-11 - Register an ECC Key Pair

647 EC recommended curve is P-256 (secp256r1)

648 - Private Key format ECPrivateKey - <http://tools.ietf.org/html/rfc5915>

649 - Public Key format SubjectPublicKeyInfo - <http://tools.ietf.org/html/rfc5480>

650 Register a EC private key in the ECPrivateKey key format, then register the corresponding public
651 key, in X.509 (SubjectPublicKeyInfo) format, with the Link attribute pointing to the previously
652 registered private key. Then add the Link attribute to the private key, and perform Locate
653 operations to find the public and private keys using the Link attribute. Get both the private and
654 public keys in default format, then destroy both the private and the public key.

655

668

669 2.2.40 TC-ECC-2-11 - Register an ECC Key Pair in PKCS8 Format

670 EC recommended curve is P-256 (secp256r1)

671 - Public Key format SubjectPublicKeyInfo - <http://tools.ietf.org/html/rfc5480>

672 Register a EC private key in PKCS8 key format (with passphrase 'secret' using pbeWithSHAAnd3-
673 KeyTripleDES-CBC), then register the corresponding public key, in X.509 (SubjectPublicKeyInfo)
674 format, with the Link attribute pointing to the previously registered private key. Then add the
675 Link attribute to the private key, and perform Locate operations to find the public and private
676 keys using the Link attribute. Get both the private and public keys in default format, then
677 destroy both the private and the public key.

678

691

692 2.2.41 TC-ECC-3-11 - Register an ECC Key Pair and ECDSA Certificate

693 EC recommended curve is P-256 (secp256r1)

694 - Private Key format ECPrivateKey - <http://tools.ietf.org/html/rfc5915>

695 - Public Key format SubjectPublicKeyInfo - <http://tools.ietf.org/html/rfc5480>

696 Register a EC private key in the ECPrivateKey key format, then register the corresponding public
697 key, in X.509 (SubjectPublicKeyInfo) format, and a corresponding ECDSA certificate, with the
698 Link attribute pointing to the previously registered private key. Return the attribute values for
699 the ECDSA certificate showing the correct server parsing of the certificate. Then add the Link
700 attribute to the private key, and perform Locate operations to find the public and private keys
701 using the Link attribute. Get both the private and public keys in default format, then destroy
702 both the private and the public key.

703

732

733 2.3 KMIP 1.2 Test Cases

734 2.3.1 TC-311-12 - Create / Destroy

735 In this test case the client issues a Create request, whereby the server creates a new symmetric
736 key and returns the Unique Identifier. To clean up, the client then performs a Destroy operation
737 to destroy the key.

739 2.3.2 TC-312-12 - Register / Create / Get attributes / Destroy

740 Here the client first registers a template object and then creates a symmetric key using the
741 registered template. To verify that the attributes of the key were set correctly from the
742 template, the client then issues a Get Attributes command, after which it destroys first the key
743 and then the template.

744

745 2.3.3 TC-313-12 - Create / Locate / Get / Destroy

746 This test case tests the Locate and Get operations. A symmetric key is first created, and then a
747 lookup is performed on the Name attribute using the Locate operation. Subsequently, a Get
748 request is issued to retrieve the located key. A locate is performed on the Unique Identifier with
749 State of PreActive (the State the key must be in). The key on the server is destroyed and the
750 locate is performed again which should return no objects (as the state of the key should now be
751 Destroyed).

753 2.3.4 TC-314-12 - Dual Client Test Case, ID Placeholder-linked Locate & Get 754 Batch

755 This test case has two clients performing operations on the same key. The first client initially
756 registers a template and creates a symmetric key using that template. The second client then
757 does a batched Locate and Get using the ID Placeholder to retrieve the key. The second client
758 thereafter performs a number of operations on the key (Get Attribute List, Get Attribute, Add
759 Attribute, Modify Attribute and Delete Attribute), before the first client finally destroys the key
760 and the template. The first client also tries to Get the key and the template after they have been
761 destroyed, but the Get operation fails in both cases. This test case demonstrates the fact that it
762 is possible for two clients to cooperate and use the same managed object while only having
763 knowledge of a single pre-agreed Name attribute value and without having to share any other
764 information.

766 2.3.5 TC-315-12 - Register / Destroy Secret Data

767 In this test case the client issues a Register request containing a Secret Data object, whereby the
768 server registers the object and returns the Unique Identifier. To clean up, the client then
769 performs a Destroy

770

771 2.3.6 TC-32-12 - Asynchronous Locate

772 This test case tests the asynchronous capabilities of KMIP using the Locate operation. A key is
773 created and then a Locate request is sent containing the Name of the created key and with the
774 message header Asynchronous Indicator-field set to True. If the server returns an asynchronous
775 response to the Locate, the client then polls the server until the operation is ready. If the server
776 responded asynchronously, a subsequent Locate operation that is also handled asynchronously
777 is then Canceled, before the key is finally destroyed.

778 This test case shows the use of two clients. Since the client is unable to force the server to
779 respond asynchronously, it is possible for a server to respond synchronously to the requests
780 issued at times 1 and 4, in which case the expected responses are the ones shown at times 2

781 and 5, respectively. In the case of the server not responding asynchronously to the Locate
782 requests, the client is permitted to skip the requests illustrated at time 7 and 8.

783 Note: a server may perform all operations synchronously and not require the use of Poll for the
784 client to wait for the operations to complete

785

786 2.3.7 TC-41-12 - Revoke Scenario

787 This test case tests the revocation aspect of the key life cycle support in KMIP. A key is created
788 and a Get Attribute for the State-attribute reveals that the key is in Pre-active state. The

789 Activation Date is then set, which changes the state to Active. The key is then revoked with a
790 revocation reason of Compromised and the state subsequently changed to Compromised, but
791 this does not stop a client from being able to add, modify and delete attributes or even get the
792 key. To clean up, the created key is finally destroyed.

794 2.3.8 TC-51-12 - Get Usage Allocation Scenario

795 This test case tests the usage management functionality of KMIP. A key is created and the
796 Activation Date and Protect Stop Date attributes are set in such a way as to allow the Get Usage
797 Allocation operation to be performed. The value of the Usage Limits attribute is set to 1000
798 bytes, and two subsequent requests for 500 bytes succeed (one of them also verifying the
799 amount that can be received using the Check operation), while a third fails since the usage
800 allocation has been used up. The key is finally revoked and destroyed. This test case shows the
801 use of multiple clients (Client-A, Client-B and Client-C).

802

803 2.3.9 TC-61-12 - Import of a Third-party Key

804 This test case tests the import of a foreign key using the Register operation. To validate that the
805 registered key is treated the same as a locally created key, an attribute is added to the key and
806 then modified. Finally, the key is destroyed.

808 2.3.10 TC-71-12 - Unrecognized Message Extension with Criticality Indicator

809 False

810 A create request is issued and the request contains a Message Extension with the Criticality

811 Indicator set to false. The server does not understand the extension, but since it is non-critical,

812 the create request is processed normally. Subsequently, the created key is deleted.

828

829 2.3.14 TC-91-12 - Create a Key, Re-key

830 Create a symmetric key with a specific name, and then use Locate to find the key. After using
831 Re-key to create a new key, verify that the name was removed from the existing key and copied
832 to the new key. Also verify that the key material for the old key is still retrievable. To clean up,
833 both keys are deleted.

834

835 2.3.15 TC-92-12 - Existing Key Expired, Re-key with Same Life-cycle

836 Create a new symmetric key. Then add the Activation Date and Deactivation Date attributes
837 based on the timestamp in the response to the Create request. The Activation Date is set to the
838 current time and the Deactivation Date to a time in the near future. Repeated Get Attribute calls
839 are performed to verify that the state is first 'Active', then subsequently 'Deactivated'. Then
840 issue a Re-key request, including an Offset value of zero leading to the Activation Date of the
841 replacement key to be set to the same value as the Initial Date of the replacement key. Verify

842 from the response that the Activation Date and Deactivation Date attributes were set correctly
843 (if they are not returned, issue a Get Attribute request). Do a Get Attribute operation to verify
844 that the state of the new key is 'Active'. To clean up, both keys are deleted.

845

846 2.3.16 TC-93-12 - Existing Key Compromised, Re-key with Same Life-cycle

847 Create a new symmetric key with the Activation Date in the past. Do a Get Attribute operation
848 on the State attribute to verify the key is 'Active'. Then revoke the key as compromised, verify
849 that the state has changed to 'Compromised'. Create a replacement key using Re-key with the
850 offset set to '0' to indicate that the times are to be copied from the existing key. Do a Get
851 Attribute operation to verify that the state of the new key is 'Active'. To clean up, both keys are
852 deleted.

858

859 2.3.18 TC-95-12 - Obtain Lease for Expired Key

860 Create a symmetric key with a specific name and obtain a lease. Revoke the key with state
861 'Compromised' and re-key the key. Try to obtain a lease on the old key which fails due to a
862 server policy which does not allow giving out leases for compromised keys. Locate the new key
863 with the original name. Get the new key and obtain a lease.

864

865 2.3.19 TC-101-12 - Create a Key, Archive and Recover it

866 Create a symmetric key with a specified name, then use Locate to find the key and get the key.

867 Archive the key (asynchronous operation, use Poll until it completes) and use Get and Locate on

868 it, but both fail (Get returns an error and Locate returns no Unique Identifiers). Add the Storage
869 Status Mask to the Locate-command, indicating to the server to search in both online and
870 archived storage. The Locate then finds the archived key. Recover the key (asynchronous
871 operation, use Poll until it completes) from the archive, then repeat the Get operation which will
872 now succeed.

873 Since the client is unable to force the server to respond asynchronously, it is possible for a
874 server to respond synchronously to the requests issued at times 3 and 9, in which case the
875 expected responses are the ones shown at times 4 and 10 respectively.

876 Note: a server may perform Archive and Recover operations synchronously and not require the
877 use of Poll for the client to wait for the operation to complete

878

879 2.3.20 TC-111-12 - Credential, Operation Policy, Destroy Date

880 Pass a Credential object of type Username and Password in the message header in all requests
881 for identification purposes. Create a symmetric key and set the Operation Policy Name attribute
882 to 'default'. Using another Username and Password Credential, attempt to perform a Get
883 operation batched with a Get Attribute List on the created symmetric key - according to the
884 Default Operation Policy, both these request SHALL fail, and with the Batch Error Continuation
885 Option set to 'Continue', the client SHALL also receive both response payloads. Using the first
886 (correct) Credential, Destroy the object and then get the Destroy Date attribute.

887 The message exchanges shown in this test case assume that the first Credential (Fred) is valid
888 and the second credential (Barney) is either invalid or does not have access to the newly created
889 key (which should always be true under the 'default' Operation Policy).

890 Note: a server can elect to not return meta-data for destroyed objects and in those
891 circumstances the Get Attributes operation may fail.

893 2.3.21 TC-112-12 - Device Credential, Operation Policy, Destroy Date

894 Pass a Credential object of type Device Credential in the message header in all requests for
895 identification purposes. Create a symmetric key and set the Operation Policy Name attribute to
896 'default'. Using another Credential, attempt to perform a Get operation batched with a Get
897 Attribute List on the created symmetric key. According to the Default Operation Policy, both
898 these request SHALL fail, and with the Batch Error Continuation Option set to 'Continue', the
899 client SHALL also receive both response payloads. Using the first Credential, Destroy the object
900 and get the Destroy Date attribute. The message exchanges shown in this test case assume that
901 the first Credential (devID2233) is valid and the second credential (devID4444) is either invalid
902 or does not have access to the newly created key (which should always be true under the
903 'default' Operation Policy).

904 Note: a server can elect to not return meta-data for destroyed objects and in those
905 circumstances the Get Attributes operation may fail.

906

907 2.3.22 TC-121-12 - Query, Maximum Response Size

908 Perform a Query operation, querying the Operations and Objects supported by the server, with
909 a restriction on the Maximum Response Size set in the request header. Since the resulting Query
910 response is too large, an error is returned. Increase the Maximum Response Size, resubmit the
911 Query request, and get a successful response.

912 Note: the list of object types supported and operations will vary depending on the server
913 implementation. The server can report the Vendor Identification in whatever TextString form
914 the vendor selects. The server may return vendor specific tags in the Server Information
915 structure indicating additional vendor-specific information about the server.

916

917 2.3.23 TC-122-12 - Query Vendor Extensions

918 Query the server for a list and map of vendor extension tags it recognizes.

919 Note: Extension Type is an Integer as there is no corresponding enumerated type for the Item
920 Type field.

923 2.3.24 TC-131-12 - Register an Asymmetric Key Pair in PKCS1 Format

924 Register a private key in the PKCS_1 key format, then register the corresponding public key, also
925 in PKCS_1 format, with the Link attribute pointing to the previously registered private key.
926 Thereafter add the Link attribute to the private key, and perform Locate operations to find the
927 public and private keys using the Link attribute. Get both the private and public keys in PKCS_1
928 key format, then destroy both the private and the public key.

930 2.3.25 TC-132-12 - Register an Asymmetric Key Pair and a Corresponding 931 X509 Certificate

- 932 Register a public/private key pair in the PKCS_1 key format and a corresponding X509 certificate.
933 Add the appropriate links between the registered objects. Make sure the certificate was
934 registered and the attributes set correctly by listing and retrieving the attributes. Get the keys
935 and certificate, and finally destroy all the registered objects.

937 2.3.26 TC-133-12 - Create, Re-key Key Pair

938 Create a public/private key pair on the server and retrieve the keys in PKCS_1 format. Re-key the
939 key pair and retrieve the new public/private key pair in transparent format. To verify that the
940 links are set correctly, the Link attributes are retrieved. Finally, all the keys are destroyed.

941 Note: a server is not required to support conversion between key formats so returning keys in
942 Transparent form when registered in PKCS_1 may not be supported.

943

944 2.3.27 TC-134-12 - Register Key Pair, Certify and Re-certify Public Key

945 Register a public/private key pair on the server. Request the server to have a certificate created
946 using the Certify operation. Retrieve the certificate and its attributes, then execute the Re-
947 certify operation to re-certify the public key. Finally, destroy all the objects.

948 The new KMIP 1.1 certificate DN attributes are retrieved as are the original (deprecated) KMIP
949 1.0 certificate DN attributes.

950

951 2.3.28 TC-141-12 - Key Wrapping using AES Key Wrap and No Encoding

952 Register a 128-bit AES key encryption key (KEK) with the Cryptographic Usage Mask attribute set
953 to Wrap and the Cryptographic Parameters specifying NIST Key Wrap as the Block Cipher Mode.
954 Subsequently, register another 128-bit AES data key (DEK). Retrieve the data key wrapped using
955 the NIST Key Wrap algorithm and the KEK. The Encoding Option is set to No Encoding, which
956 means that only the key material is wrapped as opposed to the whole TTLV-encoded Key Value
957 structure being wrapped. Finally, destroy both keys to return the server to the initial state. The
958 key material for both the KEK and the DEK are from the test vectors specified in Section 4.6 of
959 [NISTKeyWrap].

961 2.3.29 TC-142-12 - Key Wrapping using AES Key Wrap with Attributes

962 Register a 128-bit AES key encryption key (KEK) with the Cryptographic Usage Mask attribute set
963 to Wrap and the Cryptographic Parameters specifying NIST Key Wrap as the Block Cipher Mode.
964 Subsequently, register another 128-bit AES data key (DEK). Retrieve the DEK wrapped using the
965 NIST Key Wrap algorithm and the KEK. The Cryptographic Usage Mask Attribute Name is
966 specified, indicating to the server that this attribute is to be wrapped together with the key
967 material. The Encoding Option field is omitted, which means that the default TTLV-encoding is
968 used. Finally, destroy both keys to return the server to the initial state.

969 The key material for both the KEK and the DEK are from the test vectors specified in Section 4.6
970 of [NISTKeyWrap].

971

972 2.3.30 TC-151-12 - Locate a Fresh Object from the Default Group

973 Locate a single fresh object from the default object group. Perform a Get Attribute to retrieve
974 the value of the Fresh attribute to make sure that the key is fresh. Get the object (the kind of
975 object returned depends on the server policy), and get the Fresh attribute again to verify that
976 the object is no longer fresh. Finally, destroy the object. This test case illustrates only one
977 possible behavior related to the default group. In this test case, it is assumed that the server has
978 fresh objects available in the default group, or that it creates a new object on-the-fly as a
979 consequence of the Locate request. It is also assumed that no other client retrieves the object

980 after the Locate but before the batched Get Attributes request, thereby toggling the value of the
981 Fresh attribute.

983 2.3.31 TC-152-12 - Client-side Group Management

984 Register two symmetric keys, both with the same (non-default) Object Group name specified
985 and the Fresh attribute set to true. Get the Fresh attribute from both keys to make sure it was
986 set. Perform three batched Locate and Get requests to get a fresh key from the group. The first
987 two requests should return both the registered keys, whereas the third request should return no
988 key. To clean up, destroy both keys. This test case assumes that the server supports and sets
989 the Fresh attribute when requested to do so by the client.

991 2.3.32 TC-153-12 - Default Object Group Member

992 This test case exercises the 'default' Object Group Member flag in the Locate request. Three
993 keys are created on the server and put into the same group (the Object Group attribute is set to
994 the same value for all keys). Thereafter, the client performs four batched Locate and Get
995 requests, asking for the default object from the group. This test case assumes that the server
996 policy is such that it serves objects from the group in a round-robin fashion. The pointer to the
997 default object is advanced each time an object is retrieved using a Get request. The first three
998 times Locate and Get is executed, the three keys are returned one after the other. When Locate
999 and Get is executed for the fourth time, the first key is again returned. Finally, all keys are
1000 destroyed.

1001 Note: there is no requirement for a server to implement support for any round-robin based
1002 allocation; this test case illustrates a server which supports such a policy.

1003

1004 2.3.33 TC-161-12 - Discover Versions

1005 Exercise the Discover Versions operation in different ways in order to find out which versions a
1006 server supports, as well as to get a list of versions supported by both client and server.

1007 This test case shows the expected responses from a KMIP 1.2 server that supports versions 1.2,
1008 1.1 and 1.0, with 1.2 being the preferred version.

1010 2.3.34 TC-171-12 - Handling of Attributes and Attribute Index Values

1011 This test case illustrates the changes in Attribute and Attribute Index handling introduced in
1012 KMIP-1.1. A symmetric key is created on the server, and two Name attributes and the Contact
1013 Information attribute is specified for the key. A Get Attributes request containing the Object
1014 Type attribute name twice is sent, but this operation fails since a single Attribute Name cannot
1015 be specified more than once in a Get Attributes request. The Object Type Attribute is then
1016 requested once, and this request succeeds. Thereafter, the Contact Information Attribute is
1017 modified, with the Attribute Index value of 0 specified. The Name attribute is deleted without
1018 specifying the Attribute Index which succeeds (which would have failed under KMIP-1.0). Finally,
1019 the created key is destroyed.

1020

1021 2.3.35 TC-181-12 - Digests of Symmetric Keys

1022 Exercise the Digest attribute by registering two symmetric keys with the same key material but
1023 using different Key Format Type. The Digest Value for the key with the Key Format Type set to
1024 Transparent Symmetric Key is calculated on the TTLV-encoded Key Material structure, whereas
1025 the Digest Value for the key registered in the Raw Key Format Type is calculated on the raw Key
1026 Material Byte String. The server calculates the value of the mandatory Digest attribute instance
1027 using the Key Format Type used by the client when registering the keys. Thereafter, the client
1028 asks the server to create a symmetric key using the Create operation. In this situation, it is up to
1029 the server to choose what Key Format Type of the created key it uses to calculate the Digest
1030 Value.

1031 Note: This test case assumes a server that does not compute any additional Digest attributes
1032 using another Hashing Algorithm and/or Key Format Type. A server is permitted to provide
1033 multiple Digest attributes.

1035

1036 2.3.36 TC-182-12 - Digests of RSA Private Keys

1037 Exercise the Digest attribute by registering two RSA private keys with the same key material but
1038 using different Key Format Type. The Digest Value for the key with the Key Format Type set to
1039 Transparent RSA Private Key is calculated on the TTLV-encoded Key Material structure, whereas
1040 the Digest Value for the key registered in the PKCS_1 Key Format Type is calculated on the Key
1041 Material Byte String. The server calculates the value of the mandatory Digest attribute instance
1042 using the Key Format Type used by the client when registering the keys.

1043 Note: This test case assumes a server that does not compute any additional Digest attributes
1044 using another Hashing Algorithm and/or Key Format Type. A server is permitted to provide
1045 multiple Digest attributes.

1046

1047 2.3.37 TC-NP-1-12 - Put

1048 In this test case the client issues a Create request, whereby the server creates a new symmetric
1049 key and returns the Unique Identifier. To clean up, the client then performs a Destroy operation
1050 to destroy the key.

1051 The server sends Put messages to the client via a separate channel.

1053

1054 2.3.38 TC-NP-2-12 - Notify & Put

1055 This test case tests the import of key using the Register operation. To validate that the
1056 registered key is treated the same as a locally created key, an attribute is added to the key and
1057 then modified. Finally, the key is destroyed.

1058 The server sends Notify and Put messages to the client via a separate channel.

1059

1060 2.3.39 TC-ECC-1-12 - Register an ECC Key Pair

1061 EC recommended curve is secp256k1

1062 - Private Key format ECPrivateKey - <http://tools.ietf.org/html/rfc5915>

1063 - Public Key format SubjectPublicKeyInfo - <http://tools.ietf.org/html/rfc5480>

1064 Register a EC private key in the ECPrivateKey key format, then register the corresponding public
1065 key, in X.509 (SubjectPublicKeyInfo) format, with the Link attribute pointing to the previously
1066 registered private key. Then add the Link attribute to the private key, and perform Locate
1067 operations to find the public and private keys using the Link attribute. Get both the private and
1068 public keys in default format, then destroy both the private and the public key.

1069

1082

1083 2.3.40 TC-ECC-2-12 - Register an ECC Key Pair in PKCS8 Format

1084 EC recommended curve is secp256k1

1085 - Public Key format SubjectPublicKeyInfo - <http://tools.ietf.org/html/rfc5480>

1086 Register a EC private key in PKCS8 key format (with passphrase 'secret' using pbeWithSHAAnd3-
1087 KeyTripleDES-CBC), then register the corresponding public key, in X.509 (SubjectPublicKeyInfo)
1088 format, with the Link attribute pointing to the previously registered private key. Then add the
1089 Link attribute to the private key, and perform Locate operations to find the public and private
1090 keys using the Link attribute. Get both the private and public keys in default format, then
1091 destroy both the private and the public key.

1105

1106 2.3.41 TC-ECC-3-12 - Register an ECC Key Pair and ECDSA Certificate

1107 EC recommended curve is secp256k1

1108 - Private Key format ECPrivateKey - <http://tools.ietf.org/html/rfc5915>

1109 - Public Key format SubjectPublicKeyInfo - <http://tools.ietf.org/html/rfc5480>

1110 Register a EC private key in the ECPrivateKey key format, then register the corresponding public
1111 key, in X.509 (SubjectPublicKeyInfo) format, and a corresponding ECDSA certificate, with the
1112 Link attribute pointing to the previously registered private key. Return the attribute values for
1113 the ECDSA certificate showing the correct server parsing of the certificate. Then add the Link
1114 attribute to the private key, and perform Locate operations to find the public and private keys

1115 using the Link attribute. Get both the private and public keys in default format, then destroy
1116 both the private and the public key.

1117

1144 2.3.42 TC-PGP-1-12 - Register PGP Key - RSA

1145 Register a PGP public and private key block. Add the appropriate links between the registered
1146 objects. Make sure everything was registered and the attributes set correctly by listing and
1147 retrieving the attributes. Get the keys, and finally destroy all the registered objects.

1148 Note: the ascii armored keys are:

1211

1212 2.3.45 TC-MDO-3-12 - Register MDO Key using PKCS11 URI

1213 Client registers a metadata-only object with the key management server using the URI form of
1214 the Key Value Location and then locates and gets the value and the associated attributes. Finally
1215 the managed object is destroyed.

1216 See <http://tools.ietf.org/html/draft-pechanec-pkcs11uri-10> for more details on the PKCS11 URI
1217 format.

1232 Appendix A. Acknowledgments

1233 The following individuals have participated in the creation of this specification and are gratefully
1234 acknowledged:

1235 Editors of the previous versions of this document:

1236 Mathias Björkqvist, IBM (v1.0 and v1.1)
1237 Tim Hudson, Cryptsoft (v1.1)
1238 René Pawlitzek, IBM (v1.0)
1239

1240 Technical Committee Participants:

1241 Hal Aldridge, Sypris Electronics
1242 Mike Allen, Symantec
1243 Gordon Arnold, IBM
1244 Todd Arnold, IBM
1245 Richard Austin, Hewlett-Packard
1246 Lars Bagnert, PrimeKey
1247 Elaine Barker, NIST
1248 Peter Bartok, Venafi, Inc.
1249 Tom Benjamin, IBM
1250 Anthony Berglas, Cryptsoft
1251 Mathias Björkqvist, IBM
1252 Kevin Bocket, Venafi
1253 Anne Bolgert, IBM
1254 Alan Brown, Thales e-Security
1255 Tim Bruce, CA Technologies
1256 Chris Burchett, Credant Technologies, Inc.
1257 Kelley Burgin, National Security Agency
1258 Robert Burns, Thales e-Security
1259 Chuck Castleton, Venafi
1260 Kenli Chong, QuintessenceLabs
1261 John Clark, Hewlett-Packard
1262 Tom Clifford, Symantec Corp.
1263 Doron Cohen, SafeNet, Inc
1264 Tony Cox, Cryptsoft
1265 Russell Dietz, SafeNet, Inc
1266 Graydon Dodson, Lexmark International Inc.
1267 Vinod Duggirala, EMC Corporation
1268 Chris Dunn, SafeNet, Inc.
1269 Michael Duren, Sypris Electronics
1270 James Dzierzanowski, American Express CCoE
1271 Faisal Faruqui, Thales e-Security
1272 Stan Feather, Hewlett-Packard
1273 David Finkelstein, Symantec Corp.
1274 James Fitzgerald, SafeNet, Inc.
1275 Indra Fitzgerald, Hewlett-Packard
1276 Judith Furlong, EMC Corporation
1277 Susan Gleeson, Oracle
1278 Robert Griffin, EMC Corporation
1279 Paul Grojean, Individual
1280 Robert Haas, IBM

1281	Thomas Hardjono, M.I.T.
1282	ChengDong He, Huawei Technologies Co., Ltd.
1283	Steve He, Vormetric
1284	Kurt Heberlein, Hewlett-Packard
1285	Larry Hofer, Emulex Corporation
1286	Maryann Hondo, IBM
1287	Walt Hubis, NetApp
1288	Tim Hudson, Cryptsoft
1289	Jonas Iggbom, Venafi, Inc.
1290	Sitaram Inguva, American Express CCoE
1291	Jay Jacobs, Target Corporation
1292	Glen Jaquette, IBM
1293	Mahadev Karadiguddi, NetApp
1294	Greg Kazmierczak, Wave Systems Corp.
1295	Marc Kenig, SafeNet, Inc.
1296	Mark Knight, Thales e-Security
1297	Kathy Kriese, Symantec Corporation
1298	Mark Lambiase, SecureAuth
1299	John Leiseboer, Quintessence Labs
1300	Hal Lockhart, Oracle Corporation
1301	Robert Lockhart, Thales e-Security
1302	Anne Luk, Cryptsoft
1303	Sairam Manidi, Freescale
1304	Luther Martin, Voltage Security
1305	Neil McEvoy, iFOSSF
1306	Marina Milshtein, Individual
1307	Dale Moberg, Axway Software
1308	Jishnu Mukeri, Hewlett-Packard
1309	Bryan Olson, Hewlett-Packard
1310	John Peck, IBM
1311	Rob Philpott, EMC Corporation
1312	Denis Pochuev, SafeNet, Inc.
1313	Reid Poole, Venafi, Inc.
1314	Ajai Puri, SafeNet, Inc.
1315	Saravanan Ramalingam, Thales e-Security
1316	Peter Reed, SafeNet, Inc.
1317	Bruce Rich, IBM
1318	Christina Richards, American Express CCoE
1319	Warren Robbins, Dell
1320	Peter Robinson, EMC Corporation
1321	Scott Rotondo, Oracle
1322	Saikat Saha, SafeNet, Inc.
1323	Anil Saldhana, Red Hat
1324	Subhash Sankuratipati, NetApp
1325	Boris Schumperli, Cryptomathic
1326	Greg Singh, QuintessenceLabs
1327	David Smith, Venafi, Inc
1328	Brian Spector, Certivox
1329	Terence Spies, Voltage Security
1330	Deborah Steckroth, RouteOne LLC
1331	Michael Stevens, QuintessenceLabs
1332	Marcus Streets, Thales e-Security
1333	Satish Sundar, IBM
1334	Kiran Thota, VMware
1335	Somanchi Trinath, Freescale Semiconductor, Inc.
1336	Nathan Turajski, Thales e-Security

1337 Sean Turner, IECA, Inc.
1338 Paul Turner, Venafi, Inc.
1339 Rod Wideman, Quantum Corporation
1340 Steven Wierenga, Hewlett-Packard
1341 Jin Wong, QuintessenceLabs
1342 Sameer Yami, Thales e-Security
1343 Peter Yee, EMC Corporation
1344 Krishna Yellepeddy, IBM
1345 Catherine Ying, SafeNet, Inc.
1346 Tatu Ylonen, SSH Communications Security (Tectia Corp)
1347 Michael Yoder, Vormetric. Inc.
1348 Magda Zdunkiewicz, Cryptsoft
1349 Peter Zelechowski, Election Systems & Software
1350

1351 Appendix B. Revision History

Revision	Date	Editor	Changes Made
wd01	26-June-2013	Tim Hudson / Faisal Faruqui	Initial draft with updated conformance wording style. Updated test case style. Included test cases for 1.0, 1.1 and 1.2. Applied new OASIS template.
wd02	6-August-2013	Tim Hudson / Faisal Faruqui	Updated Test Cases based on July 2013 Interop
Wd02a	24-October-2013	Tim Hudson	Editorial corrections to two typographical errors in the test cases in TC-71-{10,11,12}, TC-MDO-{1,2}.
