See [#433](#). From the statement in §3.27.5 that `result.ruleId` consists of the rule's stable identifier optionally followed by an additional hierarchical component, and the statement in §3.49.3 that `rule.id` is *just* the rule's stable identifier, it follows that the spec does not support per-sub-rule metadata. However, the spec does not explicitly state that, and it's hard to deduce unless you know exactly where to look in the spec.

I will add a NOTE to §3.49.3 stating that explicitly.
